## LECTURE PLAN DEPARTMENT OF MATHEMATICS

STAFF NAME: Dr. K. KALIDASS

SUBJECT NAME: GROUP THEORY II

SEMESTER: IV

SUB.CODE: 18MMU403

CLASS: II B.SC MATHEMATICS

S. No	Lecture Duration Period	Topics to be Covered	Support Material/Page Nos
<b>UNIT-I</b>			
1	1	Introduction to cosets	S1, Ch 7,144
2	1	Lagrange's theorem	S1, Ch 7,147
3	1	Tutorial – II	
4	1	consequence of Lagrange's theorem	S1, Ch 7,148
5	1	Continuation of consequence of Lagrange's theorem	S1, Ch 7,149
6	1	Continuation of consequence of Lagrange's theorem	S1, Ch 7,150
7	1	Continuation of consequence of Lagrange's theorem	S1, Ch 7, 151
8	1	An application of cosets to $S_n$	S1, Ch 7, 151
9	1	Tutorial – III	
10	1	Continuation of application of cosets to $S_n$	S1, Ch 7, 152
11	1	Tutorial-IV	
12	1	Continuation of application of cosets to $S_n$	S1, Ch 7, 153
13	1	Continuation of application of cosets to $S_n$	S1, Ch 7, 151
14	1	Recapitulation and discussion of possible questions	
<b>Total No of Hours Planned for unit I -14</b>			
<b>UNIT-II</b>			
1	1	Introduction to external direct product	S1, Ch 8, 162

2	1	Examples on external direct product	S1, Ch 8, 162
3	1	Tutorial-I	
4	1	Examples on external direct product	S1, Ch 8, 162
5	1	Tutorial-II	
6	1	Properties of external direct product	S1, Ch 8, 163
7	1	Continuation of properties of external direct product	S1, Ch 8, 164
8	1	Continuation of properties of external direct product	S1, Ch 8, 165
9	1	Continuation of properties of external direct product	S1, Ch 8, 166
10	1	$U(n)$ as an external direct product	S1, Ch 8, 166
11	1	Tutorial – III	
12	1	Applications of external direct product	S1, Ch 8, 168
13		Tutorial – IV	
14	1	Continuation of applications of external direct product	S1, Ch 8, 169
15	1	Continuation of applications of external direct product	S1, Ch 8, 170
16	1	Recapitulation and discussion of possible questions	
<b>Total No of Hours Planned for unit II -16</b>			
		<b>UNIT-III</b>	
1	1	Introduction to normal subgroups	S1, Ch 9, 185
2	1	Examples of normal subgroups	S1, Ch 9, 186
3	1	Tutorial-I	
4	1	Factor groups	S1, Ch 9, 188
5	1	Tutorial-II	
6	1	Continuation of Factor groups	S1, Ch 9, 189
7	1	Properties of Factor groups	S1, Ch 9, 190
8	1	Continuation of Properties of Factor groups	S1, Ch 9, 193
9	1	Applications of Factor groups	
10	1	Continuation of Properties of Factor groups	S1, Ch 9, 194
11	1	Tutorial III	
12	1	Internal direct product	S1, Ch 9, 195
13	1	Tutorial IV	
14	1	Examples of internal direct product	S1, Ch 9, 196
15	1	Theorems on internal direct product	S1, Ch 9, 197
16	1	Recapitulation and discussion of possible questions	

**Total No of Hours Planned For Unit III – 16**

		<b>UNIT-IV</b>	
1	1	Introduction to group homomorphisms	S1, Ch 10, 208
2	1	Examples on group homomorphisms	S1, Ch 10, 209
3	1	<b>Tutorial – I</b>	
4	1	Continuation of examples on group homomorphisms	S1, Ch 10, 210
5	1	<b>Tutorial II</b>	
6	1	Continuation of examples on group homomorphisms	S1, Ch 10, 210
7	1	Properties of group homomorphisms	S1, Ch 10, 211
8	1	Continuation of properties of group homomorphisms	S1, Ch 10, 212
9	1	Continuation of properties of group homomorphisms	S1, Ch 10, 213
10	1	Continuation of properties of group homomorphisms	S1, Ch 10, 214
11	1	<b>Tutorial-III</b>	
12		First isomorphism theorem	S1, Ch 10, 214
13	1	<b>Tutorial IV</b>	
14	1	Problems on first isomorphism theorem	S1, Ch 10, 215
15	1	Recapitulation and discussion of possible questions	

**Total No of Hours Planned For Unit IV=15**

		<b>UNIT-V</b>	
1	1	The fundamental theorem	S1, Ch 11,226
2	1	Continuation of fundamental theorem	S1, Ch 11,226
3	1	Continuation of fundamental theorem	S1, Ch 11,226
4	1	<b>Tutorial I</b>	
5	1	Continuation of fundamental theorem	S1, Ch 11,226
6	1	<b>Tutorial – II</b>	
7	1	Isomorphism classes of Abelian groups	S1, Ch 11,226
8	1	Continuation of isomorphism classes of Abelian groups	S1, Ch 11,227
9	1	Continuation of isomorphism classes of Abelian groups	S1, Ch 11,228
10	1	Continuation of isomorphism classes of Abelian groups	S1, Ch 11,229
11	1	Continuation of isomorphism classes of Abelian groups	S1, Ch 11,230
12	1	<b>Tutorial-III</b>	
13	1	Continuation of isomorphism classes of Abelian groups	S1, Ch 11,231
14	1	<b>Tutorial IV</b>	

15	1	Proof of the fundamental theorem	S1, Ch 11,231
16	1	Recapitulation and discussion of possible questions	
17	1	Discussion of previous ESE question papers.	
18	1	Discussion of previous ESE question papers.	
19	1	Discussion of previous ESE question papers.	
<b>Total No of Hours Planned for unit V -19</b>			
Total planned hours – <b>80</b>

**Definition Group Homomorphism**

A homomorphism  $\phi$  from a group  $G$  to a group  $\bar{G}$  is a mapping from  $G$  into  $\bar{G}$  that preserves the group operation; that is,  $\phi(ab) = \phi(a)\phi(b)$  for all  $a, b$  in  $G$ .

**Definition Kernel of a Homomorphism**

The *kernel* of a homomorphism  $\phi$  from a group  $G$  to a group with identity  $e$  is the set  $\{x \in G \mid \phi(x) = e\}$ . The kernel of  $\phi$  is denoted by  $\text{Ker } \phi$ .

■ **EXAMPLE 1** Any isomorphism is a homomorphism that is also onto and one-to-one. The kernel of an isomorphism is the trivial subgroup. ■

■ **EXAMPLE 2** Let  $\mathbf{R}^*$  be the group of nonzero real numbers under multiplication. Then the determinant mapping  $A \rightarrow \det A$  is a homomorphism from  $GL(2, \mathbf{R})$  to  $\mathbf{R}^*$ . The kernel of the determinant mapping is  $SL(2, \mathbf{R})$ . ■

■ **EXAMPLE 3** The mapping  $\phi$  from  $\mathbf{R}^*$  to  $\mathbf{R}^*$ , defined by  $\phi(x) = |x|$ , is a homomorphism with  $\text{Ker } \phi = \{1, -1\}$ . ■

■ **EXAMPLE 4** Let  $\mathbf{R}[x]$  denote the group of all polynomials with real coefficients under addition. For any  $f$  in  $\mathbf{R}[x]$ , let  $f'$  denote the derivative of  $f$ . Then the mapping  $f \rightarrow f'$  is a homomorphism from  $\mathbf{R}[x]$  to itself. The kernel of the derivative mapping is the set of all constant polynomials. ■

■ **EXAMPLE 5** The mapping  $\phi$  from  $Z$  to  $Z_n$ , defined by  $\phi(m) = m \bmod n$ , is a homomorphism (see Exercise 11 in Chapter 0). The kernel of this mapping is  $\langle n \rangle$ . ■

■ **EXAMPLE 6** The mapping  $\phi(x) = x^2$  from  $\mathbf{R}^*$ , the nonzero real numbers under multiplication, to itself is a homomorphism, since  $\phi(ab) = (ab)^2 = a^2b^2 = \phi(a)\phi(b)$  for all  $a$  and  $b$  in  $\mathbf{R}^*$ . (See Exercise 5.) The kernel is  $\{1, -1\}$ . ■

■ **EXAMPLE 7** The mapping  $\phi(x) = x^2$  from  $\mathbf{R}$ , the real numbers under addition, to itself is not a homomorphism, since  $\phi(a + b) = (a + b)^2 = a^2 + 2ab + b^2$ , whereas  $\phi(a) + \phi(b) = a^2 + b^2$ . ■

*Let  $\phi$  be a homomorphism from a group  $G$  to a group  $\bar{G}$  and let  $g$  be an element of  $G$ . Then*

1.  $\phi$  carries the identity of  $G$  to the identity of  $\bar{G}$ .
2.  $\phi(g^n) = (\phi(g))^n$  for all  $n$  in  $\mathbf{Z}$ .
3. If  $|g|$  is finite, then  $|\phi(g)|$  divides  $|g|$ .
4.  $\text{Ker } \phi$  is a subgroup of  $G$ .
5.  $\phi(a) = \phi(b)$  if and only if  $a\text{Ker } \phi = b\text{Ker } \phi$ .
6. If  $\phi(g) = g'$ , then  $\phi^{-1}(g') = \{x \in G \mid \phi(x) = g'\} = g\text{Ker } \phi$ .

**PROOF** The proofs of properties 1 and 2 are identical to the proofs of properties 1 and 2 of isomorphisms in Theorem 6.2. To prove property 3, notice that properties 1 and 2 together with  $g^n = e$  imply that  $e = \phi(e) = \phi(g^n) = (\phi(g))^n$ . So, by Corollary 2 to Theorem 4.1, we have  $|\phi(g)|$  divides  $n$ .

By property 1 we know that  $\text{Ker } \phi$  is not empty. So, to prove property 4, we assume that  $a, b \in \text{Ker } \phi$  and show that  $ab^{-1} \in \text{Ker } \phi$ . Since  $\phi(a) = e$  and  $\phi(b) = e$ , we have  $\phi(ab^{-1}) = \phi(a)\phi(b^{-1}) = \phi(a)(\phi(b))^{-1} = ee^{-1} = e$ . So,  $ab^{-1} \in \text{Ker } \phi$ .

To prove property 5, first assume that  $\phi(a) = \phi(b)$ . Then  $e = (\phi(b))^{-1}\phi(a) = \phi(b^{-1})\phi(a) = \phi(b^{-1}a)$ , so that  $b^{-1}a \in \text{Ker } \phi$ . It now follows from property 5 of the lemma in Chapter 7 that  $b\text{Ker } \phi = a\text{Ker } \phi$ . Reversing this argument completes the proof.

To prove property 6, we must show that  $\phi^{-1}(g') \subseteq g\text{Ker } \phi$  and that  $g\text{Ker } \phi \subseteq \phi^{-1}(g')$ . For the first inclusion, let  $x \in \phi^{-1}(g')$ , so that  $\phi(x) = g'$ . Then  $\phi(g) = \phi(x)$  and by property 5 we have  $g\text{Ker } \phi = x\text{Ker } \phi$  and therefore  $x \in g\text{Ker } \phi$ . This completes the proof that  $\phi^{-1}(g') \subseteq g\text{Ker } \phi$ . To prove that  $g\text{Ker } \phi \subseteq \phi^{-1}(g')$ , suppose that  $k \in \text{Ker } \phi$ . Then  $\phi(gk) = \phi(g)\phi(k) = g'e = g'$ . Thus, by definition,  $gk \in \phi^{-1}(g')$ . ■

*Let  $\phi$  be a homomorphism from a group  $G$  to a group  $\bar{G}$  and let  $H$  be a subgroup of  $G$ . Then*

1.  $\phi(H) = \{\phi(h) \mid h \in H\}$  is a subgroup of  $\bar{G}$ .
2. If  $H$  is cyclic, then  $\phi(H)$  is cyclic.
3. If  $H$  is Abelian, then  $\phi(H)$  is Abelian.
4. If  $H$  is normal in  $G$ , then  $\phi(H)$  is normal in  $\phi(G)$ .
5. If  $|\text{Ker } \phi| = n$ , then  $\phi$  is an  $n$ -to-1 mapping from  $G$  onto  $\phi(G)$ .
6. If  $|H| = n$ , then  $|\phi(H)|$  divides  $n$ .
7. If  $\bar{K}$  is a subgroup of  $\bar{G}$ , then  $\phi^{-1}(\bar{K}) = \{k \in G \mid \phi(k) \in \bar{K}\}$  is a subgroup of  $G$ .
8. If  $\bar{K}$  is a normal subgroup of  $\bar{G}$ , then  $\phi^{-1}(\bar{K}) = \{k \in G \mid \phi(k) \in \bar{K}\}$  is a normal subgroup of  $G$ .
9. If  $\phi$  is onto and  $\text{Ker } \phi = \{e\}$ , then  $\phi$  is an isomorphism from  $G$  to  $\bar{G}$ .

**PROOF** First note that the proofs of properties 1, 2, and 3 are identical to the proofs of properties 4, 3, and 2, respectively, of Theorem 6.3, since those proofs use only the fact that an isomorphism is an operation-preserving mapping.

