ANDROID PROGRAMMING 2017-2020 Batch

KARPAGAM ACADEMY OF HIGHER EDUCATION

Coimbatore-641 021 (For the candidates admitted from 2017 onwards) DEPARTMENT OF CS, CA & IT

SUBJECT NAME: ANDROID PROGRAMMING

SUBJECT CODE: 17CSU401

CLASS: II- B. Sc (CS)

SEMESTER : III

Instruction Hours / week: L: 3 T: 0 P: 0 Marks: Int : 40 Ext : 60 Total: 100

COURSE OBJECTIVE

This course motivates the students to design, create, deploy, and test applications for the Android mobile phone platform.

COURSE OUTCOME

- Student can build own Android apps.
- Explain the differences between Android and other mobile development environments.
- Understand how Android applications work, their life cycle, manifest, Intents, and using external resources.
- Be able to design and develop useful Android applications with compelling user interfaces by using, extending, and creating your own layouts and Views and using Menus.
- Understand Android's APIs for data storage, retrieval, user preferences, files, databases, and content providers.

UNIT-I:

Introduction: History of Android, Introduction to Android Operating Systems, Android Development Tools, Android Architecture. (2L)

UNIT-II:

Overview of object oriented programming using Java: OOPs Concepts: Inheritance, Polymorphism, Interfaces, Abstract class, Threads, Overloading and Overriding, Java Virtual Machine. (4L)

UNIT-III:

Development Tools: Installing and using Eclipse with ADT plug-in, Installing Virtual machine for Android sandwich/Jelly bean (Emulator), configuring the installed tools, creating a android project– Hello Word, run on emulator, Deploy it on USB-connected Android device. (5L)

UNIT-IV

User Interface Architecture: Application context, intents, Activity life cycle, multiple screen size s.(2L) **User Interface Design:** Form widgets, Text Fields, Layouts, Button control, toggle buttons, Spinners(Combo boxes),Images, Menu, Dialog.(2L) **UNIT-V**

Database:Understanding of SQLite database, connecting with the database. (2L)

LECTURE PLAN

S.No	Lecture Duration (Hr)	Topics Covered	Reference Materials
		Unit I	
1.	1	Introduction: History of Android	R1: 11-15, W1
2.	1	Introduction to Android Operating Systems	W1, R1:37
3.	1	Android Development Tools	W2, R1:40
4.	1	Android Architecture. (2L)	W1
5.	1	Recapitulation and Possible Questions Discussion	
		Total No of hours for Unit 1:5	
		Unit II	
1	1	Overview of object oriented programming using Java:	W/2
1.		OOPs Concepts	W Z
2.	1	Inheritance	W1
3.	1	Polymorphism	W1
4.	1	Interfaces,	W2
5.	1	Abstract class	W1
6.	1	Threads	W2
7.	1	Overloading and Overriding	W1
8.	1	Java Virtual Machine	W2
9.	1	Recapitulation and Possible Questions Discussion	
		Total No of hours for Unit 2:9	
		Unit -III	
1.	1	Development Tools: Installing and using Eclipse with ADT plug-in	T1:1-5
2.	1	Installing Virtual machine for Android sandwich/Jelly bean (Emulator)	W1

3.	1	Configuring the installed tools	W1
4.	1	Creating a android project– Hello World run on emulator	W2
5.	1	Deploy it on USB-connected Android device	W2
6.	1	Recapitulation and Possible Questions Discussion	
		Total No of hours for Unit 3:6	
		Unit - IV	
1.	1	User Interface Architecture: Application context	W2
2.	1	Intents	T1:167
3.	1	Activity life cycle	W1
4.	1	Multiple screen sizes	W2
5.	1	User Interface Design: Form widgets	W2
6.	1	Text Fields, Layouts	T1:65
7.	1	Button control	T1:70
8.	1	Toggle buttons	W2
9.	1	Spinners(Combo boxes)	T1:74
10	1	Images Menu	T1:176-78
101			T1:179-183
11.	1	Dialog.(2L)	T1:172-173
12.	1	Recapitulation and Possible Questions Discussion	
		Total No of hours for Unit 4:12	
		Unit – V	
1.	1	Understanding of SQLite database	T1:217-218, W1
2.	1	Connecting with the database. (2L)	W1
3.	1	Recapitulation and Possible Questions Discussion	
4.	1	Previous year end-semester question paper discussion	
		Total No of hours for Unit 5:04	
		Total No. Of Hours Allocated: 36

COURSE NAME: ANDROIDP ROGRAMMING

COURSE CODE: 17CSU401

UNIT I: INTRODUCTION BATCH

BATCH: 2017-2020

<u>UNIT I</u> SYLLABUS

Introduction: History of Android, Introduction to Android Operating Systems, Android Development Tools, Android Architecture. (2L)

Android is a software package and linux based operating system for mobile devices such as tablet computers and smartphones.

It is developed by Google and later the OHA (Open Handset Alliance). Java language is mainly used to write the android code even though other languages can be used.

The goal of android project is to create a successful real-world product that improves the mobile experience for end users.

There are many code names of android such as Lollipop, Kitkat, Jelly Bean, Ice cream Sandwich, Froyo, Ecliar, Donut etc.

Open Handset Alliance (OHA)

It's a consortium of 84 companies such as google, samsung, AKM, synaptics, KDDI, Garmin, Teleca, Ebay, Intel etc.

It was established on 5th November, 2007, led by Google. It is committed to advance open standards, provide services and deploy handsets using the Android Platform.

History of Android

The history and versions of android are interesting to know. The code names of android rangesfromAtoJcurrently,suchas Aestro, Blender, Cupcake, Donut, Eclair, Froyo, Gingerbread, Honeycomb, IceCreamSandwitch, Jelly Bean, KitKat and Lollipop.Cream

Prepared By Dr. T. GENISH, Asst.Prof, Department of CS, CA & IT, KAHE

1) Initially, Andy Rubin founded Android Incorporation in Palo Alto, California, United States in October, 2003.

2) In 17th August 2005, Google acquired android Incorporation. Since then, it is in the subsidiary of Google Incorporation.

3) The key employees of Android Incorporation are Andy Rubin, Rich Miner, Chris White and Nick Sears.

4) Originally intended for camera but shifted to smart phones later because of low market for camera only.

5) Android is the nick name of Andy Rubin given by coworkers because of his love to robots.

6) In 2007, Google announces the development of android OS.

7) In 2008, HTC launched the first android mobile.

Android	Versions,	Codename	and API	

Version	Code name	API Level
1.5	Cupcake	3
1.6	Donut	4
2.1	Eclair	7
2.2	Froyo	8
2.3	Gingerbread	9 and 10

Prepared By Dr. T. GENISH, Asst.Prof, Department of CS, CA & IT, KAHE

3.1 and 3.3	Honeycomb	12 and 13
4.0	Ice Cream Sandwitch	15
4.1, 4.2 and 4.3	Jelly Bean	16, 17 and 18
4.4	KitKat	19
5.0	Lollipop	21
6.0	Marshmallow	23
7.0	Nougat	24-25
8.0	Oreo	26-27

API Level is an integer value that uniquely identifies the framework API revision offered by a version of the Android platform. The Android platform provides a framework API that applications can use to interact with the underlying Android system. An application program interface (API) is a set of routines, protocols, and tools for building software applications.

Android Operating system

Android is a mobile operating system developed by Google, based on the Linux kernel and designed primarily for touchscreen mobile devices such as smartphones and tablets. Android's user interface is mainly based on direct manipulation, using touch gestures that loosely correspond to real-world actions, such as swiping, tapping and pinching, to manipulate on-screen objects, along with a virtual keyboard for text input. In addition to touchscreen devices, Google has further developed Android TV for televisions, Android Auto for cars, and Android Wear for wrist watches, each with a specialized user interface. Variants of Android are also used on notebooks,game consoles, digital cameras, and other electronics.

Beginning with the first commercial Android device in September 2008, the operating system has gone through multiple major releases, with the current version being 7.0 "Nougat", released

3

in August 2016. Android applications ("apps") can be downloaded from the Google Play store, which features over 2.7 million apps as of February 2017. Android has been the best-selling OS on tablets since 2013, and runs on the vast majority of smartphones. As of May 2017, Android has two billion monthly active users, and it has the largest installed base of any operating system.

Android's source code is released by Google under an open source license, although most ship with combination Android devices ultimately of free and a open source and proprietary software, including proprietary software required for accessing Google services. Android is popular with technology companies that require a ready-made, low-cost and customizable operating system for high-tech devices. Its open nature has encouraged a large community of developers and enthusiasts to use the open-source code as a foundation for community-driven projects, which deliver updates to older devices, add new features for advanced users or bring Android to devices originally shipped with other operating systems.

The extensive variation of hardware in Android devices causes significant delays for software upgrades, with new versions of the operating system and security patches typically taking months before reaching consumers, or sometimes not at all. The success of Android has made it a target for patent and copyright litigation as part of the so-called "smartphone wars" between technology companies.

The Android OS was originally created by Android, Inc., which was bought by Google in 2005. Google teamed up with other companies to form the Open Handset Alliance (OHA), which has become responsible for the continued development of the Android OS. Each time the OHA releases an Android version, it names the release after a dessert. Android 1.5 is known as Cupcake, 1.6 as Donut, 2.0/2.1 as Eclair, 2.2 as Froyo and 2.3 is dubbed Gingerbread. is released. is Once а version SO its source code.

Android's underlying kernel is based on Linux, but it has been customized to suit Google's directions. There is no support for the GNU libraries and it does not have a native X Windows system. Inside the Linux kernel are found drivers for the display, camera, flash memory, keypad, WiFi and audio. The Linux kernel serves as an abstraction between the hardware and the rest of the software on the phone. It also takes care of core system services like security, memory management, process management and the network stack.

The Android OS is designed for phones. Its many features include:

Prepared By Dr. T. GENISH, Asst.Prof, Department of CS, CA & IT, KAHE Page 4/17

- Integrated browser, based on the open source WebKit engine
- Optimized 2D and 3D graphics, multimedia and GSM connectivity
- Bluetooth
- EDGE
- 3G
- WiFi
- SQLite
- Camera
- GPS

ANDROID DEVELOPMENT TOOLS

Android Studio is the official integrated development environment(IDE) for Google's Android operating system, built on JetBrains' IntelliJ IDEA software and designed specifically for Android development. It is available for download on Windows, macOS and Linux based operating systems. It is a replacement for the Eclipse Android Development Tools (ADT) as primary IDE for native Android application development.

Android Studio was announced on May 16, 2013 at the Google I/Oconference. It was in early access preview stage starting from version 0.1 in May 2013, then entered beta stage starting from version 0.8 which was released in June 2014. The first stable build was released in December 2014, starting from version 1.0.^[12] The current stable version is 3.1.3 released in June 2018.

System requirements

Version 3.x

Criterion	Description
OS version	Microsoft® Windows® 7/8/10 (32-bit or 64-bit), 64-bit required for native debugging Mac® OS X® 10.10 (Yosemite) or higher, up to 10.13 (macOS High Sierra) GNOME or KDE desktop Linux (64 bit capable of running 32-bit applications)(GNU C Library (glibc) 2.19+)

RAM	3 GB RAM minimum, 8 GB RAM recommended; plus 1 GB for the Android Emulator
Disk space	2 GB of available disk space minimum, 4 GB recommended (500 MB for IDE + 1.5 GB for Android SDK and emulator system image)
Java version	Java Development Kit (JDK) 8
Screen resolution	1280×800 minimum screen resolution

Version 2.x

Criterion	Description
OS version	Windows 7 or later Mac OS X 10.9.5 or later GNOME or KDE desktop Linux
RAM	8 GB RAM recommended; plus 1 GB for the Android Emulator
Disk space	500 MB disk space for Android Studio, at least 1.5 GB for Android SDK, emulator system images, and caches
Java version	Java Development Kit (JDK) 8
Screen resolution	1280×800 minimum screen resolution.

Prepared By Dr. T. GENISH, Asst.Prof, Department of CS, CA & IT, KAHE

Version 1.x

Criterion	Description
OS version	Mac OS X 10.8.5 or later GNOME, KDE or Unity desktop on Ubuntu or Fedora or GNU/Linux Debian Windows XP or later
RAM	3 GB RAM minimum, 4 GB RAM recommended
Disk space	500 MB disk space
Space for Android SDK	At least 1 GB for Android SDK, emulator system images, and caches
JDK version	Java Development Kit (JDK) 7 or higher
Screen resolution	1280×800 minimum screen resolution
Version history	
The following is a list of A	Android Studio's release versions.

