Forms: Working with forms-Creating forms-working with menus- working with Radio buttons- check boxes-textboxes-text areas- password boxes-submit button-Resetting the form. DHTML: Heading and Horizontal line-Hidden Message-Message at the center of the page- Moving Boxes- Changeable Box- CSS: Introduction- Creating Style Sheets- Common Tasks with CSS- Colors-The Font Family.

UNIT-III

JavaScript: Introduction-Operators-Starting with JavaScript- Using Quotes-Using Alerts-Functions-Variables-data types- Statements-Comments. Objects: Working with Objects- Date Object-Math Object-String Object--Handling Events in JavaScript-Event Handling attributes-Window Events-Window Object – Document Object-Navigator Object

UNIT-IV

PHP: Introduction-What is PHP?-Why PHP?-Basic PHP syntax-Comments in PHP- PHP5 variables-PHP5 echo and Print Statements- How Online PHP Programs Runs- PHP Datatypes-PHP String Functions

UNIT-V

Functions-Arrays-PHP Form Handling-GET,POST Methods-Form Validation-PHP File Handling-PHP Exception Handling. MySQL: Introduction to MySQL -Connecting to MySQL from a PHP application- Inserting and updating records in table- Deleting and retrieving data from table.

Course Objectives

- To identify the licensing of open source systems and make decisions on their use, based on an understanding of the legal, economical and technical issues.
- To find open source projects related to a given development problem.
- To install from source code an open source project and start using it.
- To choose the correct license, development model, and development community for open source projects, and can initiate a new project or join an existing project.
- To understand the OSS Perl and its fundamental concepts
- To develop a Perl application and connect it to MySQL

Course Outcomes(COs)

1. Can identify the licensing of open source systems and make decisions on their use, based on an understanding of the legal, economical and technical issues.
2. Can find open source projects related to a given development problem.
3. Can install from source code an open source project and start using it.
4. Can choose the correct license, development model, and development community for open source projects, and can initiate a new project or join an existing project.
5. Understand the OSS Perl and its fundamental concepts
6. Can develop a Perl application and connect it to MySQL

UNIT I

Overview of Free/ Open Source Software: The Open Source Definition - Examples of OSD Compliant Licenses - Examples of Open Source Software Product – The Open Source Software Development Process – A History of Open Source software: The Berkeley Software Distribution – The Free Software Foundation – Linux – Apache – Mozilla – Open Source Software.

UNIT II

Qualification: Defining Open Source Software – Categorizing Defining Open Source Software – Specific Characteristics of Open Source Software Transformation: The OSS Development Process – Taboos and Norms in OSS Development – The OSS Development Life Cycle – Deriving a Framework for Analyzing OSS – Zachman’s Framework for IS Architecture – CATWOE and Soft System Method – Deriving the Analytical Framework for OSS.

UNIT III

Environment: The “where” of OSS – the “when” of OSS – World View: A Framework for classifying OSS Motivations – Technological Micro-level (individual) motivation – Economic Micro-level and Macro-level (individual) Motivation – Socio-political Micro-level and Macro-level (individual) Motivation.

Open Source Server Applications: Infrastructure Services – Web Services – Database Servers – Mail Servers – Systems Management – Open Source Desktop Applications: Introduction – Graphical Desktops – Web Browsers – The Office Suite – Mail and Calendar Clients – Personal Software – Cost of OSS: Total Cost of Ownership – Types of Costs Licensing: Types of Licenses – Licenses in Use – Mixing Open and Close Code – Dual Licensing.

UNIT IV

Perl Programming

Perl - Introduction, Perl Basics: - Syntax, Variables, Strings, Numbers, Operators, Arrays: - Using Arrays, Manipulating Arrays, Associative Arrays, Chop, Length, and Sub string. Hashes, Arguments, Logic, Looping, Files, Pattern Matching, Environment Variables, Using cgilib for Forms.

UNIT V

File Management PERL: - File Handling, Reading From Files, Appending Files, Writing to Files, File Checking, Reading Directories.

Databases PERL: - DBI Module, DBI Connect, DBI Query, MySQL Module, MySQL Connect, MySQL SelectDB, MySQL Query.

2. en.wikipedia.org/wiki/PHP
3. www.w3schools.com/PHP/DEfaULT.asP

Course Objectives

- To state the basic concepts in information security, including security policies, security models, and security mechanisms.
- To provide an exposure to the spectrum of security activities methods methodologies and procedures with emphasis on practical aspects of Information Security.
- To understand principles of web security.
- To gain knowledge about securing both clean and corrupted systems, protect personal data, and secure computer networks.
- To understand key terms and concepts in cyber law, intellectual property and cybercrimes, trademarks and domain theft.
- To provide the learner will be able to examine secure software development practices.

Course Outcomes (COs)

A student who successfully completes this course should at a minimum be able to:

1. State the basic concepts in information security, including security policies, security models, and security mechanisms.
2. Explain concepts related to applied cryptography including the four techniques for crypto-analysis symmetric and asymmetric cryptography, digital signature, message authentication code, hash functions and modes of encryption operations.
3. Explain common vulnerabilities in computer programs including buffer overflow Vulnerabilities time-of-check to time-of-use flaws incomplete mediation.
4. The learner will gain knowledge about securing both clean and corrupted systems, protect personal data, and secure computer networks.
5. The learner will understand key terms and concepts in cyber law, intellectual property and cybercrimes, trademarks and domain theft.
6. The learner will be able to examine secure software development practices.