To prove property 4, let  $\phi(h) \in \phi(H)$  and  $\phi(g) \in \phi(G)$ . Then  $\phi(g)\phi(h)\phi(g)^{-1} = \phi(ghg^{-1}) \in \phi(H)$ , since  $H$  is normal in  $G$ .

Property 5 follows directly from property 6 of Theorem 10.1 and the fact that all cosets of  $\text{Ker } \phi = \phi^{-1}(e)$  have the same number of elements.

To prove property 6, let  $\phi_H$  denote the restriction of  $\phi$  to the elements of  $H$ . Then  $\phi_H$  is a homomorphism from  $H$  onto  $\phi(H)$ . Suppose  $|\text{Ker } \phi_H| = t$ . Then, by property 5,  $\phi_H$  is a  $t$ -to-1 mapping. So,  $|\phi(H)|t = |H|$ .

To prove property 7, we use the One-Step Subgroup Test. Clearly,  $e \in \phi^{-1}(\bar{K})$ , so that  $\phi^{-1}(\bar{K})$  is not empty. Let  $k_1, k_2 \in \phi^{-1}(\bar{K})$ . Then, by the definition of  $\phi^{-1}(\bar{K})$ , we know that  $\phi(k_1), \phi(k_2) \in \bar{K}$ . Thus,  $\phi(k_2)^{-1} \in \bar{K}$  as well and  $\phi(k_1k_2^{-1}) = \phi(k_1)\phi(k_2)^{-1} \in \bar{K}$ . So, by definition of  $\phi^{-1}(\bar{K})$ , we have  $k_1k_2^{-1} \in \phi^{-1}(\bar{K})$ .

To prove property 8, we use the normality test given in Theorem 9.1. Note that every element in  $x\phi^{-1}(\bar{K})x^{-1}$  has the form  $xkx^{-1}$ , where  $\phi(k) \in \bar{K}$ . Thus, since  $\bar{K}$  is normal in  $\bar{G}$ ,  $\phi(xkx^{-1}) = \phi(x)\phi(k)(\phi(x))^{-1} \in \bar{K}$ , and, therefore,  $xkx^{-1} \in \phi^{-1}(\bar{K})$ .

Finally, property 9 follows directly from property 5. ■

## ■ Corollary Kernels Are Normal

*Let  $\phi$  be a group homomorphism from  $G$  to  $\bar{G}$ . Then  $\text{Ker } \phi$  is a normal subgroup of  $G$ .*

**■ EXAMPLE 8** Consider the mapping  $\phi$  from  $\mathbb{C}^*$  to  $\mathbb{C}^*$  given by  $\phi(x) = x^4$ . Since  $(xy)^4 = x^4y^4$ ,  $\phi$  is a homomorphism. Clearly,  $\text{Ker } \phi = \{x \mid x^4 = 1\} = \{1, -1, i, -i\}$ . So, by property 5 of Theorem 10.2, we know that  $\phi$  is a 4-to-1 mapping. Now let's find all elements that map to, say, 2. Certainly,  $\phi(\sqrt[4]{2}) = 2$ . Then, by property 6 of Theorem 10.1, the set of all elements that map to 2 is  $\sqrt[4]{2}\text{Ker } \phi = \{\sqrt[4]{2}, -\sqrt[4]{2}, \sqrt[4]{2}i, -\sqrt[4]{2}i\}$ .

■ **EXAMPLE 9** Define  $\phi: Z_{12} \rightarrow Z_{12}$  by  $\phi(x) = 3x$ . To verify that  $\phi$  is a homomorphism, we observe that in  $Z_{12}$ ,  $3(a + b) = 3a + 3b$  (since the group operation is addition modulo 12). Direct calculations show that  $\text{Ker } \phi = \{0, 4, 8\}$ . Thus, we know from property 5 of Theorem 10.2 that  $\phi$  is a 3-to-1 mapping. Since  $\phi(2) = 6$ , we have by property 6 of Theorem 10.1 that  $\phi^{-1}(6) = 2 + \text{Ker } \phi = \{2, 6, 10\}$ . Notice also that  $\langle 2 \rangle$  is cyclic and  $\phi(\langle 2 \rangle) = \{0, 6\}$  is cyclic. Moreover,  $|2| = 6$  and  $|\phi(2)| = |6| = 2$ , so  $|\phi(2)|$  divides  $|2|$  in agreement with property 3 of Theorem 10.1. Letting  $K = \{0, 6\}$ , we see that the subgroup  $\phi^{-1}(K) = \{0, 2, 4, 6, 8, 10\}$ . This verifies property 7 of Theorem 10.2 in this particular case. ■

■ **EXAMPLE 10** We determine all homomorphisms from  $Z_{12}$  to  $Z_{30}$ . By property 2 of Theorem 10.1, such a homomorphism is completely specified by the image of 1. That is, if 1 maps to  $a$ , then  $x$  maps to  $xa$ . Lagrange's Theorem and property 3 of Theorem 10.1 require that  $|a|$  divide both 12 and 30. So,  $|a| = 1, 2, 3$ , or 6. Thus,  $a = 0, 15, 10, 20, 5$ , or 25. This gives us a list of candidates for the homomorphisms. That each of these six possibilities yields an operation-preserving, well-defined function can now be verified by direct calculations. [Note that  $\gcd(12, 30) = 6$ . This is not a coincidence!] ■

■ **EXAMPLE 11** The mapping from  $S_n$  to  $Z_2$  that takes an even permutation to 0 and an odd permutation to 1 is a homomorphism. Figure 10.2 illustrates the telescoping nature of the mapping. ■

Figure 10.2 Homomorphism from  $S_3$  to  $Z_2$ .

## The First Isomorphism Theorem

Let  $\phi$  be a group homomorphism from  $G$  to  $\bar{G}$ . Then the mapping from  $G/\text{Ker } \phi$  to  $\phi(G)$ , given by  $g\text{Ker } \phi \rightarrow \phi(g)$ , is an isomorphism. In symbols,  $G/\text{Ker } \phi \approx \phi(G)$ .

**PROOF** Let us use  $\psi$  to denote the correspondence  $g\text{Ker } \phi \rightarrow \phi(g)$ . That  $\psi$  is well defined (that is, the correspondence is independent of the particular coset representative chosen) and one-to-one follows directly from property 5 of Theorem 10.1. To show that  $\psi$  is operation-preserving, observe that  $\psi(x\text{Ker } \phi \ y\text{Ker } \phi) = \psi(xy\text{Ker } \phi) = \phi(xy) = \phi(x)\phi(y) = \psi(x\text{Ker } \phi)\psi(y\text{Ker } \phi)$ . ■

### ■ Corollary

*If  $\phi$  is a homomorphism from a finite group  $G$  to  $\overline{G}$ , then  $|\phi(G)|$  divides  $|G|$  and  $|\overline{G}|$ .*

### Normal Subgroups Are Kernels

*Every normal subgroup of a group  $G$  is the kernel of a homomorphism of  $G$ . In particular, a normal subgroup  $N$  is the kernel of the mapping  $g \rightarrow gN$  from  $G$  to  $G/N$ .*

**PROOF** Define  $\gamma: G \rightarrow G/N$  by  $\gamma(g) = gN$ . (This mapping is called the *natural homomorphism* from  $G$  to  $G/N$ .) Then,  $\gamma(xy) = (xy)N = xNyN = \gamma(x)\gamma(y)$ . Moreover,  $g \in \text{Ker } \gamma$  if and only if  $gN = \gamma(g) = N$ , which is true if and only if  $g \in N$  (see property 2 of the lemma in Chapter 7). ■

(Second Isomorphism Theorem) If  $K$  is a subgroup of  $G$  and  $N$  is a normal subgroup of  $G$ , prove that  $K/(K \cap N)$  is isomorphic to  $KN/N$ .

(Third Isomorphism Theorem) If  $M$  and  $N$  are normal subgroups of  $G$  and  $N \leq M$ , prove that  $(G/N)/(M/N) \approx G/M$ .

If a $G$ , then $N(a) = \{x \in G: ax = xa\}$ is called the ----- of a in G.	kernal	group	subgroup	normalizer	normalizer

### Definition Automorphism

An isomorphism from a group  $G$  onto itself is called an *automorphism* of  $G$ .

### Definition Inner Automorphism Induced by $a$

Let  $G$  be a group, and let  $a \in G$ . The function  $\phi_a$  defined by  $\phi_a(x) = axa^{-1}$  for all  $x$  in  $G$  is called the *inner automorphism of  $G$  induced by  $a$* .

## Aut( $G$ ) and Inn( $G$ ) Are Groups

*The set of automorphisms of a group and the set of inner automorphisms of a group are both groups under the operation of function composition.*

### EXAMPLE

To determine  $\text{Inn}(D_4)$ , we first observe that the complete list of inner automorphisms is  $\phi_{R_0}, \phi_{R_{90}}, \phi_{R_{180}}, \phi_{R_{270}}, \phi_H, \phi_V, \phi_D$ , and  $\phi_{D'}$ . Our job is to determine the repetitions in this list. Since  $R_{180} \in Z(D_4)$ , we have  $\phi_{R_{180}}(x) = R_{180}xR_{180}^{-1} = x$ , so that  $\phi_{R_{180}} = \phi_{R_0}$ . Also,  $\phi_{R_{270}}(x) = R_{270}xR_{270}^{-1} = R_{90}R_{180}xR_{180}^{-1}R_{90}^{-1} = R_{90}xR_{90}^{-1} = \phi_{R_{90}}(x)$ . Similarly, since  $H = R_{180}V$  and  $D' = R_{180}D$ , we have  $\phi_H = \phi_V$  and  $\phi_D = \phi_{D'}$ .

### EXAMPLE

To compute  $\text{Aut}(Z_{10})$ , we try to discover enough information about an element  $\alpha$  of  $\text{Aut}(Z_{10})$  to determine how  $\alpha$  must be defined. Because  $Z_{10}$  is so simple, this is not difficult to do. To begin with, observe that once we know  $\alpha(1)$ , we know  $\alpha(k)$  for any  $k$ , because

$$\begin{aligned}\alpha(k) &= \alpha(\underbrace{1 + 1 + \cdots + 1}_{k \text{ terms}}) \\ &= \underbrace{\alpha(1) + \alpha(1) + \cdots + \alpha(1)}_{k \text{ terms}} = k\alpha(1).\end{aligned}$$

So, we need only determine the choices for  $\alpha(1)$  that make  $\alpha$  an automorphism of  $Z_{10}$ . Since property 5 of Theorem 6.2 tells us that  $|\alpha(1)| = 10$ , there are four candidates for  $\alpha(1)$ :

$$\alpha(1) = 1; \quad \alpha(1) = 3; \quad \alpha(1) = 7; \quad \alpha(1) = 9.$$

To distinguish among the four possibilities, we refine our notation by denoting the mapping that sends 1 to 1 by  $\alpha_1$ , 1 to 3 by  $\alpha_3$ , 1 to 7 by  $\alpha_7$ , and 1 to 9 by  $\alpha_9$ . So the only possibilities for  $\text{Aut}(Z_{10})$  are  $\alpha_1$ ,  $\alpha_3$ ,  $\alpha_7$ , and  $\alpha_9$ . But are all these automorphisms? Clearly,  $\alpha_1$  is the identity. Let us check  $\alpha_3$ . Since  $x \bmod 10 = y \bmod 10$  implies  $3x \bmod 10 = 3y \bmod 10$ ,  $\alpha_3$  is well defined. Moreover, because  $\alpha_3(1) = 3$  is a generator of  $Z_{10}$ , it follows that  $\alpha_3$  is onto (and, by Exercise 10 in Chapter 5, it is also one-to-one). Finally, since  $\alpha_3(a + b) = 3(a + b) = 3a + 3b = \alpha_3(a) + \alpha_3(b)$ , we see that  $\alpha_3$  is operation-preserving as well. Thus,  $\alpha_3 \in \text{Aut}(Z_{10})$ . The same argument shows that  $\alpha_7$  and  $\alpha_9$  are also automorphisms.

This gives us the elements of  $\text{Aut}(Z_{10})$  but not the structure. For instance, what is  $\alpha_3\alpha_3$ ? Well,  $(\alpha_3\alpha_3)(1) = \alpha_3(3) = 3 \cdot 3 = 9 = \alpha_9(1)$ , so  $\alpha_3\alpha_3 = \alpha_9$ . Similar calculations show that  $\alpha_3^3 = \alpha_7$  and  $\alpha_3^4 = \alpha_1$ , so that  $|\alpha_3| = 4$ . Thus,  $\text{Aut}(Z_{10})$  is cyclic. Actually, the following Cayley tables reveal that  $\text{Aut}(Z_{10})$  is isomorphic to  $U(10)$ .

