CLASS: III BSC CS COURSE NAME: INTRODUCTION TO DATA SCIENCES
COURSE CODE: 17CSU503B BATCH-2017-2020

# **SYLLABAUS**

17CSU503B INTRODUCTION TO DATA SCIENCES 4H – 4C

Instruction Hours / week:L: 4 T: 0 P: 0 Marks:Int: 40 Ext: 60 Total: 100

### **SCOPE**

This course gives an introduction to the basics of data sciences and leave armed with practical experience extracting value from big data.

### **OBJECTIVES**

- Building a comprehensive working knowledge and expertise around various analytical and database tools which is a key step to excel in Big Data and Data Science fields.
- The Data Science course covers topics in a comprehensive manner with applications of R programming.

#### UNIT-I

**Data Scientist's Tool Box**: Turning data into actionable knowledge, introduction to the tools that will be used in building data analysis software: version control, markdown, git, GitHub, R, and RStudio.

#### **UNIT-II**

**R Programming Basics**: Overview of R, R data types and objects, reading and writing data, Control structures, functions, scoping rules, dates and times, Loop functions, debugging tools, Simulation, code profiling

#### **UNIT-III**

Getting and Cleaning Data: Obtaining data from the web, from APIs, from databases and from colleagues in various formats. basics of data cleaning and making data —tidy.

#### **UNIT-IV**

**Exploratory Data Analysis**: Essential exploratory techniques for summarizing data, applied before formal modeling commences, eliminating or sharpening potential hypotheses about the world that can be addressed by the data, common multivariate statistical techniques used to visualize high-dimensional data.

#### **UNIT-V**

**Reproducible Research**: Concepts and tools behind reporting modern data analyses in a reproducible manner, To write a document using R markdown, integrate live R code into a

CLASS: III BSC CS COURSE NAME: INTRODUCTION TO DATA SCIENCES COURSE CODE: 17CSU503B BATCH-2017-2020

literate statistical program, compile R markdown documents using knitr and related tools, and organize a data analysis so that it is reproducible and aCSUessible to others.

## **Suggested Readings**

- 1. Rachel Schutt., &Cathy O'Neil.(2013). Doing Data Science: Straight Talk from the Frontiline. Schroff/O'Reilly.
- 2. Foster Provost., &Tom Fawcett.(2013). Data Science for Business What You Need to Know About Data Mining and Data-Analytic Thinking. O'Reilly.
- 3. John, W. Foreman. (2013). Data Smart: Using data Science to Transform Information into Insight. John Wiley & Sons.
- 4. Ian Ayres. (2007). Super Crunchers: Why Thinking-by-Numbers Is the New Way to Be Smart (1st ed.). Bantam.
- 5. EricSeigel. (2013).PredictiveAnalytics:ThePowertoPredictwhoWillClick,BuyLie,or Die (1sted.). Wiley.
- 6. Matthew, A. Russel. (2013). Mining the Social Web: Data mining Facebook, Twitter, Linkedln, Goole+, GitHub, and More (2nd ed.). O'Reilly Media.

(Deemed to be University)
(Established Under Section 3 of UGC Act 1956)
Coimbatore - 641021.

(For the candidates admitted from 2017 onwards)

# DEPARTMENT OF COMPUTER SCIENCE, CA & IT

SUBJECT : INTRODUCTION TO DATA SCIENCES

SEMESTER : V L T P C

SUBJECT CODE: 17CSU503B CLASS : III B.Sc.CS A & B 4 0 0 4

### LECTURE PLAN

# STAFF NAME: S.A. SATHYA PRABHA

S.No	Lecture Topics Duration (Hr)		Support Materials						
<u> </u>	UNIT-I								
1.	1	<b>Data Scientist's Tool Box:</b> Turning data into actionable knowledge	W1						
2.	1	[Cont] Turning data into actionable knowledge	W1						
3.	1	Introduction to the tools that will be used in building data analysis software: version control, markdown, git, GitHub, R, and RStudio	W2,W3						
4.	1	[Cont] Introduction to the tools that will be used in building data analysis software: version control, markdown, git, GitHub, R, and RStudio	W2,W3

CLASS: IIIB.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE UNIT: I (DATA SCIENTIST'S TOOL BOX) BATCH-2017-2020

### UNIT- I

**Data Scientist's Tool Box**: Turning data into actionable knowledge, introduction to the tools that will be used in building data analysis software: version control, markdown, git, GitHub, R, and RStudio.

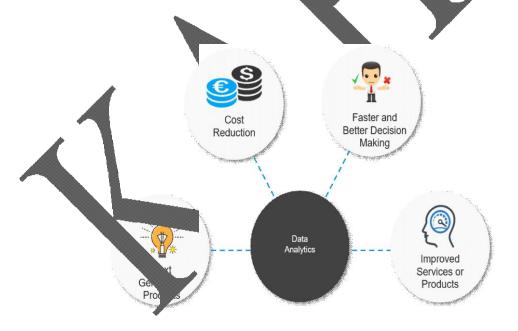

## **DATA SCIENTIST'S TOOL BOX**

Programming is an integral part of data science. Among other things, it is acknowledged that a person who understands programming logic, loops and functions has a higher chance of becoming a successful data scientist.

#### What is Data science?

**Definition 1:** Data science is a technique to change the raw data into information. It is the study of where the valuable data comes from, what it represents and how it can be turned into a valuable resource in the creation of business and IT strategies.

**Definition 2:** Data Science, it is also known as data driven science, which makes use of scientific methods, processes and systems to extract knowledge or insights from data in various forms, i.e either structured or unstructured.

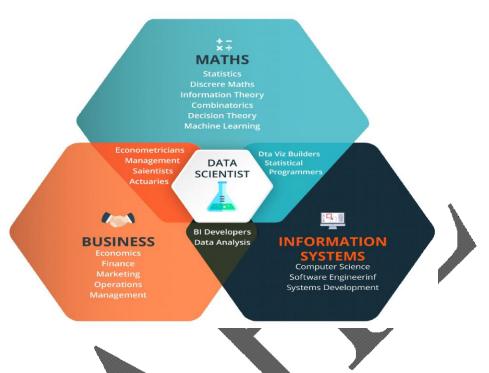

Moving forward, who does all this brain storming, or who practices Data Science? A Data Scientist.

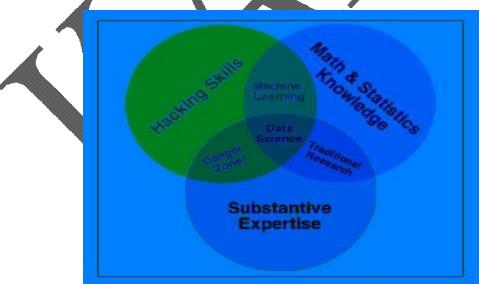

CLASS: IIIB.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE UNIT: I (DATA SCIENTIST'S TOOL BOX) BATCH-2017-2020

# Who is a Data Scientist?

Data Scientist = Programmer + Computer Scientist + Mathematician + Story teller + Domain Expert

It contains three components which are organizing, packaging and delivering data (OPD).

**OPD Data Science Process** 

CLASS: IIIB.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE UNIT: I (DATA SCIENTIST'S TOOL BOX) BATCH-2017-2020

#### Step 1: Organize Data

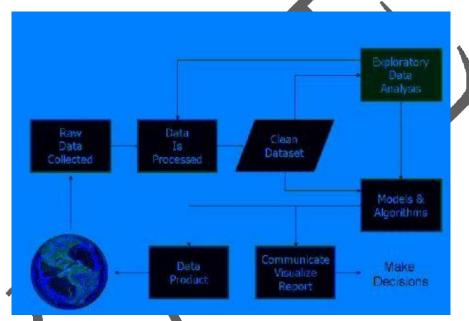

It includes the physical storage and formatting of data and integrated finest practices in data management.

#### Step 2: Package Data

In this the prototypes are created, the visualization is built and also statistics is performed. It includes logically joining and manipulating the raw data into a new representation and package.

# Step 3: Deliver Data

In this process data is delivered to those who need that data.

# Data Science vs. Data Analysis

It's very important to know that data science and Data analysis are little similar but, many differences between them. Let's check out the differences

Data Science	Data Analysis		
Providing strategic ac tionable insights into the world	Providing operational observations into issues		
Mathematical, technical and strategic knowledge are mandatory	Data analysis and visualization skills required		
Deal with big data	Not necessarily deal with big data		

CLASS: IIIB.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE UNIT: I (DATA SCIENTIST'S TOOL BOX) BATCH-2017-2020

In brief, with the help of data science, we will be able to analyze datasets, understand it and by performing necessary operations, we will get the resultant which will be beneficial for users.

# **Data Science Components**

#### 1. Datasets

What will you analyze on? Data, right? You need a lot of data which can be analyzed; this data is fed to your algorithms or analytical tools. You get this data from various researches conducted in the past.

#### 2. R Studio

R is an open source programming language and software environment for statistical computing and graphics that is supported by the R foundation. The R language is used in an IDE called R Studio.

Why is it used?

• Programming and Statistical Language

- Apart from being used as a statistical language, it can also be used a programming language for analytical purposes.
- Data Analysis and Visualization

- Apart from being one of the most dominant analytics tools, R also is one of the most popular tools used for data visualization.
- Simple and Easy to Learn

CLASS: IIIB.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE UNIT: I (DATA SCIENTIST'S TOOL BOX) BATCH-2017-2020

o R is a simple and easy to learn, read & write

### • Free and Open Source

o R is an example of a FLOSS (Free/Libre and Open Source Software) which means one can freely distribute copies of this software, read it's source code, modify it, etc.

R Studio was sufficient for analysis, until our datasets became huge, also unstructured at the same time.

# Introduction to the tools that will be used in building data analysis software:

# **Data Science: Productivity Tools**

Data science projects involve keeping track of many data files and analysis scripts. Learn GitHub, git, Unix/Linux and RStudio to keep your projects organized and produce reproducible reports.

### 1. Version control

VCS are sometimes known as SCM (Source Code Management) tools or RCS (Revision Control System). Version control is a system that records changes to a file or set of files over time so that you can recall specific versions later.

# **Types:**

- A) Local Version Control Systems
- B) Centralized Version Control Systems
- C) Distributed Version Control Systems

## **Local Version Control Systems**

Many people's version-control method of choice is to copy files into another directory (perhaps a time-stamped directory, if they're clever). This approach is very common because it is so simple, but it is also incredibly error prone. It is easy to forget which directory you're in and accidentally write to the wrong file or copy over files you don't mean to.

To deal with this issue, programmers long ago developed local VCSs that had a simple database that kept all the changes to files under revision control.

CLASS: IIIB.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE UNIT: I (DATA SCIENTIST'S TOOL BOX) BATCH-2017-2020

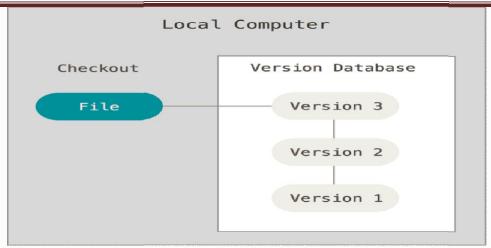

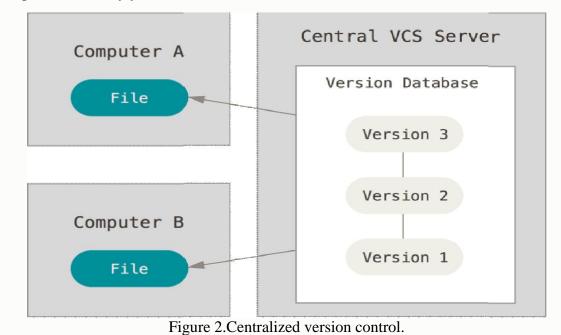

Figure 1.Local version control.

One of the more popular VCS tools was a system called RCS, which is still distributed with many computers today. RCS works by keeping patch sets (that is, the differences between files) in a special format on disk; it can then re-create what any file looked like at any point in time by adding up all the patches.

# **Centralized Version Control Systems**

The next major issue that people encounter is that they need to collaborate with developers on other systems. To deal with this problem, Centralized Version Control Systems (CVCSs) were developed. These systems, such as CVS, Subversion, and Perforce, have a single server that contains all the versioned files, and a number of clients that check out files from that central place. For many years, this has been the standard for version control.

KARPHORIE DE COURSE NAME: INTRODUCTION TO DATA SCIENCE

ACADEMY OF HORSE DOLLARS: IIIB.Sc CS

COURSE NAME: INTRODUCTION TO DATA SCIENCE

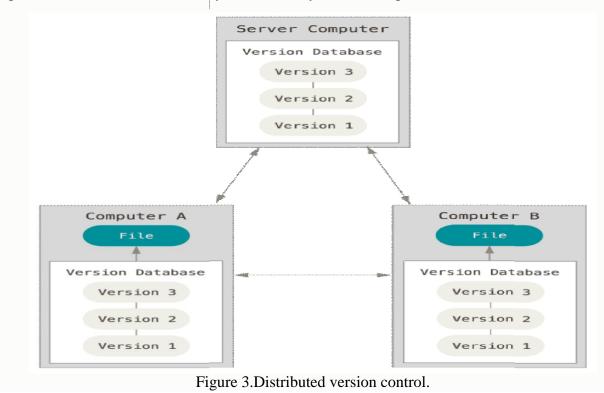

UNIT: I (DATA SCIENTIST'S TOOL BOX) BATCH-2017-2020

This setup offers many advantages, especially over local VCSs. For example, everyone knows to a certain degree what everyone else on the project is doing. Administrators have finegrained control over who can do what, and it's far easier to administer a CVCS than it is to deal with local databases on every client.

However, this setup also has some serious downsides. The most obvious is the single point of failure that the centralized server represents. If that server goes down for an hour, then during that hour nobody can collaborate at all or save versioned changes to anything they're working on. If the hard disk the central database is on becomes corrupted, and proper backups haven't been kept, you lose absolutely everything— the entire history of the project except whatever single snapshots people happen to have on their local machines. Local VCS systems suffer from this same problem—whenever you have the entire history of the project in a single place, you risk losing everything.

# **Distributed Version Control Systems**

This is where Distributed Version Control Systems (DVCSs) step in. In a DVCS (such as Git, Mercurial, Bazaar or Darcs), clients don't just check out the latest snapshot of the files; rather, they fully mirror the repository, including its full history. Thus, if any server dies, and these systems were collaborating via that server, any of the client repositories can be copied back up to the server to restore it. Every clone is really a full backup of all the data.

KARPAGAM
CLASS: IIIB.Sc CS
COURSE NAME: INTRODUCTION TO DATA SCIENCE
UNIT: I (DATA SCIENTIST'S TOOL BOX) BATCH-2017-2020

Furthermore, many of these systems deal pretty well with having several remote repositories they can work with, so you can collaborate with different groups of people in different ways simultaneously within the same project. This allows you to set up several types of workflows that aren't possible in centralized systems, such as hierarchical models.

#### 2. Markdown

**Markdown** is a lightweight markup language with plain text formatting syntax. It is designed so that it can be converted to HTMLand many other formats using a tool by the same name. Markdown is often used to format readme files, for writing messages in online discussion forums, and to create rich text using a plain text editor.

### 3. git

Git is considered to be a newer and faster emerging star when it comes to version control systems. First developed by the creator of Linux kernel, Linus Torvalds, Git has begun to take the community for web development and system administration by storm, offering a largely different form of control. Here, there is no singular centralized code base that the code can be pulled from, and different branches are responsible for hosting different areas of the code. Other version control systems, such as VCS and SVN (Subversion control system), use a centralized control, so that only one master copy of software is used. As a fast and efficient system, many system administrators and open-source projects use Git to power their repositories. However it is worth noting that Git is not as easy to learn as SVN or VCS is, which means that beginners may need to steer clear if they're not willing to invest time to learn the tool.

### 4. GitHub

GitHub is a web-based hosting service for version control using Git. It is mostly used for computer code. It offers all of the distributed version control and source code management (SCM) functionality of Git as well as adding its own features. It provides access control and several collaboration features such as bug tracking, feature requests, task management, and wikis for every project.

#### 5. R

R provides a wide variety of statistical (linear and nonlinear modelling, classical statistical tests, time-series analysis, classification, clustering, ...) and graphical techniques, and is highly extensible. The S language is often the vehicle of choice for research in statistical methodology, and R provides an Open Source route to participation in that activity.

One of R's strengths is the ease with which well-designed publication-quality plots can be produced, including mathematical symbols and formulae where needed. Great care has been taken over the defaults for the minor design choices in graphics, but the user retains full control.

R is available as Free Software under the terms of the Free Software Foundation's GNU General Public License in source code form. It compiles and runs on a wide variety of UNIX platforms and similar systems (including FreeBSD and Linux), Windows and MacOS.

CLASS: IIIB.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE UNIT: I (DATA SCIENTIST'S TOOL BOX) BATCH-2017-2020

### 6. RStudio.

**RStudio** is a free and open-source integrated development environment (IDE) for R, a programming language for statistical computing and graphics. RStudio was founded by JJ Allaire, creator of the programming language ColdFusion. Hadley Wickham is the Chief Scientist at RStudio.

RStudio is available in two editions: RStudio Desktop, where the program is run locally as a regular desktop application; and RStudio Server, which allows accessing RStudio using a web browser while it is running on a remote Linux server. Prepackaged distributions of RStudio Desktop are available for Windows, macOS, and Linux.

RStudio is available in open source and commercial editions and runs on the desktop (Windows, macOS, and Linux) or in a browser connected to RStudio Server or RStudio Server Pro (Debian, Ubuntu, Red Hat Linux, CentOS, openSUSE and SLES).

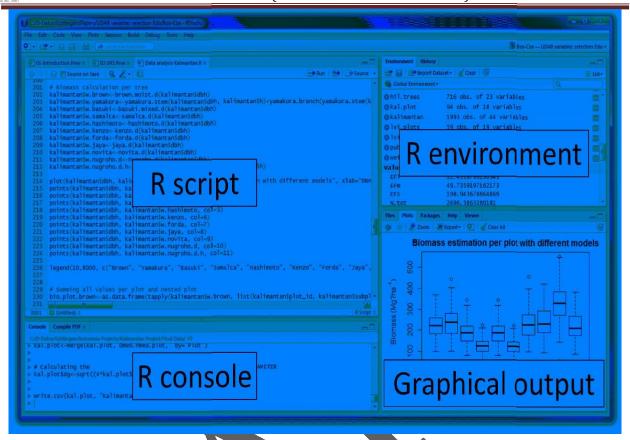

RStudio is written in the C++ programming language and uses the Qt framework for its graphical user interface.

Work on RStudio started around December 2010, <a href="https://www.wikipedia.org/wiki/RStudio-cite\_note-9">https://www.wikipedia.org/wiki/RStudio-cite\_note-9</a> and the first public beta version (v0.92) was officially announced in February 2011. Version 1.0 was released on 1 November 2016. Version 1.1 was released on 9 October 2017.

In April 2018 it was announced RStudio will providing operational and infrastructure support for Ursa Labs. Ursa Labs will focus on building a new data science runtime powered by Apache Arrow.

CLASS: IIIB.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE UNIT: I (DATA SCIENTIST'S TOOL BOX) BATCH-2017-2020

Let's quickly understand the interface of R Studio:

- 1. **R Console:** This area shows the output of code you run. Also, you can directly write codes in console. Code entered directly in R console cannot be traced later. This is where R script comes to use.
- 2. **R Script:** As the name suggest, here you get space to write codes. To run those codes, simply select the line(s) of code and press Ctrl + Enter. Alternatively, you can click on little 'Run' button location at top right corner of R Script.
- 3. **R environment:** This space displays the set of external elements added. This includes data set, variables, vectors, functions etc. To check if data has been loaded properly in R, always look at this area.
- 4. **Graphical Output:** This space display the graphs created during exploratory data analysis. Not just graphs, you could select packages, seek help with embedded R's official documentation

### **POSSIBLE QUESTIONS**

### 2 MARKS

1. What is Data science?

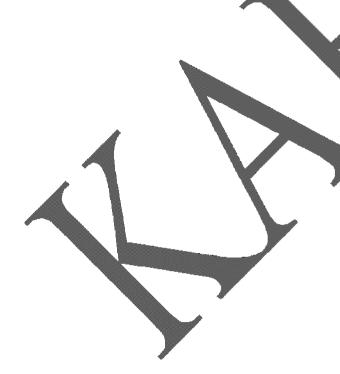

CLASS: IIIB.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE UNIT: I (DATA SCIENTIST'S TOOL BOX) BATCH-2017-2020

- 2. Who is a Data Scientist?
- 3. Define Data Science Process?
- 4. Compare Data Science vs. Data Analysis?
- 5. Name the Data Science Components?
- 6. Classify the Version control system?
- 4. Engrave GitHub?
- 5. Write down R?
- 6. Note down RStudio?