UNIT-I

Introduction to cybercrime: Introduction-Cybercrime: Definition and Information Security-who are cybercriminals? - Classification of cybercrimes. Cybercrime: The legal perspectives- cybercrimes: An Indian Perspective - cybercrime and the Indian ITA2000: Hacking and the Indian law(s) - A Global Perspective on cybercrimes: cybercrime and the Extended Enterprise - cybercrime Era: Survival Mantra for the Netizens - Concluding Remarks and Way Forward to Further Chapters.

UNIT-II

Cyberoffenses: How Criminals Plan Them: Introduction: categories of Cybercrime -How criminals Plan the Attacks: Reconnaissance, Passive Attacks, Active Attacks, Scanning and Scrutinizing Gathered Information, Attack (Gaining and Maintaining the system Access) -social Engineering: Classification of Social Engineering - Cyberstalking: Types

of stalkers, Cases Reported on Cyberstalking, How stalking Works?, real-life incident of Cyberstalking -Cybercafe and Cybercrimes

UNIT-III

Cybercrime: Mobile and wireless Devices-Introduction - Proliferation of Mobile and Wireless Devices - Trends in Mobility-Credit Card Frauds in Mobile and Wireless Computing Era: Types and Techniques of Credit Card Frauds - Security challenges Posed by Mobile Devices - Registry Settings for Mobile Devices - Authentication Service security: cryptographic security, LDAP Security, RAS Security, Media Player Control Security, Networking API Security.

UNIT-IV

Mobile Devices: Security Implication for Organizations – Managing Diversity and Proliferation of Hand-Held Devices, Unconventional/ Steath Storage Devices, Threats through Lost and Stolen Devices, Protecting Data on lost devices, Educating the Laptop Users - Organizational Measures for Handling Mobile devices - Related Security Issues:

UNIT-V

Encrypting Organization Databases, Including Mobile Devices in Security Strategy - Organizational Security Policies and Measures in mobile Computing Era: Importance of Security polices relating to mobile Computing Devices, Operating Guidelines for Implementing Mobile Devices Security Polices, Organizational Policies for the Use of Mobile Hand - Held Devices - Laptops: Physical Security Countermeasures.

Course Objectives

- To comprehend the basic concepts of the client-server model.
- To understand how client-server systems work.
- To differentiate between two-tier and three-tier architectures.
- To improve the performance and reliability of client server based systems.
- To identify security and ethical issues in client server computing
- To understand contemporary terminology, progress, issues, and trends of client server systems.

Course Outcomes (COs)

1. Comprehend the basic concepts of the client-server model.
2. Understand how Client-Server systems work.
3. Differentiate between two-tier and three-tier architectures.
4. Improve the performance and reliability of Client Server based systems.
5. Identify security and ethical issues in Client Server Computing
6. Ability to understand contemporary terminology, progress, issues, and trends of Client Server Systems.

UNIT-I Client/Server Computing

What is client/server-types of servers-FAT server-Fat clients-2tier vs 3-tier.client/server building blocks

UNIT-II Clients, Servers & Operating Systems

NOS Creating the single system image-RPC, Messaging and peer-to-peer

UNIT-III SQL Database servers

SQL Middleware and Federated Database-Data Warehouses

UNIT-IV Client/Server Transaction

Processing: The magic of transaction-TP monitors-TP Lite or TP heavy-TP Monitors: Meet the players

UNIT-V Client/Server Groupware

CORBA-Client/Server and the Internet: web client/server The Interactive era-client/server distributed system management

Text Book

1. Robert Orfali, Dan Harkey, Jeri Edwards,"Client/Server Survival Guide",3rd edition,Wiley India pvt Ltd,2008

Reference Books

- 1) Neil Jenkins et al, "Client/Server Unleashed", Techmedia, 1998 Satyapriya Battacharjee, "A Textbook of Client/Server Computing", 1st edition, Dominant Publishers & Distributors, 2001
- 2) Larry T. Vaughn, "Client/Server System Design & Implementation", Mc Graw Hill Inc, 1995 Alex Berson, "Client/Server Architecture", Mc Graw Hill Inc, 1994

Course Objectives

- To understand the fundamentals of HTML and use different formatting options
- To creation of tables and frames
- To relate with DHTML and CSS
- To develop open source applications that deal with database and website development.
- To establish a working environment for PHP web page development
- To get Familiar with GUI, coded, modified controls

Course Outcomes(COs)

1. Understand the fundamentals of HTML and use different formatting options
 2. Creation of tables and frames
 3. Relate with DHTML and CSS
 4. Develop open source applications that deal with database and website development.
 5. Establish a working environment for PHP web page development
 6. Familiarity with GUI, coded, modified controls
-
1. Create a HTML document which includes an unordered list, ordered list, definition list to your document and create a link to Yahoo.
 2. Create a table in HTML document with following formats
 - table with no borders
 - display table headers
 - to handle cells that have no content
 - table cells that span more than one row or one column
 - Adding background image to a table.
 3. Develop a HTML page to display an advertisement.
 4. Develop a HTML page to input information to create a mail id.
 5. Create a DHTML page using Various Filter on images, mask images, mask text
 6. Create a DHTML page to change background color of a dropdown list and to shake an image.
 7. Develop a Web page using Java script to perform the following information
 - Input student information.
 - Display student results for a given roll number.
 8. Develop a web page for online exam using Java Script.
 9. Design a form to submit your resume in net using PHP.
 10. Design an application to display cookies information using PHP
 11. Write a program to count web page hits.
 12. Design an application for creating an online Advertisement.