$U(10)$	1	3	7	9	$\text{Aut}(Z_{10})$	$\alpha_1$	$\alpha_3$	$\alpha_7$	$\alpha_9$
1	1	3	7	9	$\alpha_1$	$\alpha_1$	$\alpha_3$	$\alpha_7$	$\alpha_9$
3	3	9	1	7	$\alpha_3$	$\alpha_3$	$\alpha_9$	$\alpha_1$	$\alpha_7$
7	7	1	9	3	$\alpha_7$	$\alpha_7$	$\alpha_1$	$\alpha_9$	$\alpha_3$
9	9	7	3	1	$\alpha_9$	$\alpha_9$	$\alpha_7$	$\alpha_3$	$\alpha_1$

## $\text{Aut}(Z_n) \approx U(n)$

*For every positive integer  $n$ ,  $\text{Aut}(Z_n)$  is isomorphic to  $U(n)$ .*

**PROOF** As in Example 13, any automorphism  $\alpha$  is determined by the value of  $\alpha(1)$ , and  $\alpha(1) \in U(n)$ . Now consider the correspondence from  $\text{Aut}(Z_n)$  to  $U(n)$  given by  $T: \alpha \rightarrow \alpha(1)$ . The fact that  $\alpha(k) = k\alpha(1)$  (see Example 13) implies that  $T$  is a one-to-one mapping. For if  $\alpha$  and  $\beta$  belong to  $\text{Aut}(Z_n)$  and  $\alpha(1) = \beta(1)$ , then  $\alpha(k) = k\alpha(1) = k\beta(1) = \beta(k)$  for all  $k$  in  $Z_n$ , and therefore  $\alpha = \beta$ .

To prove that  $T$  is onto, let  $r \in U(n)$  and consider the mapping  $\alpha$  from  $Z_n$  to  $Z_n$  defined by  $\alpha(s) = sr \pmod{n}$  for all  $s$  in  $Z_n$ . We leave it as an exercise to verify that  $\alpha$  is an automorphism of  $Z_n$  (see Exercise 17). Then, since  $T(\alpha) = \alpha(1) = r$ ,  $T$  is onto  $U(n)$ .

Finally, we establish the fact that  $T$  is operation-preserving. Let  $\alpha, \beta \in \text{Aut}(Z_n)$ . We then have

$$\begin{aligned} T(\alpha\beta) &= (\alpha\beta)(1) = \alpha(\beta(1)) = \alpha(\underbrace{1 + 1 + \cdots + 1}_{\beta(1) \text{ terms}}) \\ &= \underbrace{\alpha(1) + \alpha(1) + \cdots + \alpha(1)}_{\beta(1) \text{ terms}} = \alpha(1)\beta(1) \\ &= T(\alpha)T(\beta). \end{aligned}$$

This completes the proof. ■

## Fundamental Theorem of Finite Abelian Groups

*Every finite Abelian group is a direct product of cyclic groups of prime-power order. Moreover, the number of terms in the product and the orders of the cyclic groups are uniquely determined by the group.*

Since a cyclic group of order  $n$  is isomorphic to  $Z_n$ , Theorem 11.1 shows that every finite Abelian group  $G$  is isomorphic to a group of the form

$$Z_{p_1^{n_1}} \oplus Z_{p_2^{n_2}} \oplus \cdots \oplus Z_{p_k^{n_k}},$$

where the  $p_i$ 's are not necessarily distinct primes and the prime-powers  $p_1^{n_1}, p_2^{n_2}, \dots, p_k^{n_k}$  are uniquely determined by  $G$ . Writing a group in this form is called *determining the isomorphism class of  $G$* .

### Greedy Algorithm for an Abelian Group of Order $p^n$

1. Compute the orders of the elements of the group  $G$ .
2. Select an element  $a_1$  of maximum order and define  $G_1 = \langle a_1 \rangle$ .  
Set  $i = 1$ .
3. If  $|G| = |G_i|$ , stop. Otherwise, replace  $i$  by  $i + 1$ .
4. Select an element  $a_i$  of maximum order  $p^k$  such that  $p^k \leq |G|/|G_{i-1}|$  and none of  $a_i, a_i^p, a_i^{p^2}, \dots, a_i^{p^{k-1}}$  is in  $G_{i-1}$ , and define  $G_i = G_{i-1} \times \langle a_i \rangle$ .
5. Return to step 3.

### ■ EXAMPLE

Let  $G = \{1, 8, 12, 14, 18, 21, 27, 31, 34, 38, 44, 47, 51,$

$53, 57, 64\}$  under multiplication modulo 65. Since  $G$  has order 16, we know it is isomorphic to one of

$$\begin{aligned} &Z_{16}, \\ &Z_8 \oplus Z_2, \\ &Z_4 \oplus Z_4, \\ &Z_4 \oplus Z_2 \oplus Z_2, \\ &Z_2 \oplus Z_2 \oplus Z_2 \oplus Z_2. \end{aligned}$$

To decide which one, we dirty our hands to calculate the orders of the elements of  $G$ .

Element	1	8	12	14	18	21	27	31	34	38	44	47	51	53	57	64
Order	1	4	4	2	4	4	4	4	4	4	4	4	2	4	4	2

From the table of orders, we can instantly rule out all but  $Z_4 \oplus Z_4$  and  $Z_4 \oplus Z_2 \oplus Z_2$  as possibilities. Finally, we observe that since this latter group has a subgroup isomorphic to  $Z_2 \oplus Z_2 \oplus Z_2$ , it has more than three elements of order 2, and therefore we must have  $G \approx Z_4 \oplus Z_4$ .

Expressing  $G$  as an internal direct product is even easier. Pick an element of maximum order, say the element 8. Then  $\langle 8 \rangle$  is a factor in the product. Next, choose a second element, say  $a$ , so that  $a$  has order 4 and  $a$  and  $a^2$  are not in  $\langle 8 \rangle = \{1, 8, 64, 57\}$ . Since 12 has this property, we have  $G = \langle 8 \rangle \times \langle 12 \rangle$ . ■

## ■ EXAMPLE

Let  $G = \{1, 8, 17, 19, 26, 28, 37, 44, 46, 53, 62, 64, 71, 73, 82, 89, 91, 98, 107, 109, 116, 118, 127, 134\}$  under multiplication modulo 135. Since  $G$  has order 24, it is isomorphic to one of

$$\begin{aligned} Z_8 \oplus Z_3 &\approx Z_{24}, \\ Z_4 \oplus Z_2 \oplus Z_3 &\approx Z_{12} \oplus Z_2, \\ Z_2 \oplus Z_2 \oplus Z_2 \oplus Z_3 &\approx Z_6 \oplus Z_2 \oplus Z_2. \end{aligned}$$

Consider the element 8. Direct calculations show that  $8^6 = 109$  and  $8^{12} = 1$ . (Be sure to mod as you go. For example,  $8^3 \bmod 135 = 512 \bmod 135 = 107$ , so compute  $8^4$  as  $8 \cdot 107$  rather than  $8 \cdot 512$ .) But now we know  $G$ . Why? Clearly,  $|8| = 12$  rules out the third group in the list. At the same time,  $|109| = 2 = |134|$  (remember,  $134 = -1 \bmod 135$ ) implies that  $G$  is not  $Z_{24}$  (see Theorem 4.4). Thus,  $G \approx Z_{12} \oplus Z_2$ , and  $G = \langle 8 \rangle \times \langle 134 \rangle$ . ■

## Existence of Subgroups of Abelian Groups

*If  $m$  divides the order of a finite Abelian group  $G$ , then  $G$  has a subgroup of order  $m$ .*

### Lemma 1

*Let  $G$  be a finite Abelian group of order  $p^n m$ , where  $p$  is a prime that does not divide  $m$ . Then  $G = H \times K$ , where  $H = \{x \in G \mid x^{p^n} = e\}$  and  $K = \{x \in G \mid x^m = e\}$ . Moreover,  $|H| = p^n$ .*

**PROOF** It is an easy exercise to prove that  $H$  and  $K$  are subgroups of  $G$  (see Exercise 29 in Chapter 3). Because  $G$  is Abelian, to prove that  $G = H \times K$  we need only prove that  $G = HK$  and  $H \cap K = \{e\}$ . Since we have  $\gcd(m, p^n) = 1$ , there are integers  $s$  and  $t$  such that  $1 = sm + tp^n$ . For any  $x$  in  $G$ , we have  $x = x^1 = x^{sm+tp^n} = x^{sm}x^{tp^n}$  and, by Corollary 4 of Lagrange's Theorem (Theorem 7.1),  $x^{sm} \in H$  and  $x^{tp^n} \in K$ . Thus,  $G = HK$ . Now suppose that some  $x \in H \cap K$ . Then  $x^{p^n} = e = x^m$  and, by Corollary 2 to Theorem 4.1,  $|x|$  divides both  $p^n$  and  $m$ . Since  $p$  does not divide  $m$ , we have  $|x| = 1$  and, therefore,  $x = e$ .

To prove the second assertion of the lemma, note that  $p^n m = |HK| = |H||K|/|H \cap K| = |H||K|$  (see Exercise 7 in the Supplementary Exercises for Chapters 5–8). It follows from Theorem 9.5 and Corollary 2 to Theorem 4.1 that  $p$  does not divide  $|K|$  and therefore  $|H| = p^n$ . ■

### Lemma 2

*Let  $G$  be an Abelian group of prime-power order and let  $a$  be an element of maximal order in  $G$ . Then  $G$  can be written in the form  $\langle a \rangle \times K$ .*

**PROOF** We denote  $|G|$  by  $p^n$  and induct on  $n$ . If  $n = 1$ , then  $G = \langle a \rangle \times \langle e \rangle$ . Now assume that the statement is true for all Abelian groups of order  $p^k$ , where  $k < n$ . Among all the elements of  $G$ , choose  $a$  of maximal order  $p^m$ . Then  $x^{p^m} = e$  for all  $x$  in  $G$ . We may assume that  $G \neq \langle a \rangle$ , for otherwise there is nothing to prove. Now, among all the elements of  $G$ , choose  $b$  of smallest order such that  $b \notin \langle a \rangle$ . We claim that  $\langle a \rangle \cap \langle b \rangle = \{e\}$ . Since  $|b^p| = |b|/p$ , we know that  $b^p \in \langle a \rangle$  by the manner in which  $b$  was chosen. Say  $b^p = a^i$ . Notice that  $e = b^{p^m} = (b^p)^{p^{m-1}} = (a^i)^{p^{m-1}}$ , so  $|a^i| \leq p^{m-1}$ . Thus,  $a^i$  is not a generator of  $\langle a \rangle$  and, therefore, by Corollary 3 to Theorem 4.2,  $\gcd(p^m, i) \neq 1$ . This proves that  $p$  divides  $i$ , so that we can write  $i = pj$ . Then  $b^p = a^i = a^{pj}$ . Consider the element  $c = a^{-j}b$ . Certainly,  $c$  is not in  $\langle a \rangle$ , for if it were,  $b$  would be, too. Also,  $c^p = a^{-jp}b^p = a^{-i}b^p = b^{-p}b^p = e$ . Thus, we have found an element  $c$  of order  $p$  such that  $c \notin \langle a \rangle$ . Since  $b$  was chosen to have smallest order such that  $b \notin \langle a \rangle$ , we conclude that  $b$  also has order  $p$ . It now follows that  $\langle a \rangle \cap \langle b \rangle = \{e\}$  because any nonidentity element of the intersection would generate  $\langle b \rangle$  and thus contradict  $b \notin \langle a \rangle$ .

Now consider the factor group  $\overline{G} = G/\langle b \rangle$ . To simplify the notation, we let  $\bar{x}$  denote the coset  $x\langle b \rangle$  in  $\overline{G}$ . If  $|\bar{a}| < |a| = p^m$ , then  $\bar{a}^{p^{m-1}} = \bar{e}$ . This means that  $(a\langle b \rangle)^{p^{m-1}} = a^{p^{m-1}}\langle b \rangle = \langle b \rangle$ , so that  $a^{p^{m-1}} \in \langle a \rangle \cap \langle b \rangle = \{e\}$ , contradicting the fact that  $|a| = p^m$ . Thus,  $|\bar{a}| = |a| = p^m$ , and therefore  $\bar{a}$  is an element of maximal order in  $\overline{G}$ . By induction, we know that  $\overline{G}$  can be written in the form  $\langle \bar{a} \rangle \times \overline{K}$  for some subgroup  $\overline{K}$  of  $\overline{G}$ . Let  $K$  be the pullback of  $\overline{K}$  under the natural homomorphism from  $G$  to  $\overline{G}$  (that is,  $K = \{x \in G \mid \bar{x} \in \overline{K}\}$ ). We claim that  $\langle a \rangle \cap K = \{e\}$ . For if  $x \in \langle a \rangle \cap K$ , then  $\bar{x} \in \langle \bar{a} \rangle \cap \overline{K} = \{\bar{e}\} = \langle \bar{b} \rangle$  and  $x \in \langle a \rangle \cap \langle b \rangle = \{e\}$ . It now follows from an order argument (see Exercise 33) that  $G = \langle a \rangle K$ , and therefore  $G = \langle a \rangle \times K$ . ■

### Lemma 3

*A finite Abelian group of prime-power order is an internal direct product of cyclic groups.*

### Lemma 4

*Suppose that  $G$  is a finite Abelian group of prime-power order. If  $G = H_1 \times H_2 \times \cdots \times H_m$  and  $G = K_1 \times K_2 \times \cdots \times K_n$ , where the  $H$ 's and  $K$ 's are nontrivial cyclic subgroups with  $|H_1| \geq |H_2| \geq \cdots \geq |H_m|$  and  $|K_1| \geq |K_2| \geq \cdots \geq |K_n|$ , then  $m = n$  and  $|H_i| = |K_i|$  for all  $i$ .*

**PROOF** We proceed by induction on  $|G|$ . Clearly, the case where  $|G| = p$  is true. Now suppose that the statement is true for all Abelian groups of order less than  $|G|$ . For any Abelian group  $L$ , the set  $L^p = \{x^p \mid x \in L\}$  is a subgroup of  $L$  (see Exercise 15 in the Supplementary Exercises for Chapters 1–4) and, by Theorem 9.5, is a proper subgroup if  $p$  divides  $|L|$ . It follows that  $G^p = H_1^p \times H_2^p \times \cdots \times H_{m'}^p$ , and  $G^p = K_1^p \times K_2^p \times \cdots \times K_{n'}^p$ , where  $m'$  is the largest integer  $i$  such that  $|H_i| > p$ , and  $n'$  is the largest integer  $j$  such that  $|K_j| > p$ . (This ensures that our two direct products for  $G^p$  do not have trivial factors.) Since  $|G^p| < |G|$ , we have, by induction,  $m' = n'$  and  $|H_i^p| = |K_i^p|$  for  $i = 1, \dots, m'$ . Since  $|H_i| = p|H_i^p|$ , this proves that  $|H_i| = |K_i|$  for all  $i = 1, \dots, m'$ . All that remains to be proved is that the number of  $H_i$  of order  $p$  equals the number of  $K_i$  of order  $p$ ; that is, we must prove that  $m - m' = n - n'$  (since  $n' = m'$ ). This follows directly from the facts that  $|H_1||H_2| \cdots |H_{m'}|p^{m-m'} = |G| = |K_1||K_2| \cdots |K_{n'}|p^{n-n'}$ ,  $|H_i| = |K_i|$ , and  $m' = n'$ . ■

## FACTOR GROUPS

### Factor Groups from Homomorphisms

### Theorem

Let  $\phi : G \rightarrow G'$  be a group homomorphism with kernel  $H$ . Then the cosets of  $H$  form a **factor group**,  $G/H$ , where  $(aH)(bH) = (ab)H$ . Also, the map  $\mu : G/H \rightarrow \phi[G]$  defined by  $\mu(aH) = \phi(a)$  is an isomorphism. Both coset multiplication and  $\mu$  are well defined, independent of the choices  $a$  and  $b$  from the cosets.