# 6 MARKS

- 1. Explain in detail about the tools that will be used in building data analysis software
- 2. Write a brief description about data science.

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE COURSE CODE: 17CSU503B UNIT: II (R PROGRAMMNG BASICS) BATCH-2017-2020

### **UNIT-II**

**R Programming Basics**: Overview of R, R data types and objects, reading and writing data, Control structures, functions, scoping rules, dates and times, Loop functions, debugging tools, Simulation, code profiling

## **R Programming Basics**:

R is a programming language and software environment used for statistical analysis, data modeling, and graphical representation and reporting. R is best tooling for software programmers, statisticians and data miners who looking forward for to easily manipulate and present data in compelling ways.

R was first created and developed by Ross Ihaka and Robert Gentleman in the University of Auckland New Zealand in 1993. And now "R Development Core Team" is developing it.

#### Overview of R:

R is an interpreted programming language (hence also called a scripting language), that means that your code does not have to be compiled before running it. This is a high-level language in which you do not have access to the inner workings of computer where you are running your code; everything is leaning toward helping you analyze data which is advantageous.

#### Uses of R

- Weather Service uses R to predict severe flooding.
- Social networking companies are using R to monitor their user experience.
- Newspapers companies are using R to create infographics and interactive data journalism applications.

R is adopted by the major companies because their data scientists prefer to use it.

#### Features of R

As described earlier, R programming language is versatile and can be used for software development environment for statistical analysis or for graphics representation and reporting purposes.

The below mentioned are the significant features of R language:

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE COURSE CODE: 17CSU503B UNIT: II (R PROGRAMMNG BASICS) BATCH-2017-2020

- R is simple and effective programming language which has been well-developed, as well as R is data analysis software.
- R is a well designed, easy and effective language that has the concepts of conditionals, looping, user-defined recursive procedures and various I/O facilities.
- R has a large, consistent and incorporated set of tools used for data analysis.
- R contains suite of operators for different types of calculations on arrays, lists and vectors.
- R provides highly extensible graphical techniques
- R graphical techniques for data analysis output either directly display to the computer, or can be print on paper.
- R has an effective data handling and storage facility.
- R is an online vibrant community.
- R is free, open source, powerful and highly extensible.

#### **Evolution of R**

In most of the time, you should be clear from the context that R is being referred to. R (which is the language) was developed in the early 1990's by Ross Ihaka and Robert Gentleman, when they both work at Department of Statistics at the University of Auckland, New Zealand. R made its first appearance in the year 1993. This programming language is based upon the S language which was developed in 1970s at Bell Laboratories, mainly by John Chambers. R (which is the software) is a GNU based project that reflects its status as important free along with open source software. Both the language along with the software is now developed by a group of 20 people approx. known as R Core Team.

R is the most widely used statistical programming language because of various reasons.

- R is free and an open source software project.
- R allows integrating with other languages, like C/C++, Java, and Python etc.
- R has an online vibrant growing community of users.
- The CRAN (The Comprehensive R Archive Network) package repository features have more than 8270 available packages.
- R is platform-independent, so you can use it on any operating system.

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE COURSE CODE: 17CSU503B UNIT: II (R PROGRAMMNG BASICS) BATCH-2017-2020

## **Basic Program**

Once you have setup the environment for R, it is easy to start R command prompt by simply typing the command mentioned below at your command prompt:

\$ R

This command will let you launch the R interpreter with a symbol like this '>' and you start writing the program using command prompt:

>newStr<- "Hello - World!" > print (newStr)

# **Output:**

[1] "Hello - World!"

### R Data types:

There are several basic data types in R which are of frequent occurrence in coding R calculations and programs. Though seemingly in the clear, they can at a halt deliver surprises. Here you will try to understand all of the different forms of data type well by direct testing with the R code.

Here is the list of all the data types provided by R:

- Numeric
- Integer
- Complex
- Logical
- Character

## **Numeric Data type**

Decimal values are referred as numeric data types in R. This is the default working out data type. If you assign a decimal value for any variable x like given below, x will become a numeric type.

> g = 62.4 # assign a decimal value to g

>g # print the variable's value - g

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE COURSE CODE: 17CSU503B UNIT: II (R PROGRAMMNG BASICS) BATCH-2017-2020

# **Integer Data type**

If you want to create any integer variable in R, you have to invoke the as.integer() function to define any integer type data. You can be certain that y is definitely an integer by applying the is.integer() function.

> s = as.integer(3)

>s # print the value of s

Fortunately, you can drive in a numeric value into an integer with this above mentioned as.integer() function like this:

>as.integer(3.14) # drives in a numeric value

But it will work like type casting where the value of 3.14 gets changed to 3.

# **Complex Data type**

A complex value for coding in R can be defined using the pure imaginary values 'i'

> k = 1 + 2i # creating a complex number

>k # printing the value of k

The below mentioned example gives an error since -1 is not a complex value.

>sqrt(-1) # square root of -1

And the error message will be something like this:

## Warning message:

In sqrt(-1): NaNs produced

### **Logical Data type**

A logical value is mostly created when comparison between variables are done. Example will be like:

> a = 4; b = 6 # sample values

> g = a > b # is a larger than b?

> g # print the logical value

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE COURSE CODE: 17CSU503B UNIT: II (R PROGRAMMNG BASICS) BATCH-2017-2020

### **Output:**

[1] False

# Character data type

A character object can be used for representing string values in R. You have to convert objects into character values using the as.character() function within your code like this:

> g = as.character(62.48)

>g # prints the character string

# **Output:**

[1] "3.14"

> class(s) # print the class name of s

# **Output:**

[1] "character"

R has a wide variety of data types including scalars, vectors (numerical, character, logical), matrices, data frames, and lists.

### **Vectors**

a <- c(1,2,5.3,6,-2,4)		# numeric vector
b <- c("one","two","three")		# character vector
c <- c(TRUE,TRUE,TRUE,FA	ALSE,TRUE,FALSE)	#logical vector

Refer to elements of a vector using subscripts

a[c(2,4)] # 2nd and 4th elements of vector

### **Matrices**

All columns in a matrix must have the same mode(numeric, character, etc.) and the same length. The general format is

mymatrix<- matrix(vector, nrow=r, ncol=c, byrow=FALSE, dimnames=list(char\_vector\_rownames, char\_vector\_colnames))

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE COURSE CODE: 17CSU503B UNIT: II (R PROGRAMMNG BASICS) BATCH-2017-2020

**byrow=TRUE** indicates that the matrix should be filled by rows. **byrow=FALSE** indicates that the matrix should be filled by columns (the default). **dimnames** provides optional labels for the columns and rows.

### # generates 5 x 4 numeric matrix

```
y<-matrix(1:20, nrow=5,ncol=4)
```

### # another example

```
cells <- c(1,26,24,68)
rnames<- c("R1", "R2")
cnames<- c("C1", "C2")
mymatrix<- matrix(cells, nrow=2, ncol=2, byrow=TRUE, dimnames=list(rnames, cnames))
```

Identify rows, columns or elements using subscripts.

x[,4] # 4th column of matrix

x[3,] # 3rd row of matrix

x[2:4,1:3] # rows 2,3,4 of columns 1,2,3

### **Arrays**

Arrays are similar to matrices but can have more than two dimensions. See **help(array)** for details.

#### **Data Frames**

A data frame is more general than a matrix, in that different columns can have different modes (numeric, character, factor, etc.). This is similar to SAS(Statistical Analysis System) and SPSS (Software package for statistical analysis)datasets.

```
d <- c(1,2,3,4)
e <- c("red", "white", "red", NA)
f <- c(TRUE,TRUE,TRUE,FALSE)
mydata<- data.frame(d,e,f)
names(mydata) <- c("ID","Color","Passed") # variable names
```

There are a variety of ways to identify the elements of a data frame.

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE COURSE CODE: 17CSU503B UNIT: II (R PROGRAMMNG BASICS) BATCH-2017-2020

myframe[3:5] # columns 3,4,5 of data frame myframe[c("ID","Age")] # columns ID and Age from data frame myframe\$X1 # variable x1 in the data frame

#### Lists

An ordered collection of objects (components). A list allows you to gather a variety of (possibly unrelated) objects under one name.

# example of a list with 4 components - a string, a numeric vector, a matrix, and a scaler w <- list(name="Fred", mynumbers=a, mymatrix=y, age=5.3)

### # example of a list containing two lists

 $v \leftarrow c(list1, list2)$ 

Identify elements of a list using the [N] convention.

mylist[[2]] # 2nd component of the list
mylist[["mynumbers"]] # component named mynumbers in list

### Object in R

In R, all types of data are treated as objects. However, objects are not simply collections of data. They are particular instances (instantiations) of particular classes. Operations, or functions, are defined for specific classes. Let's try working on something such as a point pattern.

# # This time I will not show R-outputs with codes. Just type or paste these lines into R and see what you get.

 $x \leftarrow rnorm(50, 10, 3)$  # creates 50 random x values from a normal distribution  $y \leftarrow rnorm(50, 10, 4)$  # creates 50 random y values mypoints = as.data.frame(cbind(x,y)) # makes a data frame class(mypoints)

mypoints

summary(mypoints)

plot(mypoints) # Gee, it looks like a point pattern...

box <- bbox(mypoints) # Type in library(splanes) first. Bounding Box - did this work? Why not?

It seems that most functions above work well with this data frame but "bbox" does not. See help(bbox). It didn't work because "bbox" doesn't work on objects of class data.frame.

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE COURSE CODE: 17CSU503B UNIT: II (R PROGRAMMNG BASICS) BATCH-2017-2020

"bbox" operates on objects of class points (or a matrix of x and y values). Therefore you need to change the class accordingly. The following four approaches all work (try each one separately):

box <- bbox(cbind(x,y))

box <- bbox(as.matrix(mypoints))</pre>

box <- bbox(as.points(x,y))

box <- bbox(as.points(mypoints))</pre>

### READING AND WRITING DATA TO AND FROM R

### **Functions for Reading Data into R:**

There are a few very useful functions for reading data into R

- 1. **read.table()** and **read.csv()** are two popular functions used for reading tabular data into R.
- 2. readLines() is used for reading lines from a text file.
- 3. **source()** is a very useful function for reading in R code files from a another R program.
- 4. **dget()** function is also used for reading in R code files.
- 5. **load()** function is used for reading in saved workspaces
- 6. unserialize() function is used for reading single R objects in binary format.

# **Functions for Writing Data to Files:**

There are similar functions for writing data to files

- 1. write.table() is used for writing tabular data to text files (i.e. CSV).
- 2. **writeLines()** function is useful for writing character data line-by-line to a file or connection.
- 3. **dump()** is a function for dumping a textual representation of multiple R objects.
- 4. **dput()** function is used for outputting a textual representation of an R object.
- 5. save() is useful for saving an arbitrary number of R objects in binary format to a file.
- 6. **serialize()** is used for converting an R object into a binary format for outputting to a connection (or file).

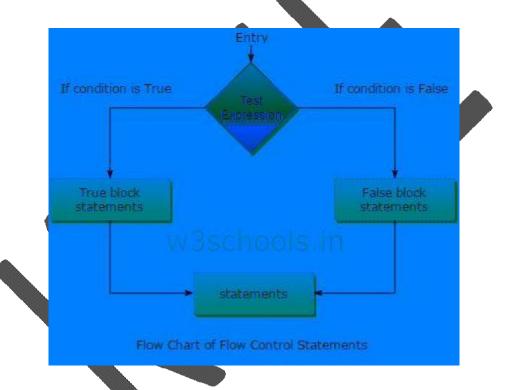

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE COURSE CODE: 17CSU503B UNIT: II (R PROGRAMMNG BASICS) BATCH-2017-2020

#### **Control Structures:**

In R programming like that with other languages, there are several cases where you might wish for conditionally execute any code. Here 'if' and 'switch' functions of R language can be implemented if you already programmed condition based code in other languages, Vectorized conditional implementation via the ifelse() function is also a characteristics of R.

There are a lot of situations where you do not just want to execute one statement after another: in fact you have to control the flow of execution also. Usually this means that you merely want to execute some code if a condition is fulfilled. In that case control flow statements are implemented within R Program.

Here is the general structure of how control flow can be handled using the conditional statements within R programming.

### **Types of Flow Control Statements in R Programming**

R programming provides three different types if statements that allows programmers to control their statements within source code. These are:

• if statement

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE COURSE CODE: 17CSU503B UNIT: II (R PROGRAMMNG BASICS) BATCH-2017-2020

- if...else statement
- switch statement

### The 'if' Statement

The simplest form of decision controlling statement for conditional execution is the 'if' statement. The 'if' produces a logical value (more exactly, a logical vector having length one) and carries out the next statement only when that value becomes TRUE. In other words, an 'if' statement is having a Boolean expression followed by single or multiple statements.

```
if (TRUE) print ("One line executed")
## One line executed
if (FALSE) print ("Line not executed")
## Line not executed
if (NA) print ("Don't know whether true or not!")
## Error: missing value where TRUE/FALSE needed
```

### The 'if....else' statements

In this type of statements the 'if' statement is usually followed by an optional 'else' statement that gets executes when the Boolean expression becomes false. This statement is used when you will be having multiple statements with multiple conditions to be executed.

### **Example:**

```
if (TRUE)
{
print ("This will execute...")
} else
{
print ("but this will not.")
}
## This will execute...
```

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE COURSE CODE: 17CSU503B UNIT: II (R PROGRAMMNG BASICS) BATCH-2017-2020

#### The 'switch' Statement in R

A switch statement permits a variable to be tested in favor of equality against a list of case values. In the switch statement, for each case the variable which is being switched is checked. This statement is generally used for multiple selection of condition based statement.

The basic syntax for programming a switch based conditional statements in R is:

#### **Syntax:**

```
switch (test_expression, case1, case2, case3.....caseN)
```

Here is a simple example of how to make use of switch statement in R:

### **Example:**

```
gk<- switch (
2,

"First",

"Second",

"Third",

"Fourth"
)

print (gk)

## [1] "Second"
```

#### **R Functions:**

All the variables that we use within a program needs to be stored somewhere. That somewhere can be called as an environment in R language. They are closely related to lists in which they are used to store diverse types of variables together. There may arise two situations where you might encounter environments. 1st, whenever a function is called, all the variables described by the function are stored in an environment belonging to that specific function (a function along with its environment is sometimes referred to as closure). 2<sup>nd</sup>, when you load a package, the functions in that package gets stored in an environment on the search path.

# What is a function in R programming?

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE COURSE CODE: 17CSU503B UNIT: II (R PROGRAMMNG BASICS) BATCH-2017-2020

A function can be defined as a collection of statements structured together for carrying out a definite task. R provides a huge number of in built functions and also user can create their own functions.

In R, a function is treated as object so the R interpreter is capable of passing control to the function, along with arguments which may be essential to the function for achieving the actions. The function has the capability to turn its performance and returns control to the interpreter that may be stored in other objects.

The keyword 'function' is used to create a function in R,

### The basic structure of a function can be:

```
function_name<- function (argu_1, argu_2, ..., argu_N)
{
#Function body
}</pre>
```

# **Various Components of a Function:**

The function in R is having various parts and each of them is having its own characteristics. These are:

- Function Name: is the real name of the function with which you can call it in some other part of the program. It is stored as an object with this name given to it.
- Arguments: is a placeholder for that specific function. As a function gets invoked, you
  can pass a value to the argument. Arguments are not mandatory to be used within the
  function; i.e. a function may not contain any arguments. Arguments can contain default
  values also.
- Function Body: It may contain a set of statements which specifies what the function does and how it will work along with its use.
- Return Value: Return value of any function is the last expression in the function which tells what that function is able to return.

### **Built in Functions:**

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE COURSE CODE: 17CSU503B UNIT: II (R PROGRAMMNG BASICS) BATCH-2017-2020

Built in functions are those functions whose meaning and working is already defined within the function's body and they are kept somewhere within the packages or libraries of R language. These pre-defined functions make programmers task easier.

### Some common examples of in built functions are:

```
seq(),max(), mean(), sum(x), paste(...) etc.
```

They are directly called and used by programmers who are writing programs.

### Example:

```
print (seq (12,30))
```

This creates a sequence of number from 12 to 30 using the predefined function seq().

```
print (mean (4:26))
```

This calculates the mean of all the numbers ranging from 4 to 26

Here is a

```
hypotenuse<- function (x, y) { sqrt (x ^2 + y ^2)
```

You can now call this function as like this:

```
hypotenuse (3, 4)
```

## [1] 5

hypotenuse (y = 24, x = 7)

## [1] 25

#### **Scoping Rules:**

#### Variable Scope:

- A variable is pairing of a name and a value.
- Variables can be created by assignment. The assignment

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE COURSE CODE: 17CSU503B UNIT: II (R PROGRAMMNG BASICS) BATCH-2017-2020

$$x = 10$$

Indicates that the value "10" and the name "x" are to be paired.

- R has both local and global variables.
- Global variables are created by assignments at top level.
- Local variables are created by assigning values within functions.

### **Example: Same Name, Different Variables**

There are two "x" variables in the following code.

```
x = 10 # <-- global fun = function() { x = 20 # <-- local to fun }
```

Inside "fun," the value of "x" is "20."

Outside "fun," the value of "x" is 10.

Changes made to one "x" do not affect the other

# Visibility of Global Variables:

Inside a function, the values of both local and global variables are visible.

```
> y = 20

>fun =

function()

{

x = 30

x + y

}
```

>fun()

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE COURSE CODE: 17CSU503B UNIT: II (R PROGRAMMNG BASICS) BATCH-2017-2020

[1] 50

Here, "fun" combines the value of a local variable, "x," and the value of a global variable, "y

**Nested Functions** 

When R functions are nested, the variables of the outer functions are visible within the nested functions.

#### **Scoping Rules:**

[1] 30

- The scoping rules of a (computer) language govern how the value of variables can be determined.
- The scope of a variable is the region of code where that variable has meaning.
- In R, a local variable has meaning only within the function it is local to (including any functions that are nested within that function).

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE COURSE CODE: 17CSU503B UNIT: II (R PROGRAMMNG BASICS) BATCH-2017-2020

- When a value is sought for a given name, the local scope is inspected for a value, then any nesting scopes (i.e. functions) and finally a global value is sought. Function Parameters, Arguments and Variables
- Assignment is not the only way that variables are created.
- The association of function's arguments with the function's formal parameters also creates variables.
- In this case the variable name is the formal parameter name and the (initial) value of the variable is corresponding function argument.

### **Example: Parameters and Arguments**

1. In the function definition
fun =
function(a, b)

 $a^2 + b^2$ 

The formal parameters of the function are "a" and "b."

2. In the function call fun(10, 20) the arguments to the function are "10" and "20." The arguments and parameters are paired as variables.

### A Simple Example

The following function adds a local variable "u" to a global variable "x."

```
> add.x.to = function(u) x + u
```

> x = 10

> add.x.to(20)

#### **Output:**

[1] 30

> x = 20

> add.x.to(20)

#### Output:

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE COURSE CODE: 17CSU503B UNIT: II (R PROGRAMMNG BASICS) BATCH-2017-2020

[1] 40

# R Date and Time:

Dates and times are very frequently used concept in data analysis — not least for time - series study. The terrible fact is that with different numbers of days for each month, leap years, leap seconds along with time zones, they can be quite awful for dealing with programmatically.