Course Objectives

- To make effective use of Java generic types.
- To write multi-threaded Java applications.
- To use the Reflection API for highly generic tasks, discovery, or code-generation.
- To use standard annotations and develop custom annotations to express meta-data in Java source files.
- To communicate between processes using network sockets.
- To create JDBC applications and connect them with other applications

Course Outcomes (COs)

1. Make effective use of Java generic types.
2. Write multi-threaded Java applications.
3. Use the Reflection API for highly generic tasks, discovery, or code-generation.
4. Use standard annotations and develop custom annotations to express meta-data in Java source files.
5. Communicate between processes using network sockets.
6. Create JDBC applications and connect them with other applications

UNIT-I

Graphics and Java2D: Graphics Contexts and graphics Objects – Color Control – Font Control – Drawing Lines, Rectangles, Ovals, Arcs, Polygons and Polylines – Java2D API. Graphical User Interface Components: Overview of Swing Components- JLabel – EventHandling – Textfields – How event handling works – JButton – JCheckBox and JRadioButton – JComboBox – JList – Multiple-Selection Lists – Mouse Event Handling – Adapter classes – Key Event Handling – Layout Managers – Panels – JTextArea – JPanel – JSlider – Using Menus with Frames – JPopupMenu – Pluggable Look-and-Feel.

UNIT-II

Exception Handling: Java Exception Hierarchy – Rethrowing and Exception – finally Clause – printStackTrace, getStackTrace and getMessage – Chained Exceptions. Multithreading: Life Cycle of a Thread – Thread Priorities and Thread Scheduling – Creating and Executing Thread – Thread Synchronization – Daemon Threads – Runnable Interface. Files and Streams: Data Hierarchy – Files and Streams – Class File – Creating a Sequential-Access File – Reading Data from a Sequential-Access File – Random-Access Files – Creating/Writing/Reading Random-Access Files – New I/O APIs for the Java Platform.

UNIT-III

Java Utilities Package and Bit Manipulation: Vector Class and Enumeration Interface – Stack Class of Package java.util – Hashtable Class – Properties Class – Bit Manipulation

and the Bitwise Operators – BitSet Class. Collections: Collections Overview – Class Arrays – Interface Collection and Class Collections – Lists – Sets – Maps.

UNIT-IV

Networking: Manipulating URLs – Reading a File on a Web Server –Client/Server Interaction with Stream Socket Connections. Multimedia: Loading, Displaying and Scaling Images – Animating a series of Images – Image Maps – Loading and Playing Audio Clips.

UNIT-V

Java Database Connectivity with JDBC: Relational Database Overview – SQL – Manipulating Databases with JDBC – Stored Procedures. Servlets: Servlet Overview and Architecture – Handling HTTP get /post Requests - Redirecting Requests to other Resources – Multi-Tier Applications. JSP: JSP Overview – Implicit Objects – Scripting – Standard Actions – Directives.

3. www.java.net/

Course Objectives

- To have an architectural overview of the TCP/IP Protocol Suite
- To understand about subnets using IP classes
- To understand the key features and functions of ARP Protocol.
- To understand how basic routing protocol works.
- To understand about DNS and its applications
- To understand the concepts of Remote Login and VPN

Course Outcomes (COs)

At the completion of the course, students will:

1. Identify the functions/ services of TCP/IP component and layer
2. Have the ability to analyze and differentiate networking protocols used in TCP/IP protocol suite.
3. Understand the routing IP datagrams and checksum.
4. Exposed to unicast and multicast routing.
5. Learn about services and operations of DHCP Servers and Domain Name Servers
6. Understand about SMTP and SNMP.

UNIT-I

Introduction: WAN, WAN technologies - Internetworking concepts - Protocols and Standards - TCP/IP protocol suite - Internetworking Devices – Routing Concept - Classful IP Addressing – Subnetting – Supernetting – Classless Addressing

UNIT-II

ARP & RARP – Proxy ARP – ARP over ATM – ARP and RARP Protocol Format. IP Datagram – Fragmentation – Options – IP Datagram Format – Routing IP Datagrams – Checksum. ICMP – Types of Messages - Message Format – Error Reporting – Query – Checksum - ICMP Package

UNIT-III

Unicast Routing Protocol: Intra Domain and Inter Domain Routing – Distance Vector Routing – RIP – Link State Routing – OSPF – Path Vector Routing – BGP – Multicast Routing – Multicast Routing Protocols. Group Management – IGMP Message – IGMP Operation – Process to Process Communication – UDP Operation – TCP Services - Flow Control.

UNIT-IV

BOOTP - DHCP – Address Discovery and Binding. DNS – Name Space – DNS in Internet – Resolution – Resource Records.