### Example

Consider the factor group  $\mathbb{Z}/5\mathbb{Z}$  with the cosets shown above. We can add  $(2 + 5\mathbb{Z}) + (4 + 5\mathbb{Z})$  by choosing 2 and 4, finding  $2 + 4 = 6$ , and noticing that 6 is in the coset  $1 + 5\mathbb{Z}$ . We could equally well add these two cosets by choosing 27 in  $2 + 5\mathbb{Z}$  and  $-16$  in  $4 + 5\mathbb{Z}$ ; the sum  $27 + (-16) = 11$  is also in the coset  $1 + 5\mathbb{Z}$ . ▲

The factor groups  $\mathbb{Z}/n\mathbb{Z}$  in the preceding example are classics. Recall that we refer to the cosets of  $n\mathbb{Z}$  as *residue classes modulo  $n$* . Two integers in the same coset are *congruent modulo  $n$* . This terminology is carried over to other factor groups. A factor group  $G/H$  is often called the **factor group of  $G$  modulo  $H$** . Elements in the same coset of  $H$  are often said to be **congruent modulo  $H$** . By abuse of notation, we may sometimes write  $\mathbb{Z}/n\mathbb{Z} = \mathbb{Z}_n$  and think of  $\mathbb{Z}_n$  as the additive group of residue classes of  $\mathbb{Z}$  modulo  $\langle n \rangle$ , or abusing notation further, modulo  $n$ .

## Factor Groups from Normal Subgroups

### Theorem

Let  $H$  be a subgroup of a group  $G$ . Then left coset multiplication is well defined by the equation

$$(aH)(bH) = (ab)H$$

if and only if  $H$  is a normal subgroup of  $G$ .

### Proof

Suppose first that  $(aH)(bH) = (ab)H$  does give a well-defined binary operation on left cosets. Let  $a \in G$ . We want to show that  $aH$  and  $Ha$  are the same set. We use the standard technique of showing that each is a subset of the other.

Let  $x \in aH$ . Choosing representatives  $x \in aH$  and  $a^{-1} \in a^{-1}H$ , we have  $(xH)(a^{-1}H) = (xa^{-1})H$ . On the other hand, choosing representatives  $a \in aH$  and  $a^{-1} \in a^{-1}H$ , we see that  $(aH)(a^{-1}H) = eH = H$ . Using our assumption that left coset multiplication by representatives is well defined, we must have  $xa^{-1} = h \in H$ . Then  $x = ha$ , so  $x \in Ha$  and  $aH \subseteq Ha$ . We leave the symmetric proof that  $Ha \subseteq aH$  to Exercise 25.

We turn now to the converse: If  $H$  is a normal subgroup, then left coset multiplication by representatives is well-defined. Due to our hypothesis, we can simply say *cosets*, omitting *left* and *right*. Suppose we wish to compute  $(aH)(bH)$ . Choosing  $a \in aH$  and  $b \in bH$ , we obtain the coset  $(ab)H$ . Choosing different representatives  $ah_1 \in aH$  and  $bh_2 \in bH$ , we obtain the coset  $ah_1bh_2H$ . We must show that these are the same cosets. Now  $h_1b \in Hb = bH$ , so  $h_1b = bh_3$  for some  $h_3 \in H$ . Thus

$$(ah_1)(bh_2) = a(h_1b)h_2 = a(bh_3)h_2 = (ab)(h_3h_2)$$

and  $(ab)(h_3h_2) \in (ab)H$ . Therefore,  $ah_1bh_2$  is in  $(ab)H$ . ♦

## Corollary

Let  $H$  be a normal subgroup of  $G$ . Then the cosets of  $H$  form a group  $G/H$  under the binary operation  $(aH)(bH) = (ab)H$ . ▲

## Proof

Computing,  $(aH)[(bH)(cH)] = (aH)[(bc)H] = [a(bc)]H$ , and similarly, we have  $[(aH)(bH)](cH) = [(ab)c]H$ , so associativity in  $G/H$  follows from associativity in  $G$ . Because  $(aH)(eH) = (ae)H = aH = (ea)H = (eH)(aH)$ , we see that  $eH = H$  is the identity element in  $G/H$ . Finally,  $(a^{-1}H)(aH) = (a^{-1}a)H = eH = (aa^{-1})H = (aH)(a^{-1}H)$  shows that  $a^{-1}H = (aH)^{-1}$ . ♦

## Example

Since  $\mathbb{Z}$  is an abelian group,  $n\mathbb{Z}$  is a normal subgroup. Corollary 14.5 allows us to construct the factor group  $\mathbb{Z}/n\mathbb{Z}$  with no reference to a homomorphism. As we observed in Example 14.2,  $\mathbb{Z}/n\mathbb{Z}$  is isomorphic to  $\mathbb{Z}_n$ . ▲

## Example

Consider the abelian group  $\mathbb{R}$  under addition, and let  $c \in \mathbb{R}^+$ . The cyclic subgroup  $\langle c \rangle$  of  $\mathbb{R}$  contains as elements

$$\dots - 3c, -2c, -c, 0, c, 2c, 3c, \dots$$

Every coset of  $\langle c \rangle$  contains just one element  $x$  such that  $0 \leq x < c$ . If we choose these elements as representatives of the cosets when computing in  $\mathbb{R}/\langle c \rangle$ , we find that we are computing their sum modulo  $c$  as discussed for the computation in  $\mathbb{R}_c$  in Section 1. For example, if  $c = 5.37$ , then the sum of the cosets  $4.65 + \langle 5.37 \rangle$  and  $3.42 + \langle 5.37 \rangle$  is the coset  $8.07 + \langle 5.37 \rangle$ , which contains  $8.07 - 5.37 = 2.7$ , which is  $4.65 +_{5.37} 3.42$ . Working with these coset elements  $x$  where  $0 \leq x < c$ , we thus see that the group  $\mathbb{R}_c$  of Example 4.2 is isomorphic to  $\mathbb{R}/\langle c \rangle$  under an isomorphism  $\psi$  where  $\psi(x) = x + \langle c \rangle$  for all  $x \in \mathbb{R}_c$ . Of course,  $\mathbb{R}/\langle c \rangle$  is then also isomorphic to the circle group  $U$  of complex numbers of magnitude 1 under multiplication. ▲

## The Center and Commutator Subgroups

### Example

The center of a group  $G$  always contains the identity element  $e$ . It may be that  $Z(G) = \{e\}$ , in which case we say that **the center of  $G$  is trivial**. For example, examination of Table 8.8 for the group  $S_3$  shows us that  $Z(S_3) = \{\rho_0\}$ , so the center of  $S_3$  is trivial. (This is a special case of Exercise 38, which shows that the center of every nonabelian group of order  $pq$  for primes  $p$  and  $q$  is trivial.) Consequently, the center of  $S_3 \times \mathbb{Z}_5$  must be  $\{\rho_0\} \times \mathbb{Z}_5$ , which is isomorphic to  $\mathbb{Z}_5$ . ▲

### Theorem

Let  $G$  be a group. The set of all commutators  $aba^{-1}b^{-1}$  for  $a, b \in G$  generates a subgroup  $C$  (the **commutator subgroup**) of  $G$ . This subgroup  $C$  is a normal subgroup of  $G$ . Furthermore, if  $N$  is a normal subgroup of  $G$ , then  $G/N$  is abelian if and only if  $C \leq N$ .

### Proof

The commutators certainly generate a subgroup  $C$ ; we must show that it is normal in  $G$ . Note that the inverse  $(aba^{-1}b^{-1})^{-1}$  of a commutator is again a commutator, namely,  $bab^{-1}a^{-1}$ . Also  $e = eee^{-1}e^{-1}$  is a commutator. Theorem 7.6 then shows that  $C$  consists precisely of all finite products of commutators. For  $x \in C$ , we must show that  $g^{-1}xg \in C$  for all  $g \in G$ , or that if  $x$  is a product of commutators, so is  $g^{-1}xg$  for all  $g \in G$ . By inserting  $e = gg^{-1}$  between each product of commutators occurring in  $x$ , we see that it is sufficient to show for each commutator  $cdc^{-1}d^{-1}$  that  $g^{-1}(cdc^{-1}d^{-1})g$  is in  $C$ . But

$$\begin{aligned} g^{-1}(cdc^{-1}d^{-1})g &= (g^{-1}cdc^{-1})(e)(d^{-1}g) \\ &= (g^{-1}cdc^{-1})(gd^{-1}dg^{-1})(d^{-1}g) \\ &= [(g^{-1}c)d(g^{-1}c)^{-1}d^{-1}][dg^{-1}d^{-1}g], \end{aligned}$$

which is in  $C$ . Thus  $C$  is normal in  $G$ .

The rest of the theorem is obvious if we have acquired the proper feeling for factor groups. One doesn't visualize in this way, but writing out that  $G/C$  is abelian follows from

$$\begin{aligned} (aC)(bC) &= abC = ab(b^{-1}a^{-1}ba)C \\ &= (abb^{-1}a^{-1})baC = baC = (bC)(aC). \end{aligned}$$

Furthermore, if  $N$  is a normal subgroup of  $G$  and  $G/N$  is abelian, then  $(a^{-1}N)(b^{-1}N) = (b^{-1}N)(a^{-1}N)$ ; that is,  $aba^{-1}b^{-1}N = N$ , so  $aba^{-1}b^{-1} \in N$ , and  $C \leq N$ . Finally, if  $C \leq N$ , then

$$\begin{aligned} (aN)(bN) &= abN = ab(b^{-1}a^{-1}ba)N \\ &= (abb^{-1}a^{-1})baN = baN = (bN)(aN). \end{aligned}$$

**Definition External Direct Product**

Let  $G_1, G_2, \dots, G_n$  be a finite collection of groups. The *external direct product* of  $G_1, G_2, \dots, G_n$ , written as  $G_1 \oplus G_2 \oplus \dots \oplus G_n$ , is the set of all  $n$ -tuples for which the  $i$ th component is an element of  $G_i$  and the operation is componentwise.