The good news is that R provides a broad range of capabilities to deal with times and dates. While these ideas are quite fundamental to R programming, they have been left until now as some of the best ways of using them comes with in add-on packages.

### **Date and Time Classes:**

There are three types of date and time classes which arrive with R programming. These are:

- 1. POSIXct
- 2. POSIXIt and
- 3. Date.

### The sub categories are explained below:

### **POSIX Dates and Times Classes**

POSIX dates and times are classic R: brightly thorough in their implementation, navigating all sorts of obscure technical issues, but with awful Unixy names that make everything seem more complicated than it really is.

The function Sys.time() is used to return the current date and time in POSIXct notation:

```
(now_ct<- Sys.time ())
```

#[1] "2016-10-28 20:48:02 BST"

Here, ct is the short form for calendar time.

Again, when the date needs to be printed, you just see a formatted version of it, so it won't go obvious how the date is stored. By using 'unclass', you can see where it is indeed just a number:

unclass (now\_ct)

#[1] 1.374e+09

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE COURSE CODE: 17CSU503B UNIT: II (R PROGRAMMNG BASICS) BATCH-2017-2020

#### **The Date Class**

The third is the 'date' class in base R which is better named as the 'Date' class. It keeps dates as if the number of days since the starting of 1970. The 'Date' class is finely used in cases where programmers' do not bother about the time of day. Fractional days are probable which can get generated by computing a mean Date (suppose), but the POSIX classes are better for those situations like:

```
(now_date<- as. Date (now_ct))
## [1] "2016-10-28"
class (now_date)
## [1] "Date"
unclass(now_date)
## [1] 15903
```

Other classes for date and time have add-on packages which include date, dates, chron, year mon, yearqtr, timeDate, ti, and jul.

#### **Lubridate**

If you have become sad with dates and you have considered to skip the using this class, do not worry about. Lubridate', as the name implies, put in some much needed lubrication to the practice of date manipulation. It does not include many new features over base R, but makes your code more readable and facilitates you to avoid thinking too much.

The real beauty is dissimilar elements in the same vector be able to have different formats (as long as the year is followed by the month that is followed by the day):

```
library (lubridate)

# Attaching the package: 'lubridate in your program

# The following object gets masked from 'package:chron':

# for - days, hours, minutes, seconds, years

karlos_rays_birth_date<- c(

"1994 - 08 - 28",
```

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE COURSE CODE: 17CSU503B UNIT: II (R PROGRAMMNG BASICS) BATCH-2017-2020

```
"1993/08\\28",

"Saturday + 1993.08*28"
)

ymd (karlos_rays _birth_date)

## [1] "1993 - 08 - 28 UTC" "1993-08-28 UTC" "1993-08-28 UTC"
```

### **Loop functions:**

Loops are used in programming to repeat a specific block of code.

- For loop
- While loop
- Break and next
- repeat loop

### For loop:

A for loop is used to iterate over a vector in R programming.

### **Syntax of for loop**

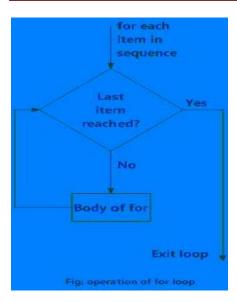

```
for (val in sequence) {
statement
}
```

Here, sequence is a vector and val takes on each of its value during the loop. In each iteration, statement is evaluated.

### Flowchart of for loop

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE COURSE CODE: 17CSU503B UNIT: II (R PROGRAMMNG BASICS) BATCH-2017-2020

### **Example:** for loop

Below is an example to count the number of even numbers in a vector.

```
x <- c(2,5,3,9,8,11,6)

count<- 0

for (val in x) {

if(val %% 2 == 0) count = count+1

}

print(count)
```

#### **Output**

[1] 3

In the above example, the loop iterates 7 times as the vector x has 7 elements.

In each iteration, val takes on the value of corresponding element of x.

We have used a counter to count the number of even numbers in x. We can see that x contains 3 even numbers.

#### While loop:

In R programming, while loops are used to loop until a specific condition is met.

### Syntax of while loop

```
while (test_expression)
{
statement
}
```

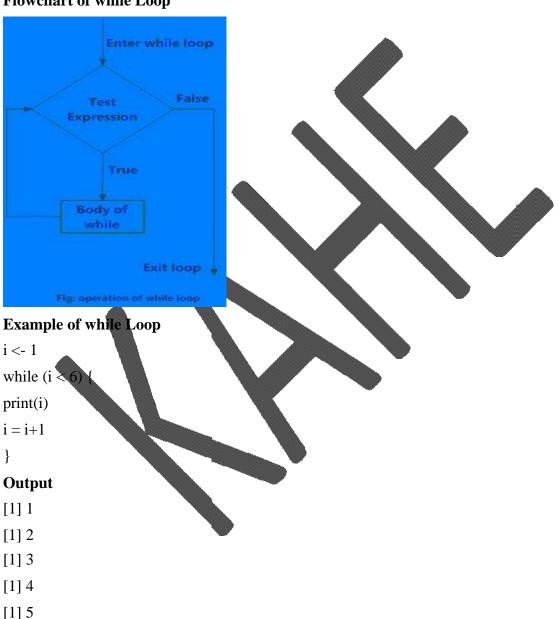

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE COURSE CODE: 17CSU503B UNIT: II (R PROGRAMMNG BASICS) BATCH-2017-2020

Here, test\_expression is evaluated and the body of the loop is entered if the result is TRUE.

The statements inside the loop are executed and the flow returns to evaluate the test\_expressionagain.

This is repeated each time until test\_expression evaluates to FALSE, in which case, the loop exits.

### Flowchart of while Loop

In the above example, i is initially initialized to 1.

Here, the test\_expression is i < 6 which evaluates to TRUE since 1 is less than 6. So, the body of the loop isentered and i is printed and incremented.

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE COURSE CODE: 17CSU503B UNIT: II (R PROGRAMMNG BASICS) BATCH-2017-2020

Incrementing i is important as this will eventually meet the exit condition. Failing to do so will result into an infinite loop.

In the next iteration, the value of i is 2 and the loop continues.

This will continue until i take the value 6. The condition 6 < 6 will give FALSE and the while loop finally exits.

#### R break and next statements:

In R programming, a normal looping sequence can be altered using the break or the next statement.

#### break statement:

A break statement is used inside a loop (repeat, for, while) to stop the iterations and flow the control outside of the loop.

In a nested looping situation, where there is a loop inside another loop, this statement exits from the innermost loop that is being evaluated.

# The syntax of break statement is:

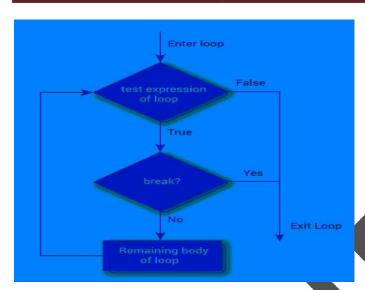

```
if (test_expression) {
break
}
```

Note: the break statement can also be used inside the else branch of if. else statement.

#### Flowchart of break statement

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE COURSE CODE: 17CSU503B UNIT: II (R PROGRAMMNG BASICS) BATCH-2017-2020

# **Example 1: break statement**

```
x <- 1:5
for (val in x) {
  if (val == 3){
    break
  }
  print(val)
}</pre>
```

# Output (

[1] 1

[1] 2

In this example, we iterate over the vector x, which has consecutive numbers from 1 to 5.

Inside the for loop we have used a if condition to break if the current value is equal to 3.

As we can see from the output, the loop terminates when it encounters the break statement.

#### **Next statement**

A next statement is useful when we want to skip the current iteration of a loop without terminating it. On encountering next, the R parser skips further evaluation and starts next iteration of the loop.

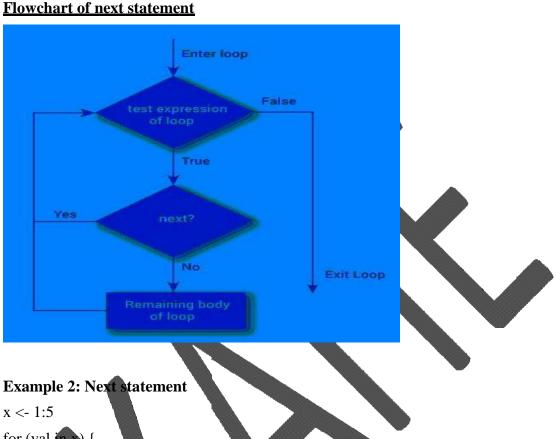

### The syntax of next statement is:

```
if (test_condition) {
next
```

COURSE NAME: INTRODUCTION TO DATA SCIENCE CLASS: III B.Sc CS COURSE CODE: 17CSU503B UNIT: II (R PROGRAMMNG BASICS) BATCH-2017-2020

**Note:** the next statement can also be used inside the else branch of if...else statement.

for (val in x) {

if (val == 3)

next

print(val)

### Output

- [1] 1
- [1] 2
- [1] 4
- [1] 5

In the above example, we use the next statement inside a condition to check if the value is equal to 3.

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE COURSE CODE: 17CSU503B UNIT: II (R PROGRAMMNG BASICS) BATCH-2017-2020

If the value is equal to 3, the current evaluation stops (value is not printed) but the loop continues with the next iteration.

The output reflects this situation.

### Repeat loop:

A repeat loop is used to iterate over a block of code multiple numbers of times.

There is no condition check in repeat loop to exit the loop.

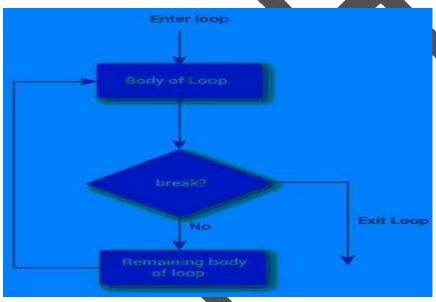

We must ourselves put a condition explicitly inside the body of the loop and use the break statement to exit the loop. Failing to do so will result into an infinite loop.

### Syntax of repeat loop

```
repeat {
statement
}
```

In the statement block, we must use the break statement to exit the loop.

# Flowchart of repeat loop

### **Example: repeat loop**

```
x <- 1
repeat {
print(x)
x = x+1</pre>
```

if (x == 6){

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE COURSE CODE: 17CSU503B UNIT: II (R PROGRAMMNG BASICS) BATCH-2017-2020

break
}

# Output

- [1] 1
- [1] 2
- [1] 3
- [1] 4
- [1] 5

In the above example, we have used a condition to check and exit the loop when x takes the value of 6.

Hence, we see in our output that only values from 1 to 5 get printed.

Debugging tools:

# What is R Debug?

A grammatically correct program may give as incorrect results due to logical errors. In case, if such errors (i.e. bugs) occur, we need to find out why and where they occur so that you can fix them. The procedure to identify and fix bugs is called "debugging".

There are number of R debug Functions, such as:

- raceback()
- debug()
- browser()
- trace()
- recover()

### **R** Debug Functions

#### traceback()

If our code has already crashed and we want to know where the offending line is, try **traceback()**. This will (sometimes) show where about in the code the problem occurred.

When an **R function** fails, an error is printed to the screen. Immediately after the error, you can call traceback() to see in which function the error occurred. The traceback() function prints the list of functions that were called before the error occurred. The functions are printed in reverse order.

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE COURSE CODE: 17CSU503B UNIT: II (R PROGRAMMNG BASICS) BATCH-2017-2020

### For Example:

```
f < -function(x) {
r < -x - g(x)
r
g<-function(y) {
r < -y * h(y)
h<-function(z) {
r < -log(z)
if(r<10)
r^2
else
r^3
}
>f(-1)
Error in if (r < 10) r<sup>2</sup> else r<sup>3</sup>: missing value where TRUE/FALSE needed
In addition: Warning message:
In log(z): NaNs produced
>traceback()
3: h(y)
2: g(x)
1: f (-1)
```

# debug()

The function **debug()** in **R** allows one to step through the execution of a function, line by line. At any point, we can print out values of variables or produce a graph of the results within the function. While debugging, we can simply type "c" to continue to the end of the current section of code. traceback() does not tell us where in the function the error occurred. In order to know which line causes the error, we may want to step through the function using debug().

#### For Example:

Compute the sum of squared error  $SS = \sum_{i=1}^{n} (xi - \mu)$ 

```
## compute sum of squares
SS<-function(mu,x) {
d<-x-mu
d2<-d^2
ss<-sum(d2)
```

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE COURSE CODE: 17CSU503B UNIT: II (R PROGRAMMNG BASICS) BATCH-2017-2020

```
SS
# set seed to get reproducible results
>set.seed(100)
> x < -rnorm(100)
>SS(1,x)
[1] 202.5615
## now start debugging
>debug(SS)
>SS(1,x)
debugging in: SS(1, x)
debug: {
d <- x - mu
d2 < - d^2
ss < -sum(d2)
SS
attr(,"srcfile")
Browse[1]>
```

After you see the "Browse[1]>" prompt, you can do different things:

- Typing n executes the current line and prints the next one;
- By typing Q, we can quit the debugging;
- Typing where tells where you are in the function call stack;
- By typing ls(), we can list all objects in the local environment;

Typing an object name or print(<object name>) tells us current value of the object. If your object has name n, c or Q, we have to use print() to see their values.

### browser()

The R debug function '**browser()**' stops the execution of a function until the user allows it to continue. This is useful if we don't want to step through all the code, line-by-line, but we want it to stop at a certain point so we can check out what is going on. Inserting a call to the browser() in a function will pause the execution of a function at the point where the browser() is called. Similar to using debug() except we can control where execution gets paused.

# For Example:

```
h<-function(z) {
```

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE COURSE CODE: 17CSU503B UNIT: II (R PROGRAMMNG BASICS) BATCH-2017-2020

```
browser() ## a break point inserted here
r < -log(z)
if(r<10)
r^2
else
r^3
}
>f(-1)
Called from: h(y)
Browse[1]>ls()
[1] "z"
Browse[1]>z
[1] -1
Browse[1]> n
debug: r < -\log(z)
Browse[1]> n
debug: if (r < 10) r^2 else r^3
Browse[1]>ls()
[1] "r" "z"
<strong>Warning message:</strong>
In log(z): NaNs produced
Browse[1]>r
[1] NaN
Browse[1]>\delta
Error in if (r < 10) r<sup>2</sup> else r<sup>3</sup>; missing value where TRUE/FALSE needed
```

### trace()

Calling **trace**() on a function allows the user to insert bits of code into a function. The syntax for R debug function trace() is a bit strange for first time users. It might be better off using debug().

#### For Example:

```
>as.list(body(h))
[[1]]
'{'
[[2]]
r <- log(z)
[[3]]
if (r < 10) r^2 else r^3
attr(,"srcfile")
```

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE COURSE CODE: 17CSU503B UNIT: II (R PROGRAMMNG BASICS) BATCH-2017-2020

```
C:\Users\jihk\doc\courses\StatisticalComputing\lecture5\debugex1.R
>trace("h",quote(if(is.nan(r)) {browser()}), at=3, print=FALSE)
>f(1)
[1] 1
>f(-1)
Called from: eval(expr, envir, enclos)
Browse[1]>ls()
[1] "r" "z"
<strong>Warning message:</strong>
In log(z): NaNs produced
Browse[1]>r
[1] NaN
Browse[1]>z
[1] -1
Browse[1]>c
>
>trace("h",quote(if(z<0) {z<-1}), at=2, print=FALSE)
[1] "h"
>f(-1)
[1] -1
```

#### recover()

When we are debugging a function, **recover()** allows us to check variables in upper level functions.

#### For Example:

```
>trace("h",quote(if(is.nan(r)) {recover()}), at=3, print=FALSE)
[1] "h"
>f(-1)
Enter a frame number, or 0 to exit
1: f(-1)
2: g(x)
3: h(y)
Selection: 1
Called from: eval(expr, envir, enclos)
Browse[1]>ls()
[1] "x"
Warning message:
In log(z): NaNs produced
Browse[1]> x
```

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE COURSE CODE: 17CSU503B UNIT: II (R PROGRAMMNG BASICS) BATCH-2017-2020

[1] -1Browse[1]>cEnter a frame number, or 0 to exit 1: f(-1) 2: g(x)3: h(y) Selection: 2 Called from: eval(expr, envir, enclos) Browse[1]>ls() [1] "y" Browse[1]> y[1] -1Browse[1]>cEnter a frame number, or Enter 0 to **exit** 1: f(-1) 2: g(x)3: h(y) Selection: 3 Called from: eval(expr, envir, enclos) Browse[1]>ls() [1] "r" "z" Browse[1]>r[1] NaN Browse[1]> [1] -1 Browse[1]>cEnter a frame number, or Enter 0 to exit 1: f(-1) 2: g(x)3: h(y) Selection: 0 Error in if (r < 10) r<sup>2</sup> else r<sup>3</sup>: missing value where TRUE/FALSE needed

- recover() can be used as an error handler, set using options() (e.g.options(error=recover)).
- When a function throws an error, execution is halted at the point of failure. We can browse the function calls and examine the environment to find the source of the problem.

#### **Simulation**

Simulations provide a powerful technique for answering a broad set of methodological and theoretical questions and provide a flexible framework to answer specific questions relevant to one's own research.

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE COURSE CODE: 17CSU503B UNIT: II (R PROGRAMMNG BASICS) BATCH-2017-2020

For example, simulations can evaluate the robustness of a statistical procedure under ideal and non-ideal conditions, and can identify strengths (e.g., accuracy of parameter estimates) and weaknesses (e.g., type-I and type-II error rates) of competing approaches for hypothesis testing.

Simulations can be used to estimate the statistical power of many models that cannot be estimated directly through power tables and other classical methods (e.g., mediation analyses, hierarchical linear models, structural equation models, etc.). The procedures used for simulation studies are also at the heart of bootstrapping methods, which use resampling procedures to obtain empirical estimates of sampling distributions, confidence intervals, and *p*-values when a parameter sampling distribution is non-normal or unknown.

Simulation studies typically are designed according to the following steps:

- 1. A set of assumptions about the nature and parameters of a dataset are specified.
- 2. A dataset is generated according to these assumptions.
- 3. Statistical analyses of interest are performed on this dataset, and the parameter estimates of interest from these analyses (e.g., model coefficient estimates, fit indices, *p*-values, etc.) are retained.
- 4. Steps 2 and 3 are repeated many times with many newly generated datasets (e.g., 1000 datasets) in order to obtain an empirical distribution of parameter estimates.
- 5. Often, the assumptions specified in step 1 are modified and steps 2–4 are repeated for datasets generated according to new parameters or assumptions.
- 6. The obtained distributions of parameter estimates from these simulated datasets are analyzed to evaluate the question of interest.
- 7. Common R commands for simulation studies.

# Commands for working with vectors

Command	Description	Examples
c	Combines arguments to	#create vector called a which
	make vectors	contains the values 3, 5, 4

function	generate customized function	# function that returns the sum of x1 and x2  myfunction = function(x1, x2){  mysum = $x1 + x2$ return(mysum)
for	create a loop, allowing sequences of	#Create vector of empirical sample means (stored as
	commands to be executed a specified	mean_vector) from 100 random samples of size $N = 20$ ,
	number of times	sampled from a population $M = 50$ and $SD = 10$ .

 $mean\_vector = NULL$ 

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE COURSE CODE: 17CSU503B UNIT: II (R PROGRAMMNG BASICS) BATCH-2017-2020

#### **Commands for programming**

### **Code profiling**

Profiling R code gives you the chance to identify bottlenecks and pieces of code that needs to be more efficiently implemented.

Profiling R code is usually the last thing I do in the process of package (or function) development. In my experience we can reduce the amount of time necessary to run an R routine by as much as 90% with very simple changes to our code. Just yesterday I reduced the time necessary to run one of my functions from 28 sec. to 2 sec. just by changing one line of the code from

x = data.frame(a = variable1, b = variable2)

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE COURSE CODE: 17CSU503B UNIT: II (R PROGRAMMNG BASICS) BATCH-2017-2020

to

```
x = c(variable1, variable2)
```

This big reduction happened because this line of code was called several times during the execution of the function.