UNIT-V

Remote Login - FTP – SMTP – SNMP. IP over ATM Wan – Cells – Routing the Cells – ATMARP – Logical IP Subnets. Mobile IP : Addressing – Agents – Agent discovery – Registration – Data Transfer - VPN

Course Objectives

- To know the types of mobile wireless technologies that are currently being used
- To know the evolution of Mobile communication and cell concept to improve capacity of the system.
- To know the fading mechanism and types of fading and effect of fading on Mobile communication.
- To know the role of equalization in Mobile communication and to study different types of Equalizers and Diversity techniques.
- To know the types of channel coding techniques, data transmission modes and services of GSM.
- To know the types of channel coding techniques, data transmission modes and services of CDMA

Course Outcomes (COs)

- Know the types of mobile wireless technologies that are currently being used
- Know the evolution of mobile communication and cell concept to improve capacity of the system.
- Know the fading mechanism and types of fading and effect of fading on mobile communication.
- Understand the role of equalization in mobile communication and to study different types of equalizers and diversity techniques.
- Know the types of channel coding techniques, data transmission modes and services of GSM.
- Know the types of channel coding techniques, data transmission modes and services of CDMA

UNIT I

Wireless Communication :Cellular systems- Frequency Management and Channel Assignment- types of handoff and their characteristics, dropped call rates & their evaluation -MAC – SDMA – FDMA –TDMA – CDMA – Cellular Wireless Networks

UNIT II

Wireless Networks : Wireless LAN – IEEE 802.11 Standards – Architecture – Services – Mobile Ad hoc Networks- WiFi and WiMAX - Wireless Local Loop

UNIT III

Mobile Communication Systems : GSM-architecture-Location tracking and call setup-Mobility management- Handover- Security-GSM SMS –International roaming for GSM- call recording functions-subscriber and service data mgt –Mobile Number portability -VoIP service for Mobile Networks – GPRS –Architecture-GPRS procedures-

attach and detach procedures-PDP context procedure-combined RA/LA update procedures-Billing

UNIT IV

Mobile Network And Transport Layers : Mobile IP – Dynamic Host Configuration Protocol-Mobile Ad Hoc Routing Protocols– Multicast routing-TCP over Wireless Networks – Indirect TCP – Snooping TCP – Mobile TCP – Fast Retransmit / Fast Recovery – Transmission/Timeout Freezing-Selective Retransmission – Transaction Oriented TCP- TCP over 2.5 / 3G wireless Networks

UNIT V

Application Layer : WAP Model- Mobile Location based services -WAP Gateway – WAP protocols – WAP user agent profile- caching model-wireless bearers for WAP - WML – WMLScripts – WTA - iMode- SyncML.

TEXT BOOKS:

3. C.K.Toh, “AdHoc Mobile Wireless Networks”, First Edition, Pearson Education, 2002.

Course Objectives

- To understand the scope and evolution of soft computing
- To learn the various soft computing frame works
- To be familiar with design of various neural networks
- To be exposed to fuzzy sets and fuzzy logic
- To understand fuzzy measures and reasoning
- To learn genetic programming.

Course Outcomes(COs)

1. Understand the scope and evolution of soft computing
2. Learn the various soft computing frame works
3. Be familiar with design of various neural networks
4. Be exposed to fuzzy sets and fuzzy logic
5. Understand fuzzy measures and reasoning
6. Learn genetic programming.

UNIT-I

Introduction : Evolution of Computing - Soft Computing Constituents – From Conventional AI to Computational Intelligence – Neural Networks - Scope and Evolution– Models of Neural Networks – Feed forward Networks – Supervised Learning Neural Networks – Associative memory networks – Unsupervised learning networks – Special Networks.

UNIT-II

Fuzzy Sets and Fuzzy Logic : Fuzzy Sets – Operations on Fuzzy Sets – Fuzzy Relations - Fuzzy Rules Non – interactive fuzzy sets – Fuzzification– Intuition , inference, Rank ordering – Defuzzification – Max-membership principle, centroid method, center of sums, center of largest area.

UNIT-III

Fuzzy Measures and Reasoning: Fuzzy arithmetic and measures – Fuzzy reasoning – approximate reasoning – categorical, qualitative, syllogistic, dispositional – Fuzzy inference systems – fuzzy decision making – individual, multiperson, multi objective, Bayesian – fuzzy logic control system – architecture, model and application.

UNIT-IV

Machine Learning And Genetic Algorithm : Machine Learning Techniques – Machine Learning Using Neural Nets – Genetic Algorithms (GA) – Simple and General GA – Classification of Genetic Algorithm – Messy, Adaptive, Hybrid, Parallel – Holland Classifier System.

UNIT-V

Application and Implementation Soft Computing: Genetic algorithms -. Traveling Salesperson Problem, Internet Search Techniques – Fuzzy Controllers – Bayesian Belief networks for Rocket Engine Control – Neural Network, Genetic algorithm and Fuzzy logic implementation in C++ and Matlab.

M.Sc. COMPUTER SCIENCE

CHOICE BASED CREDIT SYSTEM (CBCS)

Curriculum and Syllabus

Regular (2015 – 2016)

DEPARTMENT OF COMPUTER SCIENCE

FACULTY OF ARTS, SCIENCE AND HUMANITIES

KARPAGAM ACADEMY OF HIGHER EDUCATION

(Deemed to be University)

(Established Under Section 3 of UGC Act, 1956)

Eachanari(Post), Coimbatore – 641 021.