**EXAMPLE**

$$U(8) \oplus U(10) = \{(1, 1), (1, 3), (1, 7), (1, 9), (3, 1), (3, 3), (3, 7), (3, 9), (5, 1), (5, 3), (5, 7), (5, 9), (7, 1), (7, 3), (7, 7), (7, 9)\}.$$

The product  $(3, 7)(7, 9) = (5, 3)$ , since the first components are combined by multiplication modulo 8, whereas the second components are combined by multiplication modulo 10. ■

**EXAMPLE**

$$Z_2 \oplus Z_3 = \{(0, 0), (0, 1), (0, 2), (1, 0), (1, 1), (1, 2)\}.$$

Clearly, this is an Abelian group of order 6. Is this group related to another Abelian group of order 6 that we know, namely,  $Z_6$ ? Consider the subgroup of  $Z_2 \oplus Z_3$  generated by  $(1, 1)$ . Since the operation in each component is addition, we have  $(1, 1) = (1, 1)$ ,  $2(1, 1) = (0, 2)$ ,  $3(1, 1) = (1, 0)$ ,  $4(1, 1) = (0, 1)$ ,  $5(1, 1) = (1, 2)$ , and  $6(1, 1) = (0, 0)$ . Hence  $Z_2 \oplus Z_3$  is cyclic. It follows that  $Z_2 \oplus Z_3$  is isomorphic to  $Z_6$ . ■

**EXAMPLE****Classification of Groups of Order 4**

A group of order 4 is isomorphic to  $Z_4$  or  $Z_2 \oplus Z_2$ . To verify this, let  $G = \{e, a, b, ab\}$ . If  $G$  is not cyclic, then it follows from Lagrange's Theorem that  $|a| = |b| = |ab| = 2$ . Then the mapping  $e \rightarrow (0, 0)$ ,  $a \rightarrow (1, 0)$ ,  $b \rightarrow (0, 1)$ , and  $ab \rightarrow (1, 1)$  is an isomorphism from  $G$  onto  $Z_2 \oplus Z_2$ . ■

## Properties of External Direct Products

### ■ Theorem

*The order of an element in a direct product of a finite number of finite groups is the least common multiple of the orders of the components of the element. In symbols,*

$$|(g_1, g_2, \dots, g_n)| = \text{lcm}(|g_1|, |g_2|, \dots, |g_n|).$$

**PROOF** Denote the identity of  $G_i$  by  $e_i$ . Let  $s = \text{lcm}(|g_1|, |g_2|, \dots, |g_n|)$  and  $t = |(g_1, g_2, \dots, g_n)|$ . Because  $s$  is a multiple of each  $|g_i|$  implies that  $(g_1, g_2, \dots, g_n)^s = (g_1^s, g_2^s, \dots, g_n^s) = (e_1, e_2, \dots, e_n)$ , we know that  $t \leq s$ . On the other hand, from  $(g_1^t, g_2^t, \dots, g_n^t) = (g_1, g_2, \dots, g_n)^t = (e_1, e_2, \dots, e_n)$  we see that  $t$  is a common multiple of  $|g_1|, |g_2|, \dots, |g_n|$ . Thus,  $s \leq t$ . ■

### ■ EXAMPLE

We determine the number of elements of order 5 in

$Z_{25} \oplus Z_5$ . By Theorem 8.1, we may count the number of elements  $(a, b)$  in  $Z_{25} \oplus Z_5$  with the property that  $5 = |(a, b)| = \text{lcm}(|a|, |b|)$ . Clearly this requires that either  $|a| = 5$  and  $|b| = 1$  or  $5$ , or  $|b| = 5$  and  $|a| = 1$  or  $5$ . We consider two mutually exclusive cases.

**Case 1**  $|a| = 5$  and  $|b| = 1$  or  $5$ . Here there are four choices for  $a$  (namely, 5, 10, 15, and 20) and five choices for  $b$ . This gives 20 elements of order 5.

**Case 2**  $|a| = 1$  and  $|b| = 5$ . This time there is one choice for  $a$  and four choices for  $b$ , so we obtain four more elements of order 5.

Thus,  $Z_{25} \oplus Z_5$  has 24 elements of order 5. ■

## ■ EXAMPLE

We determine the number of cyclic subgroups of order 10 in  $Z_{100} \oplus Z_{25}$ . We begin by counting the number of elements  $(a, b)$  of order 10.

**Case 1**  $|a| = 10$  and  $|b| = 1$  or  $5$ . Since  $Z_{100}$  has a unique cyclic subgroup of order 10 and any cyclic group of order 10 has four generators (Theorem 4.4), there are four choices for  $a$ . Similarly, there are five choices for  $b$ . This gives 20 possibilities for  $(a, b)$ .

**Case 2**  $|a| = 2$  and  $|b| = 5$ . Since any finite cyclic group of even order has a unique subgroup of order 2 (Theorem 4.4), there is only one choice for  $a$ . Obviously, there are four choices for  $b$ . So, this case yields four more possibilities for  $(a, b)$ .

Thus,  $Z_{100} \oplus Z_{25}$  has 24 elements of order 10. Because each cyclic subgroup of order 10 has four elements of order 10 and no two of the cyclic subgroups can have an element of order 10 in common, there must be  $24/4 = 6$  cyclic subgroups of order 10. (This method is analogous to determining the number of sheep in a flock by counting legs and dividing by 4.) ■

## ■ EXAMPLE

For each divisor  $r$  of  $m$  and  $s$  of  $n$  the group  $Z_m \oplus Z_n$

has a subgroup isomorphic to  $Z_r \oplus Z_s$  (see Exercise 17). To find a subgroup of say  $Z_{30} \oplus Z_{12}$  isomorphic to  $Z_6 \oplus Z_4$  we observe that  $\langle 5 \rangle$  is a subgroup of  $Z_{30}$  of order 6 and  $\langle 3 \rangle$  is a subgroup of  $Z_{12}$  of order 4, so  $\langle 5 \rangle \oplus \langle 3 \rangle$  is the desired subgroup. ■

## ■ Theorem

*Let  $G$  and  $H$  be finite cyclic groups. Then  $G \oplus H$  is cyclic if and only if  $|G|$  and  $|H|$  are relatively prime.*

**PROOF** Let  $|G| = m$  and  $|H| = n$ , so that  $|G \oplus H| = mn$ . To prove the first half of the theorem, we assume  $G \oplus H$  is cyclic and show that  $m$  and  $n$  are relatively prime. Suppose that  $\gcd(m, n) = d$  and  $(g, h)$  is a generator of  $G \oplus H$ . Since  $(g, h)^{mn/d} = ((g^m)^{n/d}, (h^n)^{m/d}) = (e, e)$ , we have  $mn = |(g, h)| \leq mn/d$ . Thus,  $d = 1$ .

To prove the other half of the theorem, let  $G = \langle g \rangle$  and  $H = \langle h \rangle$  and suppose  $\gcd(m, n) = 1$ . Then,  $|(g, h)| = \text{lcm}(m, n) = mn = |G \oplus H|$ , so that  $(g, h)$  is a generator of  $G \oplus H$ . ■

## ■ Corollary

### Criterion for $G_1 \oplus G_2 \oplus \cdots \oplus G_n$ to Be Cyclic

*An external direct product  $G_1 \oplus G_2 \oplus \cdots \oplus G_n$  of a finite number of finite cyclic groups is cyclic if and only if  $|G_i|$  and  $|G_j|$  are relatively prime when  $i \neq j$ .*

## ■ Corollary

### Criterion for $Z_{n_1 n_2 \cdots n_k} \approx Z_{n_1} \oplus Z_{n_2} \oplus \cdots \oplus Z_{n_k}$

*Let  $m = n_1 n_2 \cdots n_k$ . Then  $Z_m$  is isomorphic to  $Z_{n_1} \oplus Z_{n_2} \oplus \cdots \oplus Z_{n_k}$  if and only if  $n_i$  and  $n_j$  are relatively prime when  $i \neq j$ .*

## ■ Theorem $U(n)$ as an External Direct Product

*Suppose  $s$  and  $t$  are relatively prime. Then  $U(st)$  is isomorphic to the external direct product of  $U(s)$  and  $U(t)$ . In short,*

$$U(st) \approx U(s) \oplus U(t).$$

*Moreover,  $U_s(st)$  is isomorphic to  $U(t)$  and  $U_t(st)$  is isomorphic to  $U(s)$ .*

**PROOF** An isomorphism from  $U(st)$  to  $U(s) \oplus U(t)$  is  $x \rightarrow (x \bmod s, x \bmod t)$ ; an isomorphism from  $U_s(st)$  to  $U(t)$  is  $x \rightarrow x \bmod t$ ; an isomorphism from  $U_t(st)$  to  $U(s)$  is  $x \rightarrow x \bmod s$ . We leave the verification that these mappings are operation-preserving, one-to-one, and onto to the reader. (See Exercises 11, 17, and 19 in Chapter 0; see also [1].) ■

## Corollary

*Let  $m = n_1 n_2 \cdots n_k$ , where  $\gcd(n_i, n_j) = 1$  for  $i \neq j$ . Then,*

$$U(m) \approx U(n_1) \oplus U(n_2) \oplus \cdots \oplus U(n_k).$$

## GROUP ACTION ON A SET

### The Notion of a Group Action

#### Definition

Let  $X$  be a set and  $G$  a group. An **action of  $G$  on  $X$**  is a map  $* : G \times X \rightarrow X$  such that

1.  $ex = x$  for all  $x \in X$ ,
2.  $(g_1g_2)(x) = g_1(g_2x)$  for all  $x \in X$  and all  $g_1, g_2 \in G$ .

Under these conditions,  $X$  is a  $G$ -set.

#### Example

Let  $X$  be any set, and let  $H$  be a subgroup of the group  $S_X$  of all permutations of  $X$ . Then  $X$  is an  $H$ -set, where the action of  $\sigma \in H$  on  $X$  is its action as an element of  $S_X$ , so that  $\sigma x = \sigma(x)$  for all  $x \in X$ . Condition 2 is a consequence of the definition of permutation multiplication as function composition, and Condition 1 is immediate from the definition of the identity permutation as the identity function. Note that, in particular,  $\{1, 2, 3, \dots, n\}$  is an  $S_n$ -set.

#### Theorem

Let  $X$  be a  $G$ -set. For each  $g \in G$ , the function  $\sigma_g : X \rightarrow X$  defined by  $\sigma_g(x) = gx$  for  $x \in X$  is a permutation of  $X$ . Also, the map  $\phi : G \rightarrow S_X$  defined by  $\phi(g) = \sigma_g$  is a homomorphism with the property that  $\phi(g)(x) = gx$ .

#### Proof

To show that  $\sigma_g$  is a permutation of  $X$ , we must show that it is a one-to-one map of  $X$  onto itself. Suppose that  $\sigma_g(x_1) = \sigma_g(x_2)$  for  $x_1, x_2 \in X$ . Then  $gx_1 = gx_2$ . Consequently,  $g^{-1}(gx_1) = g^{-1}(gx_2)$ . Using Condition 2 in Definition 16.1, we see that  $(g^{-1}g)x_1 = (g^{-1}g)x_2$ , so  $ex_1 = ex_2$ . Condition 1 of the definition then yields  $x_1 = x_2$ , so  $\sigma_g$  is one to one. The two conditions of the definition show that for  $x \in X$ , we have  $\sigma_g(g^{-1}x) = g(g^{-1}x) = (gg^{-1})x = ex = x$ , so  $\sigma_g$  maps  $X$  onto  $X$ . Thus  $\sigma_g$  is indeed a permutation.

To show that  $\phi : G \rightarrow S_X$  defined by  $\phi(g) = \sigma_g$  is a homomorphism, we must show that  $\phi(g_1 g_2) = \phi(g_1) \phi(g_2)$  for all  $g_1, g_2 \in G$ . We show the equality of these two permutations in  $S_X$  by showing they both carry an  $x \in X$  into the same element. Using the two conditions in Definition 16.1 and the rule for function composition, we obtain

$$\begin{aligned}\phi(g_1 g_2)(x) &= \sigma_{g_1 g_2}(x) = (g_1 g_2)x = g_1(g_2 x) = g_1 \sigma_{g_2}(x) = \sigma_{g_1}(\sigma_{g_2}(x)) \\ &= (\sigma_{g_1} \circ \sigma_{g_2})(x) = (\sigma_{g_1 g_2})(x) = (\phi(g_1) \phi(g_2))(x).\end{aligned}$$

Thus  $\phi$  is a homomorphism. The stated property of  $\phi$  follows at once since by our definitions, we have  $\phi(g)(x) = \sigma_g(x) = gx$ . ♦

### Example

Every group  $G$  is itself a  $G$ -set, where the action on  $g_2 \in G$  by  $g_1 \in G$  is given by left multiplication. That is,  $*(g_1, g_2) = g_1 g_2$ . If  $H$  is a subgroup of  $G$ , we can also regard  $G$  as an  $H$ -set, where  $*(h, g) = hg$ . ▲

### Example

Let  $H$  be a subgroup of  $G$ . Then  $G$  is an  $H$ -set under conjugation where  $*(h, g) = hgh^{-1}$  for  $g \in G$  and  $h \in H$ . Condition 1 is obvious, and for Condition 2 note that

$$*(h_1 h_2, g) = (h_1 h_2)g(h_1 h_2)^{-1} = h_1(h_2 g h_2^{-1})h_1^{-1} = *(h_1, *(h_2, g)).$$

We always write this action of  $H$  on  $G$  by conjugation as  $hgh^{-1}$ . The abbreviation  $hg$  described before the definition would cause terrible confusion with the group operation of  $G$ . ▲

### Example

For students who have studied vector spaces with real (or complex) scalars, we mention that the axioms  $(rs)v = r(sv)$  and  $1v = v$  for scalars  $r$  and  $s$  and a vector  $v$  show that the set of vectors is an  $\mathbb{R}^*$ -set (or a  $\mathbb{C}^*$ -set) for the multiplicative group of nonzero scalars. ▲

### Example

Let  $H$  be a subgroup of  $G$ , and let  $L_H$  be the set of all left cosets of  $H$ . Then  $L_H$  is a  $G$ -set, where the action of  $g \in G$  on the left coset  $xH$  is given by  $g(xH) = (gx)H$ . Observe that this action is well defined: if  $yH = xH$ , then  $y = xh$  for some  $h \in H$ , and  $g(yH) = (gy)H = (gxh)H = (gx)(hH) = (gx)H = g(xH)$ . A series of exercises shows that every  $G$ -set is isomorphic to one that may be formed using these left coset  $G$ -sets as building blocks. (See Exercises 14 through 17.) ▲

