

M.Sc.,BIOCHEMISTRY

PREAMBLE

- Biochemistry is the study of chemistry and relating to biological organisms.
- Biochemistry is sometimes viewed as a hybrid branch of organic chemistry which specializes in the chemical processes and chemical transformations that take place inside of living organisms.
- Biochemistry incorporates everything in size between a molecule and a cell and all the interactions between them.
- Biochemistry essentially remains the study of the structure and function of cellular components (such as enzymes and cellular organelles) and the processes carried out both on and by organic macromolecules - especially proteins, but also carbohydrates, lipids, nucleic acids and other biomolecules.
- All life forms alive today are generally believed to have descended from a single proto-biotic ancestor, which could explain why all known living things naturally have similar biochemistries.
- Biochemistry is most simply put the chemistry of life.

KARPAGAM ACADEMY OF HIGHER EDUCATION
Coimbatore – 641 021
DEPARTMENT OF BIOCHEMISTRY
FACULTY OF ARTS, SCIENCE AND HUMANITIES
PG PROGRAM (CBCS)- M.Sc., Biochemistry
(2020–2021 and onwards)

Course code	Name of the course	Objectives and outcomes		Instruction hours / week			Credit(s)	Maximum Marks			Page No
		PEOs	POs	L	T	P		CIA	ESE	Total	
SEMESTER - I											
20BCP101	Chemistry of Biopolymers	I	a	4	-	-	4	40	60	100	6
20BCP102	Enzymes and Microbial Technology	II	d	4	-	-	4	40	60	100	8
20BCP103	Bioinstrumentation and Good Laboratory Practices	II	d, e	4	-	-	4	40	60	100	11
20BCP104	Cellular Biochemistry	III	a	4	-	-	4	40	60	100	13
20BCP105A	Advanced Plant Biochemistry	III	a	4	-	-	4	40	60	100	16
20BCP105B	Ecology and Evolutionary biology	I	c, f								19
20BCP105C	Signal Transduction and Regulation	I	d								21
20BCP111	Practical – I Quantitative Estimation and Séparation Techniques	II	a	-	-	4	2	40	60	100	23
20BCP112	Practical – II Plant Biochemistry and Microbiology	I, III	a, e	-	-	4	2	40	60	100	25
	Journal paper analysis and Presentation	I- III	a, e	2	-	-	-	-	-	-	
Semester Total				22	-	8	24	280	420	700	
SEMESTER – II											
20BCP201	Regulation of Metabolic Pathways	II	a	4	-	-	4	40	60	100	27
20BCP202	Molecular Biology	II	a, b	4	-	-	4	40	60	100	29
20BCP203	Developmental Genetics	II	a, b	4	-	-	4	40	60	100	31

Blue – Employability

Green – Entrepreneurship

Red – Skill Development

Elective courses *

Elective – 1 (18BCP105)*		Core Elective – 2 (18BCP205)*		Core Elective – 3(18BCP305)*	
Course code	Name of the course (Theory)	Course Code	Name of the course (Theory)	Course Code	Name of the course (Theory)
20BCP105-A	Plant Biochemistry	20BCP205-A	Recombinant DNA Technology	20BCP305-A	Biostatistics and Research Methodology
20BCP105-B	Ecology and Evolutionary biology	20BCP205-B	Advanced Animal Tissue Culture	20BCP305-B	Clinical Research
20BCP105-C	Signal Transduction	20BCP205-C	Forensic Toxicology and Pharmacology	20BCP305-C	Dietetic Management of Disease

* The candidate has to select any one elective course from three options in each semester

VALUE ADDED COURSES

1. Scientific writing
2. Clinical research
3. Animal handling Procedures

PROGRAMME OUTCOME(POs)

PG biochemistry graduate will be able to achieve

- a. **Critical Thinking and Effective Communication:** The teaching is intended to kindle the critical thinking of the student to address problems (Problem based learning) and equip them to list out their understanding (Activity based learning). The syllabus also includes journal paper presentation and analysis on specific topics of all subjects which will be evaluated by faculty handling the subject.
- b. **Future Career:** To prepare students for future careers in the various fields of biochemistry such as academic and research institution.
- c. **Societal Contribution and Social Interaction:** The Biochemistry Programme will benefit the society on the whole by adding to the highly skilled scientific workforce, particularly for the biomedical research sectors, in the academic, industry as well as for research laboratories across the country and the globe. Inside the classrooms group discussion is encouraged on topics during the last five minutes of class to improve the understanding and to share the knowledge and view point. Outside the classroom, various outreach programme are conducted on various health initiatives.
- d. **Identification and Differential Diagnosis:** To acquire biochemist position in leading hospitals and scientist position in industries.
- e. **Ethics:** Students learn about the significance of having right moral features to develop good interpersonal skills.
- f. **Environment and Sustainability:** Understand the role of citizen to maintain sustainable environment and encourage Eco-friendly initiatives.
- g. **Self-directed and Life-long Learning:** Acquire the ability to engage in independent and life-long learning in the broadest context of health and disease.

PROGRAMME SPECIFIC OUTCOME (PSOs)

- h. To prepare students for future careers in various fields of biochemistry by enhancing analytical and critical-thinking skills in which a core understanding of the chemistry of biological processes is important for the understanding of human health and disease.
- i. To equip highly skilled scientific workforce, particularly for the biomedical research sectors, in the academic, industry as well as for research laboratories across the country and the globe.
- j. The skills acquired in the programme will help the students in acquiring scientific, academic and industrial positions such as Analyst, Research Scientist at Pharma (R&D)

- k. Industries, Academician, Project Associates (JRF, SRF), Doctoral Research positions abroad at India and abroad. Clinical biochemist at renowned hospitals, medical coding, Scientific writers.

PROGRAMME EDUCATIONAL OBJECTIVE (PEOs)

- I. The course aims to impart advanced and in depth understanding on all the human physiological and pathological state. To understand the molecular process and their perturbation during disease.
- II. The programme covers various aspects of Biomolecule estimation and regulation to ascertain health and disease state. metabolic pathways alterations along with their regulation at the replication, transcriptional, translational, and post-translational levels including by studying DNA, RNA and protein molecules, immunology, endocrinology, advancements in rDNA technologies to circumvent genetic disorders.
- III. Further to enrich research understanding various genomic, proteomic and bioinformatics tools are added. Animal cell culture, IPR, Biostatistics, research methodology, clinical research and Plant tissue culture are offered as elective papers to get specialized in a specific area. The final semester is devoted exclusively to enrich the students to address specific research objective.

Mapping of PEOs and POs

POs	a	B	c	d	e	f	g	i	j	k
PEO I	X		X			X				
PEO II	X		X	X	X	X		X	X	X
PEO III	X	X	X	X	X		X		X	X

Course objectives

Equip the students:

- To understand the biological significance of polysaccharides in living systems
- To understand the structure of amino acids and proteins and their biological significance in living systems
- To know the structure, properties and biological significance of lipids in biological systems
- To understand lipid peroxidation and the importance of antioxidants in degenerative diseases
- To understand the structure and functional role of nucleic acid in living systems
- To understand the nucleic acid interaction with proteins and their molecular aspects.

Course outcomes (CO's)

After successful completion of the course, the student will:

1. Understand the structure and organization of storage and structural polysaccharides in living system
2. Recognize the structure and importance of proteins and amino acids in biological system.
3. Recall the role of lipids in biomembrane including signal transduction
4. Equip with the knowledge on antioxidants and their importance
5. Differentiate the structure, types, properties and functions of DNA and RNA
6. Recognize the nucleic acid interaction with proteins and gain knowledge in molecular techniques.

UNIT I: Polysaccharides

Brief review of carbohydrates, classification. Occurrence, structure and biological functions of cellulose, chitin, **inulin**, agar, starch and glycogen. Fructans, arabinans and galactans. Dietary fibre. Occurrence, structure, and biological functions of bacterial cell wall polysaccharides and blood group antigens. Structure and significance of glycoconjugates- Glycosaminoglycans – structure and biological role of hyaluronic acid, chondroitin sulfate and heparin, sialic acid; glycoproteins and glycolipids.

UNIT II: Proteins

Review of structure and classification of amino acids. Orders of protein structure. Primary structure – determination of amino acid sequence of proteins. The peptide bond – The Ramachandran plot. Secondary structures – α -helix, β -sheet and β -turns. Fibrous proteins- Collagen triple helix-Structure and assembly. Globular proteins-forces involved, folding process and folding patterns. Tertiary structure – Myoglobin organisation. Quarternary structure of proteins- Structure of haemoglobin. Models for haemoglobin allostery.

Quintary structure-basics only. **Methemoglobin**. Protein function as enzymes, defensive and transport.

UNIT III: Lipids

Introduction, classification, structure and functions of simple lipid, compound lipids-phospholipids, glycolipids, storage lipids and cholesterol. Eicosanoids-prostaglandins, thromboxanes and leucotriens. Properties of lipids-Micelles, bilayers and liposomes. Steroids – Plant and Animal Steroids; Significance of lipid anchored protein-prenylated, fatty acylated and GPI anchored proteins. Lipoproteins – classification, composition and biological functions. Lipids as signals, cofactors and pigments (Brief account). Lipid peroxidation and antioxidants.

UNIT IV: Nucleic acids

DNA double helical structure – Watson and Crick model. A, B and Z forms of DNA. Tertiary and quadraplex structures of DNA. DNA supercoiling and linking number. Properties of DNA – DNA bending, buoyant density, viscosity, denaturation and renaturation – The cot curve – Chemical synthesis of DNA.

Major classes of RNA – mRNA, rRNA, tRNA, sn RNA, siRNA, hn RNA – structure and biological functions. Secondary and tertiary structure of tRNA and rRNA.

UNIT V: Nucleic acid interaction with proteins

DNA binding motifs in proteins – the basic helix loop helix (bHLH) motif, zinc finger, the leucine zipper, helix-loop helix and homeo domain. RNA binding motifs in proteins. Molecular aspects of protein-nucleic acid binding – direct interactions. Techniques characterizing nucleic acid-protein complex – chromatin immunoprecipitation assay, DNase I footprinting.

SUGGESTED READINGS

1. Nelson, D., and Cox, M. W.H. (2012) Lehninger Principles of Biochemistry (4th Ed.) New York, Freeman and Company.
2. Murray, R.K., Bender, D.A., Botham, K.M., and Kennelly, P.J., (2012). Harper's illustrated Biochemistry, 29th Edition. McGraw-Hill Medical. London.
3. Zubay, G., (2009). Biochemistry, Wm.C Brown Publishers, Saunders and Company, Philadelphia.
4. Voet, D., Voet, J. G., & Pratt, C. W. (2008). Fundamentals of biochemistry: Life at the molecular level. Hoboken, NJ: Wiley.
5. Nucleic acid structure and recognition. Neidle, Oxford University Press, 2002
6. Nucleic acids in Chemistry and Biology. Blackburn and Gait, IRL Press, 1996
7. Rawn, .J.D., (2004). Biochemistry, First Indian reprint, Panima Publishing Corporation, New Delhi.

Course objectives

Equip the students:

- To understand the structure of enzymes and their classifications.
- To analyse the active site of enzymes by various experimental approaches.
- To learn the kinetics of enzyme catalysed reactions.
- To learn the importance of enzyme immobilization and its wide applications in medicine and industries.
- To study various fermentor designs, culture systems and the application of fermentation process in industry.
- To learn the fermented products preparation, downstream processing and its industrial applications.