Android Studio version

history

Version	Release Date
0.1.x	May 2013

Prepared By Dr. T. GENISH, Asst.Prof, Department of CS, CA & IT, KAHE

0.2.x	July 2013
0.3.2	Oct 2013
0.4.2	Jan 2014
0.4.6	March 2014
0.5.2	May 2014
0.8.0	June 2014
0.8.6	August 2014
0.8.14	October 2014
1.0	December 2014
1.0.1	December 2014
1.1.0	February 2015
1.2.0	April 2015
1.2.1	May 2015

Prepared By Dr. T. GENISH, Asst.Prof, Department of CS, CA & IT, KAHE

1.2.2	June 2015
1.3.0	July 2015
1.3.1	August 2015
1.3.2	August 2015
1.4.0	September 2015
1.4.1	October 2015
1.5.0	November 2015
1.5.1	December 2015
2.0.0	April 2016
2.1.0	April 2016
2.1.1	May 2016

3.1	March 2018
3.1.1	April 2018
3.1.2	April 2018

Prepared By Dr. T. GENISH, Asst.Prof, Department of CS, CA & IT, KAHE

3.1.3	June 2018

Android software development is the process by which new applications are created for the Android operating system. Applications are usually developed in Java programming language using the Android software development kit (SDK), but other development environments are also available.

The Android software development kit (SDK) includes a comprehensive set of development tools. These include a debugger, libraries, a handset emulatorbased on QEMU, documentation, sample code, and tutorials. Currently supported development platforms include computers running Linux (any modern desktop Linux distribution), Mac OS X 10.5.8 or later, and Windows 7 later. As of March 2015, the SDK is not available on Android itself, but software development is possible by using specialized Android applications.

Until around the end of 2014, the officially supported integrated development environment (IDE) was Eclipse using the Android Development Tools (ADT) Plugin, though IntelliJ IDEA IDE (all editions) fully supports Android development out of the box, and NetBeans IDE also supports Android development via a plugin. As of 2015, Android Studio, made by Google and powered by IntelliJ, is the official IDE; however, developers are free to use others, but Google made it clear that ADT was officially deprecated since the end of 2015 to focus on Android Studio as the official Android IDE. Additionally, developers may use any text editor to edit Java and XML files, then use command line tools (Java Development Kit and Apache Ant are required) to create, build and debug Android applications as well as control attached Android devices (e.g., triggering a reboot, installing software package(s) remotely).

Enhancements to Android's SDK go hand in hand with the overall Android platform development. The SDK also supports older versions of the Android platform in case developers wish to target their applications at older devices. Development tools are downloadable components, so after one has downloaded the latest version and platform, older platforms and tools can also be downloaded for compatibility testing.

Android applications are packaged in .apk format and stored under /data/app folder on the Android OS (the folder is accessible only to the root user for security reasons). APK package contains .dexfiles^[14] (compiled byte code files calledDalvik executables), resource files, etc.

Android Debug Bridge

The Android Debug Bridge (ADB) is a toolkit included in the Android SDK package. It consists of both client and server-side programs that communicate with one another. The ADB is

typically accessed through the command-line interface, although numerous graphical user interfaces exist to control ADB.

Fastboot.

Fastboot is a diagnostic protocol included with the SDK package used primarily to modify the flash filesystem via a USBconnection from host computer. It requires that the device be started in a boot loader or Secondary Program Loader mode, in which only the most basic hardware initialization is performed. After enabling the protocol on the device itself, it will accept a specific set of commands sent to it via USB using a command line. Some of the most commonly used fastboot commands include:

- flash rewrites a partition with a binary image stored on the host computer
- erase erases a specific partition
- reboot reboots the device into either the main operating system, the system recovery partition or back into its boot loader
- devices displays a list of all devices (with the serial number) connected to the host computer
- format formats a specific partition; the file system of the partition must be recognized by the device

ANDROID NDK

Libraries written in C/C++ can be compiled to ARM, MIPS or x86 native code(or their 64-bit variants) and installed using the Android Native Development Kit (NDK). These native libraries can be called from Java code running under the Dalvik VM using the System.loadLibrary call, which is part of the standard Android Java classes.

Complete applications can be compiled and installed using traditional development tools. However, according to the Android documentation, NDK should not be used solely because the developer prefers to program in C/C++, as using NDK increases complexity while most applications would not benefit from using it.

The ADB Debugger gives a root shell under the Android Emulator which allows ARM, MIPS or x86 native code to be uploaded and executed. Native code can be compiled using Clang or GCC on a standard PC. Running native code is complicated by Android's use of a non-standard C library (libc, known as Bionic).

It is possible to use the Android Studio with Gradle to develop NDK projects. Other third-party tools allow integrating the NDK into Eclipse and Visual Studio.

Android Open Accessory Development Kit

The Android 3.1 platform (also backported to Android 2.3.4) introduces Android Open Accessory support, which allows external USB hardware (an Android USB accessory) to interact with an Android-powered device in a special "accessory" mode. When an Android-powered device is in accessory mode, the connected accessory acts as the USB host (powers the bus and enumerates devices) and the Android-powered device acts as the USB device. Android USB accessories are specifically designed to attach to Android-powered devices and adhere to a simple protocol (Android accessory protocol) that allows them to detect Android-powered devices that support accessory mode.

Another built-in Android development tool, the Android Device Monitor allows you to monitor your device or virtual device during runtime and get access to information such as how many processes are running on what thread, network stats, the LogCat and more.

ANDROID Architecture

Android is an open source, Linux-based software stack created for a wide array of devices and form factors. The following diagram shows the major components of the Android platform.

The Linux Kernel

The foundation of the Android platform is the Linux kernel. For example, the Android Runtime (ART) relies on the Linux kernel for underlying functionalities such as threading and low-level memory management.

Using a Linux kernel allows Android to take advantage of key security features and allows device manufacturers to develop hardware drivers for a well-known kernel.

Hardware Abstraction Layer (HAL)

Prepared By Dr. T. GENISH, Asst.Prof, Department of CS, CA & IT, KAHE

The hardware abstraction layer (HAL) provides standard interfaces that expose device hardware capabilities to the higher-level Java API framework. The HAL consists of multiple library modules, each of which implements an interface for a specific type of hardware component, such as the camera or bluetooth module. When a framework API makes a call to access device hardware, the Android system loads the library module for that hardware component.

Android Runtime

For devices running Android version 5.0 (API level 21) or higher, each app runs in its own process and with its own instance of the Android Runtime (ART). ART is written to run multiple virtual machines on low-memory devices by executing DEX files, a bytecode format designed specially for Android that's optimized for minimal memory footprint. Build toolchains, such as Jack, compile Java sources into DEX bytecode, which can run on the Android platform.

Some of the major features of ART include the following:

- Ahead-of-time (AOT) and just-in-time (JIT) compilation
- Optimized garbage collection (GC)
- Better debugging support, including a dedicated sampling profiler, detailed diagnostic exceptions and crash reporting, and the ability to set watchpoints to monitor specific fields

Prior to Android version 5.0 (API level 21), Dalvik was the Android runtime. If your app runs well on ART, then it should work on Dalvik as well, but the reverse may not be true.

Android also includes a set of core runtime libraries that provide most of the functionality of the Java programming language, including some Java 8 language features, that the Java API framework uses.

Native C/C++ Libraries

Prepared By Dr. T. GENISH, Asst.Prof, Department of CS, CA & IT, KAHE

Many core Android system components and services, such as ART and HAL, are built from native code that require native libraries written in C and C++. The Android platform provides Java framework APIs to expose the functionality of some of these native libraries to apps. For example, you can access OpenGL ES through the Android framework's Java OpenGL API to add support for drawing and manipulating 2D and 3D graphics in your app.

If you are developing an app that requires C or C++ code, you can use the Android NDK to access some of thesenative platform libraries directly from your native code.

Java API Framework

The entire feature-set of the Android OS is available to you through APIs written in the Java language. These APIs form the building blocks you need to create Android apps by simplifying the reuse of core, modular system components and services, which include the following:

- A rich and extensible View System you can use to build an app's UI, including lists, grids, text boxes, buttons, and even an embeddable web browser
- A Resource Manager, providing access to non-code resources such as localized strings, graphics, and layout files
- A Notification Manager that enables all apps to display custom alerts in the status bar
- An Activity Manager that manages the lifecycle of apps and provides a common navigation back stack
- Content Providers that enable apps to access data from other apps, such as the Contacts app, or to share their own data

Developers have full access to the same framework APIs that Android system apps use.

System Apps

Android comes with a set of core apps for email, SMS messaging, calendars, internet browsing, contacts, and more. Apps included with the platform have no special status among the apps the user chooses to install. So a third-party app can become the user's default web browser, SSMS

Prepared By Dr. T. GENISH, Asst.Prof, Department of CS, CA & IT, KAHE Page 15/17

messenger, or even the default keyboard (some exceptions apply, such as the system's Settings app).

The system apps function both as apps for users and to provide key capabilities that developers can access from their own app. For example, if your app would like to deliver an SMS message, you don't need to build that functionality yourself—you can instead invoke whichever SMS app is already installed to deliver a message to the recipient you specify.

Prepared By Dr. T. GENISH, Asst.Prof, Department of CS, CA & IT, KAHE

Unit I

POSSIBLE QUESTIONS

2 marks questions

- 1. What do you mean by Fastboot?
- 2. Define thread in java.
- 3. What is an Android Operating System?
- 4. What is object oriented programming?
- 5. Define software development kit.
- 6. Define Eclipse.
- 7. What is meant by Android Debug Bridge?
- 8. Define API

6 marksQuestions

- 1) Explain the history of Android.
- 2) Describe about Android Operating Systems.
- 3) Explain in detail about ADT.
- 4) Describe about SDK.
- 5) Discuss about Android operating system.
- 6) Explain in detail about Android architecture.
- 7) List and explain the version, code name and API level of android.
- 8) Explain about Android open accessory development kit.
- 9) Explain about linux kernel.
- 10) Describe Java API framework.

Prepared By Dr. T. GENISH, Asst.Prof, Department of CS, CA & IT, KAHE

KARPAGAM ACADEMY OF HIGHER EDUCATION

CLASS : II B.SC CS

COURSE NAME: ANDROID PROGRAMMING

COURSE CODE: 17CSU401 BATCH: 2017-2020

UNIT II: OVERVIEW OF OBJECT ORIENTED PROGRAMMING USING JAVA

<u>UNIT II</u> SYLLABUS

Overview of object oriented programming using Java: OOPs Concepts: Inheritance, Polymorphism, Interfaces, Abstract class, Threads, Overloading and Overriding, Java Virtual Machine. (4L)

Object-Oriented Programming is a methodology or paradigm to design a program using classes and objects. It simplifies the software development and maintenance by providing some concepts:

- o Object
- o Class
- Inheritance
- Polymorphism
- Abstraction
- Encapsulation

Inheritance

Inheritance is one of the feature of Object-Oriented Programming (**OOPs**). Inheritance allows a class to use the properties and methods of another class. In other words, the derived class inherits the states and behaviors from the base class. The derived class is also called subclass and the base class is also known as super-class. The derived class can add its own additional variables and methods. These additional variable and methods differentiates the derived class from the base class.

Inheritance is a **compile-time** mechanism. A super-class can have any number of subclasses. But a subclass can have only one superclass. This is because Java does not support multiple inheritance.

Benefits of inheritance

• For Method Overriding (so runtime polymorphism can be achieved).

```
• For Code Reusability.
```

Syntax of Java Inheritance

class Subclass-name extends Superclass-name
{
 //methods and fields
}

The **extends keyword** indicates that you are making a new class that derives from an existing class. The meaning of "extends" is to increase the functionality.

In the terminology of Java, a class which is inherited is called parent or super class and the new class is called child or subclass.

```
class Employee
{
    float salary=40000;
    }
class Programmer extends Employee
    {
    int bonus=10000;
    public static void main(String args[])
        {
        Programmer p=new Programmer();
        System.out.println("Programmer salary is:"+p.salary);
        System.out.println("Bonus of Programmer is:"+p.bonus);
        }
    Output:
    Dragrammer salary is: 40000.0
```

Programmer salary is:40000.0 Bonus of Programmer is:10000

Types of inheritance in java

On the basis of class, there can be three types of inheritance in java: single, multilevel and hierarchical.