### Example

Let  $G$  be the group  $D_4 = \{\rho_0, \rho_1, \rho_2, \rho_3, \mu_1, \mu_2, \delta_1, \delta_2\}$  of symmetries of the square, described in Example 8.10. In Fig. 16.9 we show the square with vertices 1, 2, 3, 4 as in Fig. 8.11. We also label the sides  $s_1, s_2, s_3, s_4$ , the diagonals  $d_1$  and  $d_2$ , vertical and horizontal axes  $m_1$  and  $m_2$ , the center point  $C$ , and midpoints  $P_i$  of the sides  $s_i$ . Recall that  $\rho_i$  corresponds to rotating the square counterclockwise through  $\pi i/2$  radians,  $\mu_i$

16.9 Figure

$\rho_2$	3	4	1	2	$s_3$	$s_4$	$s_1$	$s_2$	$m_1$	$m_2$	$d_1$	$d_2$	$C$	$P_3$	$P_4$	$P_1$	$P_2$
$\rho_3$	4	1	2	3	$s_4$	$s_1$	$s_2$	$s_3$	$m_2$	$m_1$	$d_2$	$d_1$	$C$	$P_4$	$P_1$	$P_2$	$P_3$
$\mu_1$	2	1	4	3	$s_1$	$s_4$	$s_3$	$s_2$	$m_1$	$m_2$	$d_2$	$d_1$	$C$	$P_1$	$P_4$	$P_3$	$P_2$
$\mu_2$	4	3	2	1	$s_3$	$s_2$	$s_1$	$s_4$	$m_1$	$m_2$	$d_2$	$d_1$	$C$	$P_3$	$P_2$	$P_1$	$P_4$
$\delta_1$	3	2	1	4	$s_2$	$s_1$	$s_4$	$s_3$	$m_2$	$m_1$	$d_1$	$d_2$	$C$	$P_2$	$P_1$	$P_4$	$P_3$
$\delta_2$	1	4	3	2	$s_4$	$s_3$	$s_2$	$s_1$	$m_2$	$m_1$	$d_1$	$d_2$	$C$	$P_4$	$P_3$	$P_2$	$P_1$

corresponds to flipping on the axis  $m_i$ , and  $\delta_i$  to flipping on the diagonal  $d_i$ . We let

$$X = \{1, 2, 3, 4, s_1, s_2, s_3, s_4, m_1, m_2, d_1, d_2, C, P_1, P_2, P_3, P_4\}.$$

Then  $X$  can be regarded as a  $D_4$ -set in a natural way. Table 16.10 describes completely the action of  $D_4$  on  $X$  and is given to provide geometric illustrations of ideas to be introduced. We should be sure that we understand how this table is formed before continuing. ▲

### Isotropy Subgroups

Let  $X$  be a  $G$ -set. Let  $x \in X$  and  $g \in G$ . It will be important to know when  $gx = x$ . We let

$$X_g = \{x \in X \mid gx = x\} \quad \text{and} \quad G_x = \{g \in G \mid gx = x\}.$$

### Example

For the  $D_4$ -set  $X$  in Example 16.8, we have

$$X_{\rho_0} = X, \quad X_{\rho_1} = \{C\}, \quad X_{\mu_1} = \{s_1, s_3, m_1, m_2, C, P_1, P_3\}$$

Also, with  $G = D_4$ ,

$$G_1 = \{\rho_0, \delta_2\}, \quad G_{s_3} = \{\rho_0, \mu_1\}, \quad G_{d_1} = \{\rho_0, \rho_2, \delta_1, \delta_2\}.$$

We leave the computation of the other  $X_\sigma$  and  $G_x$  to Exercises 1 and 2. ▲

### Theorem

Let  $X$  be a  $G$ -set. Then  $G_x$  is a subgroup of  $G$  for each  $x \in X$ .

### *Proof*

Let  $x \in X$  and let  $g_1, g_2 \in G_x$ . Then  $g_1x = x$  and  $g_2x = x$ . Consequently,  $(g_1g_2)x = g_1(g_2x) = g_1x = x$ , so  $g_1g_2 \in G_x$ , and  $G_x$  is closed under the induced operation of  $G$ . Of course  $ex = x$ , so  $e \in G_x$ . If  $g \in G_x$ , then  $gx = x$ , so  $x = ex = (g^{-1}g)x = g^{-1}(gx) = g^{-1}x$ , and consequently  $g^{-1} \in G_x$ . Thus  $G_x$  is a subgroup of  $G$ . ♦

### Definition

Let  $X$  be a  $G$ -set and let  $x \in X$ . The subgroup  $G_x$  is the **isotropy subgroup** of  $x$ . ■

### Orbits

For the  $D_4$ -set  $X$  of Example 16.8 with action table in Table 16.10, the elements in the subset  $\{1, 2, 3, 4\}$  are carried into elements of this same subset under action by  $D_4$ . Furthermore, each of the elements 1, 2, 3, and 4 is carried into all the other elements of the subset by the various elements of  $D_4$ . We proceed to show that every  $G$ -set  $X$  can be partitioned into subsets of this type.

### Theorem

Let  $X$  be a  $G$ -set. For  $x_1, x_2 \in X$ , let  $x_1 \sim x_2$  if and only if there exists  $g \in G$  such that  $gx_1 = x_2$ . Then  $\sim$  is an equivalence relation on  $X$ .

### *Proof*

For each  $x \in X$ , we have  $ex = x$ , so  $x \sim x$  and  $\sim$  is reflexive.

Suppose  $x_1 \sim x_2$ , so  $gx_1 = x_2$  for some  $g \in G$ . Then  $g^{-1}x_2 = g^{-1}(gx_1) = (g^{-1}g)x_1 = ex_1 = x_1$ , so  $x_2 \sim x_1$ , and  $\sim$  is symmetric.

Finally, if  $x_1 \sim x_2$  and  $x_2 \sim x_3$ , then  $g_1x_1 = x_2$  and  $g_2x_2 = x_3$  for some  $g_1, g_2 \in G$ . Then  $(g_2g_1)x_1 = g_2(g_1x_1) = g_2x_2 = x_3$ , so  $x_1 \sim x_3$  and  $\sim$  is transitive. ♦

### Definition

Let  $X$  be a  $G$ -set. Each cell in the partition of the equivalence relation described in Theorem 16.14 is an **orbit in  $X$  under  $G$** . If  $x \in X$ , the cell containing  $x$  is the **orbit of  $x$** . We let this cell be  $Gx$ . ■

### Theorem

Let  $X$  be a  $G$ -set and let  $x \in X$ . Then  $|Gx| = (G : G_x)$ . If  $|G|$  is finite, then  $|Gx|$  is a divisor of  $|G|$ .

**Proof**

We define a one-to-one map  $\psi$  from  $Gx$  onto the collection of left cosets of  $G_x$  in  $G$ . Let  $x_1 \in Gx$ . Then there exists  $g_1 \in G$  such that  $g_1x = x_1$ . We define  $\psi(x_1)$  to be the left coset  $g_1G_x$  of  $G_x$ . We must show that this map  $\psi$  is well defined, independent of the choice of  $g_1 \in G$  such that  $g_1x = x_1$ . Suppose also that  $g_1'x = x_1$ . Then,  $g_1x = g_1'x$ , so  $g_1^{-1}(g_1x) = g_1^{-1}(g_1'x)$ , from which we deduce  $x = (g_1^{-1}g_1')x$ . Therefore  $g_1^{-1}g_1' \in G_x$ , so  $g_1' \in g_1G_x$ , and  $g_1G_x = g_1'G_x$ . Thus the map  $\psi$  is well defined.

To show the map  $\psi$  is one to one, suppose  $x_1, x_2 \in Gx$ , and  $\psi(x_1) = \psi(x_2)$ . Then there exist  $g_1, g_2 \in G$  such that  $x_1 = g_1x, x_2 = g_2x$ , and  $g_2 \in g_1G_x$ . Then  $g_2 = g_1g$  for some  $g \in G_x$ , so  $x_2 = g_2x = g_1(gx) = g_1x = x_1$ . Thus  $\psi$  is one to one.

Finally, we show that each left coset of  $G_x$  in  $G$  is of the form  $\psi(x_1)$  for some  $x_1 \in Gx$ . Let  $g_1G_x$  be a left coset. Then if  $g_1x = x_1$ , we have  $g_1G_x = \psi(x_1)$ . Thus  $\psi$  maps  $Gx$  one to one onto the collection of left cosets so  $|Gx| = (G : G_x)$ .

If  $|G|$  is finite, then the equation  $|G| = |G_x|(G : G_x)$  shows that  $|Gx| = (G : G_x)$  is a divisor of  $|G|$ . ♦

**Example**

Let  $X$  be the  $D_4$ -set in Example 16.8, with action table given by Table 16.10. With  $G = D_4$ , we have  $G1 = \{1, 2, 3, 4\}$  and  $G_1 = \{\rho_0, \delta_2\}$ . Since  $|G| = 8$ , we have  $|G1| = (G : G_1) = 4$ . ▲

Question	Opt 1	Opt 2	Opt 3	Opt 4	Answer
The group with the set of all permutations of a finite set with respect to the operation composition of permutations is known as -----.	symmetric group	asymmetric group	normal group	cyclic group	symmetric group

## GROUPS ACTING ON THEMSELVES BY CONJUGATION —THE CLASS EQUATION

**Definition.** Two elements  $a$  and  $b$  of  $G$  are said to be *conjugate in  $G$*  if there is some  $g \in G$  such that  $b = gag^{-1}$  (i.e., if and only if they are in the same orbit of  $G$  acting on itself by conjugation). The orbits of  $G$  acting on itself by conjugation are called the *conjugacy classes of  $G$* .

### Examples

- (1) If  $G$  is an abelian group then the action of  $G$  on itself by conjugation is the trivial action:  $g \cdot a = a$ , for all  $g, a \in G$ , and for each  $a \in G$  the conjugacy class of  $a$  is  $\{a\}$ .
- (2) If  $|G| > 1$  then, unlike the action by left multiplication,  $G$  does *not* act transitively on itself by conjugation because  $\{1\}$  is always a conjugacy class (i.e., an orbit for this action). More generally, the one element subset  $\{a\}$  is a conjugacy class if and only if  $gag^{-1} = a$  for all  $g \in G$  if and only if  $a$  is in the center of  $G$ .
- (3) In  $S_3$  one can compute directly that the conjugacy classes are  $\{1\}$ ,  $\{(1\ 2), (1\ 3), (2\ 3)\}$  and  $\{(1\ 2\ 3), (1\ 3\ 2)\}$ . We shall shortly develop techniques for computing conjugacy classes more easily, particularly in symmetric groups.

**Definition.** Two subsets  $S$  and  $T$  of  $G$  are said to be *conjugate in  $G$*  if there is some  $g \in G$  such that  $T = gSg^{-1}$  (i.e., if and only if they are in the same orbit of  $G$  acting on its subsets by conjugation).

**Proposition 6.** The number of conjugates of a subset  $S$  in a group  $G$  is the index of the normalizer of  $S$ ,  $|G : N_G(S)|$ . In particular, the number of conjugates of an element  $s$  of  $G$  is the index of the centralizer of  $s$ ,  $|G : C_G(s)|$ .

*Proof:* The second assertion of the proposition follows from the observation that  $N_G(\{s\}) = C_G(s)$ .

### Theorem

*(The Class Equation)* Let  $G$  be a finite group and let  $g_1, g_2, \dots, g_r$  be representatives of the distinct conjugacy classes of  $G$  not contained in the center  $Z(G)$  of  $G$ . Then

$$|G| = |Z(G)| + \sum_{i=1}^r |G : C_G(g_i)|.$$

*Proof:* As noted in Example 2 above the element  $\{x\}$  is a conjugacy class of size 1 if and only if  $x \in Z(G)$ , since then  $gxg^{-1} = x$  for all  $g \in G$ . Let  $Z(G) = \{1, z_2, \dots, z_m\}$ , let  $\mathcal{K}_1, \mathcal{K}_2, \dots, \mathcal{K}_r$  be the conjugacy classes of  $G$  not contained in the center, and let  $g_i$  be a representative of  $\mathcal{K}_i$  for each  $i$ . Then the full set of conjugacy classes of  $G$  is given by

$$\{1\}, \{z_2\}, \dots, \{z_m\}, \mathcal{K}_1, \mathcal{K}_2, \dots, \mathcal{K}_r.$$

Since these partition  $G$  we have

$$\begin{aligned} |G| &= \sum_{i=1}^m 1 + \sum_{i=1}^r |\mathcal{K}_i| \\ &= |Z(G)| + \sum_{i=1}^r |G : C_G(g_i)|, \end{aligned}$$

where  $|\mathcal{K}_i|$  is given by Proposition 6. This proves the class equation.

### Examples

- (1) The class equation gives no information in an abelian group since conjugation is the trivial action and all conjugacy classes have size 1.
- (2) In any group  $G$  we have  $\langle g \rangle \leq C_G(g)$ ; this observation helps to minimize computations of conjugacy classes. For example, in the quaternion group  $Q_8$  we see that  $\langle i \rangle \leq C_{Q_8}(i) \leq Q_8$ . Since  $i \notin Z(Q_8)$  and  $|Q_8 : \langle i \rangle| = 2$ , we must have  $C_{Q_8}(i) = \langle i \rangle$ . Thus  $i$  has precisely 2 conjugates in  $Q_8$ , namely  $i$  and  $-i = kik^{-1}$ . The other conjugacy classes in  $Q_8$  are determined similarly and are

$$\{1\}, \{-1\}, \{\pm i\}, \{\pm j\}, \{\pm k\}.$$

The first two classes form  $Z(Q_8)$  and the class equation for this group is

$$|Q_8| = 2 + 2 + 2 + 2.$$

- (3) In  $D_8$  we may also use the fact that the three subgroups of index 2 are abelian to quickly see that if  $x \notin Z(D_8)$ , then  $|C_{D_8}(x)| = 4$ . The conjugacy classes of  $D_8$  are

$$\{1\}, \{r^2\}, \{r, r^3\}, \{s, sr^2\}, \{sr, sr^3\}.$$

The first two classes form  $Z(D_8)$  and the class equation for this group is

$$|D_8| = 2 + 2 + 2 + 2.$$

**Theorem**

If  $p$  is a prime and  $P$  is a group of prime power order  $p^\alpha$  for some  $\alpha \geq 1$ , then  $P$  has a nontrivial center:  $Z(P) \neq 1$ .