#### Rprof and summary Rprof approach

The standard approach to profile R code is to use the Rprof function to profile and the summaryRprof function to summarize the result.

```
Rprof("path_to_hold_output")

## some code to be profiled

Rprof(NULL)

## some code NOT to be profiled

Rprof("path_to_hold_output", append=TRUE)

## some code to be profiled

Rprof(NULL)

# summarize the results
```

Rprof works by recording at fixed intervals (by default every 20 msecs) which R function is being used, and recording the results in a file, summaryRprof will give you a list with four elements:

- by self: time spent in function alone.
- by.total: time spent in function and callees.

summaryRprof("path\_to\_hold\_output")

- sample.interval: the sampling interval, by default every 20 msecs.
- sampling.time: total time of profiling run. Remember that profiling does impose a small performance penalty.

Profiling short runs can be misleading, so in this case I usually use the replicate function

- 1 # Evaluate shortFunction() for 100 times
- 2 replicate(n = 100, shortFunction())

R performs garbage collection from time to time to reclaim unused memory, and this takes an appreciable amount of time which profiling will charge to whichever function happens to provoke it. It may be useful to compare profiling code immediately after a call to gc() with a profiling run without a preceding call to gc.

#### **Example**

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE COURSE CODE: 17CSU503B UNIT: II (R PROGRAMMNG BASICS) BATCH-2017-2020

A short default example collected from the help files is

- 1 Rprof(tmp<- tempfile())
- 2 example(glm)
- 3 Rprof()
- 4 summaryRprof(tmp)

which returns the following output:

\$by.self

self.time self.pct total.time total.pct

"print.default" 0.04 18.18 0.04 18.18

#### **POSSIBLE OUESTIONS**

#### 2 MARKS

- 1. What is the use of R?
- 2. Define data type.
- 3. Mention the loops in R.
- 4. What is a function?
- 5. Define control structures.
- 6. Define Matrices with example.
- 7. What are data frame?
- 8. Define List with example.
- 9. Define object in R.
- 10. Name the functions used to read data from R.
- 11. Name the functions used to write data to R.
- 12. Name some built in functions with example.
- 13. What are the components of function?
- 14. Define control structures.
- 15. What is scope of variables?
- 16. Mention any two scoping rules in R.
- 17. What is lubridate?
- 18. Define Date class.
- 19. Define break and next statements in R.
- 20. What is debugging?

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATA SCIENCE COURSE CODE: 17CSU503B UNIT: II (R PROGRAMMNG BASICS) BATCH-2017-2020

#### 6 MARKS

- 1. Explain R data types with examples.
- 2. Write about control structures in R with examples.
- 3. Explain in detail about functions.
- 4. Enlighten date and time class with example.
- 5. Explain loop functions with example.
- 6. Explain the following:
  - a) Debugging tools
  - b) Simulation
  - c) Code profiling

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATASCIENCE COURSE CODE: 17CSU503B UNIT: I (GETTING, CLEANING DATA) BATCH-2017-2020

#### **UNIT-III**

#### **Syllabus**

**Getting and Cleaning Data**: Obtaining data from the web, from APIs, from databases and from colleagues in various formats. Basics of data cleaning and making data —tidy.

#### **Overview**

- finding and extracting raw data
- today any how to make data tiny
- Raw data →→ processing script →→ tidy data →→ data analysis →→ data communication

#### Raw and processed data

- Data = values of qualitative/quantitative, variables, belonging to a set of items
  - o variables = measurement of characteristic of an item
- Raw data = original source of data, often hard to use, processing must be done before analysis, may need to be processed only once
- **Processed data** = ready for analysis, processing done (merging, transforming, etc.), all steps should be recorded
- Sequencing DNA: \$1B for Human Genome Project →→ \$10,000 in a week with Illumina

#### **Tidy Data**

#### 1. Raw Data

- o no software processing has been done
- o did not manipulate, remove, or summarize in anyway

#### 2. Tidy data set

- o end goal of cleaning data process
- o each variable should be in one column
- o each observation of that variable should be in a different row
- o one table for each kind of variable

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATASCIENCE COURSE CODE: 17CSU503B UNIT: I (GETTING, CLEANING DATA) BATCH-2017-2020

- if there are multiple tables, there should be a column to link them
- include a row at the top of each file with variable names (variable names should make sense)
- o in general data should be save in one file per table

#### 3. each variable and its values in the tidy data set

- o information about the variables (w/ units) in dataset NOT contained in tidy data
- o information about the summary choice that were made (median/mean)
- o information about experimental study design (data collection methods)
- o common format for this document = markdown/Word/text
  - "study design" section = thorough description of how data was collected
  - "code book" section = describes each variable and units

## 4. Explicit steps and exact recipe to get through 1 - 3 (instruction list)

- ideally a computer script (no parameters)
- output = processed tidy data
- in addition to script, possibly may need steps to run files, how script is run, and explicit instructions

#### **Download files**

- Set working directory
  - o **Relative**: setwd("./data"), setwd("../") = move up in directory
  - o Absolute: setwd("/User/Name/data")
- · Check if file exists and download file
  - o if(!file.exists("data"){dir.create("data")}

#### Download file

- o download.file(url, destfile= "directory/filname.extension", method = "curl")
  - method = "curl" [mac only for https]
- o dateDownloaded <- date() = record the download date

#### Read file and load data

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATASCIENCE COURSE CODE: 17CSU503B UNIT: I (GETTING, CLEANING DATA) BATCH-2017-2020

- o read.table() = need to specify file, header, sep, row.names, nrows
  - read.csv() = automatically set sep = "," and header = TRUE
- o quote = "" = no quotes (extremely helpful, common problem)
- o na.strings = set the character that represents missing value
- o nrows = how many rows to read
- o skip = how many lines to skip
- o col.names = specifies column names
- check.names = TRUE/FALSE = If TRUE then the names of the variables in the data frame are checked to ensure that they are syntactically valid variable names and are not duplicated. If necessary they are adjusted appropriately to be syntactically valid names

#### **Reading Excel files**

- xlsx package: read.xlsx(path, sheetIndex = 1, ...)
  - o colIndex, rowlndex = can be used to read certain rows and columns
- write.xlsx() = write out excel file
- read.xlsx2() = faster than read.xlsx() but unstable for reading subset of rows
- XLConnect package has more options for writing/manipulating Excel files
- generally good to store data in database/csv/tab separated files (.tab/.txt), easier to distribute

#### Reading XML

- XML = extensible markup language
- frequented used to store structured data, widely used in Internet apps
- extracting XML = basis for most of web scraping
- components
  - o *markup* = labels that give text structure
  - o *content* = actual text of document
- tags = <section>, </section>, line-break />
- elements = <Greeting> test </Greeting>

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATASCIENCE COURSE CODE: 17CSU503B UNIT: I (GETTING, CLEANING DATA) BATCH-2017-2020

- attributes = <image src ="a.jpg" alt = "b">
- reading file into R
  - o library(XML)
  - o doc <- xmlTreeParse(fileUrl, useInternal = TRUE) = loads data
  - o rootNode <- xmlRoot(doc) = wrapper element for entire document
  - o xmlName(rootNode) = returns name of the document
  - names(rootNode) = return names of elements
  - o rootNode[[1]] = access first elements, similar to list
  - o rootNode[[1]][[1]] = first sub component in the first element
  - o xmlSApply(rootNode, xmlValue) = returns every single tagged element in the doc

#### XPath

- o get specific elements of document
- o /node = top level node
- o //node = node at any level
- o node[@attr-name = 'bob'] = node with attribute name
  - xpathSApply(rootNode, "//name", xmlValue) = get the values of all elements with tag "name"
  - xpathSApply(rootNode, "//price", xmlValue) = get the values of all elements with tag "price"

#### extract content by attributes

- doc <- htmlTreeParse(url, useInternal = True)</li>
- scores <- xpathSApply(doc, "//li@class='score", xmlvalue) = look for li elements</li>
   with class = "score" and return their value

#### **Reading JSON**

- **JSON** = JavaScript Object Notation
- lightweight data storage, common format for data from application programming interfaces (API)
- similar to XML in structure but different in syntax/format

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATASCIENCE COURSE CODE: 17CSU503B UNIT: I (GETTING, CLEANING DATA) BATCH-2017-2020

- data can be stored as:
  - o numbers (double)
  - strings (double quoted)
  - boolean (true/false)
  - o array (ordered, comma separated enclosed in [])
  - o object (unordered, comma separated collection of key/value pairs enclosed in {})
- isonlite package (ison vignette can be found in help)
  - o library(jsonlite) = loads package
  - o data <- from JSON(url) = strips data
    - names(data\$owner) = returns list of names of all columns of owner data frame
    - data\$owner\$login = returns login instances
  - o data <- toJSON(dataframe, pretty = TRUE) = converts data frame into JSON format
    - pretty = TRUE = formats the code nicely
  - o cat(data) = prints out JSON code from the converted data frame
  - o from JSON() = converts from JSON object/code back to data frame

#### data.table

- inherits from data.frame (external package) →→ all functions that accept data.frame work on data.table
- can be much faster (written in C), much much faster at subsetting/grouping/updating
- syntax: dt <- data.table(x = rnorm(9), y = rep(c(a, b, c), each = 3), z = rnorm(9)
- tables() = returns all data tables in memory
  - o shows name, nrow, MB, cols, key
- some subset works like before = dt[2, ], dt[dt\$y=="a",]
  - o dt[c(2, 3)] = subset by rows, rows 2 and 3 in this case
- **column subsetting** (modified for data.table)

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATASCIENCE COURSE CODE: 17CSU503B UNIT: I (GETTING, CLEANING DATA) BATCH-2017-2020

- argument after comma is called an *expression* (collection of statements enclosed in {})
- dt[, list(means(x), sum(z)] = returns mean of x column and sum of z column (no "" needed to specify column names, x and z in example)
- o dt[, table(y)] = get table of y value (perform any functions)

#### • add new columns

- $\circ$  dt[, w:=z^2]
  - when this is performed, a new data table is created and data copied over (not good for large datasets)
- o dt2 <- dt; dt[, y := 2]
  - when changes are made to dt, changes get translated to dt2
  - *Note*: if copy must be made, use the copy() function instead

#### multiple operations

o dt[, m:= {temp  $\leftarrow$  (x+z); log2(temp +5)}]  $\rightarrow \rightarrow$  adds a column that equals log2(x+z + 5)

#### • plyr like operations

- o dt[,a:=x>0] = creates a new column a that returns TRUE if <math>x > 0, and FALSE other wise
- dt[,b:=mean(x+w), by=a] = creates a new column b that calculates the aggregated mean for x + w for when a = TRUE/FALSE, meaning every b value is gonna be the same for TRUE, and others are for FALSE

#### • special variables

- o .N = returns integer, length 1, containing the number (essentially count)
  - $dt < -data_table_x = sample_x = data_table_x =$
  - dt[, .N by = x] = creates a table to count observations by the value of x

#### • **keys** (quickly filter/subset)

- o example: dt <- data.table(x = rep(c("a", "b", "c"), each 100), y = rnorm(300)) = generates data table
  - setkey(dt, x) = set the key to the x column

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATASCIENCE COURSE CODE: 17CSU503B UNIT: I (GETTING, CLEANING DATA) BATCH-2017-2020

- dt['a'] = returns a data frame, where x = 'a' (effectively filter)
- **joins** (merging tables)
  - o example: dt1 < -data.table(x = c('a', 'b', ...), y = 1:4) = generates data table
    - dt2 <- data.table(x = c('a', 'd', ...), z = 5:7) = generates data table
    - setkey(dt1, x); setkey(dt2, x) = sets the keys for both data tables to be column x
    - merge(dt1, dt2) = returns a table, combine the two tables using column x, filtering to only the values that match up between common elements the two x columns (i.e. 'a') and the data is merged together
- fast reading of files
  - o example: big\_df <- data.frame(norm(1e6), norm(1e6)) = generates data table
    - file <- tempfile() = generates empty temp file
    - write.table(big.df, file=file, row.names=FALSE, col.names = TRUE, sep = "\t". quote = FALSE) = writes the generated data from big.df to the empty temp file
    - fread(file) = read file and load data = much faster than read.table()

## Reading from MvSOL

- install.packages("RMySQL"); library(RMySQL) = load-MySQL package
- free/widely used open sources database software, widely used for Internet base applications
- each row = record
- data are structured in databases  $\rightarrow \rightarrow$  series tables (dataset)  $\rightarrow \rightarrow$  fields (columns in dataset)
- dbConnect(MySQL(), user = "genome", db = "hg19", host = "genomemysql.cse.ucsc.edu) = open a connection to the database
  - o db = "hg19" = select specific database
  - o MySQL() can be replaced with other arguments to use other data structures
- dbGetQuery(db, "show databases;") = return the result from the specified SQL query executed through the connection
  - o any SQL query can be substituted here
- dbDisconnect(db) = disconnects the open connection

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATASCIENCE COURSE CODE: 17CSU503B UNIT: I (GETTING, CLEANING DATA) BATCH-2017-2020

- crucial to disconnect as soon as all queries are performed
- dbListFields(db, "name") = returns the list of fields (columns) from the specified table
- dbReadTable(db, "name") = returns the specified table
- query <- dbSendQuery(db, "query") = send query to MySQL database and store it remotely
- fetch(query, n = 10) = executes query and returns the result
  - $\circ$  n = 10 = returns the first 10 rows
- dbClearResult(query) = clears query from remote database, important
- sqldf package example

#### **Web Scraping**

- webscraping = programmatically extracting data from the HTML code of websites
- con = url("website") = opens connection from URL
- htmlCode = readLines(con) = reads the HTML code from the URL
  - o always remember to close(con) after using it
  - o the htmlCode return here is a bit unreadable

#### • Parsing with XML

- o library(XML)
- o url <- "http://..." = sets the desired URL as a character variable
- html <- htmlTreeParse(url, useInternalNodes = T) = reads and parses the html code
- xpathSApply(html, "//title", xmlValue) = returns the value of the //title node/element
- o xpathSApply(html, "//td[@id='col-citedBy']", xmlValue) = returns the value of the //td element where the id = 'col-citedBy' in the html code

## · Parsing with httr package

- o library(httr)
- o html2 <- GET(url) = reads the HTML code from the URL
- o cont = content(html2, as = "text") = extracts the HTML code as a long string
- o parsedHtml = htmlParse(cont, asText = TRUE) = parses the text into HTML (same output as the XML package function htmlTreeParse)

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATASCIENCE COURSE CODE: 17CSU503B UNIT: I (GETTING, CLEANING DATA) BATCH-2017-2020

- o xpathSApply(html, "//title", xmlValue) = returns the value of the //title node/element
- accessing websites with passwords
  - pg = GET("url") = this would return a status 401 if the website requires log in without authenticating
  - pg2 = GET("url", authenticate("username", "password")) = this authenticates before attempting to access the website, and the result would return a status 200 if authentication was successful
  - names2(pg2) = returns names of different components
- using handles (username/login information)
  - using handles allows you to save authentication across multiple parts of the website (only authenticate once for different requests)
  - example: google = handle("http://google.com")
  - pg1 = GET(handle = google, path = "/")
  - pg2 = GET(handle = google, path = "search")

#### **Working with API**

- load http package first: library(httr)
  - o allows GET, POST, PUT, DELETE requests if you are authorized
- myapp = oath\_app("app", key = "consumerKey", secret = "consumerSecret") = start authorization process for the app
- sig = sign\_oauth1.0(myapp, token = "tokenGenerated", token\_secret = "tokenSecret") = login using the token information (sets up access so you can use it to get data)
- homeTL = get("url", sig) = use the established authentication (instead of username/password) to get the data (usually in JSON format)
  - o use the url to specify what data you would like to get
  - o use the documentation to get information and parameters for the url and data you have access to
- json1 = content(homeTL) = recognizes the data in JSON format and converts it to a structured R object [a bit hard to read]
- json2 = jsonlite::fromJSON(toJSON(json1)) = converts data back into JSON format and then use the fromJSON function from the jsonlite package to read the data into a data frame

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATASCIENCE COURSE CODE: 17CSU503B UNIT: I (GETTING, CLEANING DATA) BATCH-2017-2020

o each row corresponds to a line of the data you received

#### GitHub example

- o library(httr)
- o myapp <- oauth\_app("github", key = "clientID", secret = "clientSecret")</pre>
  - an application must be registered with GitHub first to generate the client ID and secrets
- github\_token <- oauth2.0\_token(oauth\_endpoints("github"), myapp)</li>
  - oauth\_endpoints() = returns the the authorize/access url/endpoints for some common web applications (GitHub, Facebook, google, etc)
  - oauth2.0\_token(endPoints, app) = generates an oauth2.0 token with the credentials provided
- gtoken <- config(token = github\_token) = sets up the configuration with the token for authentication
- o req <- with config(gtoken, GET("https://api.github.com/rate\_limit")) = executes the configuration set to send a get request from the specified URL, and returns a response object
- o library(jsonlite); json1 <- from JSON(to JSON(content(req))) = converts the content of the response object, to JSON format, and converts it again to data frame format
- names(json1) = returns all the column names for the data frame
  - json1[json1\$name == "datasharing",]\$created\_at = returns the create date for the data sharing repo

#### Reading from Other Sources

- interacting directly with files
  - o file = open a connection to a text file
  - o url = opens a connection to a URL
  - o gzfile/bzfile = opens a connection to a .gz/.bz2 file
  - o ?connections = for more information about opening/closing connections in R

#### • foreign package

o loads data from Minitab/S/SAS/SPSS/Stat/Systat

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATASCIENCE COURSE CODE: 17CSU503B UNIT: I (GETTING, CLEANING DATA) BATCH-2017-2020

- basic functions
  - read.arff (Weka)
  - read.dta (Stata)
  - read.mtp (Minitab)
  - read.octave (Octave)
  - read.spss (SPSS)
  - read.xport (SAS)
  - read.fwf (fixed width files, [.for])
  - example: data <- read.fwf(file = "quiz02q5,for", skip = 4, widths = c(-1, 9,-5, 4, 4, -5, 4, 4,-5, 4, 4))
  - widths = c() = specifies the width of each variable
  - the negative numbers indicate the space to disregard/take out

## Other packages/functions

- RPostresSQL = provides DBI-compliant database connection from R
- RODBC = provides interfaces to multiple databases including PostgreQL, MySQL, Microsoft Access, SQLite
- RMongo/rmongodb = provides interfaces to MongoDb
  - similar to MySQL, except send queries in the database's syntax
- o reading images (functions)
  - jpeg, readbitmap, png, EBImage (Bioconductor)
- o reading (GIS Geographical Information Systems) data (packages)
  - rdgal, rgeos, raster
- reading music data (packages)
  - tuneR, seewave

#### dplvr

- external package, load by library(dplyr)
  - o developed by Hadley Wickham of RStudio

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATASCIENCE COURSE CODE: 17CSU503B UNIT: I (GETTING, CLEANING DATA) BATCH-2017-2020

- o optimized/distilled version of the plyr package, does not provide new functionality but greatly simplifies existing R functionality
- o very fast, many key operations coded in C++
- dplyr package also works on data.table and SQL interface for relational databases (DBI package)
- load data into tbl\_df (data frame table) by data <- tbl\_df(rawData)
  - o main advantage to using a tbl\_df over a regular data frame is printing
  - o more compact output/informative = similar to a combination of head/str
    - displays class, dimension, preview of data (10 rows and as many columns as it can fit), undisplayed variables and their class

#### • functions

- Note: for all functions, first argument always the data frame, and result is always a
  data frame
- select()
  - *example*: select(dataFrameTable, var1, var2, var3) = returns a table (similar in format as calling the actual data frame table)
  - no need to use \$ as we would normally, since select() understands that the variables are from the dataFrameTable
  - columns are returns in order specified
  - columns (from this column to that column), works in reverse order as well = select(dataFrameTable, var1:var5)
  - "-column" can be used to specify columns to throw away
     = select(dataFrameTable, -var1) = but this does not modify original dataFrameTable
  - -(var1:size) = eliminate all columns
  - normally this can be accomplished by finding the indices of names using the match("value", vector) function
- o filter()

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATASCIENCE COURSE CODE: 17CSU503B UNIT: I (GETTING, CLEANING DATA) BATCH-2017-2020

- *example*: filter(cran, package == "swirl") = returns a table (similar in format as calling the actual data frame table)
- returns all rows where the condition evaluates to TRUE
- automatically recognized that package is a column without \$
- able to specify as many conditions as you want, separated by ,, | and & work here as well
- multiple conditions specified by , is equivalent to &
- is.na(var1) also works here
- Note: ?Comparison brings up relevant documentation for relational comparators

#### o arrange()

- example: arrange(dataFrameTable, var) = order the data frame table by specified column/variable
- desc(var) = arrange in descending order by column value
- can specify multiple values to sort by by using,
- order listed in the call will be the order that the data is sorted by (can use in conjunction with desc())

#### o rename()

- *example*: rename(dataFrameTable, newColName = colName) = renames the specified column with new name
- capable of renaming multiple columns at the same time, no quotes needed

#### o mutate()

- create a new variable based on the value of one or more existing variables in the dataset
- capable of modifying existing columns/variables as well
- *example*: mutate(dataFrameTable, newColumn = size / 2^20) = create a new column with specified name and the method of calculating
- multiple columns can be created at the same time by using, as separator, new variables can even reference each other in terms of calculation

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATASCIENCE COURSE CODE: 17CSU503B UNIT: I (GETTING, CLEANING DATA) BATCH-2017-2020

- summarize()
  - collapses the dataset into a single row
  - *example*: summarize(dataFrameTable, avg = mean(size)) = returns the mean from the column in a single variable with the specified name
  - summarize(can return the requested value for each group in the dataset
- group\_by()
  - *example*: by\_package <- group\_by(cran, package) = creates a grouped data frame table by specified variable
  - summarize(by\_package, mean(size)) = returns the mean size of each group (instead of 1 value from thesummarize() example above)
  - *Note*: n() = counts number of observation in the current group
  - *Note*: n\_distinct() = efficiently count the number of unique values in a vector
  - Note: quantile(variable, probs = 0.99) = returns the 99% percentile from the data
  - Note: by default, dplyr prints the first 10 rows of data if there are more than 100 rows; if there are not, it will print everything
- o rbind\_list()
  - bind multiple data frames by row and column
  - example: rbind\_list(passed, failed)

#### Chaining/Piping

- allows stringing together multiple function calls in a way that is compact and readable, while still accomplishing the desired result
  - Note: all variable calls refer to the tbl\_df specified at the same level of the call
- $\circ$  %>% = chaining operator
  - *Note*: ?chain brings up relevant documentation for the chaining operator
  - Code on the right of the operator operates on the result from the code on the left
  - exp1 %>% exp2 %>% exp3 ...