In java programming, multiple and hybrid inheritance is supported through interface only. We will learn about interfaces later.

```
Prepared By Dr. T. GENISH, Asst.Prof, Department of CS, CA & IT, KAHE
```

Single Inheritance Example

```
class Animal{
void eat(){System.out.println("eating...");}
}
class Dog extends Animal{
void play(){System.out.println("playing...");}
}
class TestInheritance{
public static void main(String args[]){
Dog d=new Dog();
d.play();
d.eat();
}}
```

Output:

playing ...

barking ...

Multilevel Inheritance Example

```
class Animal{
void eat(){System.out.println("eating...");}
}
class Dog extends Animal{
void bark(){System.out.println("barking...");}
}
class BabyDog extends Dog{
void weep(){System.out.println("weeping...");}
}
```

```
class TestInheritance2{
  public static void main(String args[]){
  BabyDog d=new BabyDog();
  d.weep();
  d.bark();
  d.eat();
  }}
```

Output:

weeping... barking... eating...

Hierarchical Inheritance Example

```
class Animal{
void eat(){System.out.println("eating...");}
}
class Dog extends Animal{
void bark(){System.out.println("barking...");}
}
class Cat extends Animal{
void sleep(){System.out.println("sleeping...");}
}
class TestInheritance3{
public static void main(String args[]){
Cat c=new Cat();
c.sleep();
c.eat();
```

Output:

```
sleeping...
eating...
```

Polymorphism

Polymorphism in java is a concept by which we can perform a single action by different ways. Polymorphism is derived from 2 greek words: poly and morphs. The word "poly" means many and "morphs" means forms. So polymorphism means many forms.

There are two types of polymorphism in java: compile time polymorphism and runtime polymorphism. We can perform polymorphism in java by method overloading and method overriding.

Following concepts demonstrate different types of polymorphism in java.

- 1) Method Overloading
- 2) Method Overriding

Method Overloading:

In Java, it is possible to define two or more methods of same name in a class, provided that there argument list or parameters are different. This concept is known as Method Overloading.

Example:

```
class Overload
  void demo (int a)
    System.out.println ("a: " + a);
  void demo (int a, int b)
    System.out.println ("a and b: " + a + "," + b);
  double demo(double a) {
    System.out.println("double a: " + a);
    return a*a;
  }
class MethodOverloading
  public static void main (String args [])
     Overload Obj = new Overload();
     double result;
     Obj.demo(10);
     Obj.demo(10, 20);
     result = Obj.demo(5.5);
     System.out.println("O/P : " + result);
  }
}
```

Output:

a: 10 a and b: 10,20 double a: 5.5 O/P : 30.25

Method Overriding

Child class has the same method as of base class. In such cases child class overrides the parent class method without even touching the source code of the base class. This feature is known as method overriding.

```
Example:
```

```
public class BaseClass
  public void methodToOverride() //Base class method
     System.out.println ("I'm the method of BaseClass");
public class DerivedClass extends BaseClass
  public void methodToOverride() //Derived Class method
     System.out.println ("I'm the method of DerivedClass");
public class TestMethod
   public static void main (String args []) {
    // BaseClass reference and object
    BaseClass obj1 = new BaseClass();
    // BaseClass reference but DerivedClass object
    BaseClass obj2 = new DerivedClass();
    // Calls the method from BaseClass class
    obj1.methodToOverride();
    //Calls the method from DerivedClass class
    obj2.methodToOverride();
   }
```

Output:

I'm the method of BaseClass I'm the method of DerivedClass **Interface**

Java interfaces are like Java classes but they contain only static final constants and declaration of methods. Methods are not defined and classes which implements an interface must

```
Prepared By Dr. T. GENISH, Asst.Prof, Department of CS, CA & IT, KAHE
```

define the body of method(s) of interface(s). Final constants can't be modified once they are initialized; final, interface, extend and implements are Java keywords.

Declaration of interface:

```
interface InterfaceName {
 // constants declaration
 // methods declaration
}
interface Info {
 static final String language = "Java";
 public void display();
J
class Simple implements Info {
 public static void main(String []args) {
  Simple obj = new Simple();
  obj.display();
 }
 // Defining method declared in interface
 public void display() {
  System.out.println(language + " is awesome");
 }
ł
Output:
Java is awesome
Abstraction in Java
```

Abstraction is a process of hiding the implementation details and showing only functionality to the user.

Another way, it shows only important things to the user and hides the internal details for example sending sms, you just type the text and send the message. You don't know the internal processing about the message delivery.

Abstract class in Java

A class that is declared as abstract is known as **abstract class**. It needs to be extended and its method implemented. It cannot be instantiated.
Example abstract class

abstract class A{}

abstract method

A method that is declared as abstract and does not have implementation is known as abstract method.

Example abstract method

```
abstract void printStatus();//no body and abstract
```

```
abstract class Bike{
   abstract void run();
}
class Honda4 extends Bike{
void run(){System.out.println("running safely..");}
public static void main(String args[]){
   Bike obj = new Honda4();
   obj.run();
}
```

Output:

running safely ..

Threads

Thread is basically a lightweight sub-process, a smallest unit of processing. Multiprocessing and multithreading, both are used to achieve multitasking.

Life cycle of a Thread (Thread States)

The life cycle of the thread in java is controlled by JVM. The java thread states are as follows:

- 1. New
- 2. Runnable
- 3. Running
- 4. Non-Runnable (Blocked)
- 5. Terminated

1) New

The thread is in new state if you create an instance of Thread class but before the invocation of start() method.

2) Runnable

The thread is in runnable state after invocation of start() method, but the thread scheduler has not selected it to be the running thread.

3) Running

The thread is in running state if the thread scheduler has selected it.

4) Non-Runnable (Blocked)

This is the state when the thread is still alive, but is currently not eligible to run.

5) Terminated

A thread is in terminated or dead state when its run() method exits.

Java Thread Example by extending Thread class

class Multi extends Thread{

public void run(){

System.out.println("thread is running...");

Prepared By Dr. T. GENISH, Asst.Prof, Department of CS, CA & IT, KAHE

Page 9/14

}

public static void main(String args[]){

Multi t1=new Multi();

t1.start();

}

}

Output:

thread is running...

```
class Multi3 implements Runnable{
```

public void run(){

System.out.println("thread is running...");

}

public static void main(String args[]){

```
Multi3 m1=new Multi3();
```

```
Thread t1 =new Thread(m1);
```

t1.start();

}

Output: thread is running...

Priority of a Thread

Each thread have a priority. Priorities are represented by a number between 1 and 10. In most cases, thread schedular schedules the threads according to their priority.

- 1. public static int MIN_PRIORITY
- 2. public static int NORM_PRIORITY
- 3. public static int MAX_PRIORITY

Default priority of a thread is 5 (NORM_PRIORITY). The value of MIN_PRIORITY is 1 and the value of MAX_PRIORITY is 10.

Example of priority of a Thread:

class TestMultiPriority1 extends Thread{

```
public void run(){
```

System.out.println("running thread name is:"+Thread.currentThread().getName());

System.out.println("running thread priority is:"+Thread.currentThread().getPriority());

}

public static void main(String args[]){

TestMultiPriority1 m1=new TestMultiPriority1();

TestMultiPriority1 m2=new TestMultiPriority1();

m1.setPriority(Thread.MIN_PRIORITY);

m2.setPriority(Thread.MAX_PRIORITY);

m1.start();

m2.start();

.

Output:

running thread name is:Thread-0 running thread priority is:10 running thread name is:Thread-1 running thread priority is:1

Java virtual machine

A Java virtual machine (JVM) is an abstract computing machine that enables a computer to run a Java program. There are three notions of the JVM: specification, implementation, and instance. The specification is a document that formally describes what is required of a JVM implementation. Having a single specification ensures all implementations are interoperable. A JVM implementation is a computer program that meets the requirements of the JVM specification. An instance of a JVM is an implementation running in a process that executes a computer program compiled into Java bytecode.

Java Runtime Environment (**JRE**) is a software package that contains what is required to run a Java program. It includes a Java Virtual Machine implementation together with an implementation of the Java Class Library. The Oracle Corporation, which owns the Java trademark, distributes a Java Runtime environment with their Java Virtual Machine called HotSpot.

Java Development Kit (**JDK**) is a superset of a JRE and contains tools for Java programmers, e.g. a javac compiler. The Java Development Kit is provided free of charge either by Oracle Corporation directly, or by the OpenJDK open source project, which is governed by Oracle.

JVM specification

The Java virtual machine is an abstract (virtual) computer defined by a specification. This specification omits implementation details that are not essential to ensure interoperability: the memory layout of run-time data areas, the garbage-collection algorithm used, and any internal optimization of the Java virtual machine instructions (their translation into machine code). The main reason for this omission is to not unnecessarily constrain implementers. Any Java application can be run only inside some concrete implementation of the abstract specification of the Java virtual machine.^[1]

Starting with Java Platform, Standard Edition (J2SE) 5.0, changes to the JVM specification have been developed under the Java Community Process as JSR 924. As of 2006, changes to specification to support changes proposed to the class file format (JSR 202) are being done as a maintenance release of JSR 924. The specification for the JVM was published as the blue book, The preface states:

We intend that this specification should sufficiently document the Java Virtual Machine to make possible compatible clean-room implementations. Oracle provides tests that verify the proper operation of implementations of the Java Virtual Machine.

One of Oracle's JVMs is named HotSpot, the other, inherited from BEA Systems is JRockit. Clean-room Java implementations include Kaffe and IBM J9. Oracle owns the Java trademark and may allow its use to certify implementation suites as fully compatible with Oracle's specification.

Class loader

Main article: Java Class loader

One of the organizational units of JVM byte code is a class. A class loader implementation must be able to recognize and load anything that conforms to the Java class file format. Any implementation is free to recognize other binary forms besides class files, but it must recognize class files.

The class loader performs three basic activities in this strict order:

- 1. Loading: finds and imports the binary data for a type
- 2. Linking: performs verification, preparation, and (optionally) resolution
 - Verification: ensures the correctness of the imported type
 - Preparation: allocates memory for class variables and initializing the memory to default values
 - Resolution: transforms symbolic references from the type into direct references.
- 3. Initialization: invokes Java code that initializes class variables to their proper starting values.

JVM languages

A JVM language is any language with functionality that can be expressed in terms of a valid class file which can be hosted by the Java Virtual Machine. A class file contains Java Virtual Machine instructions (Java byte code) and a symbol table, as well as other ancillary information. The class file format is the hardware- and operating system-independent binary format used to represent compiled classes and interfaces.

There are several JVM languages, both old languages ported to JVM and completely new languages. JRuby and Jython are perhaps the most well-known ports of existing languages, i.e. Ruby and Python respectively. Of the new languages that have been created from scratch to compile to Java bytecode, Clojure, Groovy and Scala may be the most popular ones. A notable feature with the JVM languages is that they are compatible with each other, so that, for example, Scala libraries can be used with Java programs and vice versa.

Java 7 JVM implements JSR 292: Supporting Dynamically Typed Languages on the Java Platform, a new feature which supports dynamically typed languages in the JVM. This feature is developed within the Da Vinci Machine project whose mission is to extend the JVM so that it supports languages other than Java

JVM in the web browser

Since the very early stages of the design process, Java (and JVM) has been marketed as a web technology for creating Rich Internet Applications.

POSSIBLE QUESTIONS

UNIT II

Two marks Questions:

- 1. What is object oriented programming?
- 2. State IDE.
- 3. Define Method overriding.
- 4. Define Method overloading.
- 5. What is meant by emulator?
- 6. What is thread life cycle?
- 7. What is priority in thread?
- 7. Define Thread.

6 Marks Questions:

- 1. List and explain the concepts of OOPs in java.
- 2. Explain the concept of inheritance and its types.
- 3. Explain multilevel inheritance in java with suitable program.
- 4. State and explain the concept of method overloading in java.
- 5. Explain the concept of Method overriding with example.
- 6. Write a note on Abstract class.
- 7. Explain in detail about interface in java.
- 8. Discuss the abstract class in java.
- 9. Explain various life cycles and priorities of thread.
- 10. Describe Java virtual machine.

KARPAGAM ACADEMY OF HIGHER EDUCATION

CLASS : II B.SC CS

COURSE NAME: ANDROIDP ROGRAMMING

COURSE CODE: 17CSU401

UNIT III: DEVELOPMENT TOOLS B/

BATCH: 2017-2020

<u>UNIT III</u> SYLLABUS

Development Tools: Installing and using Eclipse with ADT plug-in, Installing Virtual machine for Android sandwich/Jelly bean (Emulator), configuring the installed tools, creating a android project– Hello Word, run on emulator, Deploy it on USB-connected Android device. (5L)

Installing the Eclipse Plugin

Android offers a custom plugin for the Eclipse IDE, called Android Development Tools (ADT). This plugin provides a powerful, integrated environment in which to develop Android apps. It extends the capabilities of Eclipse to let you quickly set up new Android projects, build an app UI, debug your app, and export signed (or unsigned) app packages (APKs) for distribution.