Course outcomes (CO's)

After successful completion of the course, the student will:

1. Understand the mechanism of action of enzymes and their classifications.
2. Recall the kinetics of enzyme catalyzed reactions
3. Understand the enzyme immobilization concept and apply the knowledge to produce more products out of it.
4. Gain knowledge in designing fermentor based on Industrial needs
5. Have clear understanding of microbe's implication to derive a product and the role of enzymes in downstream process.
6. Clear in concept of various culture techniques and apply the suitable one for a particular application.

UNIT I: Enzymes

Enzymes Nomenclature and classification of Enzymes with examples; Structure and functions of coenzymes and cofactors. Active site, the investigation of active site structure – The identification of binding sites, catalytic sites-trapping the E-S complex. Use of substrate analogs, enzyme modification by treatment with proteolytic enzymes, photo oxidation and chemical modification of amino acid side chains. Affinity labeling studies and super reactive amino acid chains. The 3-D structural features of active sites as revealed by X-ray crystallographic and chemical studies, site directed mutagenesis. catalytic triad. Lock and key model, Induced fit model. Factors affecting enzyme activity. Isolation, purification and characterization of enzymes. Mechanism of enzyme action – Acid base and covalent catalysis (Chymotrypsin, lysozyme), metal activated and metalloenzymes.

UNIT II: Enzyme Kinetics

Derivation of MM equation, LB plot, Eadie-Hofstee plot and Hanes plot. Bisubstrate reactions-types of bi-bi reactions, differentiating bi substrate mechanisms-diagnostic plots, isotope exchange. Enzyme inhibition-Types and differentiation of competitive, uncompetitive and non-competitive inhibition, Allosteric inhibition, feed-back inhibition and regulation. Reversible covalent modification (glycogen phosphorylase); proteolytic

cleavage (Zymogen); multi enzyme complex as regulatory enzymes (PDH); isoenzymes(LDH). Mechanism based inhibitors-antibiotics as inhibitors. Mechanism of action of enzymes - chymotrypsin and lysozyme. Enzyme based diagnostic techniques.

UNIT III: Immobilization of enzymes

Methods of immobilization - adsorption, covalent binding, entrapment, membrane confinement. Effect of immobilization on enzyme. Use of enzymes in clinical diagnosis and industries. Enzyme engineering. Artificial enzymes and synzymes, Abzymes, ribozymes, enzymes in organic solvents.

Biosensors –Principle, Technique and Applications. Examples - glucose oxidase, cholesterol oxidase, urease and antibodies as biosensors.

UNIT IV: Microbial Growth

Balanced and Unbalanced microbial growth; Measurement of growth; Principles of microbial growth and culture systems- culture, fed culture, semi-continuous culture and continuous culture. Isolation and screening of industrially important microbes. Important strains for better yield. Design of a fermenter. Types of bioreactor-Continuous stirred tank, Bubble column, Airlift, Fluidized bed, Packed bed and Photobioreactor. Solid substrate fermentation and Media fermentation. Examples of bioprocess for the production of biomass. Microbial metabolic products-primary and secondary metabolites.

UNIT V: Production of fermented products and downstream processing

Production of alcohol and alcoholic beverages. Microbial production of Organic acids: Source, recovery and uses of Citric acid, Lactic acid, Acetic acid and L-ascorbic acid. Production of antibiotics: Penicillin and Tetracyclin. Bioinsecticides: Production of Bacterial and fungal polysaccharides, commercial production of Xanthan gum and pullulan. Production of edible mushroom and SCP. Biofertilizers *Phosphobacterium* and *Rhizobium sp.*, Biopesticides, leaching of ores by microbes, microbial treatment of wastewater – aerobic and anaerobic methods.

**Instruction hours/week: L: 4 T: 0 P:0 Marks: Internal: 40 External: 60 Total: 100
End Semester Exam: 3 Hours**

Course objective

Equip the students:

- To learn centrifugation techniques and their applications in biological system.
- To understand the principle of colorimetry and advanced spectrophotometric techniques
- To learn the basics, advanced techniques and applications of chromatography
- To learn the importance of calibration of analytical instruments.
- To learn the principle and applications of electrophoresis and radioisotopic techniques in biological sample analysis
- In good laboratory practices procedures.

Course outcomes (CO's)

After successful completion of the course, the student will:

1. Apply the centrifugation techniques in biological system
2. Use colorimetry and spectrophotometry for sample analysis
3. Use chromatographic techniques for sample analysis
4. Calibrate analytical instruments
5. Detect radioisotopes and analyze samples using electrophoretic techniques
6. Follow the good laboratory practices procedures.

UNIT I: Centrifugation

Types of centrifuges, Principles and applications of analytical and preparative centrifuges, density gradient and ultra centrifugation. Relative molecular mass determination and sedimentation coefficient. Sub cellular fractionation of cellular components. Applications. Separation of cells on the basis of density.

Colorimetry: Beer's law and Lambert's law. Principle of photoelectric colorimeter.

Spectroscopy: Properties of electromagnetic radiations, Instrumentation and applications of UV Visible and mass spectroscopy, FTIR, NIR, reverse spectroscopy. Spectrofluorimetry, atomic spectroscopy, NMR spectroscopy, Mass spectroscopy (GC – MSMS), LC-MSMS, MALDI-TOF, ICPMS. Advantages and disadvantages and advancements of spectroscopic methods.

UNIT II: Chromatography

Principles, Types – paper chromatography, thin layer chromatography and HPTLC, Separation of phytoconstituents using TLC. Column chromatography - Ion exchange chromatography, affinity chromatography, gel filtration chromatography, Principle and application of gas chromatography, Low pressure liquid chromatography (LPLC) and High Performance Liquid Chromatography (HPLC)- Normal and Reverse Phase Gas -liquid chromatography; Application and calibrations of analytical instruments (HPLC, GC and ICPMS)

UNIT III: Electrophoresis

Principle, instrumentation and applications of agarose gel electrophoresis, sodium dodecyl sulphate – polyacrylamide gel electrophoresis (SDS-PAGE), native PAGE, isoelectric focusing, immunoelectrophoresis, 2D gel electrophoresis. Pulse field gel electrophoresis, capillary electrophoresis, gel documentation – Applications. Blotting techniques.

UNIT IV: Radioisotopic techniques

Introduction, nature of radio activity, types and rate of radioactive decay, units of radio activity, detection and measurement of radioactivity-Geiger-Muller counter, solid and liquid scintillation counter. Autoradiography, X-ray diffraction and circular dichorism. Non-radioactive, fluorescent methods. Applications of radioisotopes in biological sample analysis.

Flowcytometry: Principles and applications.

Microscopic Imaging techniques: Atomic Force Microscopy, Confocal fluorescent microscopy, SEM and TEM

UNIT V: Good Laboratory Practices

Laboratory safety procedure-General Safety-biological safety and fire safety, personal protective equipment-glass ware, equipment safety, hand washing procedure. Precaution to be undertaken to prevent accident and contamination. Quality concepts-Records and Documents, retention samples, Scope and organization and personnel, test systems, test and reference items, standard operating procedures, performance of the study, reporting of study result, storage and retention of records and materials data generation and storage. Quality management system audits, guidelines and regulations. NABL and NABH accreditation-Benefits and scope, Good Manufacturing Practices.

Course objectives

Equip the students

- To recall the knowledge in organization and dynamics of mitochondria.
- To understand the molecules within the cell and interaction between cells that allows construction of multicellular organisms.
- To understand cytoskeleton network and extracellular matrix.
- To learn cell signaling mechanisms and pathways
- To understand cell cycle, cell division and cell death process.
- To recognize cancer and mutational changes at gene level.

Course outcomes (CO's)

Upon successful completion of this course, participants will be able to:

1. Recognize the organization and dynamics of mitochondria.
2. Recognize cell cell interaction and their mechanism.
3. Maintain cytoskeleton structure and functions of micro, macro and intermediary filaments.
4. Recognize the cell signaling mechanisms and pathways.
5. Enumerate the phases of cell cycle, events in cell division and mechanism of cell death
6. Relate properties of cancerous cells to mutational changes in gene function.

UNIT I: Membrane**Cellular organization:**

Membrane models, chemical composition of membrane, membrane proteins, movement of small and large molecules across the cell membrane, osmosis, diffusion, endocytosis, phagocytosis, Membrane lipids- fluidity, asymmetry, phase transition, Liposomes: artificial liposomes and its application.

Sub-cellular organelles: Structure and functions of intracellular organelles such as nucleus, mitochondria, endoplasmic reticulum, golgi apparatus, lysosomes, plastids, peroxisomes.

Cytoskeleton: Structure, organization and function of microtubules and microfilaments, role of myosin, kinesin and dynein, cell movements.

UNIT II: Membrane transport

Membrane proteins – Types, Orientation, Mobility – Experiments, flippases, proteins of RBC membrane, RBC ghosts, Bacteriorhodopsin, Porins – aquaporin. solubilisation of proteins, lipid anchored proteins, Carbohydrates – cell surface carbohydrates – Lectins and selectins.

Passive diffusion, facilitated diffusion in erythrocytes, Carriers and ion channels, Ion concentration gradients.

Uniporter Catalyzed transport, active transport systems. Transport process driven by ATP-Ion pumps: Calcium ATPase; Na⁺ K⁺ ATPase; Mechanism, Gastric H⁺ K⁺ ATPase, ABC superfamily – ATPases that transport peptides and drugs(MDR proteins).

Co-transport by Symporters and antiporters, Group translocation. Osmosis, receptor mediated endocytosis and its significance.**Extracellular matrix and cell adhesion molecules:** Function and composition of extracellular matrix molecules, types of cell adhesion molecules, integrin, cadherin and immunoglobulin superfamily proteins.

Protein targeting: Protein synthesis on free and bound ribosomes, modification and quality control of protein in ER, secretion and transport of protein to various cell compartments, post translational modification.

UNIT III: Mitochondria

Mitochondria – Reduction potential, Free energy and entropy, electron transport chain – Complexes, Q-cycle, Cyt C oxidase complex, Translocation of protons and the establishment of a proton motive force, machinery for ATP formation and chemi-osmotic mechanism, ATP synthase – Experiments, inhibitors and uncouplers of oxidative phosphorylation.

Microfilaments – Actin – Structures, Assembly, Myosin. Microtubules – Organisation and dynamics, kinesin and dynein. Cilia and flagella – Structure and functions, intermediary filaments.

Mitochondrial transport system: ATP/ADP exchange, malate-glycero phosphate shuttle

UNIT IV: Cell – Matrix interaction

Cell – Cell interaction: Extra cellular matrix; Collagen, hyaluronan and proteoglycans, laminin, integrins, Fibrillin, elastin and fibronectins.

Cell – Cell adhesion: Specialised junctions – Desmosomes, Gap junctions, Tight junctions. Adhesion molecules – Cadherins (E and N), Connexins.

UNIT V: Cell cycle and cancer

Cell cycle and its control, Cell cycle control in mammalian cells, checkpoints in cell cycle regulation.

Cancer: Properties of tumour cells and genetic basis and onset of cancer.

Tumour viruses – DNA&RNA Viruses as transforming agents – mechanism.

Tumour suppressor genes and functions of their products. Carcinogenic and anticarcinogenic effect of chemicals and radiation. Apoptosis (Programmed cell death) – pathways, regulators and effectors on apoptosis and necrosis.