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATASCIENCE COURSE CODE: 17CSU503B UNIT: I (GETTING, CLEANING DATA) BATCH-2017-2020

- exp1 is calculated first
- exp2 is then applied on exp1 to achieve a result
- exp3 is then applied to the result of that operation, etc.
- *Note*: the chaining aspect is done with the data frame table that is being passed from one call to the next
- Note: if the last call has no additional arguments, print() for example, then it is possible to leave() off

#### **tidyr**

- gather()
  - gather columns into key value pairs
  - example: gather(students, sex, count, -grade) = gather each key (in this case named sex), value (in this case count) pair into one row
    - effectively translates to (columnName, value) with new names imposed on both = all combinations of column name and value
    - -grade = signifies that the column does not need to be remapped, so that column is preserved
    - class1:class5 = can be used instead to specify where to gather the key values
- separate()
  - separate one column into multiple column
  - o example: separate(data = res, col = sex\_class, into = c("sex", "class") = split the specified column in the data frame into two columns
    - Note: the new columns are created in place, and the other columns are pushed to the right
    - Note: separate() is able to automatically split non-alphanumeric values by finding the logical separator; it is also possible to specify the separator by using the sep argument
- spread()
  - spread key-value pairs across multiple columns = turn values of a column into column headers/variables/new columns

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATASCIENCE COURSE CODE: 17CSU503B UNIT: I (GETTING, CLEANING DATA) BATCH-2017-2020

- o *example*: spread(students3, test, grade) = splits "test" column into variables by using it as a key, and "grade" as values
  - *Note*: no need to specify what the columns are going to be called, since they are going to be generated using the values in the specified column
  - *Note*: the value will be matched and split up according their alignment with the key ("test") = midterm, A
- extract\_numeric()
  - o extract numeric component of variable
  - o example: extract\_numeric("class5") = returns 5
  - example: mutate(class = extract\_numeric(class)) = changes the class name to numbers only
- unique() = general R function not specific to tidyr
  - o returns a vector with the duplicates removed
- Note: when there are redundant information, it's better to split up the info into multiple tables; however, each table should also contain primary keys, which identify observations and link data from one table to the next

#### <u>lubridate</u>

- consistent, memorable syntax for working with dates
- wday(date, label = TRUE) = returns number 1 7 representing Sunday Saturday, or returns three letter day of the week if label = TRUE
- today(), now() = returns the current date and time, with extractable parts (hour(), month())
- tzone = "America/New\_York" = used to specify time zones
- ymd("string") = converts string in to year month day format to a POSIXct time variable
  - o mdy("string") = parses date in month day year format
  - o dmy(2508195) = parses date in day month year format using a number
  - o ymd\_hms("string") = parses the year month day, hour minute second
  - o hms("string") = parses hour minute second
    - tz = "" = can use the "tz" argument to specify time zones

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATASCIENCE COURSE CODE: 17CSU503B UNIT: I (GETTING, CLEANING DATA) BATCH-2017-2020

- Note: there are a variety of functions that are available to parse different formats, all of them are capable of converting the correct information if the order of month year day is correct
- o *Note*: when necessary, // or should be added to provide clarity in date formatting
- update(POSIXct, hours = 8, minutes = 34, seconds = 55) = updates components of a date time
  - o Note: does not alter the date time passed in unless explicitly assigned
- arithmetic can be performed on date times by using the days() hours() minutes(), etc. functions
  - o *example*: now() + hours(5) + minutes(2) = returns the date time for 5 hours and 2 minutes from now
- with\_tz(time, tone ="") = return date-time in a different time zone
- as.period(new\_interval(last\_time, arrive)) = return the properly formatted difference between the two date times

#### Missing values

Changing the representation of a dataset brings up an important subtlety of missing values. Surprisingly, a value can be missing in one of two possible ways:

- Explicitly, i.e. flagged with NA.
- Implicitly, i.e. simply not present in the data.

#### Let's illustrate this idea with a very simple data set:

```
stocks <- tibble(
year = \mathbf{c}(2015, 2015, 2015, 2015, 2016, 2016, 2016),
qtr = \mathbf{c}(1, 2, 3, 4, 2, 3, 4),
return = \mathbf{c}(1.88, 0.59, 0.35, NA, 0.92, 0.17, 2.66)
```

#### There are two missing values in this dataset:

• The return for the fourth quarter of 2015 is explicitly missing, because the cell where its value should be instead contains NA.

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATASCIENCE COURSE CODE: 17CSU503B UNIT: I (GETTING, CLEANING DATA) BATCH-2017-2020

• The return for the first quarter of 2016 is implicitly missing, because it simply does not appear in the dataset.

One way to think about the difference is with this Zen-like koan: An explicit missing value is the presence of an absence; an implicit missing value is the absence of a presence.

The way that a dataset is represented can make implicit values explicit. For example, we can make the implicit missing value explicit by putting years in the columns:

```
stocks %>%

spread(year, return)

#> # A tibble: 4 x 3

#> qtr `2015` `2016`

#> <dbl> <dbl> <dbl> <dbl> #> 1  1 1.88 NA

#> 2  2 0.59 0.92

#> 3  3 0.35 0.17

#> 4 4 NA 2.66
```

#> 5 3 2016 0.17

Because these explicit missing values may not be important in other representations of the data, you can set na.rm = TRUE in gather() to turn explicit missing values implicit:

```
stocks %>%

spread(year, return) %>%

gather(year, return, `2015`: `2016`, na.rm = TRUE)

#> # A tibble: 6 x 3

#> qtr year return

#> * <dbl> <chr> <dbl>
#> 1 1 2015 1.88

#> 2 2 2015 0.59

#> 3 3 2015 0.35

#> 4 2 2016 0.92
```

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATASCIENCE COURSE CODE: 17CSU503B UNIT: I (GETTING, CLEANING DATA) BATCH-2017-2020

#> 6 4 2016 2.66

Another important tool for making missing values explicit in tidy data is complete():

stocks %>%

#### complete(year, qtr)

#> # A tibble: 8 x 3

#> year qtr return

*#> <dbl> <dbl> <dbl>* 

#> 1 2015 1 1.88

#> 2 2015 2 0.59

#> 3 2015 3 0.35

#> 4 2015 4 NA

#> 5 2016 1 NA

#> 6 2016 2 0.92

*#> # ... with 2 more rows* 

complete() takes a set of columns, and finds all unique combinations. It then ensures the original dataset contains all those values, filling in explicit NAs where necessary.

There's one other important tool that you should know for working with missing values. Sometimes when a data source has primarily been used for data entry, missing values indicate that the previous value should be carried forward:

#### treatment <- **tribble**(

```
~ person, ~ treatment, ~response,
```

"Derrick Whitmore", 1,

NA, 2, 10,

NA, 3, 9,

"Katherine Burke", 1,

)

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATASCIENCE COURSE CODE: 17CSU503B UNIT: I (GETTING, CLEANING DATA) BATCH-2017-2020

You can fill in these missing values with fill(). It takes a set of columns where you want missing values to be replaced by the most recent non-missing value (sometimes called last observation carried forward).

treatment %>%

#### fill(person)

#> # A tibble: 4 x 3

*#> person treatment response* 

*#*> *<chr*> *<dbl*> *<dbl*>

#> 1 Derrick Whitmore 1 7

#> 2 Derrick Whitmore 2 10

#> 3 Derrick Whitmore 3 9

#> 4 Katherine Burke 1 4

#### The purpose of tidy data for data science

#### **Definition:**

"Happy families are all alike; every unhappy family is unhappy in its own way." — Leo Tolstoy

"Tidy datasets are all alike, but every messy dataset is messy in its own way." — Hadley Wickham

#### Tidy data

You can represent the same underlying data in multiple ways. The example below shows the same data organized in four different ways. Each dataset shows the same values of four variables *country*, *year*, *population*, and *cases*, but each dataset organizes the values in a different way.

#### table1

#> # A tibble: 6 x 4

#> country year cases population

*#*> *<chr*> *<int*> *<int*> *<int*>

#> 1 Afghanistan 1999 745 19987071

#> 2 Afghanistan 2000 2666 20595360

#> 3 Brazil 1999 37737 172006362

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATASCIENCE COURSE CODE: 17CSU503B UNIT: I (GETTING, CLEANING DATA) BATCH-2017-2020

#> 4 Brazil 2000 80488 174504898

#> 5 China 1999 212258 1272915272

#> 6 China 2000 213766 1280428583

#### table2

#> # A tibble: 12 x 4

#> country year type count

*#*> *<chr*> *<int*> *<chr*> *<int*>

*#> 1 Afghanistan 1999 cases 745* 

#> 2 Afghanistan 1999 population 19987071

#> 3 Afghanistan 2000 cases 2666

#> 4 Afghanistan 2000 population 20595360

#> 5 Brazil 1999 cases 37737

#> 6 Brazil 1999 population 172006362

*#> #.... with 6 more rows* 

#### table3

# > # A tibble: 6 x 3

*#> country year rate* 

#> \* < chr> < int> < chr>

#> 1 Afghanistan 1999 745/19987071

#> 2 Afghanistan 2000 2666/20595360

#> 3 Brazil 1999 37737/172006362

#> 4 Brazil 2000 80488/174504898

#> 5 China 1999 212258/1272915272

#> 6 China 2000 213766/1280428583

#### # Spread across two tibbles

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATASCIENCE COURSE CODE: 17CSU503B UNIT: I (GETTING, CLEANING DATA) BATCH-2017-2020

## table4a # cases

#> # A tibble: 3 x 3

#> country `1999` `2000`

*#*> \* <*chr*> <*int*> <*int*>

#> 1 Afghanistan 745 2666

#> 2 Brazil 37737 80488

#> 3 China 212258 213766

#### table4b # population

#> # A tibble: 3 x 3

#> country `1999` `2000`

#> \* <*chr*> <*int*> <*int*>

#> 1 Afghanistan 19987071 20595360

#> 2 Brazil 172006362 174504898

#> 3 China 1272915272 1280428583

These are all representations of the same underlying data, but they are not equally easy to use. One dataset, the tidy dataset, will be much easier to work with inside the tidyverse.

There are three interrelated rules which make a dataset tidy:

- 1. Each variable must have its own column.
- 2. Each observation must have its own row.
- 3. Each value must have its own cell.

Figure: 1 shows the rules visually.

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATASCIENCE COURSE CODE: 17CSU503B UNIT: I (GETTING, CLEANING DATA) BATCH-2017-2020

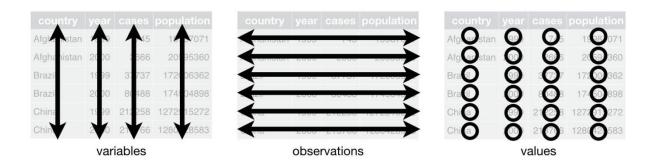

Figure: 1 following three rules makes a dataset tidy: variables are in columns, observations are in rows, and values are in cells.

These three rules are interrelated because it's impossible to only satisfy two of the three. That interrelationship leads to an even simpler set of practical instructions:

- 1. Put each dataset in a tibble.
- 2. Put each variable in a column.

In this example, only table 1 is tidy. It's the only representation where each column is a variable.

Why ensure that your data is tidy? There are two main advantages:

- 1. There's a general advantage to picking one consistent way of storing data. If you have a consistent data structure, it's easier to learn the tools that work with it because they have an underlying uniformity.
- 2. There's a specific advantage to placing variables in columns because it allows R's vectorised nature to shine. As you learned in mutate and summary functions, most built-in R functions work with vectors of values. That makes transforming tidy data feel particularly natural.

dplyr, ggplot2, and all the other packages in the tidyverse are designed to work with tidy data. Here are a couple of small examples showing how you might work with table1.

#### # Compute rate per 10.000

#### <u>table1 %>%</u>

**mutate**(rate = cases / population \* 10000)

#> # A tibble: 6 x 5

*#> country year cases population rate*

# POSSIBLE OUESTIONS 2 MARKS

- 1. Define raw data.
- 2. Define processed data.
- 3. What is tidy data?
- 4. What is web scraping?
- 5. Define mutate(), and arrange() functions.
- 6. Define chaining/piping?
- 7. What is tidyr? Mention its function.
- 8. Define lubridate.
- 9. What is missing values? Mention its types.
- 10. What is dplyr?

#### **6 MARKS**

- 1. Write a detailed note on getting data from various sources.
- 2. Illustrate the purpose of tidy data in data science.

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATASCIENCE COURSE CODE: 17CSU503B UNIT: VI (EXPLORATORY DATA ANALYSIS) BATCH-2017-2020

#### **UNIT-IV**

### **Syllabus**

**Exploratory Data Analysis**: Essential exploratory techniques for summarizing data, applied before formal modeling commences, eliminating or sharpening potential hypotheses about the world that can be addressed by the data, common multivariate statistical techniques used to visualize high-dimensional data.

## What is Exploratory Data Analysis?

It is an approach to analyze data sets to summarize their main characteristics, often with visual methods. It is most useful while identifying outliers, trends and patterns. It was promoted by John Tukey to encourage statisticians to explore the data. Tukey also invented the term "bit", "software", and extended the "jackknife method".

Exploratory Data Analysis (EDA) is the first step in your data analysis process. Exploratory Data Analysis (EDA) is an approach/philosophy for data analysis that employs a variety of techniques (mostly graphical) to

- maximize insight into a data set;
- uncover underlying structure;
- extract important variables;
- detect outliers and anomalies;
- test underlying assumptions;
- develop parsimonious models; and
- Determine optimal factor settings.

## **Primary and Secondary Goals:**

The primary goal of EDA is to maximize the analyst's insight into a data set and into the underlying structure of a data set, while providing all of the specific items that an analyst would want to extract from a data set, such as:

- 1. a good-fitting, parsimonious model
- 2. a list of outliers
- 3. a sense of robustness of conclusions
- 4. estimates for parameters
- 5. uncertainties for those estimates
- 6. a ranked list of important factors

ARPAGAM CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATASCIENCE

UNIT: VI (EXPLORATORY DATA ANALYSIS) BATCH-2017-2020

- 7. conclusions as to whether individual factors are statistically significant
- 8. optimal settings

#### **Data Analysis Approaches:**

EDA is a data analysis approach. What other data analysis approaches exist and how does EDA differ from these other approaches?

Three popular data analysis approaches are:

- Classical
- Exploratory (EDA)
- Bayesian

### **Paradigms for Analysis Techniques:**

These three approaches are similar in that they all start with a general science/engineering problem and all yield science/engineering conclusions. The difference is the sequence and focus of the intermediate steps.

For classical analysis, the sequence is

Problem => Data => Model => Analysis => Conclusions

For EDA, the sequence is

Problem => Data => Analysis => Model => Conclusions

For Bayesian, the sequence is

Problem => Data => Model => Prior Distribution => Analysis => Conclusions

#### **Techniques:**

#### Classical:

Classical techniques are generally quantitative in nature. They include ANOVA, t tests, chi-squared tests, and F tests.

#### **Exploratory**:

EDA Techniques are generally graphical. They include scatter plots, character plots, box plots, histograms, bihistograms, probability plots, residual plots, and mean plots.

### **Introduction to Exploratory Data Analysis:**

To summarize main characteristics of data analysis in R, EDA is the only approach with the help of descriptive statistics and visual methods.

It is not a formal process that contains a strict set of rules. More than anything, EDA is a state of mind. During the initial phases of EDA, you should feel free to investigate every idea that occurs to you.

### Why do we use exploratory graphs in data analysis?

• To understand data properties

ARPAGAM CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATASCIENCE
UNIT: VI (EXPLORATORY DATA ANALYSIS)

BATCH-2017-2020

- For finding patterns in data
- To suggest modeling strategies
- To "Debug" analyses

#### **Terminologies in EDA**

#### Variable

It is a quantity, quality, or property that you can measure.

#### Value

It is the state of a variable when you measure it. The value of a variable may change from measurement to measurement.

#### Observation

It is a set of measurements made under similar conditions. An observation will contain several values, each associated with a different variable. I'll sometimes refer to an observation as a data point.

#### Tabular data

Basically, it is a set of values, each associated with a variable and an observation. Tabular data is tidy if each value is placed in its own "cell", each variable in its own column and each observation in its own row.

#### **Dataset**

Following are the components of a data/dataset:

- Basically, a data set is represented as a matrix
- There is a row for each unit
- There is a column for each variable
- A unit is an object which we use to measure, such as a person, or a thing
- A variable is a characteristic of a unit. We use it to assign a number or a category

### **Dimensionality of Data Sets:**

- Univariate: Measurement made on one variable per subject
- Bivariate: Measurement made on two variables per subject
- Multivariate: Measurement made on many variables per subject

#### **Type of variables:**

**a.** Qualitative: Variables take on values that are names or labels.

Ex. The color of a ball (e.g., red, green, blue) or the breed of a dog (e.g., collie, shepherd, terrier.

### **Types of Qualitative Variables:**

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATASCIENCE UNIT: VI (EXPLORATORY DATA ANALYSIS) BATCH-2017-2020

**i. Nominal:** Basically, it displays graphical data — all orderings are equally meaningful.

**Ex.** a student's religion (Atheist, Christian, Muslim, Hindu, ...) is nominal.

ii. Ordinal: A categorical variable whose categories can be meaningfully ordered is called ordinal.