Download the ADT Plugin

- 1. Start Eclipse, then select **Help** > **Install New Software**.
- 2. Click Add, in the top-right corner.
- 3. In the Add Repository dialog that appears, enter "ADT Plugin" for the Name and the following URL for the Location:

https://dl-ssl.google.com/android/eclipse/

4. Click **OK**.

If you have trouble acquiring the plugin, try using "http" in the Location URL, instead of "https" (https is preferred for security reasons).

- 5. In the Available Software dialog, select the checkbox next to Developer Tools and click **Next**.
- 6. In the next window, you'll see a list of the tools to be downloaded. Click Next.
- 7. Read and accept the license agreements, then click **Finish**.

If you get a security warning saying that the authenticity or validity of the software can't be established, click **OK**.

8. When the installation completes, restart Eclipse.

Configure the ADT Plugin

Once Eclipse restarts, you must specify the location of your Android SDK directory:

- 1. In the "Welcome to Android Development" window that appears, select Use existing SDKs.
- 2. Browse and select the location of the Android SDK directory you recently downloaded and unpacked.
- 3. Click Next.

Your Eclipse IDE is now set up to develop Android apps, but you need to add the latest SDK platform tools and an Android platform to your environment. To get these packages for your SDK, continue to Adding Platforms and Packages.

Troubleshooting Installation

If you are having trouble downloading the ADT plugin after following the steps above, here are some suggestions:

• If Eclipse can not find the remote update site containing the ADT plugin, try changing the remote site URL to use http, rather than https. That is, set the Location for the remote site to:

http://dl-ssl.google.com/android/eclipse/

• If you are behind a firewall (such as a corporate firewall), make sure that you have properly configured your proxy settings in Eclipse. In Eclipse, you can configure proxy information from the main Eclipse menu in Window (on Mac OS X, Eclipse) > Preferences > General > Network Connections.

If you are still unable to use Eclipse to download the ADT plugin as a remote update site, you can download the ADT zip file to your local machine and manually install it:

1. Download the ADT Plugin zip file (do not unpack it):

Package	Size	MD5 Checksum
ADT-21.1.0.zip	13564671 bytes	f1ae183891229784bb9c33bcc9c5ef1e

- 2. Start Eclipse, then select **Help** > **Install New Software**.
- 3. Click **Add**, in the top-right corner.
- 4. In the Add Repository dialog, click Archive.
- 5. Select the downloaded ADT-21.1.0.zip file and click **OK**.
- 6. Enter "ADT Plugin" for the name and click **OK**.

- 7. In the Available Software dialog, select the checkbox next to Developer Tools and click **Next**.
- 8. In the next window, you'll see a list of the tools to be downloaded. Click Next.
- 9. Read and accept the license agreements, then click **Finish**.

If you get a security warning saying that the authenticity or validity of the software can't be established, click **OK**.

10. When the installation completes, restart Eclipse.

Installing virtual machine for Android sandwich

Android is Linux based open source operating system, especially designed for touch based smart phones and tablets and is one of the most widely used operating system by Mobile phone and tablets manufacturers. As Android OS only supports ARM architecture based hardware so you can't run it on x86 architecture i.e. Computer or laptop. In order to run it on x86 architecture, you need to have an Android OS which supports x86 architecture luckily Android x86 project provides it for various testing purposes and you can install Android OS along with your Windows Vista, 7 & 8 operating system.

Steps for installing Android OS Ice Cream Sandwich on Virtual PC

As I am using Microsoft Windows 8 OS thus I have mentioned the steps for installing Android OS on Virtual PC along with Windows 8(learn how to install Windows 8 on virtual PC) but these steps are very much applicable to Windows Vista and 7.

- First download and install Oracle VM VirtualBox from this link (http://www.oracle.com/technetwork/server-storage/virtualbox/downloads/index.html). If you already have it installed then upgrade it to the latest version

- Now visit android-x86.org site and head over to download page. If your system name is listed then download the Android OS ISO image from the respective link else download the ISO image especially created for x86 architecture based hardware which will work on every system (from here https://docs.google.com/open?id=0B4GbJReHMmu_amMzQzJoNGw3WFU). Also if you experience internet connectivity and audio problem with ISO image downloaded for respective system then download the generic ISO image from link given above

- Now open Oracle VM VirtualBox and press CTRL + N for creating a new Virtual Machine and also click the Hide Description button to make visible the hidden Hard drive options

- In name box write Android ICS or it could be anything which helps you to recognize it easily, in Type box select Linux option and in Version choose Linux 2.6 respectively

- Under Memory size option increase the slider to 512 MB for better performance though you can assign higher or lower memory than this

- In Hard drive option make sure "Create a virtual hard drive now" is selected, Click Create button

9	Create Virtual Machine	? ×
Θ	Name and operating system	
	Name: Android Ice Cream Sandwitch	
	Type: Linux	_
	Version: Linux 2.6	
	Memory size 4 MB Hard drive C Do not add a virtual hard drive	2048 MB
	Create a virtual hard drive now	
	Empty	
	Show Description	< Back Create Cancel
Ŷ	Create Virtual Hard Driv	/e ? ×
Θ	File location	
	Android Ice Cream Sandwitch	
	File size	
	4.00 MB	2.00 TB
	Hard drive file type	Storage on physical hard drive
	 VDI (VirtualBox Disk Image) 	C Dynamically allocated
	C VMDK (Virtual Machine Disk)	 Fixed size
	O VHD (Virtual Hard Disk)	☐ Split into files of less than 2GB
	C HDD (Parallels Hard Disk)	
	C QED (QEMU enhanced disk)	
	C QCOW (QEMU Copy-On-Write)	
	Show Description	< Back Create Cancel

This will create the virtual machine named Android ICS. Now you have to modify few options to optimize it for better performance. Open settings Window, navigate to System tab then to Processor tab and tick the check box against the "Enable PAE/NX" option. Now navigate to display tab and increase the video memory size to more than 10 MB and enable the 3D acceleration under extended feature.

	System
System System Storage Audio Audio PNetwork Serial Ports USB Shared Folders	Motherboard Processor Acceleration Processor(s): 1 CPU 4 CPUs Execution Cap: 100 100 1% 100%
	Select a settings category from the list on the left-hand side and move the mouse over a settings item to get more information.
	OK Cancel Help
}	Android Ice Cream Sandwitch - Settings ? ×
 General System Display Storage 	Display Video Remote Display Video Memory:
Audio	Extended Features: F Enable 3D Acceleration
Audio Audio Audio Audio Network Serial Ports USB Shared Folders	Extended Features: F Enable 3D Acceleration F Enable 2D Video Acceleration Controls the amount of video memory provided to the virtual machine.

On Android -x86 Installation Window, select the "Installation – Install Android -x86 to harddisk option". It will initiate the process of installing Android OS

- On Choose Partition Window, choose "Create/Modify Partitions" option and click OK button. It will open up cfdisk utility. Under cfdisk utility choose the options as below

1) Select NEW option

2) Select PRIMARY option

3) On next screen hit enter again to accept the default partition size

4) Select BOOTABLE option then WRITE option

5) Type yes when prompted to write the partition table to disk

6) Now QUIT the cfdisk utility

7) On next screen, select the "sda1 Linux VBOX HARDDISK" option and click OK button

8) Under Choose file system, select the "ext3" option. On the next screen, press YES option to format sda to ext3 file system

9) Press YES option when prompted to install boot loader GRUB and install/system directory as read-write

10) If you wish you can create a fake SD card by selecting the "Create a fake SD card" option else select the Reboot option.

11) You are Done with installation of Android Ice Cream Sandwich OS on Virtual PC.

Installing virtual machine for Android Jellybean

Steps to Install Jelly Bean Android With VirtualBox

1) Make sure you have the latest VirtualBox on your PC.

2) Download Android 4.3 ISO from Google site here.

An open source project to provi	36 Sysprobs.com ide android support on x86
Project Home Downloads Wiki	Issues Source
Search Current downloads v for	
Filename v	Summary + Labels V
android-x86-4.3-20130725.iso	Android-x86 4.3 2013072
3) Create a new virtual machine, select	t OS type as Linux as below.
Create Virtual Machine	Sysprobs.com
Name and operating system Name: Android4.3 Type: Linux Version: Linux 2.6/3.x	- 2
Memory size	1024 C MB
4 MB Hard drive Do not add a virtual hard drive Create a virtual hard drive now Use an existing virtual hard drive file	6144 MB
B Windows8EA-64bit.vdi (Normal, 25.00 G8)	ription Create Cancel

Set the RAM size to more than 512MB. I configured 1GB. Create a new hard disk.

4) Go to the settings of virtual machine and edit the storage settings. We need to browse and mount the ISO file which was downloaded from Google site, to IDE controller of CD/DVD drive.

۲	Android4.3 -	Settings ? ×
General	Storage Loade	d ISO
 Display Storage Audio 	Storage Tree Controller: IDE android-x86-4.3-20130725.so	Attributes CD/DVD Drive: IDE Secondary Master CD/DVD Live CD/DVD
 Network Serial Ports USB 	Controller: SATA	Type: Image Browse here to Size: 199.00 MB mount the ISO Location: C:\Users\Dinesh\Downloads\and
Shared Folders		Attached to: Sysprobs.com

The CD/DVD drive should appear as shown above after loading the ISO.

5) Power on VM which will boot from attached ISO. Select the installation option as below.

14	Android43 [Running] - Oracle VM VirtualBox -

	Sysprobs.com
(Help) [Urite]	(The second of
	Create way partities from from space

Make it as 'Primary' in next screen and press Enter to allocate full size for the partition.

8.) The partition should be bootable, select 'Bootable' in next screen.

To confirm type 'yes' and press enter.

Quit from the next screen.

9) Once you have come out of partition creation tool, you can chose the newly created partition to start the installation on VirtualBox.

12	Android4.3 [Running] - Oracle VM VirtualRox				
Machine View Devices He	rip				
Please select a	-Choose Partition partition to install Android-x06:				
Cre Det	technology participation store in the store in the store is the store				
10) Select ext3 format and enter.					
14	Android4.3 (Running) - Oracle VM VirtualBox				
Machine View Devices H	felp				
Please select	a filesystem to format sdal:				
	Do not format				
	Sysprobs.com				

Press 'Yes' to format the partition. Also select 'Yes' to install **boot loader GRUB**. Again 'Yes' to install /System directory as read-write in next screen.

Installation process will start.

11) We have successfully install Android 4.3 on Windows 8 with VirtualBox. Reboot the virtual machine to use.

Note – Remove the ISO file from CD/DVD drive before booting, otherwise it will again boot from ISO and start installation process.

12) Once virtual machine is booted, it is better to disable mouse integration with VM. So, it will be easy to access and use mouse inside Android OS.

13) Network worked directly in bridge mode inside virtual machine. Performance of graphics is not up the the standard. Do not think to play Android games inside this virtual machine, it will not work. But still it is worth to install and play around with it without having a real phone or tablet device.

Here are some of the screenshots taken from Jelly Bean virtual machine in Windows 8.

Creating a Simple Hello World Android Project

Creating a Simple Hello World Android Project

To create a simple Hello World Android project can be done either with Eclipse or Android Studio. Here I am going to explain how it can be created by using Android Studio 0.8.0.

Android Studio:

Studio can be downloaded from the below link.

http://tools.android.com/download/studio/beta

Pre-requisite:

Ensure appropriate JDK version is installed.

Download appropriate Android SDK based on the version we are developing.

https://www.codeproject.com/KB/android/803646/SDKManager.png

Create new project

First step load Android Studio. Click on the New project...

https://www.codeproject.com/KB/android/803646/NewProject.png

Configure the New Project

Enter the application and company domain and select the project location as shown below and click on Next button.

https://www.codeproject.com/KB/Android/803646/Configure.png

Select form factor

Select the appropriate minimum version of android we are going to target as shown in the list as below

https://www.codeproject.com/KB/android/803646/formfactor.png

Select the Activity

Select the template need as pre requirement. I have selected the blank activity.

https://www.codeproject.com/KB/Android/803646/Activity.png

The class will be created based on the Activity Name entered.

https://www.codeproject.com/KB/Android/803646/ActivityName.png

Click on the finish button. The project gets created and will be shown as below

https://www.codeproject.com/KB/Android/803646/FinishNavigation.png

Files / Components

Important files and directory of Android project to be known and their purpose

1. src - This contains the .java source files for your project. By default, it includes an MainActivity.java source file having an activity class that runs when your app is launched using the app icon.