Instruction hours/week: L: 4 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100
End Semester Exam: 3 Hours

Course objectives

Equip the students

- To recollect the knowledge in plant cell organelles and their functions
- To understand the functions and regulations of major biosynthetic pathways of plants,
- To learn and understand the role of plant growth substances in various stages of plant growth
- Obtaining knowledge on tissue culture techniques
- To learn metabolic engineering to increase the production of plant secondary metabolites
- To become familiar with the transformation process and its applications

Course outcomes (CO's)

Upon successful completion of this course, participants will be able to:

1. Recall the understanding of plant cell organelles and their functions
2. Recognize the source of food for other organisms and their synthesis in plants
3. Recall the role of plant growth substances in various stages of plant growth
4. Equip with tissue culture techniques
5. Understand the role of secondary metabolites and their production and importance
6. Equip with gene transfer techniques

UNIT I: Plant photosynthesis

Overview of photosynthesis: **photosynthetic pigments**, photosynthetic apparatus, reaction center, photosystems I and II, mechanism of photosynthesis-cyclic and non cyclic photophosphorylation; evidences in support of light and dark reactions.

Solute transport and photoassimilate translocation – Uptake, transport and translocation of water, ions, solutes and macromolecules from soil.

UNIT II: Assimilatory mechanisms in plants

Photorespiration and water consumption, CO₂ assimilation by C₃ and C₄ plants, **function and regulation of RUBISCO**, CAM pathway. Nitrogen assimilation; reduction of nitrate, nitrogen fixation in symbiotic and non-symbiotic plants, nitrogen cycle, **NIF genes and its regulation**. Sulphate metabolism in leaf; sulfite reduction and sulphur cycle, glutathione synthesis. Carbon and phosphorus cycles.

UNIT III: Lipid metabolism in plants

Biosynthesis of fatty acids in plastids, synthesis of waxes, triacylglycerols and glycolipids. Synthesis of chlorophyll. Carotenoid formation. Synthesis of nitrogenous compounds: caffeine synthesis, ureide synthesis in nodulated legumes. Secondary oxidative mechanisms: β - oxidation, ω - oxidation, glyoxylate pathway.

UNIT IV: Plant growth substances and plant defense response

Chemistry, biosynthesis, mode of action and physiological role of auxins, gibberellins, cytokinins, abscisic acid and ethylene. Factors influencing endogenous growth- Biotic and Abiotic factors. Phytochromes: molecule, biological display, functions as light sensor. Cryptochromes and phototropins, stomatal movement, photoperiodism and biological clock. Senescence: biochemical changes, regulation.

Plant defense response, antimicrobial molecules; genes for resistance, hypersensitive response and cell death; systemic and acquired resistance.

UNIT V: Plant secondary metabolites

Synthesis of secondary metabolites- shikimate pathway. Alkaloids, flavonoids, terpenoids, phenols and glycosteroids-Occurrence, distribution & functions, Production of secondary metabolites in plants, stages of secondary metabolite production. Biochemistry of plant toxins, phytohemagglutinins, lathyragens, nitriles, protease inhibitors, protein toxins, role of secondary metabolites in chemical defence. Importance of secondary metabolites: Uses of secondary metabolites to man: as drugs, precursors of drugs in pharmaceutical industry, as natural pesticides/insecticides; other uses of secondary metabolites.

Plant Tissue Culture- Totipotency, meristematic and nodal cultures-Callus induction. Somatic embryogenesis, Cell suspension culture. Metabolic engineering for increased production of secondary metabolites.

Instruction hours/week:L: 4 T: 0 P:0**Marks: Internal: 40 External: 60 Total: 100****End Semester Exam: 3 Hours****Course objective**

Equip the students

- To gain an appreciation for the diversity of life
- To understand how organisms interact with each other and their environment
- To gain a basic understanding of how populations function,
- To learn how communities are structured
- To understand behavioral ecology
- To be aware of the central role that evolution plays in biology

Course outcomes (CO's)

After completion of this course the student will

1. Appreciate the diversity of life
2. Interact with each other and their environment
3. Have practical understanding of species interaction
4. Built a structured community
5. Expertise in behavioral ecology
6. Recognize the central role of ecology and evolution in biology

UNIT I: Ecology

Population ecology; metapopulation dynamics; growth rates; density independent growth; density dependent growth; niche concept; Species interactions: Plant-animal interactions; mutualism, commensalism, competition and predation; trophic interactions; functional ecology; ecophysiology; behavioural ecology.

UNIT II: Community Ecology

Community assembly, organization and evolution; biodiversity: species richness, evenness and diversity indices; endemism; species-area relationships; Ecosystem structure, function and services; nutrient cycles; biomes; habitat ecology; primary and secondary productivity; invasive species; global and climate change; applied ecology.

UNIT III: Basics of Evolution

Origin, evolution and diversification of life; natural selection; levels of selection. Types of selection (stabilizing, directional etc.); sexual selection; genetic drift; gene flow; adaptation; convergence; species concepts; Life history strategies; adaptive radiation; biogeography and evolutionary ecology.

UNIT IV: Origin of genetic variation

Mendelian genetics; polygenic traits, linkage and recombination; epistasis, gene-environment interaction; heritability; population genetics; Molecular evolution; molecular clocks; systems of classification: cladistics and phenetics; molecular systematics; gene expression and evolution.

UNIT V: Behavioural Ecology

Classical ethology; neuroethology; evolutionary ethology; chemical, acoustic and visual signaling; Mating systems; sexual dimorphism; mate choice; parenting behaviour; Competition; aggression; foraging behaviour; predator-prey interactions; Sociobiology: kin selection, altruism, costs and benefits of group-living.

SUGGESTED READINGS

3. Hall, B.J, (2011) Evolution, Jones and Bartlett Publishers, 1st Edition, USA.
4. McMillan, Victoria E.(2012). Writing Papers in the Biological Sciences, 5th Edition. Bedford/St. Martin's Press, Boston. ISBN- 0-312-64971-1.

Instruction hours/week:L:4 T:0 P:0 Marks: Internal: 40 External: 60 Total: 100
End Semester Exam: 3 Hours

Course objectives

The students should be able to:

- To make the regulation of transcription and translation
- Understand the basic mechanism of signal transduction
- Understand the cell cycle regulation
- Understand cell cycle check point
- Signal transduction mechanism in various disease conditions.
- Understand Nuclear Receptor Signaling

Course outcomes (CO's)

After completion of this course

1. Students will understand the underlying mechanism behind the signal transduction
2. Application of their knowledge in studying the gene regulation in the maintenance of health
3. Students will understand the receptors and signaling pathways
4. Application of their knowledge in studying the gene regulation during disease
5. The student may be able to extend their research through drug development.
6. Students can find potential job opportunity in Pharma and Research institutions

Unit – I: Different modes of Signal Transduction

Signal transduction: definition, signals, Endocrine, paracrine and autocrine signaling. Sensory Transduction : Nerve impulse transmission – Nerve cells, synapses, reflex arc structure, Resting membrane potential, action potential, voltage gated ion-channels, impulse transmission, neurotransmitters, neurotransmitter receptors. Rod and cone cells in the retina, biochemical changes in the visual cycle, photochemical reaction and regulation of rhodopsin. Odor receptors. Chemistry of muscle contraction – actin and myosin filaments, theories involved in muscle contraction, mechanism of muscle contraction, energy sources for muscle contraction.

Unit – II-Membrane Receptor Signaling

Receptors and signaling pathways: cell signaling, cell surface receptors. G Protein coupled receptors- structure, mechanism of signal transmission, regulatory GTPases, heterotrimeric G proteins and effector molecules of G Proteins. Signal transmission via transmembrane receptors with tyrosine specific protein kinase activity. Role of phosphotyrosine in SH2 domain binding. Signal transmission via Ras proteins Intracellular signal transduction: The protein cascade of the MAP kinase pathway.

Membrane receptors with associated tyrosine kinase activity, Other receptor classes: TGF β receptors, smad proteins, receptor regulation by intra membrane proteolysis; signal transduction via the two component pathway.

Ser/Thrspecific protein kinases and phosphatases.

Unit – III-Nuclear Receptor Signaling

Signaling by nuclear receptors:ligands, structure and functions of nuclear receptors, nuclear functions for hormones/metabolites - orphan receptors; cytoplasmic functions and crosstalk with signaling molecules, signaling pathway of the steroid hormone receptors. Cytokine receptors- structure and activation of cytokine receptors, Jak-Stat path way, Janus kinases, Stat proteins.

Unit - IV Cell Cycle Regulation by different Signaling

Regulation of the cell cycle: Overview of the cell cycle, cell cycle control mechanisms, Cyclin-dependent protein kinases (CDKs), regulation of cell cycle by proteolysis, G1/S Phase transition, G2/M Phase transition, cell cycle control of DNA replication, DNA damage check points. Cancer, types of cancer, factors causing cancer-physical, chemical and biological agents. Malfunctioning of signalling pathways and tumerogenesis.Oncogenes, proto-oncogenes and tumor suppressor genes.Tumor suppressor protein p53 and its role in tumor suppression.Tumor suppressor APC and Wnt/ β -Catenin signaling. Apoptosis. Signal transduction in Health and Disease: Cancer, Neurodegeneration, Diabetes and Obesity and Inflammation

Unit – V- Signaling and Transcription Control

Regulation of transcription and translation in prokaryotes: Concept of operon, lac-, and trp operons, attenuation, regulons. Regulation in eukaryotes- gene families, regulatory strategies in eukaryotes, gene alteration, regulation of synthesis of primary transcripts, hormonal control, transcription factors, transcription factors: targets of signaling pathways, Regulation at the level of translation in prokaryotes and eukaryotes.

QUANTITATIVE ESTIMATION AND SEPARATION TECHNIQUES

Instruction hours / week: L:0 T:0 P:4 Marks: Internal: 40 External: 60 Total: 100
End Semester Exam: 3 Hours

Course objectives

- To provide hands on experience on preparation of buffers and determination of pH of solutions
- To estimate the macromolecules quantitatively thro colorimetric procedures
- To perform fluorometric experiments and titrimetry
- To separate the macromolecules using TLC and column chromatography.
- To perform the secondary metabolite quantification using HPLC.
- Gain hands on training in protein extraction and purification techniques.

Course outcomes (CO's)

After completion of this course the student will

1. Prepare buffers and reagents based on the needs of experiments
2. Estimate macromolecules quantitatively thro colorimetric procedures
3. Estimate vitamins and calcium using fluorimetry and titrimetry
4. Quantify secondary metabolites using HPLC
5. Separate the macro molecules using TLC and column chromatography
6. Extract and purify protein from various sources

Experiments**Colorimetry**

1. Isolation and estimation of starch from potato (Anthrone method)
2. Isolation and estimation of glycogen from liver (Anthrone method)
3. Estimation of Total carotenoids (Spectroscopic method)
4. Estimation of fructose in fruits (Resorcinol method)
5. Estimation of ascorbic acid (DNPH method)
6. Estimation of Vitamin E (Dipyridyl method)
7. Estimation of methionine (Sodium nitroprusside method)
8. Determination of saponification and iodine number of fat or oil

Fluorimetry

9. Estimation of thiamine from cereals or fruits
10. Estimation of riboflavin

Titrimetry

11. Estimation of lactose in milk
12. Estimation of calcium in milk

Separation techniques

13. Separation of amino acids by paper chromatography- circular, ascending & Descending.
14. Separation of plant pigments by TLC.
15. Separation of plant pigments by column chromatography.
16. Estimation of quercetin using HPLC (Demo).