Tamilnadu, India

Phone No. 0422-2980011 - 15 Fax No: 0422-2980022-23

E mail ID: info@karpagam.com

Web: www.kahedu.edu.in

PROGRAM OUTCOMES: Post Graduate student of Computer Science programme will be able to

- a. Apply basic concepts of Computer Science to effectively involve in the research.
- b. Design software to meet required needs with realistic constraints such as economical, environmental, social, ethical and sustainable in the field of Computer Science.
- c. Design and conduct experiments as well as to analyze, interpret data on experiments relevant to Computer Science practice.
- d. implement software designs to provide working solutions, including use of appropriate programming languages, web-based systems and tools, design methodologies, and database systems
- e. To attain in depth knowledge and understanding the principles of programming for applying in broad range of languages and open source platforms.
- f. use IT skills and display mature computer literacy
- g. Demonstrate understanding of the societal, health, safety, legal and cultural issues and the consequent responsibilities relevant to computer science practice.
- h. Communicate effectively on complex research issues with research community and society, such as, being able to comprehend, write effective reports, design documentation and make effective presentations with clear instructions.
- i. Demonstrate knowledge and understanding of the computer science and management principles and apply these to one's own work, as a member and leader in a team, to manage projects and in multidisciplinary environments.
- j. Recognize the need for ability to engage in independent and life-long learning.

PROGRAM SPECIFIC OUTCOMES (PSOs)

- k. Exhibit an outstanding association and active contribution in their professional including entrepreneurship using the information in Computer Science.
- l. Contribute effectively as a team member/leader using common tools and adopt latest technologies in education and solve real world problems.
- m. Pursue life-long learning and research in specific fields of Computer Science and develop novel and research oriented methodologies in an effective manner.

PROGRAM EDUCATIONAL OBJECTIVES (PEOs)

PEO I: Understand analyze and develop computer programs in the areas related to Database systems and Big data Analytics, cloud computing, soft computing, IoT, Image processing, Green computing, web designing, mobile computing and networking for efficient design of computer based system of varying complexity.

PEO II: Apply standard software Engineering practices and strategies in software project development using open-source programming environment to deliver a quality for business success.

PEO III: Be acquainted with the contemporary issues, latest trends in technological development and thereby innovate new ideas and solutions to existing problems.

Elective courses*

15CSP204A	Software Testing
15CSP204B	Soft Computing
15CSP204C	Object Oriented Analysis & Design with UML
15CSP204D	Grid Computing
15CSP204E	Geographical Information System

Core Elective – II

15CSP305A	Distributed Operating System
15CSP305B	Distributed Database Management System
15CSP305C	Web Services
15CSP305D	Wireless Application Protocol
15CSP305E	WAN Technologies

Open Elective - I

15OEP201	Multimedia and its Applications
----------	---------------------------------

Course Objectives

- To understand the fundamentals of JavaScript and use different objects
- To know the basics of ASP.NET, its objects and web forms
- To relate SQL Server and ASP.NET through database components
- To develop web application that deals with database and website development.
- To understand XML , Namespace and W3C XML Schema
- To get Familiar with Document Object Model for XML

Course Outcomes(COs)

1. Create a client side scripting web application using forms and Java Script
2. Understand the server side scripting of ASP.NET, its objects and web forms
3. Relate SQL Server and ASP.NET through database components
4. Develop web application that deals with database and website development.
5. Understand XML , Namespace and W3C XML Schema
6. Understand the Document Object Model for XML and JavaScript.

UNIT-I

JavaScript: Introduction to JavaScript – Programming fundamentals – Functions and objects – Navigator object model. Form and form elements – Scripting frames and multiple windows – Event object.

UNIT-II

ASP.NET: ASP & ASP.NET: An Overview – Programming ASP.NET with VB.NET: ASP Data types – operators- Request Object- Response Object – Server object - Web forms and ASP.NET: Web forms

UNIT-III

ASP.NET: ASP.NET Configuration, Scope and State: Configuration – state- application – session object- ASP.NET Objects & Components: Scripting object models- ASP components and controls- ASP.NET and SQL server-Using SQL server, using database in ASP.NET applications, ActiveX data objects

UNIT-IV

Creating Mark up with XML: Introduction – Parsers and well formed XML Documents – Parsing an XML Document - Characters – Mark up – CDATA Sections – XML Namespaces. Document Type Definition – Parsers, Well formed and valid XML documents – Element type declarations – Attribute declarations- Attributes Types. Schemas – Schemas VS DTD's – W3C XML Schema

UNIT-V

Document Object Model: DOM implementations – DOM with JavaScript – Components- Creating nodes – Traversing the DOM. Simple API for XML: DOM vs SAX – SAX based Parsers. XLink, XPointer, XInclude and XBase

TEXT BOOKS

1. Javascript: The Definitive Guide, David Flanagan, 6th Edition, 2011, O'Reilly Media.
2. Danny Goodman, 2000, "Javascript Bible", 3rd Edition, IDG Books India Pvt Ltd. (Page Nos.: 9-16, 24-33, 68-89, 116-130, 151-157, 174-198, 248-252, 323-329, 348-356)
3. Dave Mercer. ASP.NET – Beginner's Guide. 2nd Edition, New Delhi: McGraw Hill, 2010.
4. Rohit Khurana's , 2002, "Javascript Professional edition", 2nd Edition, A.P.H. Publishing company, NewDelhi. (Page Nos.: 1-93, 98-170)

		Semester-I
		L T P C
15CSP102	CRYPTOGRAPHY AND NETWORK SECURITY	4 0 0 4

Course Objectives

This course will provide students with a theoretical knowledge to understand the fundamental principles of access control models and techniques and,

- To understand theory of fundamental cryptography, encryption and decryption algorithms
- To know about various encryption techniques.
- To understand various Block Ciphers, DES and AES algorithms
- To understand the concept of Public key cryptography.
- To study about message authentication and hash functions
- To impart knowledge on web security, electronic mail security, firewalls

Course Outcomes (COs)

On successful completion of the course the student should be able to:

1. Classify the symmetric encryption techniques
2. Illustrate various Public key cryptographic techniques
3. Evaluate the authentication and hash algorithms.
4. Summarize the intrusion detection and its solutions to overcome the attacks.
5. Understand basic concepts of system level security
6. Build secure authentication systems by use of message authentication techniques.