2. generated - This contains the .R file, a compiler-generated file that references all the resources found in your project. You should not modify this file

3. bin - This folder contains the Android package files .apk built by the ADT during the build process and everything else needed to run an Android application.

4. res/drawable-hdpi - This is a directory for drawable objects that are designed for high-density screens.

5. res/layout - This is a directory for files that define your app's user interface.

6. res/values - This is a directory for other various XML files that contain a collection of resources, such as strings and colors definitions.

7. AndroidManifest.xml - This is the manifest file which describes the fundamental characteristics of the app and defines each of its components.

String file

The strings.xml file is located in the res/values folder and it contains all the text that your application uses. For example, the names of buttons, labels, default text, and similar types of strings go into this file. This file is responsible for their textual content. For example, a default strings file will look like as following file

R file

The gen/myapps.helloworld/R.java file is the glue between the activity Java files like Main.java and the resources like strings.xml. It is an automatically generated file and you should not modify the content of the R.java file. Following is a sample of R.java filehttps://www.codeproject.com/KB/Android/803646/rfile.png

Layout File

The activity_main.xml is a layout file available in res/layout directory, that is referenced by your application when building its interface. You will modify this file very frequently to change the layout of your application. For your "Hello World!" application, this file will have following content related to default layout

Running app on Emulator

Emulator takes more time to load so before running app we should start emulator. Emulator can be started from SDK manager tools Manage AVDs.

https://www.codeproject.com/KB/Android/803646/SDKManager.pngAVD Manager

Create the AVD and click on the start to run the emulator

https://www.codeproject.com/KB/Android/803646/AVDmanagers.png

Once emulator is started it will get loaded by creating an AVD Manager

https://www.codeproject.com/KB/Android/803646/Emulator.png

Things to do on Mobile Device

Pre-requisite

Generate a signed APK from the Android Studio under Build / generate signed APK.

Steps

- 1.Go to settings on Mobile Device
- 2. Tap on applications or Developer options
- 3. If it is applications options on mobile device follow below steps
 - a. Put a check for Unknown Sources (to allow installation of non-Market applications)
 - b. Tap on Development (to set options for application development)

4. Check on USB debugging

5.Plug the USB cable to computer.

6.Go the platform-tools under studio directory and run the following comment

- a. adb install app-release.apk. App installs
 - b. On success full install you can run the app on mobile.

POSSIBLE QUESTIONS UNIT III

2 marks Questions:

1. What is meant by a widget?

- 2. What is the purpose of xml files in android project?
- 3. How to run an android project?
- 4. Write the use of update() method in Android.
- 5. Define DatePicker.
- 6. State the function of IDE.

6 marks Questions:

1. How to install Eclipse with ADT plug-in.

- 2. Explain the steps of installing Virtual machine for Android sandwich.
- 3. Explain the steps of installing Virtual machine for Android Jelly bean.
- 4. Discuss about configuring the installed tools.
- 5. Write and explain the steps to create the Android project-Hello World.
- 6. Explain about installation of Android Development Kit.
- 7. Describe in detail about emulator for android.
- 8. How to create an android project?
- 9. Explain about the installation of virtual machine.
- 10. List out the steps to run an android project in an emulator.

Karpagam Academy of Higher Education Department of CS Subject : Android Programming Class: II B.Sc (CS A& B) SUBJECT.CODE:17CSU304A Objective Type Questions

Unit-III

S.	QUESTIONS	OPT1	OPT2	OPT3	OPT4	ANSWER
NO						
1	What is Pending Intent in android?	It is a kind of an intent	It is used to pass the data between activities	It will fire at a future point of time	None of the Above	It will fire at a future point of time
2	What is the life cycle of services in android?	onCreate()- >onStartCo mmand()->o nDestory()	onRecieve()	final()	Service life cycle is same as activity life cycle.	onCreate()->on StartCommand()->onDestory()
3	How many threads are there in asyncTask in android?	Only one	Two	AsyncTask doesn't have tread	None of the Above	Only one
4	How to store heavy structured data in android?	Shared Preferences	Cursor	SQlite database	Not possible	SQlite database
5	What is singleton class in android?	A class that can create only one object	Anonymous class	Java class	Manifest file	A class that can create only one object
6	What is ADB in android?	Image tool	Developme nt tool	Android Debug Bridge	None of the above.	Android Debug Bridge
7	What is an HTTP client class in android?	httprequest(g et/post) and returns response from the server	Cookies managemen t	Authenticat ion manageme nt	None of the above	httprequest(get/ post) and returns response from the server

8	What is fragment life cycle in android?	onReceive()	onCreate()	onAttach()- >onCreate() -> onCreateVi ew() -> onActivity Created() -> onStart()	None of the above	onAttach()- >onCreate() -> onCreateView() -> onActivityCreat ed() -> onStart() -> onResume()
				onResume())		
9	What is the purpose of super.onCreate() in android?	To create an activity	To create a graphical window for subclass	It allows the developers to write the program	None of the above	To create a graphical window for subclass
10	What is off-line synchronization in android?	Synchronizat ion with internet	Background synchroniza tion	Synchroniz ation without internet	None of the above	Synchronization without internet
11	specif ies how child Views are positioned.	android:layo ut_weight	android:lay out_gravity	android:lay out_width	android : layout_x	android:layout_ gravity
12	Lay out is a view group that aligns all children in a single direction, vertically or horizontally.	Relative	Table	Linear	Frame	Linear
13	specifies how much of the extra space in the layout should be allocated to the View.	android:layo ut_gravity	android : layout_x	android:lay out_weight	android:layo ut_width	android:layout_ weight

KARPAGAM ACADEMY OF HIGHER EDUCATION

CLASS : II B.SC CS

COURSE NAME: ANDROIDP ROGRAMMING

COURSE CODE: 17CSU401

BATCH: 2017-2020

UNIT IV: USER INTERFACE ARCHITECTURE

UNIT IV

SYLLABUS

User Interface Architecture: Application context, intents, Activity life cycle, multiple screen size s.(2L) **User Interface Design:** Form widgets, Text Fields, Layouts, Button control, toggle buttons, Spinners(Combo boxes),Images, Menu, Dialog.(2L)

Activity life cycle

In C, C++ or Java programming language, program starts from **main()** function. Very similar way, Android system initiates its program with in an **Activity** starting with a call on onCreate() callback method. There is a sequence of callback methods that start up an activity and a sequence of callback methods that tear down an activity as shown in the below Activity life cycle diagram:

The Activity class defines the following call backs i.e. events. You don't need to implement all the callbacks methods. However, it's important that you understand each one and implement those that ensure your app behaves the way users expect.

Sr.No	Callback & Description
	onCreate()
1	This is the first callback and called when the activity is first created.
	onStart()
2	This callback is called when the activity becomes visible to the user.
2	onResume()
3	This is called when the user starts interacting with the application.
	onPause()
4	The paused activity does not receive user input and cannot execute any code and called when the current activity is being paused and the previous activity is being resumed.
	onStop()
5	This callback is called when the activity is no longer visible.
	onDestroy()
6	This callback is called before the activity is destroyed by the system.
	onRestart()
7	This callback is called when the activity restarts after stopping it.

Multiple screen size

Android runs on a variety of devices that offer different screen sizes and densities. For applications, the Android system provides a consistent development environment across devices and handles most of the work to adjust each application's user interface to the screen on which it is displayed. At the same time, the system provides APIs that allow you to control your application's UI for specific screen sizes and densities, in order to optimize your UI design for different screen configurations. For example, you might want a UI for tablets that's different from the UI for handsets.

Although the system performs scaling and resizing to make your application work on different screens, you should make the effort to optimize your application for different screen sizes and densities. In doing so, you maximize the user experience for all devices and your users believe that your application was actually designed for *their* devices—rather than simply stretched to fit the screen on their devices.

By following the practices described in this document, you can create an application that displays properly and provides an optimized user experience on all supported screen configurations, using a single .apk file.

Overview of Screens Support

This section provides an overview of Android's support for multiple screens, including: an introduction to the terms and concepts used in this document and in the API, a summary of the screen configurations that the system supports, and an overview of the API and underlying screen-compatibility features.

Terms and concepts

Screen size

Actual physical size, measured as the screen's diagonal.

For simplicity, Android groups all actual screen sizes into four generalized sizes: small, normal, large, and extra-large.

Screen density

The quantity of pixels within a physical area of the screen; usually referred to as dpi (dots per inch). For example, a "low" density screen has fewer pixels within a given physical area, compared to a "normal" or "high" density screen.

For simplicity, Android groups all actual screen densities into six generalized densities: low, medium, high, extra-high, extra-extra-high, and extra-extra-extra-high.

Orientation

The orientation of the screen from the user's point of view. This is either landscape or portrait, meaning that the screen's aspect ratio is either wide or tall, respectively. Be aware that not only do different devices operate in different orientations by default, but the orientation can change at runtime when the user rotates the device. *Resolution*

The total number of physical pixels on a screen. When adding support for multiple screens, applications do not work directly with resolution; applications should be concerned only with screen size and density, as specified by the generalized size and density groups.

Density-independent pixel (dp)

A virtual pixel unit that you should use when defining UI layout, to express layout dimensions or position in a density-independent way.

The density-independent pixel is equivalent to one physical pixel on a 160 dpi screen, which is the baseline density assumed by the system for a "medium" density screen. At runtime, the system transparently handles any scaling of the dp units, as necessary, based on the actual density of the screen in use. The conversion of dp units to screen pixels is simple: px = dp * (dpi / 160). For example, on a 240 dpi screen, 1

dp equals 1.5 physical pixels. You should always use dp units when defining your application's UI, to ensure proper display of your UI on screens with different densities.

Range of screens supported

Android provides support for multiple screen sizes and densities, reflecting the many different screen configurations that a device may have. You can use features of the Android system to optimize your application's user interface for each screen configuration and ensure that your application not only renders properly, but provides the best user experience possible on each screen.

To simplify the way that you design your user interfaces for multiple screens, Android divides the range of actual screen sizes and densities into:

• A set of four generalized sizes: *small*, *normal*, *large*, and *xlarge*

Note: Beginning with Android 3.2 (API level 13), these size groups are deprecated in favor of a new technique for managing screen sizes based on the available screen width. If you're developing for Android 3.2 and greater.

- A set of six generalized **densities**:
 - *ldpi* (low) ~120dpi
 - *mdpi* (medium) ~160dpi
 - *hdpi* (high) ~240dpi
 - *xhdpi* (extra-high) ~320dpi
 - o xxhdpi (extra-extra-high) ~480dpi
 - o xxxhdpi (extra-extra-high) ~640dpi

Each generalized size and density spans a range of actual screen sizes and densities. For example, two devices that both report a screen size of *normal* might have actual screen sizes and aspect ratios that are slightly different when measured by hand. Similarly, two devices that report a screen density of *hdpi* might have real pixel densities that are slightly different. Android makes these differences abstract to applications, so you can provide UI designed for the generalized sizes and densities and let the system handle any final adjustments as necessary. Figure 1 illustrates how different sizes and densities are roughly categorized into the different size and density groups.

As you design your UI for different screen sizes, you'll discover that each design requires a minimum amount of space. So, each generalized screen size above has an associated minimum resolution that's defined by the system. These minimum sizes are in "dp" units—the same units you should use when defining your layouts—which allows the system to avoid worrying about changes in screen density.

- *xlarge* screens are at least 960dp x 720dp
- *large* screens are at least 640dp x 480dp
- *normal* screens are at least 470dp x 320dp

• *small* screens are at least 426dp x 320dp

Note: These minimum screen sizes were not as well defined prior to Android 3.0, so you may encounter some devices that are mis-classified between normal and large. These are also based on the physical resolution of the screen, so may vary across devices—for example a 1024x720 tablet with a system bar actually has a bit less space available to the application due to it being used by the system bar.

To optimize your application's UI for the different screen sizes and densities, you can provide alternative resources for any of the generalized sizes and densities. Typically, you should provide alternative layouts for some of the different screen sizes and alternative bitmap images for different screen densities. At runtime, the system uses the appropriate resources for your application, based on the generalized size or density of the current device screen.