Cell biology:

17. Preparation of standard buffer and determination of pH of buffers.
18. Subcellular fractionation by differential centrifugation and purity assessment with marker enzymes (Group Experiment).
19. Salting out of proteins using ammonium sulphate precipitation

EQUIPMENTS REQUIRED

1. Spectrophotometer
2. Fluorimeter
3. Column chromatography
4. Microscope

SUGGESTED READINGS

1. Jayaraman, J., (2007). Laboratory Manual in Biochemistry, New Age International Publishers, New Delhi.
2. Sadasivam, S., and Manickam, A., (2009). Biochemical Methods, New Age, International Publishers, New Delhi.
3. Singh, S.P., (2009). Practical Manual of Biochemistry, CBS Publishers, New Delhi.
Karp, G., (2010) Cell and Molecular biology : Concepts and Experiments. 6 th Edition. John Wiley & sons. Inc.
4. Lodish, H., Berk, A., Kaiser, C.A., and Krieger, M., (2012). Molecular Cell Biology, 7th edition. W.H. Freeman & Company, London. IBSN: 10: 1- 4641-0981-8.

Instruction hours/week: L:0 T:0 P: 4Marks: Internal: 40 External: 60Total: 100
End Semester Exam: 3 Hours

Course objectives**Equip the students**

- To screen phytochemicals and estimate the amount of secondary metabolites
- To handle microbiological techniques
- To identify microbes in soil and water samples
- To isolate, characterize and purify microbial enzymes
- To perform antibacterial activity of active compounds
- To gain hands on experience in plant tissue culture

Course outcomes (CO's)**After completion of this course the student will perform**

1. Phytochemical screening and secondary metabolite estimation
2. Microbiological techniques
3. Microbial identification in soil and water samples
4. Isolation, characterization and purification of microbial enzymes.
5. Antibacterial activity of active compounds
6. Callus induction and regeneration of plantlets

Experiments**Plant Biochemistry**

1. Phytochemical screening of any one selected medicinal plant-Extraction and analysis, lyophilisation
2. Estimation of Tannins
3. Estimation of Flavonoids
4. Estimation of Chlorophyll
5. Estimation of Phenols
6. Spectrophotometric estimation of Indole acetic acid in plant tissues

Microbiology

7. Isolation of pure culture – serial dilution, pour plate, spread plate, streak plate methods.
8. Colony morphology – colony counting.
9. Staining techniques- simple, differential, spore, and fungal staining.
10. Antibiotic resistance / sensitivity test (Disc method)

11. Estimation of bacteria- growth curve of bacteria and generation time.
12. Identification of microorganisms – biochemical tests (IMVIC test) (Group Experiment)
13. Microbiology of potable water
14. Isolation, characterization and purification of ANY one of the following microbial enzymes
 - a) Amylase
 - b) Protease
15. Assay of Antibacterial of ANY ONE selected medicinal plant by Disc or Well diffusion and broth dilution method.
16. Assay of antifungal activity of ANY ONE selected medicinal plant by Disc or Well diffusion. TLC-Bioautography.

Plant Tissue Culture (Group experiment)

17. Induction of meristem culture
18. Callus induction.
19. Regeneration of shoot and root from callus culture.
20. Micropropagation of any one medicinal plant

EQUIPMENTS REQUIRED

1. Spectrophotometer
2. Microscope
3. Laminar air flow
4. Incubator

SUGGESTED READINGS

Course objectives

- To shed knowledge on generation and transformation of energy in metabolic pathways.
- To know the metabolic pathway of carbohydrate and their regulation with associated disorders.
- To learn fatty acid synthesis and degradation and their regulation
- To study the regulation of amino acid metabolism and its regulations with Metabolic disorders.
- To understand the inter relationship of carbohydrate, lipid, protein and nucleic acid metabolism and understand the importance of TCA cycle.
- To aware about the homeostasis of glucose metabolites by intrinsic and extrinsic control mechanism.

Course outcomes (CO's)

1. Gain knowledge on glucose anabolic and catabolic pathways that ultimately control the glucose homeostasis.
2. know the metabolic pathway of amino acid and their regulation with associated disorders.
3. learn fatty acid synthesis and degradation and their regulation
4. Able to explain the role of lipids, their metabolism and their stringent control by hormones and other factors.
5. Understand the anabolic and catabolic processes associated with amino acids and nucleic acids and their regulation.
6. Able to understand the energy homeostasis during starvation and energy excess

UNIT I: Introduction to control of enzyme activity

Controlling amount of enzymes: **Enzyme induction and repression**. **Controlling activity of enzyme**: Allosteric interaction; covalent modification; Reversible and irreversible; feed back inhibition; feed forward stimulation. Role of compartmentation. Elucidation of Metabolic pathways- Single- and Multi-step pathways. Experimental approaches to study the metabolism- using metabolic inhibitors and isotopes.

UNIT II: Carbohydrate Metabolism

An overview of Glycolysis and Gluconeogenesis. **Role of PDH** and its regulation. Regulation of Glycolysis and Gluconeogenesis- Reciprocal control of Glycolysis and Gluconeogenesis, TCA cycle- steps, regulation at branch points; Glycogen Metabolism: Overview of glycogenesis and glycogenolysis. Reciprocal control of glycogenesis and glycogenolysis. Alternative pathways of metabolism- HMP shunt, Entner- Doudoroff pathway, glucuronate and Glyoxalate pathway, cori cycle. Hormonal regulation of fuel metabolism; Metabolic disorders- Diabetes mellitus and insipidus.

UNIT III: Lipid metabolism

An overview of fatty acid synthesis and degradation, Regulation of fatty acid synthesis-control of acetyl CoA carboxylase and fatty acid synthetase complex; Reciprocal control of fatty acid synthesis and degradation. Biosynthesis of triacyl glycerol, phosphatidyl choline, phosphatidyl ethanolamine and sphingomyelin and their regulation. Synthesis and degradation of cholesterol and its regulation. Metabolism of prostaglandins-COX and LOX pathways. Metabolic fate of VLDL, LDL and HDL. **Ketogenesis and its control**. Obesity and regulation of body mass. Metabolic disorders- Atherosclerosis, Hyper and hypo lipoproteinemia.

UNIT IV: Amino acid metabolism

Regulation of synthesis of pyruvate, serine, glutamate, aspartate, aromatic and histidine family of amino acids (Flow chart only) . Key role of glutamate dehydrogenase and glutamine synthetase in nitrogen metabolism and their allosteric regulations. **General breakdown of amino acid** - Oxidative deamination, **Non oxidative deamination**, decarboxylation and transamination. Fate of amino group- Ammonia formation and disposal- urea cycle and its regulation. **Fate of carbon skeleton**. Biosynthesis of heme (porphyrin) and its regulations. Molecules derived from amino acids. Metabolic disorders- Alkaptonuria, phenyl ketonuria.

UNIT V: Nucleic acid metabolism

De novo synthesis of purine and its regulation – Role of PRPP amino transferase. De novo synthesis of pyrimidine and its regulation – Role of aspartate carbonyltransferase. Regulation of deoxyribonucleotides by activators and inhibitors. Intergration of metabolism. Metabolism during starvation. Tissue specific metabolism- Metabolic profile of major organs- Brain, Muscle, Liver and Adipose tissue. Metabolic disorders- Gout, SCID. **Metabonomics - Introduction to metabolomics- biological aspects and applications.**

SUGGESTED READINGS

1. Lehninger, L., Nelson, D.L., and Cox, M.M., (2012). Principles of Biochemistry, 6th edition WH Freeman and Company, New York.
2. Murray, R.K., Bender, D.A., Botham, K.M., and Kennelly, P.J., (2012). Harper's illustrated Biochemistry, 29th Edition. McGraw-Hill Medical. London.

6. Smith. 2003. Principles of Biochemistry, McGraw– Hill International Book Company, London.
7. Zubay, G., (2009). Biochemistry, W.C Brown Publishers, Saunders and Company, Philadelphia.

Course objectives

The course aims to provide students with a basic understanding of

- To acquire the knowledge on Organization of DNA in a genome and transposons
- To know the mechanism behind replication and repair.
- To enable the knowledge on transcription and translation.
- To understand the mechanism of Regulation of gene expression in prokaryotes
- To study the structure and remodeling of chromatin
- To learn the mechanism of Eukaryotic gene regulation

Course outcomes (CO's)

At the end of the course, student will be able to

1. Acquire the knowledge on molecular structure of genes.
2. Understand the structure of nucleic acids and the DNA replication process
3. Learn about the process of transcription
4. Understand the mechanism of translation
5. Learn about gene regulation in prokaryotes
6. Learn about gene regulation in eukaryotes

UNIT I: Molecular structure of genes

Molecular definition of gene, chromosomal organization of genes and non-coding DNA, protein coding genes, tandemly repeated genes, single sequence DNA. Comparison between Prokaryotes and Eukaryotes. Structural organization of eukaryotic chromosomes- histone proteins, chromatin, functional elements. **DNA Supercoiling**. Mobile DNA elements- bacterial IS elements, transposons, viral transposons and non- viral transposons- **Mechanisms**. Mutation- types.

UNIT II: DNA replication and repair

General features of chromosomal replication. Enzymology of DNA replication, DNA replication machinery. Replication in prokaryotes and eukaryotes- Initiation, elongation and termination. Relationship between replication and cell division. DNA damage- types. Repair mechanism of DNA damage- **Replication errors and mismatch repair system, repair of DNA damage, direct repair, base excision repair, nucleotide excision repair and recombination repair**. Translesion DNA synthesis.

UNIT III: Transcription

Prokaryotic gene transcription- Initiation, elongation and termination. Eukaryotic gene transcription- transcription unit, RNA polymerases- types, Transcription and processing of mRNA, tRNA and rRNA. Regulatory sequences in protein coding genes- TATA box, initiators, CpG island, promoter-proximal element, activators and repressors of transcription, Multiple transcription control elements. Regulation of transcription factor activity by lipid-soluble hormones. **Inhibitors for transcription process**.

UNIT IV: Transcription Regulation and Translation

Post Transcriptional modification of RNA. RNA splicing mechanism all types. RNA editing.

Translation- Deciphering genetic code, features. Wobble hypothesis. **Ribosomes as protein synthetic machinery.** Initiation, elongation and termination of prokaryotic and eukaryotic translation. Fidelity of translation. Post translational modifications-all types.

UNIT V: Prokaryotic gene regulation

Operon model, Lac, trp ara and **Gal operons.** Regulatory proteins-DNA binding domain, protein- protein interaction domain.Recombination- holiday model, Rec BCD enzymes, Rec A protein, MesselsonRadding model, site- specific recombination. Antisense RNA technology.

Eukaryotic gene regulation: Transcriptionally active chromatin, chromatin remodeling, DNA binding transactivators and coactivators.Regulation of gene expression by intracellular and intercellular signal, RNAi, **synthesis and function of miRNA molecules, phosphorylation of nuclear transcription factors.**

8. James D. Watson, A. Baker Tania, P. Bell Stephen, Gann Alexander, Levine Michael, Losick Richard. Molecular biology of the Gene.2017.

Course objective

- To interpret the Mendelian Principle and experiments
- To infer the environmental effects and human intelligence
- To acquire the knowledge on diagnosis of infectious disease and molecular probes used in diagnosis.
- To study gametogenesis and fertilization
- To have knowledge on chemical changes in cell division and cleavage
- To understanding and discuss ramifications of inherence, gene structure and function, gene mutation, and research related to genetics and its applications.