*Proof:* By the class equation

$$|P| = |Z(P)| + \sum_{i=1}^r |P : C_P(g_i)|$$

where  $g_1, \dots, g_r$  are representatives of the distinct non-central conjugacy classes. By definition,  $C_P(g_i) \neq P$  for  $i = 1, 2, \dots, r$  so  $p$  divides  $|P : C_P(g_i)|$ . Since  $p$  also divides  $|P|$  it follows that  $p$  divides  $|Z(P)|$ , hence the center must be nontrivial.

**Corollary**

If  $|P| = p^2$  for some prime  $p$ , then  $P$  is abelian. More precisely,  $P$  is isomorphic to either  $Z_{p^2}$  or  $Z_p \times Z_p$ .

*Proof:* Since  $Z(P) \neq 1$  by the theorem, it follows that  $P/Z(P)$  is cyclic. By Exercise 36, Section 3.1,  $P$  is abelian. If  $P$  has an element of order  $p^2$ , then  $P$  is cyclic. Assume therefore that every nonidentity element of  $P$  has order  $p$ . Let  $x$  be any nonidentity element of  $P$  and let  $y \in P - \langle x \rangle$ . Since  $|\langle x, y \rangle| > |\langle x \rangle| = p$ , we must have that  $P = \langle x, y \rangle$ . Both  $x$  and  $y$  have order  $p$  so  $\langle x \rangle \times \langle y \rangle = Z_p \times Z_p$ . It now follows directly that the map  $(x^a, y^b) \mapsto x^a y^b$  is an isomorphism from  $\langle x \rangle \times \langle y \rangle$  onto  $P$ . This completes the proof.

**Conjugacy in  $S_n$** **Proposition**

Let  $\sigma, \tau$  be elements of the symmetric group  $S_n$  and suppose  $\sigma$  has cycle decomposition

$$(a_1 a_2 \dots a_{k_1}) (b_1 b_2 \dots b_{k_2}) \dots$$

Then  $\tau \sigma \tau^{-1}$  has cycle decomposition

$$(\tau(a_1) \tau(a_2) \dots \tau(a_{k_1})) (\tau(b_1) \tau(b_2) \dots \tau(b_{k_2})) \dots,$$

that is,  $\tau \sigma \tau^{-1}$  is obtained from  $\sigma$  by replacing each entry  $i$  in the cycle decomposition for  $\sigma$  by the entry  $\tau(i)$ .

*Proof:* Observe that if  $\sigma(i) = j$ , then

$$\tau \sigma \tau^{-1}(\tau(i)) = \tau(j).$$

Thus, if the ordered pair  $i, j$  appears in the cycle decomposition of  $\sigma$ , then the ordered pair  $\tau(i), \tau(j)$  appears in the cycle decomposition of  $\tau \sigma \tau^{-1}$ . This completes the proof.

### Example

Let  $\sigma = (1\ 2)(3\ 4\ 5)(6\ 7\ 8\ 9)$  and let  $\tau = (1\ 3\ 5\ 7)(2\ 4\ 6\ 8)$ . Then

$$\tau\sigma\tau^{-1} = (3\ 4)(5\ 6\ 7)(8\ 1\ 2\ 9).$$

### Definition.

- (1) If  $\sigma \in S_n$  is the product of disjoint cycles of lengths  $n_1, n_2, \dots, n_r$  with  $n_1 \leq n_2 \leq \dots \leq n_r$  (including its 1-cycles) then the integers  $n_1, n_2, \dots, n_r$  are called the *cycle type* of  $\sigma$ .
- (2) If  $n \in \mathbb{Z}^+$ , a *partition* of  $n$  is any nondecreasing sequence of positive integers whose sum is  $n$ .

### Proposition

Two elements of  $S_n$  are conjugate in  $S_n$  if and only if they have the same cycle type. The number of conjugacy classes of  $S_n$  equals the number of partitions of  $n$ .

*Proof:* By Proposition 10, conjugate permutations have the same cycle type. Conversely, suppose the permutations  $\sigma_1$  and  $\sigma_2$  have the same cycle type. Order the cycles in nondecreasing length, including 1-cycles (if several cycles of  $\sigma_1$  and  $\sigma_2$  have the same length then there are several ways of doing this). Ignoring parentheses, each cycle decomposition is a list in which all the integers from 1 to  $n$  appear exactly once. Define  $\tau$  to be the function which maps the  $i^{\text{th}}$  integer in the list for  $\sigma_1$  to the  $i^{\text{th}}$  integer in the list for  $\sigma_2$ . Thus  $\tau$  is a permutation and since the parentheses which delineate the cycle decompositions appear at the same positions in each list, Proposition 10 ensures that  $\tau\sigma_1\tau^{-1} = \sigma_2$ , so that  $\sigma_1$  and  $\sigma_2$  are conjugate.

Since there is a bijection between the conjugacy classes of  $S_n$  and the permissible cycle types and each cycle type for a permutation in  $S_n$  is a partition of  $n$ , the second assertion of the proposition follows, completing the proof.

### Examples

- (1) Let  $\sigma_1 = (1)(3\ 5)(8\ 9)(2\ 4\ 7\ 6)$  and let  $\sigma_2 = (3)(4\ 7)(8\ 1)(5\ 2\ 6\ 9)$ . Then define  $\tau$  by  $\tau(1) = 3, \tau(3) = 4, \tau(5) = 7, \tau(8) = 8$ , etc. Then

$$\tau = (1\ 3\ 4\ 2\ 5\ 7\ 6\ 9)(8)$$

and  $\tau\sigma_1\tau^{-1} = \sigma_2$ .

- (2) If in the previous example we had reordered  $\sigma_2$  as  $\sigma_2 = (3)(8\ 1)(4\ 7)(5\ 2\ 6\ 9)$  by interchanging the two cycles of length 2, then the corresponding  $\tau$  described above is defined by  $\tau(1) = 3, \tau(3) = 8, \tau(5) = 1, \tau(8) = 4$ , etc., which gives the permutation

$$\tau = (1\ 3\ 8\ 4\ 2\ 5)(6\ 9\ 7)$$

again with  $\tau\sigma_1\tau^{-1} = \sigma_2$ , which shows that there are many elements conjugating  $\sigma_1$  into  $\sigma_2$ .

- (3) If  $n = 5$ , the partitions of 5 and corresponding representatives of the conjugacy classes (with 1-cycles not written) are as given in the following table:

Partition of 5	Representative of Conjugacy Class
1, 1, 1, 1, 1	1
1, 1, 1, 2	(1 2)
1, 1, 3	(1 2 3)
1, 4	(1 2 3 4)
5	(1 2 3 4 5)
1, 2, 2	(1 2)(3 4)
2, 3	(1 2)(3 4 5)

### Theorem $A_5$ is a simple group.

*Proof:* We first work out the conjugacy classes of  $A_5$  and their orders. Proposition 11 does not apply directly since two elements of the same cycle type (which are conjugate in  $S_5$ ) need *not* be conjugate in  $A_5$ . Exercises 19 to 22 analyze the relation of classes in  $S_n$  to classes in  $A_n$  in detail.

We have already seen that representatives of the cycle types of even permutations can be taken to be

$$1, (1 2 3), (1 2 3 4 5) \text{ and } (1 2)(3 4).$$

The centralizers of 3-cycles and 5-cycles in  $S_5$  were determined above, and checking which of these elements are contained in  $A_5$  we see that

$$C_{A_5}((1 2 3)) = \langle (1 2 3) \rangle \text{ and } C_{A_5}((1 2 3 4 5)) = \langle (1 2 3 4 5) \rangle.$$

These groups have orders 3 and 5 (index 20 and 12), respectively, so there are 20 distinct conjugates of  $(1 2 3)$  and 12 distinct conjugates of  $(1 2 3 4 5)$  in  $A_5$ . Since there are a total of twenty 3-cycles in  $S_5$  (Exercise 16, Section 1.3) and all of these lie in  $A_5$ , we see that

all twenty 3-cycles are conjugate in  $A_5$ .

There are a total of twenty-four 5-cycles in  $A_5$  but only 12 distinct conjugates of the 5-cycle  $(1 2 3 4 5)$ . Thus some 5-cycle,  $\sigma$ , is *not* conjugate to  $(1 2 3 4 5)$  in  $A_5$  (in fact,  $(1 3 5 2 4)$  is not conjugate in  $A_5$  to  $(1 2 3 4 5)$  since the method of proof in Proposition 11 shows that any element of  $S_5$  conjugating  $(1 2 3 4 5)$  into  $(1 3 5 2 4)$  must be an odd permutation). As above we see that  $\sigma$  also has 12 distinct conjugates in  $A_5$ , hence

the 5-cycles lie in two conjugacy classes in  $A_5$ , each of which has 12 elements.

Since the 3-cycles and 5-cycles account for all the nonidentity elements of odd order, the 15 remaining nonidentity elements of  $A_5$  must have order 2 and therefore have cycle type (2,2). It is easy to see that  $(1\ 2)(3\ 4)$  commutes with  $(1\ 3)(2\ 4)$  but does not commute with any element of odd order in  $A_5$ . It follows that  $|C_{A_5}((12)(34))| = 4$ . Thus  $(1\ 2)(3\ 4)$  has 15 distinct conjugates in  $A_5$ , hence

all 15 elements of order 2 in  $A_5$  are conjugate to  $(1\ 2)(3\ 4)$ .

In summary, the conjugacy classes of  $A_5$  have orders 1, 15, 20, 12 and 12.

Now, suppose  $H$  were a normal subgroup of  $A_5$ . Then as we observed above,  $H$  would be the union of conjugacy classes of  $A_5$ . Then the order of  $H$  would be both a divisor of 60 (the order of  $A_5$ ) and be the sum of some collection of the integers  $\{1, 12, 12, 15, 20\}$  (the sizes of the conjugacy classes in  $A_5$ ). A quick check shows the only possibilities are  $|H| = 1$  or  $|H| = 60$ , so that  $A_5$  has no proper, nontrivial normal subgroups.

Question	Opt 1	Opt 2	Opt 3	Opt 4	Answer
A non-trivial group $G$ is called ----- if its only normal subgroups are $\{e\}$ and $G$ itself.	simple	unique	inverse	identity	simple
A infinite ----- group cannot be simple.	non abelian	abelian	non trivial	trivial	abelian
A finite abelian group is simple iff its ----- is a prime.	ring	value	abelian	order	order
The alternating group $A_n$ is simple for -----.	$n \geq 3$	$n \geq 2$	$n \geq 5$	$n \geq 1$	$n \geq 5$
The $G$ must have a subgroup of order equal to the highest power of $p$ that divides $ G $ . One such subgroup is called a ----- of $G$ .	Sylow $p$ -subgroup	normal subgroup	trivial subgroup	non trivial subgroup	Sylow $p$ -subgroup
Using ----- test, it is possible to sort out numbers which cannot be order of any simple group.	odd	Sylow	even	unique	Sylow
If $G$ is a group of order -----, where $n$ is an odd integer greater than 1 then $G$ cannot be simple.	$2+n$	$2-n$	$2n$	$2/n$	$2n$
The ----- helps to use the known properties of alternating groups to determine non-simplicity of a group.	Sylow's theorem	Lagrange's theorem	Embedded theorem	Index theorem	Embedded theorem
Which is the test of non-simplicity?	Sylow's theorem	odd test	both Sylow's theorem and odd test	neither Sylow's theorem nor odd theorem	both Sylow's theorem and odd test
If the normal subgroups are $\{e\}$ and $G$ itself then the non-trivial group $G$ is called -----.	simple	unique	inverse	identity	simple
When does a finite abelian group is simple?	iff order is 2	iff order is not prime	iff order is odd	iff order is prime	iff order is prime
The elements $a$ and $b$ of a group $G$ are conjugate in $G$ , if -----.	$xax^{-1}=1$	$xax^{-1}=b$	$xax^{-1}=0$	$xax^{-1}=a$	$xax^{-1}=b$
The ----- of $a$ is the set $cl(a)=\{xax^{-1}   x \in G\}$ .	normal	subgroup	conjugacy class	prime	conjugacy class
A group of order $p^n$ , where $p$ is prime is called a -----.	$p$ -group	$n$ -group	$p^2$ -group	$n^2$ -group	$p$ -group
If $ G  =$ -----, then $G$ is abelian.	$p$	$p^2$	$p^3$	$-p$	$p^2$
If $G$ is a group of order $m$ and $n$ divides $m$ , $G$ need not have a subgroup of order -----.	$m$	$m^2$	$n$	$n^2$	$n$
Which is the most important results in finite group theory?	Sylow's theorem	Lagrange's theorem	Index theorem	both Sylow's and Lagrange theorem	both Sylow's and Lagrange theorem
The ----- theorem gives a sufficient condition for the existence of subgroups.	Sylow's	Lagrange	Index	Embedded	Sylow's
If $p^k$ divides $ G $ , then $G$ has atleast one subgroup of order ----.	$p$	$p^k$	$p^3$	$-p$	$p^k$
Any subgroup of order $p^k$ is called a ----- of $G$ .	normal subgroup	cyclic subgroup	Sylow $p$ -subgroup	abelian subgroup	Sylow $p$ -subgroup

[illegible]

## Group theory I

1. Define subgroup.
2. Define permutation group
3. Define external direct product.
4. Prove that for every positive integer  $n$ ,  $Aut(Z_n)$  is isomorphic to  $U(n)$
5. Define center of a group
6. Define torsion subgroup
7. What is quaternion group?
8. State a product of two groups.
9. Define odd permutation group.
10. Find the Cayley table for  $U(11)$
11. Prove that number of idempotent element in a group is only one.
12. Write all the elements of  $S_3$
13. Define divisible groups
14. Define a group.
15. Define congruent.
16. Prove that any cyclic group is abelian
17. Define quotient groups.
18. Define basic subgroup.
19. Define center of a group.
20. Define cyclic subgroup.