You do not need to provide alternative resources for every combination of screen size and density. The system provides robust compatibility features that can handle most of the work of rendering your application on any device screen, provided that you've implemented your UI using techniques that allow it to gracefully resize (as described in the Best Practices, below).

Note: The characteristics that define a device's generalized screen size and density are independent from each other. For example, a WVGA high-density screen is considered a normal size screen because its physical size is about the same as the T-Mobile G1 (Android's first device and baseline screen configuration). On the other hand, a WVGA medium-density screen is considered a large size screen. Although it offers the same resolution (the same number of pixels), the WVGA medium-density screen has a lower screen density, meaning that each pixel is physically larger and, thus, the entire screen is larger than the baseline (normal size) screen.

Density independence

Your application achieves "density independence" when it preserves the physical size (from the user's point of view) of user interface elements when displayed on screens with different densities.

Maintaining density independence is important because, without it, a UI element (such as a button) appears physically larger on a low-density screen and smaller on a high-density screen. Such density-related size changes can cause problems in your application layout and usability. Figures 2 and 3 show the difference between an application when it does not provide density independence and when it does, respectively.

Figure 2. Example application without support for different densities, as shown on low, medium, and high-density screens.

Figure 3. Example application with good support for different densities (it's density independent), as shown on low, medium, and high density screens.

The Android system helps your application achieve density independence in two ways:

- The system scales dp units as appropriate for the current screen density
- The system scales drawable resources to the appropriate size, based on the current screen density, if necessary

In figure 2, the text view and bitmap drawable have dimensions specified in pixels (px units), so the views are physically larger on a low-density screen and smaller on a high-density screen. This is because although the actual screen sizes may be the same, the high-density screen has more pixels per inch (the same amount of pixels fit in a smaller area). In figure 3, the layout dimensions are specified in density-independent pixels (dp units). Because the baseline for density-independent pixels is a medium-density screen,

the device with a medium-density screen looks the same as it does in figure 2. For the low-density and high-density screens, however, the system scales the density-independent pixel values down and up, respectively, to fit the screen as appropriate.

In most cases, you can ensure density independence in your application simply by specifying all layout dimension values in density-independent pixels (dp units) or with "wrap_content", as appropriate. The system then scales bitmap drawables as appropriate in order to display at the appropriate size, based on the appropriate scaling factor for the current screen's density.

However, bitmap scaling can result in blurry or pixelated bitmaps, which you might notice in the above screenshots. To avoid these artifacts, you should provide alternative bitmap resources for different densities. For example, you should provide higherresolution bitmaps for high-density screens and the system will use those instead of resizing the bitmap designed for medium-density screens.

Intents

An Android **Intent** is an abstract description of an operation to be performed. It can be used with **startActivity** to launch an Activity, **broadcastIntent** to send it to any interested BroadcastReceiver components, and **startService(Intent)** or **bindService(Intent, ServiceConnection, int)** to communicate with a background Service.

For example, let's assume that you have an Activity that needs to launch an email client and sends an email using your Android device. For this purpose, your Activity would send an ACTION_SEND along with appropriate **chooser**, to the Android Intent Resolver. The specified chooser gives the proper interface for the user to pick how to send your email data.

```
Intent email = new Intent(Intent.ACTION_SEND, Uri.parse("mailto:"));
email.putExtra(Intent.EXTRA_EMAIL, recipients);
email.putExtra(Intent.EXTRA_SUBJECT, subject.getText().toString());
email.putExtra(Intent.EXTRA_TEXT, body.getText().toString());
startActivity(Intent.createChooser(email, "Choose an email client
from..."));
```

Above syntax is calling startActivity method to start an email activity and result should be as shown below –

There are separate mechanisms for delivering intents to each type of component – activities, services, and broadcast receivers.

Sr.No	Method & Description
1	Context.startActivity() The Intent object is passed to this method to launch a new activity or get an existing activity to do something new.
2	Context.startService() The Intent object is passed to this method to initiate a service or deliver new instructions to an ongoing service.
3	Context.sendBroadcast() The Intent object is passed to this method to deliver the message to all interested broadcast receivers.

Intent Objects

Android Intent is the *message* that is passed between components such as activities, content providers, broadcast receivers, services etc.

It is generally used with startActivity() method to invoke activity, broadcast receivers etc.

The **dictionary meaning** of intent is *intention or purpose*. So, it can be described as the intention to do action.

The LabeledIntent is the subclass of android.content.Intent class.

Android intents are mainly used to:

- Start the service
- Launch an activity
- Display a web page
- Display a list of contacts
- Broadcast a message
- Dial a phone call etc.

Action

This is mandatory part of the Intent object and is a string naming the action to be performed — or, in the case of broadcast intents, the action that took place and is being reported. The action largely determines how the rest of the intent object is structured. The Intent class defines a number of action constants corresponding to different intents. Here is a list of Android Intent Standard Actions.

The action in an Intent object can be set by the setAction() method and read by getAction().

Data

Adds a data specification to an intent filter. The specification can be just a data type (the mimeType attribute), just a URI, or both a data type and a URI. A URI is specified by separate attributes for each of its parts –

These attributes that specify the URL format are optional, but also mutually dependent -

- If a scheme is not specified for the intent filter, all the other URI attributes are ignored.
- If a host is not specified for the filter, the port attribute and all the path attributes are ignored.

The setData() method specifies data only as a URI, setType() specifies it only as a MIME type, and setDataAndType() specifies it as both a URI and a MIME type. The URI is read by getData() and the type by getType().

Some examples of action/data pairs are -

Sr.No.	Action/Data Pair & Description		
	ACTION_VIEW content://contacts/people/1		
1			
	Display information about the person whose identifier is "1".		
	ACTION_DIAL content://contacts/people/1		
2			
	Display the phone dialer with the person filled in.		

	ACTION_VIEW tel:123	
3		
	Display the phone dialer with the given number filled in.	
4	ACTION_DIAL tel:123	
	Display the phone dialer with the given number filled in.	
5	ACTION_EDIT content://contacts/people/1	
5	Edit information about the person whose identifier is "1".	
	ACTION_VIEW content://contacts/people/	
6		
	Display a list of people, which the user can browse through.	
ACTION_SET_WALLPAPER		
7		
	Show settings for choosing wallpaper	

User Interface Design: Form widgets

There are given a lot of **android widgets** with simplified examples such as Button, EditText, AutoCompleteTextView, ToggleButton, DatePicker, TimePicker, ProgressBar etc.

Android widgets are easy to learn. The widely used android widgets with examples are given below:

Android Button

Let's learn how to perform event handling on button click.

Android Toast

Displays information for the short duration of time.

Custom Toast

We are able to customize the toast, such as we can display image on the toast

ToggleButton

It has two states ON/OFF.

CheckBox

Let's see the application of simple food ordering.

<u>AlertDialog</u>

AlertDialog displays a alert dialog containing the message with OK and Cancel buttons.

Spinner

Spinner displays the multiple options, but only one can be selected at a time.

<u>AutoCompleteTextView</u>

Let's see the simple example of AutoCompleteTextView.

RatingBar

RatingBar displays the rating bar.

DatePicker

Datepicker displays the datepicker dialog that can be used to pick the date.

TimePicker

TimePicker displays the timepicker dialog that can be used to pick the time.

ProgressBar

ProgressBar displays progress task.

Button control

A Button is a Push-button which can be pressed, or clicked, by the user to perform an action.

2 days :	igo	\sim	Vibrate	2
(800) 55 United Stat	5-3456 ies igo	€)	Label	
Philip Mobile (32	3) 555-1234 Igo	<u>v</u>	\cap

Ĵ		ם רב	60	
			(

Button Attributes

Following are the important attributes related to Button control. You can check Android official documentation for complete list of attributes and related methods which you can use to change these attributes are run time.

Inherited from android.widget.TextView Class -

Sr.No	Attribute & Description	
1	android:autoText If set, specifies that this TextView has a textual input method and automatically corrects some common spelling errors.	
2	android:drawableBottom This is the drawable to be drawn below the text.	
3	android:drawableRight This is the drawable to be drawn to the right of the text.	
4	android:editable If set, specifies that this TextView has an input method.	
5	android:text This is the Text to display.	

Android Button represents a push-button. The android.widget.Button is subclass of TextView class and CompoundButton is the subclass of Button class.

There are different types of buttons in android such as RadioButton, ToggleButton, CompoundButton etc.

Here, we are going to create two textfields and one button for sum of two numbers. If user clicks button, sum of two input values is displayed on the Toast.

Drag the component or write the code for UI in activity_main.xml

First of all, drag 2 textfields from the Text Fields palette and one button from the Form Widgets palette as shown in the following figure.

The generated code for the ui components will be like this:

File: activity_main.xml

<RelativeLayout xmlns:androclass="http://schemas.android.com/apk/res/android" xmlns:tools="http://schemas.android.com/tools" android:layout_width="match_parent" android:layout_height="match_parent" tools:context=".MainActivity" >

<EditText

android:id="@+id/editText1"
android:layout_width="wrap_content"
android:layout_height="wrap_content"
android:layout_alignParentTop="true"
android:layout_centerHorizontal="true"
android:layout_marginTop="24dp"
android:ems="10" />

<EditText

android:id="@+id/editText2"
android:layout_width="wrap_content"
android:layout_height="wrap_content"
android:layout_alignLeft="@+id/editText1"
android:layout_below="@+id/editText1"
android:layout_marginTop="34dp"
android:ems="10" >

<requestFocus />
</EditText>

<Button

android:id="@+id/button1"
android:layout_width="wrap_content"
android:layout_height="wrap_content"
android:layout_centerHorizontal="true"
android:layout_centerVertical="true"
android:text="@string/Button" />

</RelativeLayout>

Layouts

We have different layouts which are subclasses of ViewGroup class and a typical layout defines the visual structure for an Android user interface and can be created either at run time using **View/ViewGroup** objects or you can declare your layout using simple XML file **main_layout.xml** which is located in the res/layout folder of your project.

A layout may contain any type of widgets such as buttons, labels, textboxes, and so on. Following is a simple example of XML file having LinearLayout

```
<?xml version="1.0" encoding="utf-8"?>
<LinearLayout xmlns:android="http://schemas.android.com/apk/res/androic
android:layout_width="fill_parent"
android:layout_height="fill_parent"
android:orientation="vertical" >

<TextView android:id="@+id/text"
android:layout_width="wrap_content"
android:layout_height="wrap_content"
android:text="This is a TextView" />

<Button android:id="@+id/button"
android:layout_width="wrap_content"
android:layout_height="wrap_content"
android:layout_width="wrap_content"
android:layout_width="wrap_content"
android:layout_width="wrap_content"
android:layout_width="wrap_content"
android:layout_width="wrap_content"
android:layout_width="wrap_content"
android:layout_height="wrap_content"
android:text="This is a Button" />
<!-- More GUI components go here -->
```

Android Layout Types

There are number of Layouts provided by Android which you will use in almost all the Android applications to provide different view, look and feel.

Sr.No	Layout & Description
	Linear Layout
1	LinearLayout is a view group that aligns all children in a single direction, vertically or horizontally.
	Relative Layout
2	RelativeLayout is a view group that displays child views in relative positions.
3	Table Layout

	TableLayout is a view that groups views into rows and columns.
	Absolute Layout
4	
	AbsoluteLayout enables you to specify the exact location of its children.
	Frame Layout
5	The Framel event is a pleasholder on screen that you can use to display a single
	view
	T •
6	List view
	ListView is a view group that displays a list of scrollable items.
	Grid View
7	
'	GridView is a ViewGroup that displays items in a two-dimensional, scrollable
	grid.

Layout Attributes

.....

Each layout has a set of attributes which define the visual properties of that layout. There are few common attributes among all the layouts and their are other attributes which are specific to that layout. Following are common attributes and will be applied to all the layouts:

C- N-	Attailet & Description		
Sr.No	Attribute & Description		
1	android:id This is the ID which uniquely identifies the view.		
2	android:layout_width This is the width of the layout.		
3	android:layout_height This is the height of the layout		
4	android:layout_marginTop This is the extra space on the top side of the layout.		
5	android:layout_marginBottom This is the extra space on the bottom side of the layout.		
6	android:layout_marginLeft		

	This is the extra space on the left side of the layout.
-	android:layout_marginRight
7	This is the extra space on the right side of the layout.

Toggle button

A ToggleButton displays checked/unchecked states as a button. It is basically an on/off button with a light indicator.

Toggle Button

Android Toggle Button can be used to display checked/unchecked (On/Off) state on the button.