Course outcomes (CO's)

1. Comprehensive, detailed understanding of the chemical basis of heredity
2. Comprehensive and detailed understanding of genetic methodology
3. Quantification of heritable traits in families and populations provides insight into cellular and molecular mechanisms.
4. Comprehensive detailed understanding of cellular mechanisms of developmental stages.
5. ramifications of inherence, gene structure and function, gene mutation, and research related to genetics and its applications.
6. knowledge on chemical changes in cell division and cleavage

UNIT-I: Mendelian Principle and experiments

Mendelian inheritance-principles; Mendel's experiments-monohybrid, dihybrid trihybrid and multihybrid crosses. Interaction of genes: incomplete dominance, codominance, epistasis, complementary genes, duplicate genes, polymeric genes, modifying genes; lethal genes. Environmental influence of gene expression: penetrance and expressivity; temperature, light, phenocopies. Environmental effects and twin studies; human intelligence. Quantitative or polygenic inheritance: Inheritance of kernel color in wheat; corolla length in tobacco skin color inheritance in man, transgressive and regressive variation. Multiple alleles; Sex determination; Extra chromosomal inheritance. Genetic abnormalities

UNIT-II: Prenatal Screening

Amniocentesis; Prenatal diagnosis of genetic diseases, XX and XY karyotyping, DNA/RNA probes. DNA probes in the diagnosis of infectious diseases; Mycobacterial, plasmodial, HIV and HPV infections during development. Molecular probes in diagnosis of genetic diseases: Down syndrome, Cystic fibrosis, Sickle cell anemia, Alkaptonuria, Phenylketonuria, Klinefelter syndrome and Cancer (breast cancer, Leukaemia, Burkets lymphoma).

UNIT-III: Developmental Stage I, II and III

Gametogenesis – Origin of germ cells – Significance of different stages of gametogenesis
Oogenesis – Types of eggs–growth, development and maturation of oocyte, Egg envelopes,

Polarity and symmetry, Spermatogenesis–Sperm Structure, Types of sperm, Fertilization – Approach of spermatozoon–Reaction of egg, essence of activation–Changes in egg cytoplasm during fertilization. Cell division in cleavage – Chemical changes–Patterns of embryonic cleavage. Gastrulation – Primary organ, Rudimental organs, Organizer–Morphogenetic movements- invagination, extension, ingression movements and locomotion. Organogenesis: Induction and differentiation. Development of Immune system, Genetic basis of differentiation.

UNIT-IV: Regeneration & Aging

Genetics of Metamorphosis, Regeneration & Aging – Metamorphosis in Insects, Metamorphosis in Amphibia, Morphallactic Regeneration in Hydra, Epimorphic regeneration of Salamander limbs, Compensatory regeneration in the Mammalian Liver, Causes of Aging, Genetically regulated pathway of Aging.

UNIT-V: Medical implications of Developmental Biology

Global patterning, holoprosencephaly, Spandlocostal dysostosis (somitogenesis), imprinting, Hirschsprung disease, Arabidopsis, Demethylation, Ubiquitination, Fins, Transition to limbs, Hox Genes and molecular controls, controlling the segmentation clock, Stem cells, Alzheimer's, Pancreas development and cancer. Genetic errors of Human development, inborn errors of nuclear RNA processing & translation, identifying the genes for Human developmental anomalies, Teratogenesis – environmental assaults on Human development.

Course objectives

To make the students

- To make students understand the essential features of the interdisciplinary field of science for better understanding the biological data.
- To retrieve the sequence analysis of Nucleic acid and protein
- To create students opportunity to interact with algorithms, tools and data in current scenario.
- To make the students look at a biological problem from a computational point of view.
- To find out the methods for analyzing the expression, structure and function of proteins,
- To understand the relationships between species.

Course outcomes (CO's)

1. Acquire the knowledge on biological data, submission and retrieval from databases.
2. Able to make experiment pair wise and multiple sequence alignment
3. Analyze the secondary and tertiary structures of protein sequences.
4. Understand the data structure (databases) used in bioinformatics and interpret the information (especially: find genes; determine their functions),
5. Understand and be aware of current research and problems relating to this area.
6. Knowledge on applications of bioinformatics

UNIT I: Concepts of Bioinformatics

Definition, concepts of Bioinformatics: Objectives, Genome sequencing projects, Human Genome Project.

Introduction to Biological databases: Types of databases, sequence databases-nucleic acid sequence databases, GenBank, protein sequence database, Swiss-Prot, PIR, motif database-PROSITE, structural databases, bibliographic databases and organism specific databases-GMOD- Searching and retrieval of data-Entrez and SRS. Microbial Genome Database (MBGD), Organism specific Database OMIM/OMIA, Genome Browser: NCBI Map viewer, UCSC Browser.

UNIT II: Sequence Analysis

Introduction to sequence Alignment: Pairwise and multiple sequence alignment, substitution matrices. Dynamic programming algorithms-Needleman and Wunsch and Smith-Waterman, Similarity searching programs, BLAST, FASTA, Multiple sequence alignment – CLUSTAL, Introduction and application to phylogenetic trees, basic terminologies, Phylogenetic analysis-PHYLIP theory of phylogeny, tree building methods.

Sequence analysis, dot blot, Clustal omega

UNIT III: Gene Identification and Protein prediction strategies

Protein three dimensional structure prediction-Comparative modeling, threading, Concepts of Molecular modeling, Model refinement, **Ramachandran plot**, evaluation of the model, protein folding and visualization of molecules – Visualization tools-RasMol, SPDB viewer. Protein Data Bank, Molecular modeling database (MMDB). Gene structure in prokaryotes and eukaryotes. Gene prediction tool (GeneMark, GenScan), Pattern Recognition, Global gene expression studies-DNA Micro array. Analysis and prediction of regulatory regions

UNIT IV: Genomics and Proteomics

Genomics

Genome sequencing strategies, comparative genomics-whole genome alignments, megaBlast, MUMmer, Applications of comparative genomics. Functional Genomics: Sequence comparison, structure analysis and comparison, Machine learning, SVM, Artificial Neural Networks.

Proteomics: Proteome analysis: 2D gel electrophoresis, Mass Spectroscopy, MALDI-TOF, Protein-Protein Interactions. Proteomics in drug Discovery. sequencing, Genome database-SWISS-2D PAGE database, , Probabilistic models: Markov chain-random walk-Hidden markov models.

UNIT V: Applications of Bioinformatics

Applications of Bioinformatics-Molecular medicine, biotechnology, forensic analysis, agricultural, Computer Aided Drug Designing-structure and ligand based drug designing, ADME profiles, QSAR. Docking- principles and Methods. Autodocking, GEMDOCK, GOLD, Molegro Virtual Docker.

Course objectives

To make the students

- To make the student to understand the concept of gene manipulation and gene transfer technologies.
- To understand the concept of recombinant DNA technology or genetic engineering
- To interpret the characterization of recombinant protein
- To infer the knowledge on cDNA
- To expose students to application of recombinant DNA technology in biotechnological research.
- To train students in strategizing research methodologies employing genetic engineering techniques.

Course outcomes (CO's)

1. An understanding on application of genetic engineering techniques in basic and applied experimental biology
2. The concept of recombinant DNA technology or genetic engineering
3. Study the gene cloning vectors and their expression
4. Explore the knowledge on genomic library
5. Proficiency in designing and conducting experiments involving genetic manipulation.
6. Describe DNA fingerprinting, and restriction fragment length polymorphism (RFLP) analysis and their applications.

UNIT I: Introduction to gene manipulation

Basic techniques- Isolation and purification of nucleic Acids, Agarose gel Electrophoresis. Hybridization of nucleic acids-probes and types. Hybridization techniques- Southern, Northern, Western blotting. DNA and RNA markers.

Enzymology of Genetic manipulation, Genome Editing.

UNIT II: Gene cloning vectors

Plasmids, bacteriophages, phagemids, cosmids, Artificial chromosomes- BAC, YAC, HAC. Restriction mapping of DNA fragments, Map construction, Cloning in *E. coli*- Vector engineering and codon optimization. Gene expression in *E. coli*. Expression vector- PET vector. Genomic library.

UNIT III: Isolation and characterization of gene transcripts

Introduction, Converting mRNA transcripts into cDNA, Screening representative cDNA libraries, Functional sequencing of cDNA expression libraries. Expressed cDNAs compared with computer databases. Characterization of recombinant proteins- Processing, purification and refolding and stabilization-Insulin, hGH, tpA.

UNIT IV: Mutagenesis

Mutagenesis, Knock-in, Knock-out, conditional knock-outs, Regulation of gene expression, cDNA arrays, gene silencing by RNAi, dominant negative approach, *in vivo* and *in vitro* protein protein interactions, bacterial and yeast one, two and three hybrids, phage display, GST pull down, co-immunoprecipitation, Far Western blot, FRET, Biacore; DNA, RNA – protein interactions, Applications of genetic engineering

Gene therapy- Different strategies for gene therapy, therapeutics based on targeted exhibition of gene expression and mutation correction *in vivo*, Gene therapy for inherited diseases, ADA, FH, Cystic fibrosis.

UNIT V: Transgenics

Gene transfer techniques- Microinjection, biolistic methods, vector based transfer.

Transgenic plants: Agrobacterium & Ti plasmids. Methods of engineering herbicide resistance plants, Stress resistance plants and modification of plant nutritional content (amino acids, β - carotene) Plants as bioreactors: edible vaccines.

Transgenic animals: Method of Engineering transgenic mice, transgenic cattle- applications Biosafety- regularities and concerns. Societal impact of genetically modified food.

Instruction hours/week:L:4T:0P:0Marks: Internal: 40 External: 60Total: 100
End Semester Exam: 3 Hours

Course objectives

To make the students

- To impart the knowledge on basic tissue culture techniques and limitations in products
- To study about tissue culture laboratory and safety – biohazards
- To extrapolate the different types of culture media
- To understand the various types of cultures
- To learn synchronization of cell cultures and cell division
- To know the importance of stem cell research and its applications.

Course outcomes (CO's)

1. Learn to demonstrate foundational knowledge of Cell culture techniques and competence in laboratory techniques.
2. Set up a tissue culture lab to carry out research based on cell lines.
3. Extrapolate the different types of culture media
4. Understand the various types of cultures
5. Learn synchronization of cell cultures and cell division
6. Know the importance of stem cell research and its applications.

UNIT I: Introduction to cell culture

Introduction, importance, history of cell culture development, different tissue culture techniques including primary and secondary culture, continuous cell lines, suspension culture, organ culture, advantages and limitations medical/pharmaceutical products of animal cell culture-genetic engineering of animal cells and their applications. **CART therapy**
Risks in a tissue culture laboratory and safety - biohazards.

UNIT II: Different types of cell culture media

Different types of cell culture media-Basal and advanced, growth supplements, serum free media, balanced salt solution, other cell culture reagents, culture of different tissues and its application. Facilities for animal cell culture-infrastructure, Clean room, equipment, culture vessels. Biology and characterization of cultured cells- STR Profiling cell adhesion, proliferation, differentiation, morphology of cells and identification.

UNIT III: Types of cell culture techniques

Primary cell culture techniques - mechanical disaggregation, enzymatic disaggregation-collagenase I, II, IV, Trypsin digestion, separation of viable and non-viable cells. Mass culture of cells - manipulation of cell line selection –Transformation of plasmid-types of cell lines -maintenance of cell lines - immobilization of cells and its application - synchronization of cell cultures and cell division - production of secondary metabolites -

biotransformation - Induction of cell line mutants and mutations - cryopreservation – germplasm conservation and establishment of gene banks.