21. Prove that any cyclic group is abelian
22. What is statement of Cauchy theorem for abelian groups?
23. Define reduced groups.
24. Define centre of the group
25. Define binary operation.
26. Define equivalence relation.
27. Define Lagrange's theorem.
28. Define odd permutation
29. The centre  $H$  of a group  $G$  is a normal subgroup of  $G$ ?
30. Prove that  $\mathbb{Z} = \langle 1 \rangle$ .
31. Prove that number elements in any left coset  $aH$  is the same as the number of elements in  $H$
32. If  $G$  is a group, then prove that
  - i) for every  $a \in G$ ,  $(a^{-1})^{-1} = a$
  - ii) for all  $a, b \in G$ ,  $(a.b)^{-1} = b^{-1} \cdot a^{-1}$
33. Prove that  $A_n$  is a group. Give two reasons why the set of odd permutations in  $S_n$  is not a subgroup
34. Write all the elements of  $Q_8$  in matrix representation
35. Let  $G$  denote the set of all matrices of the form  $\begin{pmatrix} x & x \\ x & x \end{pmatrix}$  where  $x \in \mathbb{R}^*$ . Prove that  $G$  is a group under matrix multiplication
36. Let  $A = \{1, 2, 3\}$ . Prove that  $S_3$  is a group under permutation product. Prove that the set of even permutations in  $S_n$  forms a subgroup of  $S_n$ .
37. Prove that union of two subgroups of a group  $G$  is a subgroup iff one is contained in the other

38. Prove that subgroup of a cyclic group is cyclic
39. Find all generators of  $Z_6, Z_8$ , and  $Z_{20}$
40. Let  $G$  be a group. Let  $a, b \in G$ . Prove that
- i) order of  $a$  = order of  $a^{-1}$
  - ii) order of  $a$  = order of  $b^{-1}ab$
  - iii) order of  $ab$  = order of  $ba$
41. Given  $a, b$  in a group  $G$ , then prove that  $a \cdot x = b$  and  $y \cdot a = b$  have unique solutions for  $x, y \in G$
42. In  $\mathbb{R} - \{1\}$ , we define  $aNb = a + b - ab$ . Show that  $(\mathbb{R} - \{1\}, N)$  is a group. Is this abelian?
43. Let  $G$  be a group and let  $a \in G$  be a fixed element. Let  $H_a = \{x \in G \mid ax = xa\}$ . Prove that  $H_a$  is a subgroup of  $G$
44. Let  $G$  be a group and  $H$  be a subgroup of  $G$ . Prove that the number of cosets of  $H$  is the same as the number of right cosets of  $H$ .
45. Describe about Klein 4 group
46. Let  $G$  be a group and  $H$  be a subgroup of  $G$ . Prove that
- i)  $aH = bH \Rightarrow a^{-1}b \in H$
  - ii)  $a \in bH \Rightarrow a^{-1} \in Hb^{-1}$
  - iii)  $a \in bH \Rightarrow aH = bH$
- 10 in  $Z_{100} \oplus Z_{25}$
47. Let  $H$  be a subgroup of  $G$ . Define  $a \sim b \Leftrightarrow a^{-1}b \in H$ . Prove that  $\sim$  is an equivalence relation.
48. Prove that every permutation of a finite set can be written as a cycle or as a product of disjoint cycles.
49. Let  $G$  be a finite group. Show that the number of elements  $x$  of  $G$  such that  $x^3 = e$  is odd. Also show that the number of elements  $x$  of  $G$  such that  $x^2 = e$  is even

50. Find all cyclic subgroups of  $V_4$ .
51. Let  $G$  be a group and let  $H$  be a normal subgroup of  $G$ . Prove that the set  $G/H = \{aH | a \in G\}$  is a group under the operation  $(aH)(bH) = abH$ .
52. Compute the order of each member of  $A_4$ . What arithmetic relationships do these orders have with the order of  $A_4$ ?
53. Suppose that  $H$  is a proper subgroup of  $\mathbb{Z}$  under addition and  $H$  contains 18, 30, and 40. Determine  $H$ .
54. If  $G$  is a group, in which  $(a \cdot b)^i = a^i b^i$  for three consecutive integers  $i$  for all  $a, b \in G$ . Show that  $G$  is abelian.
55. If  $H$  is a non-empty finite subset of a group  $G$  and  $H$  is closed under multiplication then prove that  $H$  is a subgroup of  $G$ .
56. Prove that  $HK$  is a subgroup of  $G$  iff  $HK = KH$ .
57. State and prove Lagrange's theorem.
58. State and prove cancellation theorem.
59. In a finite group, prove that the number of elements of order  $d$  is divisible by  $\phi(d)$ .
60. State and prove Cauchy theorem for abelian groups.
61. Prove that if  $G$  is an abelian group, then for all  $a, b \in G$  and all integers  $n$ ,  $(a \cdot b)^n = a^n \cdot b^n$ .
62. If  $Z$  is a center of a group  $G$  defined as  $Z = \{z \in G : zx = xz\}$ , then prove that  $Z$  is a subgroup of  $G$ .
63. If  $G$  is a finite group, show that there exist a positive integers  $N$  such that  $a^N = e$  for all  $a \in G$ .
64. Show that if every element of the group  $G$  is its own inverse, then  $G$  is abelian.

65. Define automorphism.
66. Let  $G$  be a group. Prove that the mapping  $\alpha(g) = g^c - 1$  for all  $g \in G$  is an automorphism if and only if  $G$  is Abelian.
67. Define Subgroup. Prove that a non-empty subset  $H$  of a group  $G$  is a subgroup if and only if
  - (i)  $a, b \in H \Rightarrow ab \in H$
  - (ii)  $a \in H \Rightarrow a^{-1} \in H$
68. Let  $H$  and  $K$  be two subgroups of  $G$ . Prove that  $H \cap K$  is a subgroup of  $G$
69. Prove that a subgroup of cyclic group is cyclic
70. If  $H$  and  $K$  are finite subgroups of  $G$  of orders  $o(H)$  and  $o(K)$ , then prove that  $o(HK) = \frac{o(H)o(K)}{o(H \cap K)}$ .
71. Find  $Aut(Z_{10})$
72. Given  $a, b$  in a group  $G$ , then prove that  $a \cdot x = b$  and  $y \cdot a = b$  have unique solutions for  $x$  and  $y$  in  $G$ .
73. Show that if every element of the group  $G$  is its own inverse, then  $G$  is abelian
74. Give two examples of groups with 44 elements..
75. Let  $\mathbb{Q}$  be the group of rational numbers under addition. In  $\mathbb{Q}$ , list the elements in  $\langle 1/2 \rangle$
76. Find the subgroup lattice of  $V_4$
77. Define even permutation.
78. Prove that  $U(10) \cong Z_4$
79. Prove that  $\{1, -1, i, -i\}$  is a group under multiplication

80. Let  $G$  be the group of all real  $2 \times 2$  matrices  $\begin{pmatrix} a & b \\ c & d \end{pmatrix}$  with  $ad - bc \neq 0$  under multiplication. Let  $H = \left\{ \begin{pmatrix} a & b \\ 0 & d \end{pmatrix} : ad \neq 0 \right\}$ . Prove that  $H$  is a subgroup of  $G$ .
81. Prove that the relation  $a \equiv b \pmod H$  is an equivalence relation.
82. Let  $H$  be a subgroup of  $G$ . Prove that the number of left coset of  $H$  is the same as the number of right coset of  $H$ .
83. Let  $H$  and  $K$  be two subgroups of  $G$ . Prove that  $H \cap K$  is a subgroup of  $G$ .
84. Prove that the order of a permutation  $P$  is the l.c.m of the length of its disjoint cycles.
85. Prove that disjoint cycles commute.
86. State and prove fundamental theorem of cyclic groups.
87. Prove that a non-empty subset  $H$  of a group  $G$  is a subgroup of  $G$  iff  $a, b \in H \Rightarrow ab^{-1} \in H$ .
88. Prove that  $N(a)$  is a subgroup of  $G$ .
89. Prove that every group is isomorphic to a group of permutations. Show that the set  $\{5, 15, 25, 35\}$  is a group under multiplication modulo 40.
90. State finite subgroup test.
91. List the cyclic subgroups of  $U(30)$ .
92. If  $\alpha$  is even permutation, prove that  $\alpha^l - 1$  is even. If  $\alpha$  is odd permutation, prove that  $\alpha^l - 1$  is odd.
93. Prove that there is a one-to-one correspondence between any two right coset of  $H$  in  $G$ .
94. Let  $H$  and  $K$  be two subgroups of  $G$  of finite index in  $G$ . Prove that  $H \cap K$  is a subgroup of finite index in  $G$ .

95. Show that if a group  $G$  has exactly one subgroup  $H$  of given order then  $H$  is a normal subgroup of  $G$
96. Define idempotent element of a group
97. State one step subgroup test
98. Define cyclic group
99. Define alternating group
100. Give an reason to  $U(10)$  is not isomorphic to  $U(12)$
101. Every group is isomorphic to a group of permutations
102. Let  $\mathbb{Z}$  denote the group of integers under addition. Is every subgroup of  $\mathbb{Z}$  cyclic? Why? Describe all the subgroups of  $\mathbb{Z}$ . Let  $a$  be a group element with infinite order. Describe all subgroups of  $\langle a \rangle$
103. Find the decomposition of a permutation  $(1632)(457)$  in  $S_7$  into a product of 2-cycles
104. Prove that  $\text{Inn}(G)$  is a group

Max Marks: 50

**Answer ALL questions**  
**PART - A ( $20 \times 1 = 20$  marks)**

1. Normal subgroup of  $(\mathbb{Z}, +)$  is —  
a.  $2\mathbb{Z}$  b.  $3\mathbb{Z}$   
c.  $4\mathbb{Z}$  d. all the above
2. — subgroup of  $(\mathbb{Z}_n, \oplus)$  is normal  
a. All b. No c. Few d. all the above
3. Every subgroup of — group is normal  
a. Non Abelian b. cyclic  
c. Abelian d. both b and c
4. Order of  $\mathbb{Z}_6 / \langle 3 \rangle$  is —  
a. 4 b. 3  
c. 2 d. 1
5. Order of  $\mathbb{Z}_{60} / \langle 5 \rangle$  is —  
a. 4 b. 3  
c. 2 d. 1
6. Number of elements in  $\mathbb{Z}/4\mathbb{Z}$  is —  
a. 1 b. 2  
c. 4 d. both a and b
7. If  $H$  be any subgroup of a group  $G$  and  $h \in H$ , then —  
a.  $Hh \neq H = hH$  b.  $Hh = H \neq hH$   
c.  $Hh \neq H \neq hH$  d.  $Hh = H = hH$
8.  $\mathbb{Z}/4\mathbb{Z} \approx$  —  
a.  $\mathbb{Z}_3$  b.  $\mathbb{Z}_4$   
c.  $\mathbb{Z}_5$  d. all the above
9. Order of  $\mathbb{Z}/11\mathbb{Z}$  is —  
a. composite b. prime  
c. neither a nor b d. both a and b
10.  $\mathbb{Z}/11\mathbb{Z}$  is —  
a. cyclic b. abelian  
c. neither a nor b d. both a and b
11. Let  $G$  be the additive group of integers and let  $H = \{\dots, -6, -3, 0, 3, 6, \dots\}$ . Then number of distinct right cosets is —  
a. 0 b. 1  
c. 2 d. 3
12. Let  $G$  be a group and let  $H$  be a subgroup of  $G$ . Then number distinct left cosets of  $H$  in  $G$  is —  
a.  $G/H$  b.  $H/G$   
c. neither a nor b d. both a and b
13. Any two left cosets of a subgroup are —  
a. identical  
b. disjoint  
c. neither a nor b d. both a and b
14. Order of  $\mathbb{Z}_{18}/H =$  — where  $H = \{0, 6, 12\}$   
a. 1 b. 2  
c. 6 d. both a and b
15. Let  $G$  be a group and let  $H$  be a subgroup of  $G$ . Then for  $a \in G$ ,  $\{ha|h \in H\} =$  —