**Ex.** a student's grade in an exam (A, B, C or Fail) is ordinal.

**b. Quantitative**: Variables that can measure on a numeric or quantitative scale.

Ex. Age, count of anything etc.

### **Types of Quantitative Variables:**

i. Discrete: A discrete variable is one that cannot take on all values within the limits of the variable.

Ex. The number of children is a discrete numerical variable (a count). The variable cannot have the value 1.7

ii. Continuous: In this, the variable can take on any value between two specified values.

Ex. age of a human: 25 years, 10 months, 2 days, 5 hours

### **Techniques**

Classical Classical techniques are generally quantitative in nature.

They include ANOVA, t tests, chi-squared tests, and F

tests.

Exploratory EDA techniques are generally graphical. They

include scatter plots, character plots, box plots, histograms, bihistograms, probability plots, residual

plots, and mean plots.

## Graphical Data Analysis with R

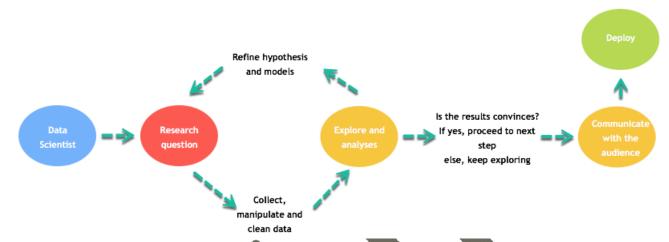

Graphs are the third part of the process of data analysis. The first part is about **data extraction**, the second part deals with **cleaning and manipulating the data**. At last, the data scientist may need to **communicate his results graphically**.

The job of the data scientist can be reviewed in the following picture

- The first task of a data scientist is to define a research question. This research question depends on the objectives and goals of the project.
- After that, one of the most prominent tasks is the feature engineering. The data scientist needs to collect, manipulate and clean the data

TOTAL PROPERTY OF THE PROPERTY

• When this step is completed, he can start to explore the dataset. Sometimes, it is necessary to refine and change the original hypothesis due to a new discovery.

- When the **explanatory** analysis is achieved, the data scientist has to consider the capacity of the reader to **understand the underlying concepts and models**.
- His results should be presented in a format that all stakeholders can understand. One of the best methods to **communicate** the results is through a **graph**.
- Graphs are an incredible tool to simplify complex analysis.

Graphs are useful for non-numerical data, such as colors, flavors, brand names, and more. When numerical measures are difficult or impossible to compute, graphs play an important role.

Statistical computing is done with the aim to produce high-quality graphics.

Various types of plots drawn in R are:

- Plots with single variables You can plot a graph for a single variable.
- Plots with multiple variables You can plot graph with multiple variables
- Special plots R has low and high-level graphics facilities.

#### **Boxplot using R:**

Boxplots can be created for individual variables or for variables by group.

The format is boxplot(x, data=), where x is a formula and data= denotes the data frame providing the data.

A box plot gives a nice summary of one or several numeric variables. It is composed of several elements:

- The line that divides the box into 2 parts represents the median of the data. If the median is 10, it means that there are the same number of data points below and above 10.
- The end of the box shows the upper and lower quartiles. If the third quartile is 15, it means that 75% of the observation are lower than 15.
- The difference between Quartiles 1 and 3 is called the interquartile range (IQR)

CLASS: III B.Sc CS

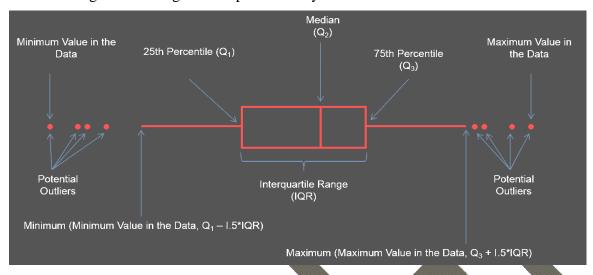

COURSE NAME: INTRODUCTION TO DATASCIENCE

UNIT: VI (EXPLORATORY DATA ANALYSIS)

BATCH-2017-2020

• The extreme lines show the highest and lowest value excluding outliers.

Here is a diagram showing the box plot anatomy:

Boxplots are a measure of how well distributed is the data. This graph represents the minimum, maximum, median, first quartile and third quartile in the data set. It is also useful in comparing the distribution of data across data sets by drawing boxplots. Roxplot is created by using the **boxplot**() function.

## **Syntax:**

The basic syntax to create a boxplot in R is:

boxplot(x,data,notch,varwidth,names,main)

Following is the description of the parameters used:

- x is a vector or a formula.
- data is the data frame
- notch is a logical value. Set as TRUE to draw a notch.
- varwidth is a logical value. Set as true to draw width of the box proportionate to the sample size.
- names are the group labels which will be printed under each boxplot.
- main is used to give a title to the graph.

### Creating the Boxplot in R

The below script will create a boxplot graph for the relation between mpg(miles per gallon) and cyl (number of cylinders) from the well known mtcars data set.

CLASS: III B.Sc CS

COURSE NAME: INTRODUCTION TO DATASCIENCE

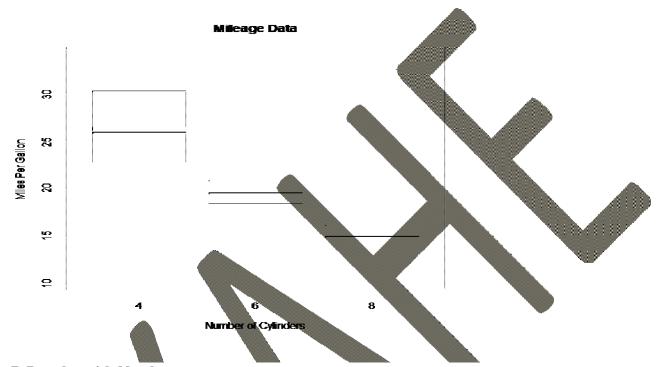

WOOD HIGHER EDUCATION
WOOD AT THE COURSE CODE: 17CSU503B

UNIT: VI (EXPLORATORY DATA ANALYSIS)

BATCH-2017-2020

boxplot(mpg ~ cyl, data=mtcars,xlab="Number of Cylinders",ylab="Miles Per Gallon",main="Mileage Data")

When we execute the above code, it produces the following result

## R Boxplot with Notch

We can draw boxplot with notch to find out how the medians of different data groups match with each other. The below script will create a boxplot graph with notch for each of the data group.

boxplot(mpg ~ cyl, data=mtcars,xlab="Number of Cylinders",ylab="Miles Per Gallon",

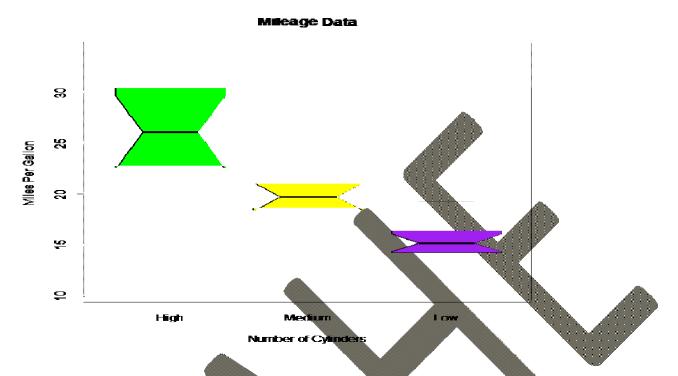

main="MileageData",notch=TRUE,col=c("green","yellow","purple"),names=c("High","Medium","Low"))

output of above script is

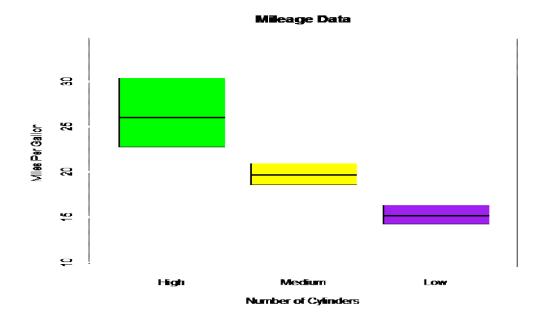

M CLASS: III B.Sc CS COURSE NAME: I

COURSE NAME: INTRODUCTION TO DATASCIENCE UNIT: VI (EXPLORATORY DATA ANALYSIS) BATCH-2017-2020

In the above script if we replace value of notch=FALSE Then the output will be

BATCH-2017-2020

### **Graphics with ggplot2**

The **ggplot2** package, created by Hadley Wickham, offers a powerful graphics language for creating elegant and complex plots. Its popularity in the **R** community has exploded in recent years...... There is a helper function called **qplot()** (for quick plot) that can hide much of this complexity when creating standard graphs.

In ggplot2, a graph is composed of the following arguments:

- data
- aesthetic mapping
- geometric object
- statistical transformations
- scales
- coordinate system
- position adjustments
- faceting

## The basic syntax of ggplot2 is:

ggplot(data, mapping=aes()) + geometric object

#### **Arguments:**

data: Dataset used to plot the graph

mapping: Control the x and y-axis

geometric object: The type of plot you want to show. The most common objects are:

- Point: `geom\_point()`
- Bar: `geom\_bar()`
- Line: `geom\_line()`
- Histogram: `geom\_histogram()`

The ggplot2 package, created by Hadley Wickham, offers a powerful graphics language for creating elegant and complex plots. Its popularity in the R community has exploded in recent years. Originally based on Leland Wilkinson's The Grammar of Graphics, ggplot2 allows you to create graphs that represent both univariate and multivariate numerical and categorical data in a straightforward manner. Grouping can be represented by color, symbol, size, and transparency. The creation of trellis plots (i.e., conditioning) is relatively simple.

#### aplot()

The **qplot**() function can be used to create the most common graph types. While it does not expose **ggplot**'s full power, it can create a very wide range of useful plots.

The format is:

AM CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATASCIENCE

Manual Course Code: 17CSU503B UNIT: VI (EXPLORATORY DATA ANALYSIS) BATCH-2017-2020

qplot(x, y, data=, color=, shape=, size=, alpha=, geom=, method=, formula=, facets=, xlim=, ylim= xlab=, ylab=, main=, sub=)

where the options are:

option	description
alpha	Alpha transparency for overlapping elements expressed as a fraction between 0 (complete transparency) and 1 (complete opacity)
color, shape, size, fill	Associates the levels of variable with symbol color, shape, or size. For line plots, color associates levels of a variable with line color. For density and box plots, fill associates fill colors with a variable. Legends are drawn automatically.
data	Specifies a data frame
facets	Creates a trellis graph by specifying conditioning variables. Its value is expressed as <i>rowvar</i> ~ <i>colvar</i> . To create trellis graphs based on a single conditioning variable, use <i>rowvar</i> ~. or .~ <i>colvar</i> )
geom	Specifies the geometric objects that define the graph type. The geom option is expressed as a character vector with one or more entries. geom values include "point", "smooth", "boxplot", "line", "histogram", "density", "bar", and "jitter".
main, sub	Character vectors specifying the title and subtitle
method, formula	If geom="smooth", a loess fit line and confidence limits are added by default. When the number of observations is greater than 1,000, a more efficient smoothing algorithm is employed. Methods include "lm" for regression, "gam" for generalized additive models, and "rlm" for robust regression. The formula parameter gives the form of the fit.
	For example, to add simple linear regression lines, you'd specify geom="smooth", method="lm", formula= $y$ - $x$ . Changing the formula to $y$ - $poly(x,2)$ would produce a quadratic fit. Note that the formula uses the letters $x$ and $y$ , not the names of the variables.
	For method="gam", be sure to load the mgcv package. For method="rml", load the MASS package.
<i>x</i> , <i>y</i>	Specifies the variables placed on the horizontal and vertical axis. For univariate plots (for example, histograms), omit $y$
xlab, ylab	Character vectors specifying horizontal and vertical axis labels
xlim,ylim	Two-element numeric vectors giving the minimum and maximum values for the horizontal and vertical axes, respectively

ARPAGAM CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATASCIENCE
UNIT: VI (EXPLORATORY DATA ANALYSIS)

BATCH-2017-2020

### Notes:

- At present, ggplot2 cannot be used to create 3D graphs or mosaic plots.
- Use **I**(*value*) to indicate a specific value. For example **size=z** makes the size of the plotted points or lines proporational to the values of a variable z. In contrast, **size=I(3)**sets each point or line to three times the default size.

Here are some examples using automotive data (car mileage, weight, number of gears, number of cylinders, etc.) contained in the **mtcars** data frame.

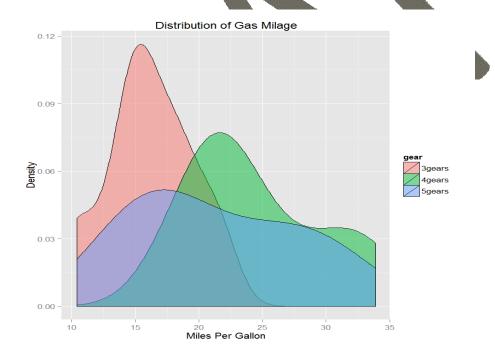

## # ggplot2 examples

library(ggplot2)

# create factors with value labels
mtcars\$gear <- factor(mtcars\$gear,levels=c(3,4,5), labels=c("3gears","4gears","5gears"))
mtcars\$am <- factor(mtcars\$am,levels=c(0,1), labels=c("Automatic","Manual"))
mtcars\$cyl <- factor(mtcars\$cyl,levels=c(4,6,8), labels=c("4cyl","6cyl","8cyl"))

# Kernel density plots for mpg

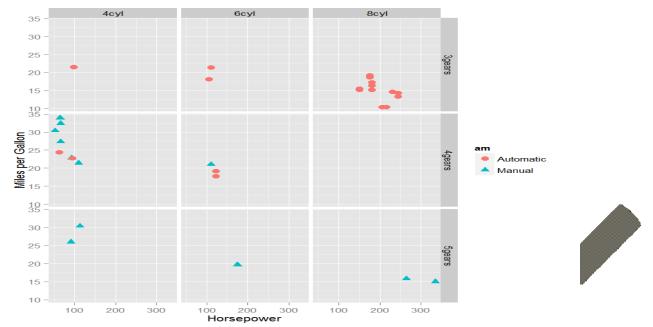

# grouped by number of gears (indicated by color)
qplot(mpg, data=mtcars, geom="density", fill=gear, alpha=I(.5), main="Distribution of Gas Milage",
xlab="Miles Per Gallon", ylab="Density")

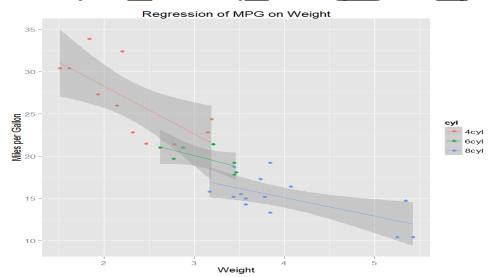

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATASCIENCE COURSE CODE: 17CSU503B UNIT: VI (EXPLORATORY DATA ANALYSIS) BATCH-2017-2020

# Scatterplot of mpg vs. hp for each combination of gears and cylinders # in each facet, transmittion type is represented by shape and color qplot(hp, mpg, data=mtcars, shape=am, color=am, facets=gear~cyl, size=I(3), xlab="Horsepower", ylab="Miles per Gallon")

# Separate regressions of mpg on weight for each number of cylinders qplot(wt, mpg, data=mtcars, geom=c("point", "smooth"), method="lm", formula=y~x, color=cyl, main="Regression of MPG on Weight", xlab="Weight", ylab="Miles per Gallon")

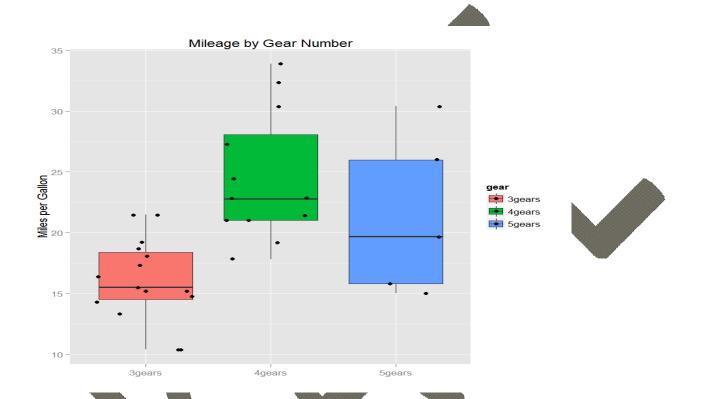

CLASS: III B.Sc CS

COURSE NAME: INTRODUCTION TO DATASCIENCE

UNIT: VI (EXPLORATORY DATA ANALYSIS) BATCH-2017-2020

# Boxplots of mpg by number of gears
# observations (points) are overlayed and jittered
qplot(gear, mpg, data=mtcars, geom=c("boxplot", "jitter"), fill=gear, main="Mileage by Gear Number",
xlab="", ylab="Miles per Gallon")

### **Scatterplot**

You start by plotting a scatterplot of the mpg variable and drat variable.

### Basic scatter plot

library(ggplot2)

ggplot(mtcars, aes(x = drat, y = npg)) + geom\_point()

#### **Code Explanation**

- You first pass the dataset mtcars to ggplot.
- Inside the aes() argument, you add the x-axis and y-axis.
- The + sign means you want R to keep reading the code. It makes the code more readable by breaking it.
- Use geom\_point() for the geometric object.

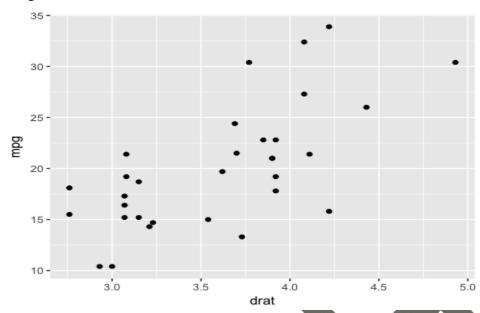

CLASS: III B.Sc CS

COURSE CODE: 17CSU503B

COURSE NAME: INTRODUCTION TO DATASCIENCE

UNIT: VI (EXPLORATORY DATA ANALYSIS) BATCH-2017-2020

### **Output:**

## Scatter plot with groups

Sometimes, it can be interesting to distinguish the values by a group of data (i.e. factor level data).  $ggplot(mtcars, aes(x = mpg, y = drat)) + geom_point(aes(color = factor(gear)))$ 

### **Code Explanation**

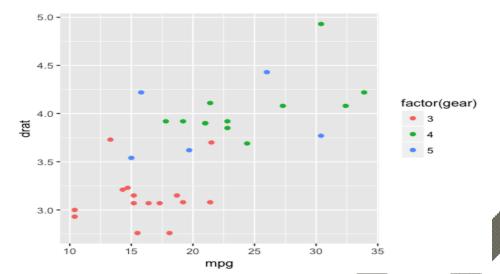

- The aes() inside the geom\_point() controls the color of the group. The group should be a factor variable. Thus, you convert the variable gear in a factor.
- Altogether, you have the code aes(color = factor(gear)) that change the color of the dots.

## **Output:**

M CLASS: III B.Sc CS
COURSE CODE: 17CSU503B

COURSE NAME: INTRODUCTION TO DATASCIENCE

UNIT: VI (EXPLORATORY DATA ANALYSIS) BATCH-2017-2020

#### **Change axis**

Rescale the data is a big part of the data scientist job. In rare occasion data comes in a nice bell shape. One solution to make your data less sensitive to outliers is to rescale them.

 $ggplot(mtcars, aes(x = log(mpg), y = log(drat))) + geom_point(aes(color = factor(gear)))$ 

## **Code Explanation**

You transform the x and y variables in log() directly inside the aes() mapping.

Note that any other transformation can be applied such as standardization or normalization.

### **Output:**

#### **Scatter plot with fitted values**

You can add another level of information to the graph. You can plot the fitted value of a linear regression.