UNIT IV: Animal cell culture scale up

Animal cell culture scale up: Scale up in suspension - Stirrer culture, impellor, continuous flow culture, air-lift fermentor culture; Scale up in monolayer - Roller bottle culture, multi-surface culture, multiarray disks, spirals and tubes - monitoring of cell growth. Organ culture –Mini gut development in vitro-organ on a chip-whole embryo culture - specialized culture techniques - measurement of cell death-AO/EtBr staining

UNIT V: Tissue engineering

Tissue engineering: Design and engineering of tissues - tissue modeling. Embryonic stem cell engineering - ES cell culture to produce differential cells - Human embryonic stem cell research. Transgenic animals-transgenic animals and xenotransplantation

Instruction hours/week:L: 4 T:0 P:0 Marks: Internal: 40 External: 60 Total: 100
End Semester Exam: 3 Hours

Course objectives

The main objective of this course is

- To provide a comprehensive theoretical knowledge on genomics and proteomics including fundamentals
- Understand the concept and Significance Poisons
- Get knowledge about current techniques and applications.
- Get knowledge about extraction techniques
- To update and strengthen basic concepts in proteomics and genomics to address the modern biological issues.
- Isolation and General characterization of alkaloids.

Course outcomes (CO's)

After completion of this course the student will have

1. The students will to identify and describe the different components in prokaryotic and eukaryotic genomes and proteomes.
2. To identify molecular mechanisms responsible for diseases.
3. To use the different methodologies, techniques and tools commonly used in genome sequencing, assembly and annotation.
4. To use the different methodologies, techniques and tools commonly used in proteomics.
5. To understand and strengthen basic concepts in proteomics and genomics to address the modern biological issues.
6. Understand about current techniques and applications.

UNIT-I Forensic Toxicology:

Introduction, concept and Significance Poisons: Definition, Classification of poisons, Types of poisoning sign and symptoms of poisoning, mode of action, factors modifying the action of poisons, Toxicological exhibits in fatal and survival cases, their preservation Treatment in cases of poisoning, Analysis report.

UNIT-II Extraction, Isolation and Clean-up procedures:

Non-volatile organic poison, Stas-otto, DovbrieyNickolls (Ammonium sulphate) method, acid digest and Valov (Tungstate) methods, Solid phase micro extraction techniques, Solvent extraction methods Volatile Poisons: Industrial solvent acid and basic Distillation Toxic Cations: Dry Ashing and Wet digestion process Toxic Anions: Dialysis method total alcoholic extract

UNIT-III General Study and Analysis:

Barbiturates, methaqualone, Hydromorphone, Methadone, Meprobamate, Mescaline, Amphetamines, LDS, Heroin, Cannabinoids, Phinothiazines Insecticides: Types, General methods for their analysis Alkaloids: Definition, classification, Isolation and General characterization.

UNIT-IV Forensic Examination of Metallic Poisons:

Arsenic, Mercury, Lead, Bismuth, Copper, Aluminium, Iron, Barium, Zinc Analysis of Ethyl Alcohol in blood and urine, illicit liquor, Methanol, Acetone, Chloroform, Phenol Snake venoms and Poisons, Irrespirable gases

UNIT-V Forensic Pharmacological studies:

Absorption, Distribution, Metabolism, Pathways of drug metabolism General studies and Analysis of some vegetable poisons, Opium, Abrus, Cyanogenetic glycosides, Dhatura, Marking nuts, Nux-vomica, Oleander and Aconite.

7. Dettean J D; Kirk's Fire Investigation, 5th Ed., Prentice Hall, Eaglewood Cliffs, N.J.(2002) w.e.f. 2005-2006.

Instruction hours/week: L:0 T:0 P:4 Marks: Internal: 40 External: 60 Total: 100
End Semester Exam: 3 Hours

Course objectives

To make the students

- To understand the Molecular structure, functions of cells, molecules such as DNA, RNA, proteins.
- To understand the principles of animal cell culture and its application.
- To learn the knowledge on quantity of DNA by Diphenylamine method
- To infer the Estimation of RNA by Orcinol method
- To know the Preparation of competent *E coli*- transformation
- To explore the knowledge on Ligation of DNA

Course outcomes (CO's)

By the end of the course, students should be able

1. To demonstrate knowledge and understanding of the molecular machinery of living cells, cell and tissue culture to manipulate.
2. To explore the genomes of animals for ways to improve the livestock for food production and biomedical purpose as well as and to analyse, interpret, and participate in reporting to their peers on the results of their laboratory experiments.
3. Identification of DNA by Agarose gel electrophoresis
4. Estimation of RNA by Orcinol method
5. Preparation of competent *E coli*- transformation
6. Ligation of DNA

MOLECULAR BIOLOGY

1. Isolation of DNA and RNA from liver
2. Estimation of DNA and RNA - UV method
3. Estimation of DNA by Diphenylamine method
4. Estimation of RNA by Orcinol method
5. Estimation of Protein by Lowry's method
6. Culturing and Isolation of Plasmid DNA
7. Agarose gel electrophoresis of DNA
8. Restriction digestion analysis of DNA (Demonstration)
9. Preparation of competent *E coli*- transformation (demonstration)
10. Determination of Molecular weight of polypeptides by SDS PAGE (group)
11. Polymerase Chain Reaction for amplification of DNA (demonstration)
12. Ligation of DNA
13. Southern Blot Analysis (Demonstration)
14. Western Blotting (Demonstration)

ANIMAL TISSUE CULTURE (Demonstration)

15. Preparation and Sterilization of media
16. Cell lines and maintenance-Trypsinisation, Passaging, Staging
17. Cell counting and cell staining
18. Cell viability determination – Tryphan blue exclusion.

EQUIPMENTS USED:

1. Cooling centrifuge
2. Spectrophotometer
3. Electrophoresis unit
4. Gel Documentation unit

SUGGESTED READINGS

1. Freshney, R. I. (2010). Culture of Animal Cells- A Manual of Basic Techniques, 6th edition, John Wiley and Sons, Inc, Publication, New York.

Instruction hours/week: L:0 T:0P:4Marks: Internal: 40 External: 60Total: 100
End Semester Exam: 3 Hours

Course objectives

To make the students

- To provide hands on experience on various biological databases
- To learn the retrieval of data from the biological databases
- To make them learn about pair wise and multiple sequence analysis.
- To learn and apply the statistical approaches
- To study the models for phylogenetic analysis and tree reconstruction.
- To learn them protein prediction methods and its validation.

Course outcomes (CO's)

The students shall be able to understand

1. The use of various biological databases
2. The importance functions in the biological system.
3. The use computational approaches for pair wise, multiple and phylogenetic analysis.
4. Aware to predict the physio-chemical properties, protein structure and validation using computer based labs.
5. Solve the biological problems using various computational tools and techniques.
6. Visualization of Protein structure by RASMOL.

Experiments

1. Biological Databanks Sequence databases, Structure Databases, Specialized databases
2. Data base file formats.
3. Data retrieval tools and methods (PUBMED, ENTREZ, SRS)
4. Sequence Similarity searching (NCBI- BLAST, FASTA)
5. Protein sequence analysis (ExPASy proteomics tools)
6. Multiple sequence alignment (Clustal-W)
7. Gene structure and function prediction (Using ORF Finder, Genscan, GeneMark)
8. Molecular Phylogeny (PHYLIP)
9. Sequence Analysis using EMBOSS
10. Protein structure visualization – RASMOL (Menu function and Command line entries), Deep View.
11. Homolgy modeling using Swiss Model
12. Active site & Pocket prediction
13. Molecular Docking using PATCH DOCK
14. Retrive Drug molecule using PubChem

INSTRUMENTS REQUIRED

1. SEESAR Software
2. Online free software

SUGGESTED READINGS

2. Attwood, K., and Parry-Smith, J., (2003). Introduction to Bioinformatics, Pearson Education, Singapore.
3. Baxevanis., A.D., and Quellette, B.F.F., (2001). Practical Guide to the Analysis of Genes and Proteins, 3rd edition, John Wiley & Sons, New York.
4. Mount, D.W., (2013). Bioinformatics: Sequence and Genome Analysis. Cold Spring Harbour Laboratory Press, New York.

Course objectives

Equip the students with

- Specialized immune cells and their function
- Mechanisms of humoral immunity
- Mechanisms of cell mediated immunity
- Hyperactivation of immune cell and associated pathogenesis
- Basis behind immunodeficiency diseases
- Utility of immune based principles in diagnostic field

Course outcomes (CO's)

After successful completion, the students will understand:

1. The structure and functions of specialized immune cells
2. Basis of humoral immunity
3. Basis of cell mediated immunity
4. Hypersensitivity reactions (I-V)
5. Hereditary and acquired immunodeficiency diseases
6. Utility of immune based principles in diagnostic field

UNIT I: Cells and Organs of the Immune System

Primary and secondary lymphoid organs, Overview of immune stem cells - Lymphoid cells, mononuclear, granulocytes, mast cells and dendritic cells. Lymphoid classes B, T and NK – B & T Cell maturation, activation and differentiation; Lymphocyte surface markers, CD nomenclature. Innate immune responses: Physical, chemical, biological barrier immunity. Cell-mediated and humoral response, soluble molecules and membrane associated receptors (PRR), connections between innate and adaptive immunity cell adhesion molecules, complements (classical and alternate pathways), chemokines, leukocyte extravasation, localized and systemic response.

UNIT II: Antigen - Antibody, Processing and Presentation

Epitope, B cell and T cell epitope, haptens, viral and bacterial antigens; factors influencing adjuvant technology. Immunoglobulins-domains, B cell receptors, antigenic determinants on immunoglobulins, Immunoglobulin super family. Immunoglobulin genes: multigene family; Immunoglobulin rearrangement- antibody diversity - Burnet's clonal selection theory. Cell-mediated immunity – MHC: organization, MHC molecules and genes, MHC class-I/II and non-MHC antigen presentations.

UNIT III: Hypersensitivity and Autoimmunity

Coombs & Gell classification, IgE mediated (Type I), antibody mediated cytotoxic (Type II), immune-complex mediated (type III) and cell-mediated (Type IV) hypersensitivity, Principles of autoimmunity and autoimmune diseases, MHC and immune responsiveness, transplantation and rejection, tumor immunology, primary and secondary immunodeficiency disorders.

UNIT IV: Immunity to infection

Definition and types of immunity, Vaccines: active and passive immunization, types of vaccines with examples. Immune responses against bacterial, viral, fungal and parasitic agents. Evasion of infectious agents from immune system, Monoclonal antibodies - Production of monoclonal and polyclonal antibodies – Genetically engineered antibodies.

UNIT V: Immunodiagnostics

Antigen-antibody interactions - precipitation reaction, agglutination tests - haemagglutination; complement fixation test, direct and indirect immunofluorescence, immune-precipitation, RIA, ELISA, CMIA, ECLIA, Immuno-blotting, effector cell assay, heme adsorption, hemolytic plaque and ELISPOT assays. Experimental Animal models.