It is beneficial if user have to change the setting between two states. It can be used to On/Off Sound, Wifi, Bluetooth etc.

Since Android 4.0, there is another type of toggle button called *switch* that provides slider control.

Android ToggleButton and Switch both are the subclasses of CompoundButton class.

Android ToggleButton class

ToggleButton class provides the facility of creating the toggle button.

XML Attributes of ToggleButton class

The 3 XML attributes of ToggleButton class.

XML Attribute	Description
android:disabledAlpha	The alpha to apply to the indicator when disabled.
android:textOff	The text for the button when it is not checked.
android:textOn	The text for the button when it is checked.

Methods of ToggleButton class

The widely used methods of ToggleButton class are given below.

Method	Description
CharSequence getTextOff()	Returns the text when button is not in the checked state.
CharSequence getTextOn()	Returns the text for when button is in the checked state.
void setChecked(boolean checked)	Changes the checked state of this button.

File: activity_main.xml

<RelativeLayout xmlns:androclass="http://schemas.android.com/apk/res/android" xmlns:tools="http://schemas.android.com/tools" android:layout_width="match_parent" android:layout_height="match_parent" tools:context=".MainActivity" >

<ToggleButton

android:id="@+id/toggleButton1" android:layout_width="wrap_content" android:layout_height="wrap_content" android:layout_alignParentLeft="true" android:layout_alignParentTop="true" android:layout_marginLeft="60dp" android:layout_marginTop="18dp" android:text="ToggleButton1" android:textOff="Off" android:textOn="On" />

<ToggleButton

android:id="@+id/toggleButton2"
android:layout_width="wrap_content"
android:layout_height="wrap_content"
android:layout_alignBaseline="@+id/toggleButton1"
android:layout_alignBottom="@+id/toggleButton1"
android:layout_marginLeft="44dp"
android:layout_toRightOf="@+id/toggleButton1"
android:text="ToggleButton2"
android:textOff="Off"
android:textOn="On" />

<Button

android:id="@+id/button1"
android:layout_width="wrap_content"
android:layout_height="wrap_content"
android:layout_below="@+id/toggleButton2"
android:layout_marginTop="82dp"
android:layout_toRightOf="@+id/toggleButton1"
android:text="submit" />

</RelativeLayout>

File: MainActivity.java

package com.example.togglebutton;

import android.os.Bundle;

import android.app.Activity;

import android.view.Menu;

import android.view.View;

import android.view.View.OnClickListener;

import android.widget.Button;

import android.widget.Toast;

import android.widget.ToggleButton;

public class MainActivity extends Activity {

private ToggleButton toggleButton1, toggleButton2;

private Button buttonSubmit;

@Override

}

protected void onCreate(Bundle savedInstanceState) {
 super.onCreate(savedInstanceState);
 setContentView(R.layout.activity_main);

addListenerOnButtonClick();

public void addListenerOnButtonClick(){

//Getting the ToggleButton and Button instance from the layout xml file toggleButton1=(ToggleButton)findViewById(R.id.toggleButton1); toggleButton2=(ToggleButton)findViewById(R.id.toggleButton2); buttonSubmit=(Button)findViewById(R.id.button1);

//Performing action on button click

buttonSubmit.setOnClickListener(new OnClickListener(){

@Override

```
public void onClick(View view) {
```

StringBuilder result = new StringBuilder();

result.append("ToggleButton1 : ").append(toggleButton1.getText());

result.append("\nToggleButton2 : ").append(toggleButton2.getText());

//Displaying the message in toast

Toast.makeText(getApplicationContext(), result.toString(),Toast.LENGTH_LONG).show();

}

});

Android Spinner (Combo boxes)

Android Spinner is like the combox box of AWT or Swing. It can be used to display the multiple options to the user in which only one item can be selected by the user.

Android spinner is like the drop down menu with multiple values from which the end user can select only one value.

Android spinner is associated with AdapterView. So you need to use one of the adapter classes with spinner.

Android Spinner class is the subclass of AsbSpinner class.

Android Spinner Example

In this example, we are going to display the country list. You need to use **ArrayAdapter** class to store the country list.

Let's see the simple example of spinner in android.

activity_main.xml

Drag the Spinner from the pallete, now the activity_main.xml file will like this:

```
File: activity_main.xml
```

```
<RelativeLayout xmlns:androclass="http://schemas.android.com/apk/res/android"

xmlns:tools="http://schemas.android.com/tools"

android:layout_width="match_parent"

android:layout_height="match_parent"

tools:context=".MainActivity" >

<Spinner

android:id="@+id/spinner1"

android:layout_width="wrap_content"

android:layout_height="wrap_content"
```

android:layout_alignParentTop="true"

android:layout_centerHorizontal="true"

```
android:layout_marginTop="83dp" />
```

</RelativeLayout>

Activity class

Let's write the code to display item on the spinner and perform event handling.

File: MainActivity.java

package com.example.spinner; import android.app.Activity; import android.os.Bundle; import android.view.Menu; import android.view.View; import android.widget.AdapterView; import android.widget.AdapterView; import android.widget.Spinner; import android.widget.TextView; import android.widget.Toast;

public class MainActivity extends Activity implements AdapterView.OnItemSelectedListener {

String[] country = { "India", "USA", "China", "Japan", "Other", };

@Override

protected void onCreate(Bundle savedInstanceState) {

super.onCreate(savedInstanceState);
setContentView(R.layout.activity_main);
//Getting the instance of Spinner and applying OnItemSelectedListener on it
Spinner spin = (Spinner) findViewById(R.id.spinner1);
spin.setOnItemSelectedListener(this);

//Creating the ArrayAdapter instance having the country list ArrayAdapter aa = new ArrayAdapter(this,android.R.layout.simple_spinner_item,country); aa.setDropDownViewResource(android.R.layout.simple_spinner_dropdown_item); //Setting the ArrayAdapter data on the Spinner spin.setAdapter(aa);

}

//Performing action onItemSelected and onNothing selected

@Override

public void onItemSelected(AdapterView<?> arg0, View arg1, int position,long id) {

Toast.makeText(getApplicationContext(),country[position] ,Toast.LENGTH_LONG).show();

Images

Android provides many views which we can use to define a user interface for our apps. Amongst these it provides a large number to display information and take input from the user, these include text and image views.

Android provides views which can be used to display images from various sources and provide transitions between them. Some of these views are the ImageView and the ImageSwitcher. These views provide a high level of functionality to display images in a user interface so that we can concentrate on the images we want to display rather than taking care of rendering.

Nested classes

	Image.Plane							
class	A single color plane of image data							
Public	Public methods							
abstra void	act <pre>close()</pre>							
	Free up this frame for reuse.							
<u>Rect</u>	Get the crop rectangle associated with this frame.							
abstra int	act getFormat() Get the format for this image.							
abstract int The height of the image in pixels.								
abstra <u>Plane</u>	act Get the array of pixel planes for this Image.							
abstra long	Get the timestamp ()							
abstra int	act getWidth() The width of the image in pixels.							
void Set the crop rectangle associated with this frame.								
void	setTimestamp(long timestamp)Set the timestamp associated with this frame.							
public	class ImageGalleryActivity extends Activity {							

```
private Integer images[] = {R.drawable.pic1, R.drawable.pic2,
R.drawable.pic3};
```

```
@Override
protected void onCreate(Bundle savedInstanceState) {
```

Menus

Menus are a common user interface component in many types of applications. To provide a familiar and consistent user experience, you should use the <u>Menu</u> APIs to present user actions and other options in your activities.

Beginning with Android 3.0 (API level 11), Android-powered devices are no longer required to provide a dedicated *Menu* button. With this change, Android apps should migrate away from a dependence on the traditional 6-item menu panel and instead provide an app bar to present common user actions.

Although the design and user experience for some menu items have changed, the semantics to define a set of actions and options is still based on the <u>Menu</u> APIs. This guide shows how to create the three fundamental types of menus or action presentations on all versions of Android.

Options menu and app bar

The <u>options menu</u> is the primary collection of menu items for an activity. It's where you should place actions that have a global impact on the app, such as "Search," "Compose email," and "Settings."

Context menu and contextual action mode

A context menu is a <u>floating menu</u> that appears when the user performs a longclick on an element. It provides actions that affect the selected content or context frame.

Popup menu

A popup menu displays a list of items in a vertical list that's anchored to the view that invoked the menu.

Android Option Menus are the primary menus of android. They can be used for settings, search, delete item etc.

Here, we are going to see two examples of option menus. First, the simple option menus and second, options menus with images.

Here, we are inflating the menu by calling the **inflate**() method of **MenuInflater** class. To perform event handling on menu items, you need to override **onOptionsItemSelected**() method of Activity class.

Android Option Menu Example

Let's see how to create menu in android. Let's see the simple option menu example that contains three menu items.

activity_main.xml

We have only one textview in this file.

File: activity_main.xml

File: activity_main.xml

<RelativeLayout xmlns:androclass="http://schemas.android.com/apk/res/android" xmlns:tools="http://schemas.android.com/tools" android:layout_width="match_parent" android:layout_height="match_parent" android:paddingBottom="@dimen/activity_vertical_margin" android:paddingLeft="@dimen/activity_horizontal_margin" android:paddingRight="@dimen/activity_horizontal_margin" android:paddingTop="@dimen/activity_vertical_margin" tools:context=".MainActivity" >

<TextView

android:layout_width="wrap_content"
android:layout_height="wrap_content"
android:text="@string/hello_world" />

</RelativeLayout>

menu_main.xml

It contains three items as show below. It is created automatically inside the res/menu directory.

🧌 👔 5:39	🦓 🖻 5:39
Hello world!	Hello world!
Item 1 Item 2	Item 2 Selected
Item 3	

Dialog

A Dialog is small window that prompts the user to a decision or enter additional information. A dialog does not fill the screen and is normally used for modal events that require users to take an action before they can proceed.

ext message lim		Erase USI	B storage?
Set number of messages	s to save.	You'll lose all pl	notos and media
499		Cancel	Erase
500			
501			
~			
	C-1		

In order to make an alert dialog, you need to make an object of AlertDialogBuilder which an inner class of AlertDialog. Its syntax is given below

AlertDialog.Builder alertDialogBuilder = new AlertDialog.Builder(this);

Now you have to set the positive (yes) or negative (no) button using the object of the AlertDialogBuilder class. Its syntax is

```
alertDialogBuilder.setPositiveButton(CharSequence text,
    DialogInterface.OnClickListener listener)
alertDialogBuilder.setNegativeButton(CharSequence text,
    DialogInterface.OnClickListener listener)
```

Apart from this, you can use other functions provided by the builder class to customize the alert dialog. These are listed below

Sr.No	Method type & description						
	setIcon(Drawable icon)						
1	This method set the icon of the elect dialog here						
	This method set the icon of the alert dialog box.						
setCancelable(boolean cancel able)							
2	This method sets the property that the dialog can be cancelled or not						
	setMessage(CharSequence message)						
3	This method sets the message to be displayed in the alert dialog						
	setMultiChoiceItems(CharSequence[] items, boolean[] checkedItems,						
	DialogInterface.OnMultiChoiceClickListener listener)						
4	This method sets list of items to be displayed in the dialog as the content. The selected option will be notified by the listener						
	setOnCancelListener(DialogInterface.OnCancelListener onCancelListener)						
5							
This method Sets the callback that will be called if the dialog is cancelled							
-	setTitle(CharSequence title)						
6	This method set the title to be appear in the dialog						

Application context

instance It is an which be accessed activity via can in an getApplicationContext(). This context is tied to the lifecycle of an application. The application context can be used where you need a context whose lifecycle is separate from the current context or when you are passing a context beyond the scope of an activity.

We generally call context when we need to get information about different parts of our application like Activities, Applications etc.

Some operations(things where assistant is needed) where context is involved:

- 1. Loading common resources
- 2. Creating dynamic views
- 3. Displaying Toast messages
- 4. Launching Activities etc.

Different ways of getting context:

- getContext()
- getBaseContext()
- getApplicationContext()
- this

Need of Context :

The documentation says that every view needs the context to access the right resources (e.g. the theme, strings etc.).

1.Because the resources must be accessible while the view is being constructed (the constructor will need some resources to fully initialise the view).

2. This allows the flexibility of using a context that is different from the one of the current activity (imagine a view that uses some other string resources and not the ones from the current activity).

3. The designers of the Android SDK seem to have chosen that the context must be set only once and then stay the same throughout the lifetime of the view.