UNIT -I

Introduction – Security Trends - The OSI Security Architecture – Security Attacks – Security Services – Security Mechanisms – A Model for Network Security. Classical Encryption Techniques – Symmetric Cipher Model – Substitution Techniques - Transposition Techniques – Rotor Machines - Steganography.

UNIT -II

Block Ciphers and Data Encryption Standard –Block Cipher Principles – The Data Encryption Standard - The Strength of DES –Advanced Encryption Standard (AES) – Evaluation Criteria for AES – The AES Cipher – Multiple Encryption and Triple DES – Block Cipher Modes of Operation – Stream Ciphers and RC4- modular Arithmetic and Euclidean Algorithm.

UNIT-III

Confidentiality using Symmetric Encryption – Placement of Encryption Function – Traffic Confidentiality – Key Distribution – Public key Cryptography and RSA – Principles of Public Key Cryptosystems – The RSA Algorithm- Basic prime numbers and Discrete Logarithms •Key Management – Diffie Hellman Key Exchange.

UNIT-IV

Message Authentication and hash functions – Authentication Functions – Message Authentication Codes (MAC's) Functions – Security of Hash Functions and MAC's Digital Signatures and Authentication Protocols – Digital Signatures – Digital Signature Standard

UNIT-V

Network Security Applications - Authentication Applications – KERBEROS – X.509 Authentication Service – Public Key Infrastructure – Electronic Mail Security – Pretty Good Privacy – S/MIME – IP Security.

15CSP103	DATA MINING AND WAREHOUSING	Semester-I L T P C 4 0 0 4			
----------	-----------------------------	----------------------------------	--	--	--

Course Objectives

- To identify the scope and essentiality of Data Warehousing and Mining.
- To analyze data, choose relevant models and algorithms for respective applications.
- To study spatial and web data mining.
- To develop research interest towards advances in data mining.
- To introduce students to the basic concepts and techniques of Data Mining.
- To develop skills of using recent data mining software for solving practical problems.

Course Outcomes (COs)

1. Understand Data Warehouse fundamentals, Data Mining Principles
2. Design data warehouse with dimensional modelling and apply OLAP operations.
3. Identify appropriate data mining algorithms to solve real world problems
4. Compare and evaluate different data mining techniques like classification, prediction, clustering and association rule mining
5. Describe complex data types with respect to spatial and web mining.
6. Benefit the user experiences towards research and innovation integration.

UNIT-I

Introduction: Fundamentals of data mining - Data Mining Functionalities - Classification of Data Mining systems - Major issues in Data Mining.

Data Warehouse and OLAP Technology: An Overview - Data Warehouse - Multidimensional Data Model - Data Warehouse Architecture - Data Warehouse Implementation - From Data Warehousing to Data Mining.

UNIT-II

Data Preprocessing: Needs Preprocessing the Data - Data Cleaning - Data Integration and Transformation - Data Reduction - Discretization and Concept Hierarchy Generation - Online Data Storage.

UNIT-III

Mining Frequent Patterns, Associations and Correlations: Basic Concepts - Efficient and Scalable Frequent item set Mining Methods - Mining various kinds of Association rules – From Association Mining to Correlation Analysis - Constraint-Based Association Mining.

UNIT-IV

Classification and Prediction: Issues Regarding Classification and Prediction - Classification by Decision Tree Induction - Rule-based Classification – Prediction -

Accuracy and Error Measures - Evaluating the Accuracy of a classifier or Predictor - Ensemble Methods - increases the Accuracy - Model Selection.

UNIT-V

Cluster Analysis Introduction : Types of Data in Cluster Analysis - A Categorization of Major Clustering Methods - Partitioning Methods - Hierarchical Methods – Density-Based Methods, Grid-Based Methods - Model-Based Clustering Methods - Clustering High-Dimensional Data – Constraint-Based Cluster Analysis - Outlier Analysis.

Applications and Trends in Data mining: Text Mining - Web Mining - Multimedia Mining-Spatial Mining - Visual data mining.

WEB SITES

1. Thedacs.Com
2. Dwreview.Com
3. Pcai.Com
4. Eruditionhome.Com

Course Objectives

To learn about the basic things involved in cloud computing and its architecture.

- To know the basics of cloud computing and its types.
- To know about the services such as IaaS, PaaS, SaaS, IDaaS and CaaS.
- To understand the Virtualization Technologies.
- To understand the Information Security, Privacy and Compliance Risks.
- To learn commercial Google Web services – Open Nebula.
- To portray the recent trends in the field of cloud computing and providing exposures to some open source and commercial clouds.