SUGGESTED READINGS

7. Soboloff J, KappesDJ,(2018) editors. Signaling Mechanisms Regulating T Cell Diversity and Function. Boca Raton (FL): CRC Press/Taylor & Francis

Course objectives

Equip the students with:

1. Biological fluid collection and analysis
2. Blood cell counting
3. Assessment of inflammatory markers
4. Estimation of clinically relevant enzymes
5. Diagnosis of cancer
6. Assessment of endocrine pathophysiology

Course outcomes (CO's)

After completion of the Course students will gain

1. The students will integrate the knowledge gained on Biochemistry, Anatomy and Physiology, in order to understand the pathophysiology of disease processes and their correlation in the study of body functions.
2. The students will learn how to assess blood test results and their involvement in the assessment of different pathologies.
3. Describe and identify the main characteristics of diagnosis, screening, and prognosis of disease.
4. Apply the processes of scientific research to use in emergency services in clinical biochemistry.

UNIT I: Clinical Samples

Blood collection, processing and transfusion process. Normal blood profile. Cerebrospinal fluid: Composition, clinical investigation of CSF in meningitis. Amniotic fluid: Origin, composition and analysis of amniotic fluid. Collection of urine Urine preservatives. Test for urine compounds. Clinical significance of urinary components. **Pre-analytical errors, data handling and confidentiality of patients.**

UNIT II: Serology and Hematology

C- reactive protein test, immunological test for pregnancy. Rheumatoid arthritis (RA) test, ESR.Coagulation test, prothrombin test.Haemoglobin Normal and abnormal Hb, separation of haemoglobin, Thalassemia, Hemoglobinopathies.Disorder of erythrocyte metabolic pathways, erythrocyte enzyme disorders.Porphyrins and disorder: porphyrias.

End reaction- End up reaction-(Glucose, urea, magnesium , total cholesterol). Kinetic reaction-AST, ALT, ALP, LDH, CK).Immunoturbometric (ASO, RA, CRP). Electrophoresis-Serum protein and hemoglobin).Agglutination test-ABO grouping, PT, activated partial thromboplastin time. Infectious diseases-test principles and applications.

UNIT III: Clinical Pathology

Myocardial infarctions, hepatobiliary disease. - Enzyme tests in the determination of

myocardial infarction. Diagnostic enzymes: Principles of diagnostic enzymology. Clinical significance of aspartate aminotransferase, alanine aminotransferase, creatine kinase, aldolase and lactate dehydrogenase. Enzymes of pancreatic origin and biliary tract. Clinical significance of electrolytes. AIDS- Clinical diagnosis. Diagnosis of genetic diseases by molecular biology techniques (cystic fibrosis, Hemochromatosis, thalassemias, sickle cell diseases). **HIV counseling.**

UNIT IV: Oncology

Oncogenes and cell cycle, Etiology-Free radical induced cancer. Free radical scavengers. Antioxidants in disease prevention. Benign and malignant types- Different stages of cancer progression-Cancer Markers. Therapy-Chemotherapy, 4 R's of radiotherapy, Diagnosis and prognosis of various cancers.

UNIT V: Pathophysiology

Pathophysiology of hypothalamus and pituitary (dwarfism, Klienfelter syndrome, adenoma, galactorrhea, amenorrhea). Pathophysiology of thyroid cretinism, myxedema, hashimoto's (autoimmune thyroid disorder), hypo- and hyperparathyroidism, bone (osteopenia and osteoporosis), adrenal (Cushing syndrome and Addison's disease) Pancreas (IDDM and NIDDM) and gonads (cystic ovaries, endometriosis, hypogonadism, cryptorchidism and testicular carcinoma).

Instruction hours/week: L:4 T:0 P:0 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

Course objectives

Equip the students with:

1. Hypothalamo - Hypophyseal axis
2. Classification of hormones
3. Mechanism of action of peptide and steroid hormones
4. Endocrine pathologies
5. Endocrinology of pregnancy
6. Investigative techniques in endocrinology

Course outcomes (CO's)

After successful completion, the students will understand:

1. Hypothalamo - Hypophyseal axis
2. Different classification of hormones
3. Functioning of peptide and steroid hormones
4. The molecular and cellular basis of endocrine pathologies
5. Role of hormones in different stages of gestation
6. The techniques involved in the assessment of endocrine functions

Unit I: General Introduction

A brief history of endocrinology, key figures and research; Hypothalamo-hypophyseal axis, Chemical signaling – endocrine, paracrine, autocrine, intracrine and neuroendocrine mechanisms. Chemical classification of hormones, transport of hormones in the circulation and their half-lives. Hormone receptors – extracellular, transmembrane and intracellular. Receptor – hormone binding, Scatchard analysis, recycling and degradation of receptors. Releasing/release-inhibiting hormones (TRH, GnRH, CRH, GHRH, somatostatin, dopamine), their structure, secretion and regulation.

Unit II: Protein/Peptide hormones

Protein/Peptide hormones, Steroid and Thyroid hormones, GH, prolactin, ACTH, insulin, glucagon, PTH and calcitonin, and glycoprotein hormones (TSH, FSH, LH and hCG) – Source, structure, synthesis, secretion, receptors, regulation, transport and metabolism.

Unit III: Hormones and gonads

Physiological action of hormones in the regulation of spermatogenesis, sperm maturation, oogenesis and menstrual/estrus cycles. Gonadal and adrenal steroidogenesis. Cell-cell communication – Two cell concept. Hormonal control of implantation and formation of the fetus and placenta - as a fetomaternal unit, mechanisms for single births and multiple births; fetal development, gestation and parturition. Physiology of lactation; milk and its production, hormonal effects on maternal-infant bonding; beginning and end of reproductive life – puberty-menopause; hormonal contraception. Semen analysis.

Unit IV: Hormone action

Protein and steroid hormone receptors and their signaling cascades; non-genomic actions; Ras-Raf-MAPK signaling- PI3K signaling. Genomic actions of hormones- thyroid hormone nuclear receptor superfamily. Renin-angiotensin system, atrial natriuretic hormones. Vasopressin and water retention.

Unit V: Investigative techniques in endocrinology and endocrine disorders

Hormone assays, RIA, IRMA, ELISA, Radio receptor assay, extraction, purification, and quantification of hormone receptors (cell surface, cytosolic and nuclear receptors). Radiolabeling techniques – Radioiodination of peptides, autoradiography. Properties of different types of radioisotopes commonly used in biology, radioactivity, detection and measurement of radioactivity, safety guidelines and disposal procedures. **Diseases of endocrine organs:** Diabetes, osteoporosis, Adrenal insufficiency, Cushing's disease, Gigantism (acromegaly), Hypothyroidism/Hyperthyroidism, Hypopituitarism, Multiple endocrine neoplasia I and II (MEN I and MEN II), Polycystic ovary syndrome (PCOS), Precocious puberty

7. Widmaier, E.P., Raff, H. and Strang, K.T. Vander's Human Physiology (2008) 11th ed., McGraw Hill International Publications, ISBN: 978-0-07-128366-3.

Course objectives

To enlighten the students with details of the

- This paper gives insight knowledge about the emerging themes of drug biochemistry.
- Provides an in-depth analysis of specific drug classes, its metabolism and therapeutic approaches.
- Drug tolerance and dependence
- Genetically engineered drugs
- Mechanism of action of drugs
- Undesired effects of drugs

Course outcomes (CO's)

After completion of the Course students will gain

1. Ensure the widespread visibility and high impact of Drugs, thereby promoting on emerging research, pointing the way for the establishment of new medicines – from the identification of targets, through to the synthesis and evaluation of putative therapeutic entities.
2. Able to understand the adverse effect of drugs in various organs.
3. The principles and procedure for genetically engineered drugs
4. How the drugs elicit the desired effect
5. Undesired effects of drugs
6. Drug dependence

UNIT I: Basic concepts of Drugs

Drugs – Introduction, sources and routes of administration, Structural features and pharmacological activity, prodrug concept, Adsorption – factors modifying drug absorption. Distribution, metabolism - phase I, II reactions, action of cytochrome P450 and excretion of drugs.

Drug receptors – Localization, types and subtypes, models and theories. G-protein coupled receptor and ion-channel linked receptors. Examples of drug-receptor interactions. Agonists and antagonists. Bioavailability of drug

UNIT II: Assay of Drug and Engineered drug

Drug tolerance and drug dependence. Principles of basic pharmacokinetics. Adversse response to drugs, drug intolerance, pharmacogenetics, drug allergy, tachyphylaxis, drug abuse, vaccination against infection, factors modifying drug action and effect. Assay of drug potency: chemical, bioassay and immunoassay.

Engineered Drug

Genetically engineered protein and peptide agents as drugs, Novel drug delivery systems, anti-AIDS drug development, oncogenes as targets for drugs, multidrug resistance

phenotypes, production of secondary metabolites by plant tissue culture. Genome based medicine. **Regulatory requirements of drug discovery FDA, IUDA and Indian regulations.**

UNIT III: Mechanism of action of drugs used in therapy

Mechanism of action of drugs used in therapy of Respiratory system – cough, bronchial asthma, pulmonary tuberculosis. Antimicrobial drugs – sulphonamides, trimethoprim, penicillins, aminoglycosides and bacterial resistance, Cancer chemotherapy. Thyroid and antithyroid drugs, insulin and oral antidiabetic drugs, antifertility and ovulation inducing drugs. Pharmacotherapy of gout and rheumatoid arthritis, Immuno therapy – Immunosuppressants and immunostimulants, Enzymes in therapy.

UNIT IV: Neurotransmitter Drugs

Brain – Neurotransmitters, encephalins and endorphins; general function of autonomic and somatic nervous system; cholinergic transmission and receptors; adrenergic transmission and receptors; muscarinic receptors. Non-steroidal and anti-inflammatory drugs; adrenergic blocking drugs; cholinergic blocking drugs; muscarinic blocking drugs; parkinson's disease; Alzheimer's disease. Neurodegenerative disorders – Amyotrophic, lateral sclerosis, senile dementia, schizophrenia, Huntington's disease.

UNIT V: Clinical Toxicology

Toxicology: Principles of toxicology and treatment of poisoning. Heavy metals and antagonists. Nonmetallic environmental toxicants. Methods involved in the development of new drugs. Preclinical toxicological studies. Irwin profile test, Pre-clinical pharmacokinetic and dynamic studies. Lipinski's rule for drug like molecule, High Throughput screening (*in vitro* and *in vivo*) for pre-clinical pharmacokinetic and pharmacodynamics studies.

SUGGESTED READING

1. Satoskar, R.S and Bhandarkar, S.D. (2000) Pharmacology and Pharmacotherapeutics, 13th edition, Vol. I and II, Popular Prakeshan PVT Ltd, Mumbai.
2. Tripathi, K.D. (2013) Essentials of Medical Pharmacology, 7th edition, Jaypeebrothers medical publishers, New Delhi.
3. Rang, H.P., Dale, M.M., Ritter, J. and Flower, R.J. (2007) Pharmacology, 6th edition, Churchill Living Stone Elsevier.
4. Barar, F.S.K. (2013) Text Book of Pharmacology, 1st edition, S.Chand and Company Pvt. Ltd.
5. Shargel, L. et al., 2012. Applied Biopharmaceutics and Pharmacokinetics, 6th Edition, McGraw-Hill Medical.

Objectives

Equip the students with:

1. Definition and representation styles of data
2. Analysis of data using correlation to understand the interdependence
3. Analysis of data using regression to understand the interdependence
4. To learn various measures of central values and standard deviation.
5. To understand the relationship between two variables.
6. To test the significance of a particular data by various parameters.

Course outcomes (CO's)

After successful completion, the students will:

1. Use appropriate representation styles to present the data
2. Perform correlation analysis
3. Perform regression analysis
4. Calculate mean, median, mode and standard deviation.
5. Calculate the relationship between two variables.
6. Test the significance of a particular data by various parameters.