POSSIBLE QUESTIONS UNIT IV

2 marks Questions:

- 1. What is easy-to-implement user interfaces?
- 2. What can be polled in the application's code for a checked or unchecked state?
- 3. Which is used to draw table in android?
- 4. Which method is used to add the new record ?
- 5. What is related with database?
- 6. Define SQLite.
- 7. What is the function onDraw() method

6 marks Questions:

- 1. Explain Application context with suitable program.
- 2. Briefly describe about intents in Android.
- 3. Discuss TextField in Android with suitable example.
- 4. Briefly describe about Layouts.
- 5. Explain Form widgets in Android with suitable program.
- 6. Briefly describe about Button controls in Android.
- 7. Describe multiple screen size in Android.
- 8.Explain about toggle buttons.
- 9. Explain about SQLite DBMS.
- 10. Discuss about connecting with database.

<u>UNIT V</u>

SYLLABUS

Database:Understanding of SQLite database, connecting with the database. (2L)

SQLite Database

SQLite is a opensource SQL database that stores data to a text file on a device. Android comes in with built in SQLite database implementation.

SQLite supports all the relational database features. In order to access this database, you don't need to establish any kind of connections for it like JDBC,ODBC e.t.c

Database - Package

The main package is android.database.sqlite that contains the classes to manage your own databases

Database - Creation

In order to create a database you just need to call this method openOrCreateDatabase with your database name and mode as a parameter. It returns an instance of SQLite database which you have to receive in your own object. Its syntax is given below

SQLiteDatabase mydatabase = openOrCreateDatabase("your database name",MODE_PRIVATE,null);

Apart from this, there are other functions available in the database package, that does this job. They are listed below

Sr.No	Method & Description						
1	openDatabase(String path, SQLiteDatabase.CursorFactory factory, int flags, DatabaseErrorHandler errorHandler) This method only opens the existing database with the appropriate flag mode. The common flags mode could be OPEN_READWRITE OPEN_READONLY						
2	openDatabase(String path, SQLiteDatabase.CursorFactory factory, intflags)It is similar to the above method as it also opens the existing database but it doesnot define any handler to handle the errors of databases						
3	openOrCreateDatabase(String path, SQLiteDatabase.CursorFactoryfactory)It not only opens but create the database if it not exists. This method isequivalent to openDatabase method.						
4	openOrCreateDatabase(File file, SQLiteDatabase.CursorFactory factory) This method is similar to above method but it takes the File object as a path rather then a string. It is equivalent to file.getPath()						

Database - Insertion

we can create table or insert data into table using execSQL method defined in SQLiteDatabase class. Its syntax is given below

mydatabase.execSQL("CREATE TABLE IF NOT EXISTS TutorialsPoint(Username VARCHAR,Password VARCHAR);"); mydatabase.execSQL("INSERT INTO TutorialsPoint VALUES('admin','admin');");

This will insert some values into our table in our database. Another method that also does the same job but take some additional parameter is given below

Sr.No	Method & Description
1	execSQL(String sql, Object[] bindArgs) This method not only insert data, but also used to update or modify already existing data in database using bind arguments

Database - Fetching

We can retrieve anything from database using an object of the Cursor class. We will call a method of this class called rawQuery and it will return a resultset with the cursor pointing to the table. We can move the cursor forward and retrieve the data.

Cursor resultSet = mydatbase.rawQuery("Select * from TutorialsPoint",null); resultSet.moveToFirst(); String username = resultSet.getString(0); String password = resultSet.getString(1);

There are other functions available in the Cursor class that allows us to effectively retrieve the data. That includes

Sr.No	Method & Description
1	getColumnCount()
1	This method return the total number of columns of the table.
	getColumnIndex(String columnName)
2	This method returns the index number of a column by specifying the name of the column
	getColumnName(int columnIndex)
3	This method returns the name of the column by specifying the index of the column
	getColumnNames()
4	This method returns the array of all the column names of the table.
	getCount()
5	This method returns the total number of rows in the cursor
	getPosition()
6	This method returns the current position of the cursor in the table
7	isClosed()
/	This method returns true if the cursor is closed and return false otherwise

Database - Helper class

For managing all the operations related to the database, a helper class has been given and is called SQLiteOpenHelper. It automatically manages the creation and update of the database. Its syntax is given below

```
public class DBHelper extends SQLiteOpenHelper {
   public DBHelper(){
      super(context,DATABASE_NAME,null,1);
   }
   public void onCreate(SQLiteDatabase db) { }
   public void onUpgrade(SQLiteDatabase database, int oldVersion, int newVersion) { }
}
```

Example of android SQLite database

Let's see the simple example of android sqlite database.

```
File: Contact.java
```

```
package com.example.sqlite;
public class Contact {
    int _id;
    String _name;
    String _phone_number;
    public Contact(){ }
    public Contact(int id, String name, String _phone_number){
        this._id = id;
        this._name = name;
        this._phone_number = _phone_number;
    }
```

```
public Contact(String name, String _phone_number){
```

```
this._name = name;
this._phone_number = _phone_number;
}
public int getID(){
return this._id;
```

}

```
public void setID(int id){
     this._id = id;
  }
  public String getName(){
     return this._name;
  }
  public void setName(String name){
     this._name = name;
  }
  public String getPhoneNumber(){
     return this._phone_number;
  }
  public void setPhoneNumber(String phone_number){
     this._phone_number = phone_number;
  }
}
```

Connecting with the database

MYSQL is used as a database at the webserver and PHP is used to fetch data from the database. Our application will communicate with the PHP page with necessary parameters and PHP will contact MYSQL database and will fetch the result and return the results to us.

PHP - MYSQL

Creating Database

MYSQL database can be created easily using this simple script. The **CREATE DATABASE** statement creates the database.

```
<?php
$con=mysqli_connect("example.com","username","password");
$sql="CREATE DATABASE my_db";
if (mysqli_query($con,$sql)) {
    echo "Database my_db created successfully";
}
?>
```

Creating Tables

Once database is created, its time to create some tables in the database. The **CREATE TABLE** statement creates the database.

```
<?php
```

```
$con=mysqli_connect("example.com","username","password","my_db");
$sql="CREATE TABLE table1(Username CHAR(30),Password CHAR(30),Role
CHAR(30))";
if (mysqli_query($con,$sql)) {
```

echo "Table have been created successfully";

} ?>

Inserting Values in tables

When the database and tables are created. Now its time to insert some data into the tables. The Insert Into statement creates the database.

<?php

```
$con=mysqli_connect("example.com","username","password","my_db");
```

```
$sql="INSERT INTO table1 (FirstName, LastName, Age) VALUES ('admin',
'admin','adminstrator')";
```

```
if (mysqli_query($con,$sql)) {
```

echo "Values have been inserted successfully";

} ?>

Android - Connecting MYSQL

Connecting Via Get Method

There are two ways to connect to MYSQL via PHP page. The first one is called Get method. We will use HttpGet and HttpClient class to connect. Their syntax is given below –

URL url = new URL(link); HttpClient client = new DefaultHttpClient(); HttpGet request = new HttpGet(); request.setURI(new URI(link));

After that you need to call **execute** method of HttpClient class and receive it in a HttpResponse object. After that you need to open streams to receive the data.

HttpResponse response = client.execute(request); BufferedReader in = new BufferedReader (new InputStreamReader(response.getEntity().getContent()));

Prepared By Dr. T. GENISH, Asst.Prof, Department of CS, CA & IT, KAHE Page 6/8

Connecting Via Post Method

In the Post method, the URLEncoder, URLConnection class will be used. The urlencoder will encode the information of the passing variables. It's syntax is given below –

URL url = new URL(link); String data = URLEncoder.encode("username", "UTF-8") + "=" + URLEncoder.encode(username, "UTF-8"); data += "&" + URLEncoder.encode("password", "UTF-8") + "=" + URLEncoder.encode(password, "UTF-8"); URLConnection conn = url.openConnection();

The last thing you need to do is to write this data to the link. After writing, you need to open stream to receive the responded data.

OutputStreamWriter wr = new OutputStreamWriter(conn.getOutputStream()); wr.write(data); BufferedReader reader = new BufferedReader(new InputStreamReader(conn.getInputStream()));

POSSIBLE QUESTIONS- Unit V

2 marks Questions:

- 1. What is the function of insert() method?
- 2. Which is used to return number of values?
- 3. What is the function of ScrollView?
- 4. What is an essential side to use XML files?
- 5. Which is used to clear the content of location?
- 6. Which is called as easy-to-implement user interfaces?
- 7. What will Android treat as a graph with x-axis.?

6 marks Questions:

- 1. Discuss about SQLite database management system.
- 2. Explain the packages to be implemented in database.
- 3. Explain about SQLite DBMS.
- 4. Discuss about connecting with database
- 5. Discuss about working with Data tables using SQLite.
- 6. Explain about SQLite DBMS.
- 7. Discuss about the queries in SQLite.
- 8. Explain about Working with Data Tables Using SQLite.
- 9. Discuss about SQLite database.
- 10.Discuss about SQLite data tables.

KARPAGAM ACADEMY OF HIGHER EDUCATION (Deemed to be University) (Established Under Section 3 of UGC Act 1956) Coimbatore-641021. B.Sc COMPUTER SCIENCE FIRST INTERNAL EXAMINATION - JULY 2018 Third Semester ANDROID PROGRAMMING

Date & Session: .7.2018 & N Maximum : 50 Marks Duration: 2 Hours Class : II – B. Sc (CS) A & B

SECTION A – (20 X 1 = 20 Marks) ANSWER ALL THE QUESTIONS

1.	invented A	ndroid programmir	ng.		
	a. Andy Rubin	b. Dennis Ritchie	;	c. James gosling	d. Martin
2.	Android Incorporation	was founded in		·	
	a. 2005	b. 2003	c.	2008	d. 2001
3.	SDK refers to	_·			
	a. System develop	ment kit	b.	Software Develop	ment Kit
	c. Software Desig	ning Kernal	d.	Software Developm	nent Kernal
4.	ADT stands for	·			
	a. Activex Design	ing tool	b.	Activex Developme	ent tool
	c. Android Devel	opment tool	d.	Android Designing	tool
5.	Expand IDE	·			
	a. Internet Design	ing environment	b.	Integrated develop	oment environment
	c. Integrated Desig	gning environment	d.	Intermediate develo	opment environment
6.	Android byte code is ca	alled as	_•		
	a. Source file		b.	Object file	
	c. Dalvik code		d.	jdk file	
7.	ADB represents	·			
	a. Android debug	g bridge	b.	Android designing	bridge
	c. Android develo	pment bridge	d.	Android dalvik bric	lge
8.	Android NDK is a	·			
	a. Nation Develop	ment kit	b.	Native Developme	nt kit
	c. Nation Develop	ment kernel	d.	Native Designing k	it
9.	HAL provides	·			
	a. Hardware cap a	abilities		b. Software ca	pabilities
	c. Hardware capac	cities		d. System capa	abilities
10	. OpenGL API is used	to support			
	a. 2D and 3D gra	phics		b. CUI	
	c. JIT compiler			d. Dalvik code	

11. Expand API____

a. Android Programming interface b. Application Programming interface c. Android Programming interactive d. Active Programming interface 12. A notification manager is used to display a. Interface b. Alerts c. Webpage d. Applications 13. The version of Honeycomb version is _____ d. 2.1 and 2.2 a. 4.4 b. 5.0 c. 3.1 and 3.3 14.In ______ google acquired android Incorporation. a. 2005 b. 2006 c. 2007 d. 2008 15.SDK includes a. Hardware b. Debugger c. Compiler d. Interpreter 16._____ is a diagnostic protocol. a. ADB b. SDK c. ADT d. Fastboot 17.Android is the nick name of _____. a. Rich miner b. Chris white c. Nick sears d. Andy Rubin 18. _____ launched the first android mobile. a. Apple b. HTC c. Sony d. Samsung 19. The version of kitkat is a. **4.4** b. 3.0 c. 5.2 d. 1.6 20. Android is a a. Linux-based software **b.** Kernal based software c. Java-based software d. C-based software

SECTION – B (3 X 2 =6 Marks) ANSWER ALL THE QUESTIONS

- 21. What is an Android Operating System?
- 22. Define software development kit.
- 23. What is meant by ADT.

SECTION – C (3 X 8 =24 Marks) ANSWER ALL THE QUESTIONS

24. (a) Explain the history of Android. [OR]
(b) List and explain the version, code name and API level of android.
25. (a) Describe about Android Operating Systems. [OR]
(b) Explain in detail about ADT.
26. (a) Describe about SDK. [OR]
(b) Explain in detail about Android architecture.