Course Outcomes (COs)

On successful completion of the course the student should be able to:

1. Understand cloud architecture and model.
2. Identify various service models of Cloud computing.
3. Explore cloud infrastructure.
4. Learn Threat issues and Database Integrity Issues.
5. Learn Open Source and Commercial Clouds such as Microsoft Azure, Amazon EC2.
6. Provide a good understanding of the concepts, standards and protocols in Cloud computing

UNIT-I

Introduction to Cloud Computing -Characteristics of Cloud Computing -Paradigm shift - Benefits of cloud computing - Disadvantages of cloud computing- Role of Open Standards-Cloud Computing Architecture: Cloud computing stack-Public cloud -Private cloud -Hybrid cloud -Community cloud

UNIT –II

Infrastructure as a Service (IaaS) -Platform as a Service (PaaS) -Software as a Service (SaaS) -Identity as a Service (IDaaS) -Compliance as a Service (CaaS)- Cloud storage.

UNIT -III

Virtualization Technologies -Load Balancing and Virtualization -Advanced load balancing -The Google cloud - Hypervisors -Virtual machine types -VMware vSphere - Machine Imaging -Porting Applications -The Simple Cloud API - AppZero Virtual Application Appliance

UNIT-IV

Cloud Information Security Objectives -Confidentiality, Integrity, and Availability -
Cloud Security Services - Relevant Cloud Security Design Principles -Cloud Computing
Risk Issues -The CIA Triad
Privacy and Compliance Risks -Threats to Infrastructure, Data, and Access Control -
Cloud Access Control Issues -Database Integrity Issues -Cloud Service Provider Risks
Architectural Considerations
General Issues- Trusted Cloud Computing -Identity Management and Access Control

UNIT -V

Case Study on Open Source and Commercial Clouds: Microsoft Azure- Amazon EC2-
Google Web services – Open Nebula.

15CSP105	WIRELESS AND MOBILE COMPUTING	Semester-I L T P C 4 0 0 4			
-----------------	--------------------------------------	---	--	--	--

Course Objectives

- To learn about the concepts and principles of mobile computing;
- To explore both theoretical and practical issues of mobile computing;
- To develop skills of finding solutions and building software for mobile computing applications.
- To identify the use of mobile wireless technologies
- To know the types of mobile wireless technologies that are currently being used
- To understand the working of mobile wireless technologies access to network resources.

Course Outcomes (COs)

1. Grasp the concepts and features of mobile computing technologies and applications
2. Have a good understanding of how the underlying wireless and mobile communication networks work, their technical features, and what kinds of applications they can support
3. Identify the important issues of developing mobile computing systems and applications
4. Organize the functionalities and components of mobile computing systems into different layers and apply various techniques for realizing the functionalities;
5. Develop mobile computing applications by analyzing their characteristics and requirements, selecting the appropriate computing models and software architectures, and applying standard programming languages and tools;
6. Organize and manage software built for deployment and demonstration.

UNIT-I

Mobile computing applications and Platforms - Introduction – Strengths and Weakness of Wireless – Applications – Platforms to support Mobile Computing Applications –Wireless Networks – Wireless Architecture, Security and Management – Wireless Business

UNIT-II

Mobile Computing Applications - Key Characteristics of Mobile Applications – Messaging for users – Mobile Portals – Special Applications – Mobile agent applications

UNIT-III

Wireless Internet, Mobile IP and Wireless Web - Internet and Web – How it works – Mobile IP – WWW for wireless – Mobile Web Services - **Mobile Computing Platforms** - Introduction – Wireless Middleware – Wireless Gateways and Mobile Application Servers – WAP – I-MODE, Wireless JAVA, MMIT, and BREW – Voice communication

UNIT-IV

Wireless LANs - IEEE 802.11 – MANET – HiperLAN2 - **Wireless Personal Area Networks** - IEEE 802.15 – Home Networks – Blue tooth LANs – Sensor Networks - **Cellular Networks** - Principles – First Generation(1G) Cellular – Paging networks – Second Generation(2G) Cellular – Data over Cellular Networks – Third Generation Cellular (3G) Networks – Beyond 3G

UNIT-V

WML: Formatting Output – Variables – Input Operations – WML Script – WML Libraries.

TEXT BOOKS

1. Amjad Umar. 2004. Mobile Computing and Wireless Communication – Applications, Networks, Platforms Architecture and Security, NGE Solutions INC., New York.
(Page Nos: 1.1- 1.52, 2.3 – 2.51, 3.2 – 3.37, 4.3-4.51, 6.16-6.36, 7.3-7.33, 8.4-8.39)
2. Kris Jamsa. 2001. WML & WML Script, Tata McGraw Hill Publishing, New Delhi

Course Objectives

- To understand the fundamentals of JavaScript and use different objects
- To know the basics of ASP.NET, its objects and web forms
- To relate SQL Server and ASP.NET through database components
- To develop web application that deals with database and website development.
- To understand XML , Namespace and W3C XML Schema
- To get Familiar with Document Object Model for XML

Course Outcomes(COs)

1. Create a client side scripting web application using forms and Java Script
 2. Understand the server side scripting of ASP.NET, its objects and web forms
 3. Relate SQL Server and ASP.NET through database components
 4. Develop web application that deals with database and website development.
 5. Understand XML , Namespace and W3C XML Schema
 6. Understand the Document Object Model for XML and JavaScript.
-
1. Using Javascript change the font color on reloading a webpage.
 2. Generate web page that represents clock-every 60 see the page updated with server current time Using JavaScript.
 3. Design a form and validate it using JavaScript.
 4. Write Database Access program using ASP.NET
 5. Program to retrieve Cookies information using ASP.NET
 6. Program to count web page hits using ASP.NET
 7. Create a menu in XML.
 8. Create a demo for XSLT.
 9. Display XML information in Tree structure format.