CLASS: III B.Sc CS

COURSE NAME: INTRODUCTION TO DATASCIENCE

COURSE CODE: 17CSU503B

UNIT: VI (EXPLORATORY DATA ANALYSIS)

BATCH-2017-2020

 $my\_graph \leftarrow ggplot(mtcars, aes(x = log(mpg), y = log(drat))) + geom\_point(aes(color = factor(gear))) + stat\_smooth(method = "lm", col = "#C42126", se = FALSE, size = 1)$ 

> my\_graph

### **Code Explanation**

- graph: You store your graph into the variable graph. It is helpful for further use or avoid too complex line of codes
- The argument stat\_smooth() controls for the smoothing method
- method = "lm": Linear regression
- col = "#C42126": Code for the red color of the line
- se = FALSE: Don't display the standard error
- size = 1: the size of the line is 1

### **Output:**

## Note that other smoothing methods are available

- glm
- gam
- loess: default value
- rim

### Add information to the graph

RPAGAM CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATASCIENCE UNIT: VI (EXPLORATORY DATA ANALYSIS)

BATCH-2017-2020

So far, we haven't added information in the graphs. Graphs need to be informative. The reader should see the story behind the data analysis just by looking at the graph without referring additional documentation. Hence, graphs need good labels. You can add labels with labs()function.

### The basic syntax for lab() is:

lab(title = "Hello Guru99")

### argument:

- title: Control the title. It is possible to change or add title with:
- subtitle: Add subtitle below title
- caption: Add caption below the graph
- x: rename x-axis
- y: rename y-axis

Example: lab(title = "Hello Guru99", subtitle = "My first plot").

#### Add a title

One mandatory information to add is obviously a title.

my\_graph + labs(title = "Plot Mile per hours and drat, in log")

#### Code Explanation

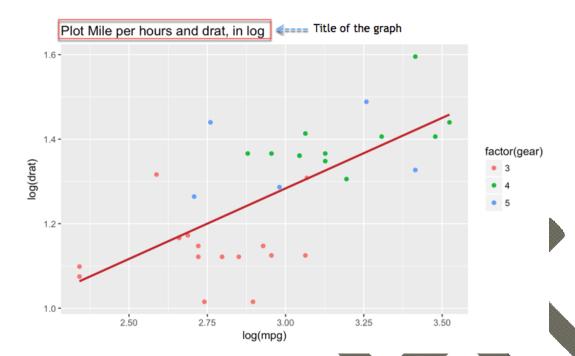

- my\_graph: You use the graph you stored. It avoids rewriting all the codes each time you add new information to the graph.
- You wrap the title inside the lab().
- Code for the red color of the line
- se = FALSE. Don't display the standard error
- size = 1: the size of the line is 1

#### **Output:**

CLASS: III B.Sc CS COURSE CODE: 17CSU503B COURSE NAME: INTRODUCTION TO DATASCIENCE BATCH-2017-2020

UNIT: VI (EXPLORATORY DATA ANALYSIS)

#### Add a subtitle

Two additional detail can make your graph more explicit. You are talking about the subtitle and the caption. The subtitle goes right below the title. The caption can inform about who did the computation and the source of the data.

```
my_graph +
  labs(
    "Relation between Mile per hours and drat"
    subtitle =
    "Relationship break down by gear class",
    caption = "Authors own computation"
  )
```

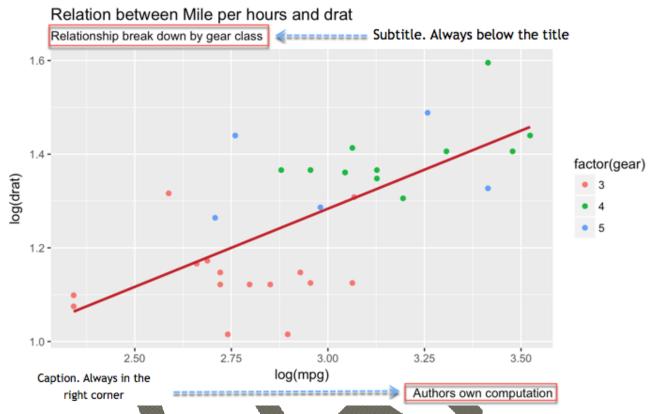

### **Code Explanation**

- Inside the lab(), you added:
  - title = "Relation between Mile per hours and drat": Add title
  - subtitle = "Relationship break down by gear class": Add subtitle
  - caption = "Authors own computation: Add caption
  - You separate each new information with a comma,

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATASCIENCE COURSE CODE: 17CSU503B UNIT: VI (EXPLORATORY DATA ANALYSIS) BATCH-2017-2020

• Note that you break the lines of code. It is not compulsory, and it only helps to read the code more easily

### Output:

## Rename x-axis and v-axis

Variables itself in the dataset might not always be explicit or by convention use the \_ when there are multiple words (i.e. GDP\_CAP). You don't want such name appear in your graph. It is important to change the name or add more details, like the units.

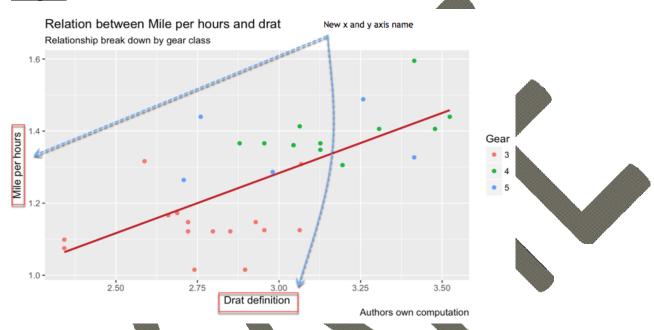

```
my_graph +
labs(
    x = "Drat definition",
    y = "Mile per hours",
    color = "Gear",
    title = "Relation between Mile per hours and drat",
    subtitle = "Relationship break down by gear class",
    caption = "Authors own computation"
)
```

AM CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATASCIENCE
UNIT: VI (EXPLORATORY DATA ANALYSIS) BATCH-2017-2020

## **Code Explanation**

- Inside the lab(), you added:
  - o x = "Drat definition": Change the name of x-axis
  - $\circ$  y = "Mile per hours": Change the name of y-axis

## Control the scales

You can control the scale of the axis.

The function seq() is convenient when you need to create a sequence of number. The basic syntax is: seq(begin, last, by = x)

#### arguments:

- begin: First number of the sequence
- last: Last number of the sequence
- by= x: The step. For instance, if x is 2, the code adds 2 to `begin-1` until it reaches `last`

For instance, if you want to create a range from 0 to 12 with a step of 3, you will have four numbers, 0 4 8 12 seq(0, 12,4)

#### **Output:**

## [1] 0 4 8 12

CLASS: III B.Sc CS

COURSE NAME: INTRODUCTION TO DATASCIENCE

COURSE CODE: 17CSU503B UNIT: VI (EXPLORATORY DATA ANALYSIS)

BATCH-2017-2020

You can control the scale of the x-axis and y-axis as below my\_graph + scale\_x\_continuous(breaks = seq(1, 3.6, by = 0.2)) + scale\_y\_continuous(breaks = seq(1, 1.6, by = 0.1)) + labs(
 x = "Drat definition",
 y = "Mile per hours",
 color = "Gear",
 title = "Relation between Mile per hours and drat",
 subtitle = "Relationship break down by gear class",

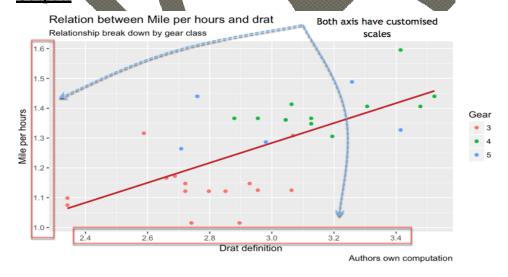

caption = "Authors own computation"

## **Code Explanation**

)

- The function scale\_y\_continuous() controls the y-axis
- The function scale\_x\_continuous() controls the x-axis.
- The parameter breaks controls the split of the axis. You can manually add the sequence of number or use the seq()function:
  - $\circ$  seq(1, 3,6, by = 0.2): Create six numbers from 2.4 to 3.4 with a step of 3
  - $\circ$  seq(1, 1.6, by = 0.1): Create seven numbers from 1 to 1.6 with a step of 1

BATCH-2017-2020

## **Theme**

Finally, R allows us to customize out plot with different themes. The library ggplot2 includes eights themes:

```
theme_bw()
theme_light()
theme_classis()
theme_linedraw()
theme_dark()
theme_minimal()
theme_gray()
```

• theme\_void()

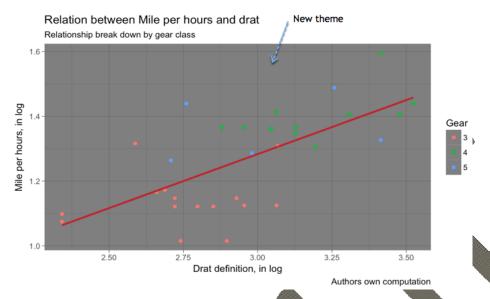

```
my_graph +
theme_dark() +
labs(
    x = "Drat definition, in log",
    y = "Mile per hours, in log",
    color = "Gear",
    title = "Relation between Mile per hours and drat",
    subtitle = "Relationship break down by gear class",
    caption = "Authors own computation"
)
```

## **Output:**

CLASS: III B.Sc CS

COURSE NAME: INTRODUCTION TO DATASCIENCE UNIT: VI (EXPLORATORY DATA ANALYSIS) BATCH-2017-2020

## **Save Plots**

After all these steps, it is time to save and share your graph. You add ggsave('NAME OF THE FILE) right after you plot the graph and it will be stored on the hard drive.

The graph is saved in the working directory. To check the working directory, you can run this code:

directory <-getwd()</pre>

> directory

ggsave("my\_fantastic\_plot.png")

CLASS: III B.Sc CS
COURSE CODE: 17CSU503B

COURSE NAME: INTRODUCTION TO DATASCIENCE UNIT: V (REPRODUCIBLE RESEARCH) BATCH-2017-2020

#### <u>UNIT-V</u>

#### **SYLLABUS**

**Reproducible Research**: Concepts and tools behind reporting modern data analyses in a reproducible manner, To write a document using R markdown, integrate live R code into a literate statistical program, compile R markdown documents using knitr and related tools, and organize a data analysis so that it is reproducible and aCSUessible to others.

#### What is **Reproducible research**?

**Reproducible research** is the idea that data analyses, and more generally, scientific claims, are published with their data and software code so that others may verify the findings and build upon them. ... We also cover structuring and organizing a data analysis to help make it more **reproducible**.

If someone was to carry out the test again using the same method and got the same result, the data is said to be **repeatable**. If a measurement was taken using a **different** method and got the same result, the result is referred to as **reproducible**.

A study can be truly reproducible when it satisfies at least the following three criteria.

- All methods are fully reported.
- All data and files used for the analysis are (publicly) available.
- The process of analyzing raw data is well reported and preserved.

Therefore:

Same data + Same script = Same results

#### **Basic definitions**

- 1. Analysis = software + data + environment + invocations
- 2. Reproducible analysis = analysis that can be carried out by independent parties
- 3. Extensible analysis = analysis supporting independent variations
- 4. Study = Design + implementation + analysis
- 5. Replicable study = A study that, when executed by independent parties, produces statistically compatible interpretations

AMON CLASS: III B.Sc CS
COURSE CODE: 17CSU503B

COURSE NAME: INTRODUCTION TO DATASCIENCE
UNIT: V (REPRODUCIBLE RESEARCH) BATCH-2017-2020

# Replication

- The ultimate standard for strengthening scientific evidence is replication of findings and conducting studies with independent
  - Investigators
  - Data
  - Analytical methods
  - Laboratories
  - Instruments
- Replication is particularly important in studies that can impact broad policy or regulatory

decisions

# What's Wrong with Replication?

- Some studies cannot be replicated
  - No time, opportunistic
  - No money
  - Unique
- Reproducible Research: Make analytic data and code available so that others may reproduce findings

CLASS: III B.Sc CS
COURSE CODE: 17CSU503B

COURSE NAME: INTRODUCTION TO DATASCIENCE UNIT: V (REPRODUCIBLE RESEARCH) BATCH-2017-2020

# Why Do We Need Reproducible Research?

- New technologies increasing data collection throughput; data are more complex and extremely high dimensional
- Existing databases can be merged into new "megadatabases"
- Computing power is greatly increased, allowing more sophisticated analyses
- For every field "X" there is a field "Computational X"

#### **Research Pipeline**

The basic issue is when you read a description of a data analysis, such as in an article or a technical report, for the most part, what you get is the report and nothing else. Of course, everyone knows that behind the scenes there's a lot that went into this report and that's what I call the data science pipeline.

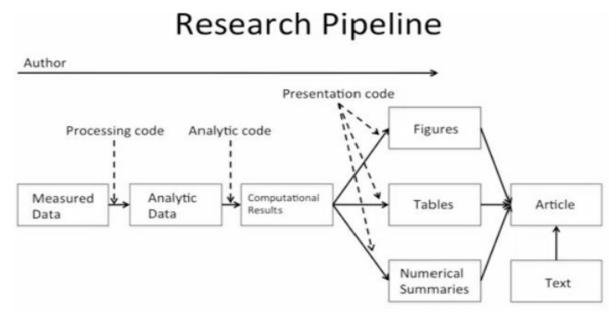

Fig:1 The Data Science Pipeline

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATASCIENCE UNIT: V (REPRODUCIBLE RESEARCH) BATCH-2017-2020

In this pipeline, there are two "actors": the author of the report/article and the reader. On the left side, the author is going from left to right along this pipeline. The reader is going from right to left. If you're the reader you read the article and you want to know more about what happened: Where is the data? What was used here? The basic idea behind reproducibility is to focus on the elements in the blue blox: the analytic data and the computational results. With reproducibility the goal is to allow the author of a report and the reader of that report to "meet in the middle".

#### **Elements of Reproducibility:**

What do we need for reproducibility? There's a variety of always to talk about this, but one basic definition that we've come up with is that there are four things that are required to make results reproducible:

#### 1. Analytic data:

The data that were used for the analysis that was presented should be available for others to access. This is different from the raw data because very often in a data analysis the raw data are not all used for the analysis, but rather some subset is used. It may be interesting to see the raw data but impractical to actually have it. Analytic data is key to examining the data analysis.

#### 2. Analytic code:

The analytic code is the code that was applied to the analytic data to produce the key results. This may be preprocessing code, regression modeling code, or really any other code used to produce the results from the analytic data.

#### 3. Documentation:

Documentation of that code and the data is very important.

#### 4. Distribution:

Finally, there needs to be some standard means of distribution, so all this data in the code is easily accessible

# Literate (Statistical) Programming

- An article is a stream of text and code
- Analysis code is divided into text and code "chunks"
- Each code chunk loads data and computes results
- Presentation code formats results (tables, figures, etc.)
- Article text explains what is going on
- Literate programs can be weaved to produce human-readable documents and tangled to produce machine-readable documents

CLASS: III B.Sc CS COURSE CODE: 17CSU503B COURSE NAME: INTRODUCTION TO DATASCIENCE

UNIT: V (REPRODUCIBLE RESEARCH) BATCH-2017-2020

# Literate (Statistical) Programming

- Literate programming is a general concept that requires
  - A documentation language (human readable)
  - A programming language (machine readable)
- Sweave uses LAT<sub>F</sub>X and R as the documentation and programming languages
- Sweave was developed by Friedrich Leisch (member of the R Core) and is maintained by R core
- Main web site: http://www.statistik.lmu.de/ ~leisch/Sweave

# Literate (Statistical) Programming

- knitr is an alternative (more recent) package
- · Brings together many features added on to Sweave to address limitations
- knitr uses R as the programming language (although others are allowed) and variety of documentation languages
  - LaTeX, Markdown, HTML
- knitr was developed by Yihui Xie (while a graduate student in statistics at Iowa State)
- See http://yihui.name/knitr/

CLASS: III B.Sc CS COURSE NAME: INTRODUCTION TO DATASCIENCE
UNIT: V (REPRODUCIBLE RESEARCH) BATCH-2017-2020

#### R Markdown

#### **Introduction**

R Markdown provides a unified authoring framework for data science, combining your code, its results, and your prose commentary. R Markdown documents are fully reproducible and support dozens of output formats, like PDFs, Word files, slideshows, and more.

#### R Markdown files are designed to be used in three ways:

- 1. For communicating to decision makers, who want to focus on the conclusions, not the code behind the analysis.
- 2. For collaborating with other data scientists (including future you!), who are interested in both your conclusions, and how you reached them (i.e. the code).
- 3. As an environment in which to *do* data science, as a modern day lab notebook where you can capture not only what you did, but also what you were thinking.

R Markdown integrates a number of R packages and external tools. This means that help is, by-and-large, not available through? Instead, as you work through this chapter, and use R Markdown in the future, keep these resources close to hand:

- R Markdown Cheat Sheet: *Help > Cheatsheets > R Markdown Cheat Sheet*,
- R Markdown Reference Guide: *Help > Cheatsheets > R Markdown Reference Guide*.

#### **Prerequisites**

You need the rmarkdown package, but you don't need to explicitly install it or load it, as RStudio automatically does both when needed.

#### R Markdown basics:

This is an R Markdown file, a plain text file that has the extension .Rmd:

```
title: "Diamond sizes"
date: 2016-08-25
output: html_document
```{r setup, include = FALSE}
library(ggplot2)
library(dplyr)
smaller <- diamonds %>%
 filter(carat <= 2.5)
We have data about 'r nrow(diamonds)' diamonds. Only
'r nrow(diamonds) - nrow(smaller)' are larger than
           carats. The distribution of the remainder
       is shown below:
```{r, echo = FALSE}
smaller %>%
ggplot(aes(carat)) +
 geom\_freqpoly(binwidth = 0.01)
```

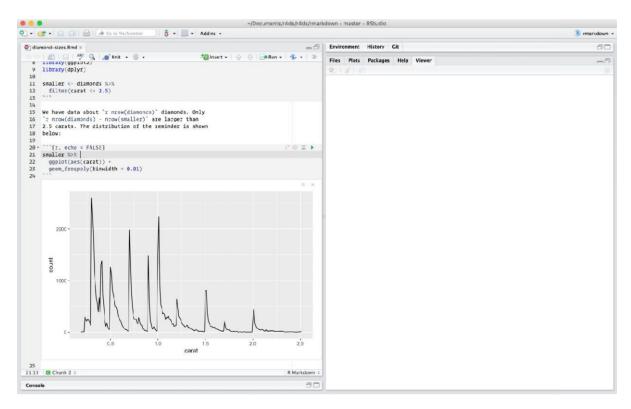

CLASS: III B.Sc CS COURSE CODE: 17CSU503B COURSE NAME: INTRODUCTION TO DATASCIENCE UNIT: V (REPRODUCIBLE RESEARCH) BATCH-2017-2020

It contains three important types of content:

- 1. An (optional) YAML header surrounded by ---s.
- 2. Chunks of R code surrounded by ```.
- 3. Text mixed with simple text formatting like # heading and \_italics\_.

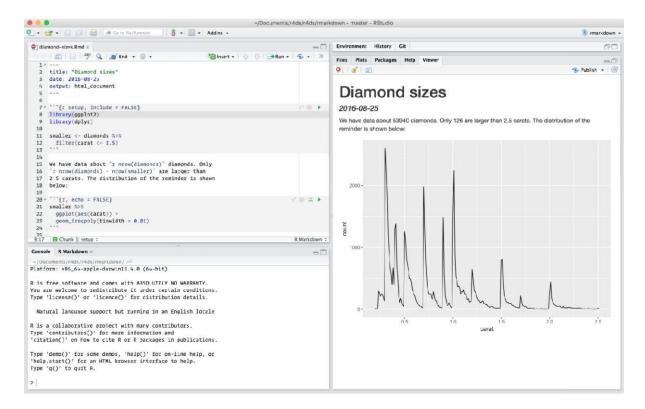

When you open an .Rmd, you get a notebook interface where code and output are interleaved. You can run each code chunk by clicking the Run icon (it looks like a play button at the top of the chunk), or by pressing Cmd/Ctrl + Shift + Enter. RStudio executes the code and displays the results inline with the code:

To produce a complete report containing all text, code, and results, click "Knit" or press Cmd/Ctrl + Shift + K. You can also do this programmatically with rmarkdown::render("1-example.Rmd"). This will display the report in the viewer pane, and create a self-contained HTML file that you can share with others.