UNIT I: Introduction to Biostatistics

Definition and scope of Biostatistics- Statistical survey-organizing , planning and executing the survey; Sources of data-primary and secondary data, Collection of data-Methods of data collection; Classification and tabulation of data- Graphical and diagrammatic representation. Measures of central tendency – Arithmetic mean, median, mode, quartiles, deciles and percentiles. Measures of dispersion-Range, quartile deviation, mean deviation and standard deviation, Coefficient of variation.

UNIT II: Correlation and Regression

Correlation: Meaning and definition - Scatter diagram –Karl Pearson's correlation coefficient. Rank correlation.

Regression: Regression in two variables – Regression coefficient problems – uses of regression.

UNIT III: Probability

Probability- Definition, concepts, theorems (proofs of the theorems not necessary) and calculations of probability-simple problems, theoretical distributions-Binomial, Poisson and Normal distribution – simple problems

UNIT IV: Sampling distribution and test of significance

Sampling distribution and test of significance – concepts of sampling, testing of hypothesis, errors in hypothesis testing, standard errors and sampling distribution– Student’s t test, F-test, Chi-square test - goodness of fit. Analysis of variance – one way and two-way classification. CRD, RBD Designs. Duncan’s multiple range tests. **Various statistical packages used for data analysis: Excel, SPSS, R Programming, Python and Statistica.** Null hypothesis, alternative hypothesis, paired and unpaired t-test, t-test correlation and Medlab statistical software.

UNIT V: Introduction to Research

Research: Scope and significance – Types of Research – Research Process – Characteristics of good research – Problems in Research – Identifying research problems. Research Designs – Features of good designs.

Sources of information: Journals, eJournals, books, biological abstracts, preparation of index cards, review writing, article writing – structure of an article, selection of journals for publication – Impact factor – citation index and H index. Proposal writing for funding. IPR and patenting. Concepts and types. **Outliers and specifications.**

CORE ELECTIVE –III CLINICAL RESEARCH

Semester III

4H-4C

Instruction hours/week:L:4 T:0 P:0

Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

Course objectives

- Students understand the concept of drug discovery, clinical research and IPR.
- Pre-clinical studies
- Components of clinical research (Phases)
- Understand about Indian GCP guidelines
- Understand about Ethical Guidelines for Biomedical Research on Human Subjects Schedule.
- Get knowledge about Finding and Evaluation databases of Scientific Literature

Course outcomes (CO's)

1. This paper deals with the basic concept of drug discovery, clinical trial and IPR.
2. Using small experimental animals
3. Phase 2 and Phase 3 trials
4. Understand about Indian GCP guidelines
5. Understand about Ethical Guidelines for Biomedical Research on Human Subjects Schedule.
6. Get knowledge about Finding and Evaluation databases of Scientific Literature

UNIT I: Preclinical research: Definition of research and types of research. Preclinical studies - Preclinical technology, Chemistry manufacturing and controls / Pharmaceutics Pharmacology/Toxicology. Various regulatory requirements in clinical trials. ICMR guideline set. Documents in clinical study. Indian GCP guidelines, CDCSO guidelines, ICMR Guidelines-Ethical Guidelines for Biomedical Research on Human Subjects Schedule.

UNIT II: Clinical Research

Definition of clinical research and development, History of randomized trial Literature - Finding and Evaluation databases of Scientific Literature; Critiquing of Research Projects, Time management and resource implications. Proband evaluation, document submission and precision.

UNIT III: Epidemiology Research

Experimental Procedure, Classification of epidemiological study designs. Controlled Experiments, Sampling Techniques, Questioner Design, Validity and reliability of observations, Primary variables, Acquisition and using secondary data, Randomization and Blinding: Theory and practice

UNIT IV: Drug discovery and Development

Introduction to Pharmaceutical Industry, New drug discovery-Steps involved in drug discovery process. Target Identification- Target Prioritization/ validation, Lead identification, Lead optimization.

UNIT V: Stem Cell Research

Ethical issues associated with stem cell research. Implication of human embryonic stem cell research, societal implications: religious vs. scientific views. Ethical guidelines for stem cell research (National (ICMR-DBT) & International).

6. Prichard,E.,(1995). Quality in the Analytical Chemistry Laboratory, 1st edition, Wiley, U.S.A.

Course objectives

Equip the students with

- Nutrition as a drug
- Dietary management of diabetes
- Dietary management of obesity
- Dietary management of cardiovascular diseases
- Nutrition deficiency affecting hematopoiesis and diet for individual with cancer
- Dietary management of musculoskeletal diseases

Course outcomes (CO's)

After successful completion, the students will understand:

1. Nutrition as a drug
2. Dietary management of diabetes
3. Dietary management of obesity
4. Dietary management of cardiovascular diseases
5. Nutrition deficiency affecting hematopoiesis and diet for individual with cancer
6. Dietary management of musculoskeletal diseases

UNIT-1: Nutrition

Foods for normal nutrition. Diets in gastrointestinal diseases-Acute gastrointestinal conditions, chronic and non-acute disorders of the upper gastrointestinal tract, lower gastrointestinal conditions, pancreatitis, liver diseases, gall stones, appendicitis, cholelithiasis. Diet for hepatitis

Nutrition for critically ill-Burns, Enteral nutrition, Enteral feeding vs parenteral feeding, Indications of enteral nutrition, Types of enteral feed formula, Complications of enteral feeding. Parenteral nutrition- Techniques of infusion, Complications of parenteral feeding.

UNIT II: Diet for diabetes mellitus

Nutrition recommendations for patient with diabetes, Meal planning, Exchange list of different food groups, Diabetic diets based on exchange list, Diabetic diets menu wise.

Diets in Renal disease-Acute renal failure, Proteinuria, Indoor diet charts for renal patients.

UNIT III: Diet for Cardiovascular Diseases

Risk Factors, Hypertension, Atherosclerosis, Stroke and other peripheral diseases, Cardiomyopathy and cardiac failure, Rheumatic heart disease, dietary management, **cardiac arrest** and general guidelines for coronary heart disease, Dietary recommendations of WHO. **Diet for Acute cardiac diseases.**

Obesity- Body fat distribution, Health risks of obesity, Weight reduction, Factors contributing to obesity.

UNIT IV: Cancer and diet therapy

Influence of diet on carcinogenesis, Dietary risk factors and cancers at various sites in the human body, diet therapy, eating well during cancer treatment, managing eating problems during treatment. **Hormonal imbalance**-Poly cystic ovarian syndrome, hypogonadism, cushing syndrome and thyroiditis. Causes of hormonal imbalance. Treatment- Dietary and stress management.

Diet for inborn errors of metabolism- phenylketonuria, Galactosaemia, Celiac disease, Alkaptonuria and methylmalonicaciduria.

UNIT V: Nutrition related disease

Nutrition related bone disease- osteoporosis.

Dietary factors in dental disease- Starch & dental cavities, protective factor in food

Blood –Nutrition deficiency affecting hematopoiesis.

Diet for Bone diseases – osteoporosis,osteomalacia, osteogenesisimperfecta.

SUGGESTED READINGS

2. Garrow,J.S., and James, W.P.T.,(2000). Human Nutrition &Dietetics,Longman Group, UK.
3. Srilakshmi, (2006). Dietetics, 5thEdition.New Age International.Pvt Ltd, New Delhi.

Instruction hours/week: L:0 T:0 P: 4 Marks: Internal: 40 External: 60 Total: 100
End Semester Exam: 3 Hours

Course objectives

The main objective of this practical is

- To understand the principles and diagnostic importance of various clinically important enzymes
- To determine the activity of various clinically important enzymes
- To learn the immunological experiments and understand the antigen – antibody reactions.
- To analyse a case for various diseases like diabetes, cardiac diseases and cancer.
- Handling experimental animals
- Various routes of injections

Course outcomes (CO's)

After learning this practicals the students could be able

1. To analyse the biological samples and can be able to interpret the results
2. By doing a case study they will be getting a clear picture of various diseases and their etiology.
3. Assess liver function through the estimation of bilirubin
4. Determine A/G ratio and interpret its relevance
5. Handle the small experimental animals
6. Understand the differences and significance of routes of injections

ENZYMOLGY

1. Determination of the activity of the following serum enzymes:
 - a. LDH
 - b. Acid phosphatase
 - c. Alkaline phosphatase
 - d. Aspartate amino transferase
 - e. Alanine amino transferase
 - f. 5' nucleotidase
 - g. Sodium potassium ATPase
 - h. Ceruloplasmin

IMMUNOLOGY(DEMONSTRATION)

2. Raising of antibodies- single soluble and particulate antigen
3. Immunodiffusion- single radial and double diffusion.
4. Immunoelectrophoresis.
5. Rocket immunoelectrophoresis
6. ELISA - Antibody titration
7. Bacterial Agglutination: WIDAL-tube agglutination method

Case study-Report

8. Serum enzymes in liver disease
9. Serum enzymes in cardiac disease
10. Serum enzymes in cancer disease
11. Glucose Tolerance Test
12. Installation, operation and performance qualities of any instrument
13. Autoanalyser

EXPERIMENTALANIMAL STUDIES (Group experiment)

14. Handling of animals
15. Methods of injection
16. Induction of liver toxicity
17. Assay of lipid peroxidation in rat liver.

INSTRUMENTS REQUIRED

1. UV Visible Spectrophotometer
2. Electrophoresis unit
3. ELISA Reader

SUGGESTED READINGS

1. Jayaraman, J.,(2007). Laboratory Manual in Biochemistry, New Age International Publishers New Delhi.
2. Sadasivam,S., and Manickam, A.,(2009). Biochemical Methods, New Age International Publishers, New Delhi.
3. Singh, S.P., (2009). Practical Manual of Biochemistry, CBS Publishers, New Delhi.
4. Talib, V. H., (2003). A Handbook of Medical Laboratory Technology, CBS Publishers, New Delhi.
5. David Wild, (2013). Elsevier; Immuno Assay Hand Book

Instruction hours/week: L:0T:0P:4**Marks: Internal: 40 External: 60 Total: 100**
End Semester Exam: 3 Hours**Course objectives**

To make the students

- To know the statistical methods commonly used in the clinical laboratory.
- To know how can contribute the clinical laboratory to assess the health status of individuals.
- To understand the pathophysiology and molecular basis of the most prevalent diseases.
- To know the clinical data interpretation
- Understand what is correlation and regression
- To know the T test and F test

Course outcomes (CO's)

Upon successful completion of this course, students will be able to:

1. Explain the physiopathological bases and the biochemical markers of the most prevalent diseases in our population.
2. Identify the principal analytical procedures used to measure biochemical magnitudes.
3. Interpret and integrate the analytical data from the principal biochemical and molecular genetics tests for the screening, diagnosis, prognosis and epidemiological monitoring of pathologies.
4. Understand the commonly used methods in the clinical laboratory.
5. To know how to use SPSS software in clinical data interpretation.
6. Compare and analyze data after correlation and regression

Clinical analysis

Collection of sample data on fasting glucose, glucose tolerance test, lipid profile, renal and thyroid profiles and subject the samples to following analysis

1. T-test (Paired and Unpaired)
2. F-test
3. Chi-square test
4. Karl Pearson rank correlation analysis
5. One way ANOVA
6. Two way ANOVA
7. Regression Analysis using SPSS software or Excel

INSTRUMENTS/TOOLS REQUIRED

1. SPSS
2. EXCEL