CLASS: III B.Sc CS COURSE CODE: 17CSU503B COURSE NAME: INTRODUCTION TO DATASCIENCE UNIT: V (REPRODUCIBLE RESEARCH) BATCH-2017-2020

When you knit the document, R Markdown sends the .Rmd file to knitr, http://yihui.name/knitr/, which executes all of the code chunks and creates a new markdown (.md) document which includes the code and its output. The markdown file generated by knitr is then processed by pandoc, http://pandoc.org/, which is responsible for creating the finished file. The advantage of this two step workflow is that you can create a very wide range of output formats, as you'll learn about in R markdown formats.

To get started with your own .Rmd file, select *File* > *New File* > *R Markdown*... in the menu bar. RStudio will launch a wizard that you can use to pre-populate your file with useful content that reminds you how the key features of R Markdown work.

CLASS: III B.Sc CS COURSE CODE: 17CSU503B COURSE NAME: INTRODUCTION TO DATASCIENCE UNIT: V (REPRODUCIBLE RESEARCH) BATCH-2017-2020

#### Compiling R mark down documents

R Markdown is a file format for making dynamic documents with R. An R Markdown document is written in markdown (an easy-to-write plain text format) and contains chunks of embedded R code, like the document below.

output: html\_document This is an R Markdown document. Markdown is a simple formatting syntax for authoring HTML, PDF, and MS Word documents. For more details on using R Markdown see . When you click the \*\*Knit\*\* button a document will be generated that includes both content as well as the output of any embedded R code chunks within the document. You can embed an R code chunk like this: ```{r} summary(cars) You can also embed plots, for example: ```{r, echo=FALSE} plot(cars) Note that the 'echo = FALSE' parameter was added to the code chunk to prevent printing of the R code that

generated the plot.

R Markdown files are designed to be used with the rmarkdown package. rmarkdown comes installed with the RStudio IDE, but you can acquire your own copy of rmarkdown from CRAN with the command

install.packages("rmarkdown")

R Markdown files are the source code for rich, reproducible documents. You can transform an R Markdown file in two ways.

CLASS: III B.Sc CS **COURSE CODE: 17CSU503B**  COURSE NAME: INTRODUCTION TO DATASCIENCE

UNIT: V (REPRODUCIBLE RESEARCH) BATCH-2017-2020

1. **knit** - You can *knit* the file. The rmarkdown package will call the knitr package. knitr will run each chunk of R code in the document and append the results of the code to the document next to the code chunk. This workflow saves time and facilitates reproducible reports.

Consider how authors typically include graphs (or tables, or numbers) in a report. The author makes the graph, saves it as a file, and then copy and pastes it into the final report. This process relies on manual labor. If the data changes, the author must repeat the entire process to update the graph.

In the R Markdown paradigm, each report contains the code it needs to make its own graphs, tables, numbers, etc. The author can automatically update the report by re-knitting.

2. **convert** - You can *convert* the file. The rmarkdown package will use the pandoc program to transform the file into a new format. For example, you can convert your .Rmd file into an HTML, PDF, or Microsoft Word file. You can even turn the file into an HTML5 or PDF slideshow. rmarkdown will preserve the text, code results, and formatting contained in your original .Rmd file.

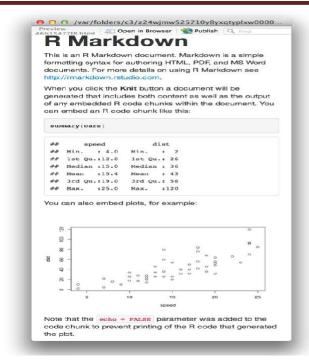

Conversion lets you do your original work in markdown, which is very easy to use. You can include R code to knit, and you can share your document in a variety of formats.

In practice, authors almost always knit and convert their documents at the same time. In this article, I will use the term *render* to refer to the two step process of knitting and converting an R Markdown file.

You can manually render an R Markdown file with rmarkdown::render(). This is what the above document looks like when rendered as a HTML file.

CLASS: III B.Sc CS COURSE CODE: 17CSU503B COURSE NAME: INTRODUCTION TO DATASCIENCE UNIT: V (REPRODUCIBLE RESEARCH) BATCH-2017-2020

In practice, you do not need to call rmarkdown::render(). You can use a button in the RStudio IDE to render your reprt. R Markdown is heavily integrated into the RStudio IDE.

#### **Getting started**

To create an R Markdown report, open a plain text file and save it with the extension .*Rmd*. You can open a plain text file in your scripts editor by clicking File > New File > Text File in the RStudio toolbar.

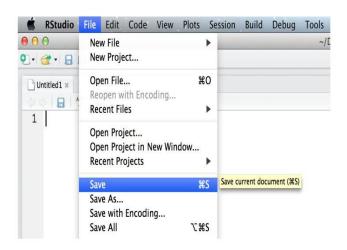

CLASS: III B.Sc CS **COURSE CODE: 17CSU503B**  COURSE NAME: INTRODUCTION TO DATASCIENCE UNIT: V (REPRODUCIBLE RESEARCH) BATCH-2017-2020

R Documentation

RStudio File Edit Code View Plots Session Build Debug Tools 000 New File R Script 企器N New Project... 인 - 🥣 - 🔒 R Markdown... Open File... 80 Console ~/Deskt Create Text File Recent Files > C++ File Open Project... Open Project in New Window... R Sweave Recent Projects R HTML R Presentation Save

Be sure to save the file with the extension . Rmd. The RStudio IDE enables several helpful buttons when you save the file with the .Rmd extension. You can save your file by clicking File > Save in the RStudio toolbar.

COURSE CODE: 17CSU503B

COURSE NAME: INTRODUCTION TO DATASCIENCE
UNIT: V (REPRODUCIBLE RESEARCH) BATCH-2017-2020

R Markdown reports rely on three frameworks

- 1. markdown for formatted text
- 2. knitr for embedded R code
- 3. YAML for render parameters

#### Markdown for formatted text

.Rmd files are meant to contain text written in markdown. Markdown is a set of conventions for formatting plain text. You can use markdown to indicate

- bold and italic text
- lists
- headers (e.g., section titles)
- hyperlinks
- and much more

The conventions of markdown are very unobtrusive, which make Markdown files easy to read. The file below uses several of the most useful markdown conventions.

#### # Say Hello to markdown

Markdown is an \*\*easy to use\*\* format for writing reports. It resembles what you naturally write every time you compose an email. In fact, you may have already used markdown \*without realizing it\*. These websites all rely on markdown formatting

- \* [Github](www.github.com)
- \* [StackOverflow](www.stackoverflow.com)
- \* [Reddit](www.reddit.com)

The file demonstrates how to use markdown to indicate:

- 1. **headers** Place one or more hashtags at the start of a line that will be a header (or sub-header). For example, # Say Hello to markdown. A single hashtag creates a first level header. Two hashtags, ##, creates a second level header, and so on.
- 2. **italicized and bold text** Surround italicized text with asterisks, like this \*without realizing it\*. Surround bold text with two asterisks, like this \*\*easy to use\*\*.
- 3. **lists** Group lines into bullet points that begin with asterisks. Leave a blank line before the first bullet, like this

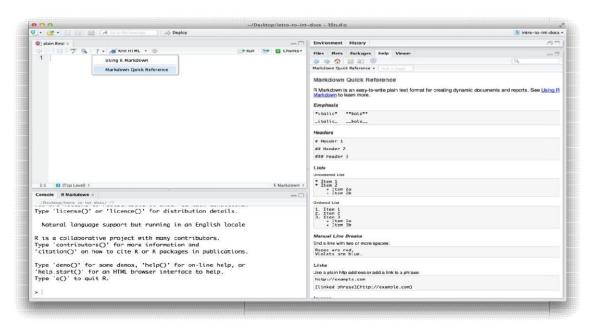

CLASS: III B.Sc CS COURSE CODE: 17CSU503B COURSE NAME: INTRODUCTION TO DATASCIENCE UNIT: V (REPRODUCIBLE RESEARCH) BATCH-2017-2020

This is a list	
* item 1	
* item 2	
* item 3	

4. **hyperlinks** - Surround links with brackets, and then provide the link target in parentheses, like this [Github](www.github.com).

You can learn about more of markdown's conventions in the *Markdown Quick Reference* guide, which comes with the RStudio IDE.

To access the guide, open a .md or .Rmd file in RStudio. Then click the question mark that appears at the top of the scripts pane. Next, select "Markdown Quick Reference". RStudio will open the Markdown Quick Reference guide in the Help pane.

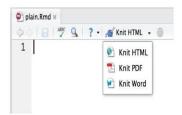

CLASS: III B.Sc CS COURSE CODE: 17CSU503B COURSE NAME: INTRODUCTION TO DATASCIENCE

UNIT: V (REPRODUCIBLE RESEARCH) BATCH-2017-2020

### Rendering

To transform your markdown file into an HTML, PDF, or Word document, click the "Knit" icon that appears above your file in the scripts editor. A drop down menu will let you select the type of output that you want.

When you click the button, rmarkdown will duplicate your text in the new file format. rmarkdown will use the formatting instructions that you provided with markdown syntax.

Once the file is rendered, RStudio will show you a preview of the new output and save the output file in your working directory.

Here is how the markdown script above would look in each output format.

CLASS: III B.Sc CS COURSE CODE: 17CSU503B COURSE NAME: INTRODUCTION TO DATASCIENCE UNIT: V (REPRODUCIBLE RESEARCH) BATCH-2017-2020

Note: RStudio does not build PDF and Word documents from scratch. You will need to have a distribution of Latex installed on your computer to make PDFs and Microsoft Word (or a similar program) installed to make Word files.

#### knitr for embedded R code

The knitr package extends the basic markdown syntax to include chunks of executable R code.

When you render the report, knitr will run the code and add the results to the output file. You can have the output display just the code, just the results, or both.

To embed a chunk of R code into your report, surround the code with two lines that each contain three backticks. After the first set of backticks, include {r}, which alerts knitr that you have included a chunk of R code. The result will look like this

CLASS: III B.Sc CS COURSE CODE: 17CSU503B COURSE NAME: INTRODUCTION TO DATASCIENCE UNIT: V (REPRODUCIBLE RESEARCH) BATCH-2017-2020

```
Here's some code
""r
dim(iris)
""
## [1] 150 5
```

When you render your document, knitr will run the code and append the results to the code chunk. knitr will provide formatting and syntax highlighting to both the code and its results (where appropriate).

As a result, the markdown snippet above will look like this when rendered (to HTML).

To omit the *results* from your final report (and not run the code) add the argument eval = FALSE inside the brackets and after r. This will place a copy of your code into the report.

AM CLASS: III B.Sc CS
COURSE CODE: 17CSU503B

COURSE NAME: INTRODUCTION TO DATASCIENCE

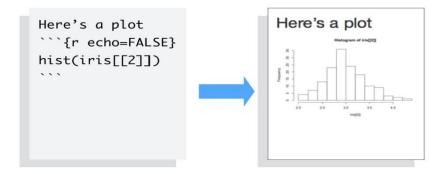

COURSE CODE: 17CSU503B UNIT: V (REPRODUCIBLE RESEARCH) BATCH-2017-2020

To omit the *code* from the final report (while including the results) add the argument echo = FALSE. This will place a copy of the results into your report.

echo = FALSE is very handy for adding plots to a report, since you usually do not want to see the code that generates the plot.

CLASS: III B.Sc CS COURSE CODE: 17CSU503B COURSE NAME: INTRODUCTION TO DATASCIENCE
UNIT: V (REPRODUCIBLE RESEARCH) BATCH-2017-2020

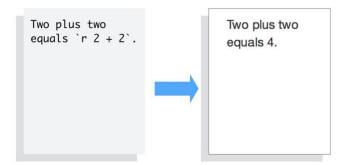

echo and eval are not the only arguments that you can use to customize code chunks. You can learn more about formatting the output of code chunks at the rmarkdown and knitr websites.

#### **Inline code**

To embed R code in a line of text, surround the code with a pair of backticks and the letter r, like this.

Two plus two equals 4.

knitr will replace the inline code with its result in your final document (inline code is *always* replaced by its result). The result will appear as if it were part of the original text. For example, the snippet above will appear like this:

#### YAML for render parameters

You can use a YAML header to control how rmarkdown renders your .Rmd file. A YAML header is a section of key: value pairs surrounded by --- marks, like below

title: "Untitled"
author: "Garrett"
date: "July 10, 2014"
output: html\_document
---

Some inline R code, 4.

Dr. V. SAMESWARI., Asst. Professor., Dept. of CS, CA and IT, KAHE

CLASS: III B.Sc CS COURSE CODE: 17CSU503B COURSE NAME: INTRODUCTION TO DATASCIENCE

E CODE: 17CSU503B UNIT: V (REPRODUCIBLE RESEARCH) BATCH-2017-2020

The output: value determines what type of output to convert the file into when you call rmarkdown::render(). *Note:* you do not need to specify output: if you render your file with the RStudio IDE knit button.

**Output**: recognizes the following values:

- html\_document, which will create HTML output (default)
- pdf\_document, which will create PDF output
- word\_document, which will create Word output

If you use the RStudio IDE knit button to render your file, the selection you make in the gui will override the output: setting.

#### **Slideshows**

You can also use the output: value to render your document as a slideshow.

- output: ioslides\_presentation will create an ioslides (HTML5) slideshow
- output: beamer\_presentation will create a beamer (PDF) slideshow

Note: The knit button in the RStudio IDE will update to show slideshow options when you include one of the above output values and save your .Rmd file.

#### What is Knitr?

**knitr** is an engine for dynamic report generation with **R**. It is a package in the statistical programming language **R** that enables integration of **R** code into LaTeX, LyX, HTML, Markdown, AsciiDoc, and reStructuredText documents.

The purpose of knitr is to allow reproducible research in R through the means of Literate Programming. It is licensed under the GNU General Public License. knitr was inspired by Sweave and written with a different design for better modularization, so it is easier to maintain and extend. Sweave can be regarded as a subset of knitr in the sense that all features of Sweave are also available in knitr. Some of knitr's extensions include the R Markdown format (used in reports published on RPubs), caching, TikZ graphics and support to other languages such as Python, Perl, C++, Shell scripts and CoffeeScript, and so on.

knitr is officially supported in the RStudio IDE for R, LyX, Emacs/ESS and the Architect IDE for data science.

CLASS: III B.Sc CS
COURSE CODE: 17CSU503B

COURSE NAME: INTRODUCTION TO DATASCIENCE
UNIT: V (REPRODUCIBLE RESEARCH) BATCH-2017-2020

#### **Knitr commands:**

Documents that contain R code must be saved with the extension .Rtex, otherwise the code won't work. Let's see an example:

```
\documentclass{article}
\usepackage[utf8]{inputenc}
\usepackage[english]{babel}
```

\begin{document}

\end{document}

You can type R commands in your  $LaTeX\{\}$  document and they will be properly run and the output printed in the document.

```
<>>>=
# Create a sequence of numbers
X = 2:10
# Display basic statistical measures
summary(X)
```

run and the output printed in the document.

You can type R commands in your LATEX document and they will be properly

```
# Create a sequence of numbers
X = 2:10

# Display basic statistical measures
summary(X)

## Min. 1st Qu. Median Mean 3rd Qu. Max.
## 2 4 6 6 8 10
```

As you see, the text in between the characters <<>>= and @ is R code, this code and its output is printed in a listing-like format.

This chunk of code can take some extra parameters to customize the dynamic output.

M CLASS: III B.Sc CS
COURSE CODE: 17CSU503B

COURSE NAME: INTRODUCTION TO DATASCIENCE UNIT: V (REPRODUCIBLE RESEARCH) BATCH-2017-2020

#### **Chunks of code**

A code block as the one presented in the previous section is usually called a *chunk*. You can set some extra options in knitr chunks. See the example below:

You can type R commands in your \LaTeX{} document and they will be properly run and the output printed in the document.

<<echo=FALSE, cache=TRUE>>= # Create a sequence of numbers X = 2:10

# Display basic statistical measures summary(X)

You can type R commands in your LATEX document and they will be properly run and the output printed in the document.

##	Min. 1st	Qu.	Median	Mean 3rd	l Qu.	Max.
##	2	4	6	6	8	10

There are three additional options passed inside << and >>.

#### echo=FALSE

This hides the code and only prints the output generated by R.

#### cache=TRUE

If cache is set to true the chunk is not run, only the objects generated by it. This saves time if the data in that chunk haven't changed. *Note that the cache=TRUE option is not currently supported in ShareLaTeX, but it should work locally.* 

AM CLASS: III B.Sc CS
AURION COURSE CODE: 17CSU503B

COURSE NAME: INTRODUCTION TO DATASCIENCE UNIT: V (REPRODUCIBLE RESEARCH) BATCH-2017-2020

#### **Inline commands**

It is possible to access objects generated in a chunk and print them in-line.

You can type R commands in your \LaTeX{} document and they will be properly run and the output printed in the document.

<<echo=FALSE, cache=TRUE>>= # Create a sequence of numbers X = 2:10

# Display basic statistical measures summary(X)

(a)

So, the mean of the data is  $\operatorname{Sexpr}\{\operatorname{mean}(X)\}$ \$

You can type R commands in your LATEX document and they will be properly run and the output printed in the document.

```
## Min. 1st Qu. Median Mean 3rd Qu. Max.
## 2 4 6 6 8 10
```

So, the mean of the data is 6

The command  $\S \exp\{ (X) \}$  prints the output returned by the R code mean(X). Inside the braces any R command can be passed.

#### **Plots**

Plots can also be added to a **knitr** document. See the next example

<<pre><<plotquery</pre>fig.pos="t", fig.height=4, fig.width=4, fig.cap="First plot">>=

xdata = read.csv(file="data.txt", head=TRUE,sep=" ")

hist(xdata\$data, main="ShareLaTeX histogram", xlab="Data")

(a)

The figure \ref{fig:plot1} is simple histogram.

CLASS: III B.Sc CS COURSE CODE: 17CSU503B COURSE NAME: INTRODUCTION TO DATASCIENCE
UNIT: V (REPRODUCIBLE RESEARCH) BATCH-2017-2020

This histogram uses data stored in "data.txt", saved in the current working directory. A few figure-related options are passed to the chunk.

#### ShareLaTeX histogram

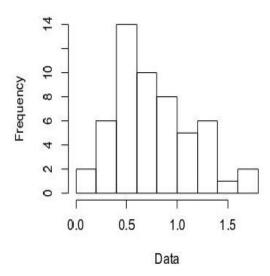

Figure 1: First plot

```
xdata = read.csv(file = "data.txt", head = TRUE, sep = " ")
hist(xdata$data, main = "ShareLaTeX histogram", xlab = "Data")
```

The figure 1 is simple histogram.

#### plot1

This is the label used to reference the plot. The prefix "fig:" is mandatory. You can see in the example that the figure is referenced with \ref{fig:plot1}.

fig.pos="t"

Positioning parameter. This is the same used in the figure environment.

fig.height=4, fig.width=4

Figure width and height

fig.cap="First plot"

Caption for the figure.

#### **POSSIBLE OUESTIONS**

#### **2 MARKS**

- 1. What is **Reproducible research**?
- 2. What is replication?
- 3. What is wrong with replication?
- 4. Why do we need Reproducible Research?
- 5. Define Research Pipeline.
- 6. List the elements of Reproducibility.
- 7. Define R Markdown.
- 8. What is Knitr?
- 9. How can you transform R Markdown files?

#### 6 MARKS

- 1. Write about Reproducible Research in detail.
- 2. Explain in detail about R Markdown.
- 3. How to Compiling R mark down documents with example.
- 4. Explain Knitr commands with example.