		Semester-I
		L T P C
15CSP112	DATA MINING LAB USING MATLAB	0 0 4 2

Course Objectives

- To identify the scope and essentiality of Data Warehousing and Mining.
- To analyze data, choose relevant models and algorithms for respective applications.
- To study spatial and web data mining.
- To develop research interest towards advances in data mining.
- To introduce students to the basic concepts and techniques of Data Mining.
- To develop skills of using recent data mining software for solving practical problems.

Course Outcomes (COs)

1. Understand Data Warehouse fundamentals, Data Mining Principles
2. Design data warehouse with dimensional modelling and apply OLAP operations.
3. Identify appropriate data mining algorithms to solve real world problems
4. Compare and evaluate different data mining techniques like classification, prediction, clustering and association rule mining
5. Describe complex data types with respect to spatial and web mining.
6. Benefit the user experiences towards research and innovation integration.

List of Programs

1. Write a MATLAB program to do all basic matrix operations in MATLAB for a multidimensional array.
2. Write a MATLAB code to compares and contrasts some similarity and distance measures for the following .
 - (a) Compute the Hamming distance and the Jaccard similarity between the following two binary vectors.

$$x = 0101010001$$

$$y = 0100011000$$
3. a. Plot the graph of $f(x) = \exp(-2x^2 - 3y^2)$. Choose appropriate intervals for x and y.
 b. Plot the graph of $f(x) = \cos(x) \sin(y)$. Choose appropriate intervals for x and y.
4. The number of children for different patients in a database is given with a vector $c = \{3,1,0,2,7,6,3,4,-2,0,0,10,15,6\}$. Find the outliers in the set C using standard statistical parameters mean and variance.
 - a. If the threshold value is changed from ± 3 standard deviations to ± 2 standard deviations, what additional outliers are found?

5. For a given data set X of three-dimensional samples,

$X = \{\{1,2,0\}, \{3,1,4\}, \{2,1,5\}, \{0,1,6\}, \{2,4,3\}, \{4,4,2\}, \{5,2,1\}, \{7,7,7\}, \{0,0,0\}, \{3,3,3\}\}$

a) find the outliers using the distance-based technique if

i) the threshold distance is 4, and threshold fraction p for non-neighbor samples is 3.

ii) the threshold distance is 6, and threshold fraction p for non-neighbor samples is 2.

6. Given the data set X with three input features and one output feature representing the classification of samples

X:	I₁	I₂	I₃	O
	2.5	1.6	5.9	0
	7.2	4.3	2.1	1
	3.4	5.8	1.6	1
	5.6	3.6	6.8	0
	4.8	7.2	3.1	1
	8.1	4.9	8.3	0
	6.3	4.8	2.4	1

Rank the features using a comparison of means and variances

7. A data set for analysis includes only one attribute X:

$X = \{7, 12, 5, 18, 5, 9, 13, 12, 19, 7, 12, 12, 13, 3, 4, 5, 13, 8, 7, 6\}$

a) What is the mean of the data set X?

b) What is the median?

c) What is the mode, and what is the modality of the data set X?

d) Find the standard deviation for X.

e) Give a graphical summarization of the data set X using a boxplot representation.

f) Find outliers in the data set X.

8. Given a data set with two dimensions X and Y.

X	Y
1	5
4	2.75
3	3
5	2.5

a) Use a linear-regression method to calculate the parameters α and β where $y = \alpha + \beta x$.

b) Estimate the quality of the model obtained in a) Using the correlation coefficient r.

9. The following is the data set X:

X:	Year	A	B
	1996	7	100
	1997	5	150

1998	7	120
1999	9	150
2000	5	130
2001	7	150

Create 2D Presentations:

- Show a bar chart for the variable A
 - Show a histogram for the variable B.
 - Show a line chart for the variable B
 - Show a pie chart for the variable A
- Create a MATLAB function to count the number of lines in a text file.
 - Create a structure array for student mark details and print a plot for the marks of the students.
 - The test scores for the three students are given in the following table:

	RDBMS	OracleDBA	WebDesigning	AI
Smith	66	91	95	83
Sam	91	88	80	73
John	80	88	80	78

Find the best student using multifactorial evaluation, if the weight factors for the subjects are given as the vector $W = [0.3, 0.2, 0.1, 0.4]$

15CSP201	INTERNETWORKING WITH TCP/IP	Semester-II L T P C 4 1 0 5			
-----------------	------------------------------------	--	--	--	--

Course Objectives

- To get an architectural overview of the TCP/IP Protocol Suite
- To understand about subnets using IP classes
- To understand the key features and functions of ARP Protocol.
- To understand how basic routing protocol works.
- To understand about DNS and its applications
- To understand the concepts of Remote Login and VPN

Course Outcomes (COs)

At the completion of the course, students will:

1. Have the ability to analyze and differentiate networking protocols used in TCP/IP protocol suite.
2. Understand the routing IP datagrams and checksum.
3. Exposed to unicast and multicast routing.
4. Learn about host name resolution and the Domain Name System (DNS).
5. Learn about services and operations of DHCP Servers and Domain Name Servers
6. Understand about SMTP and SNMP.

UNIT-I

Introduction: WAN, WAN technologies - Protocols and Standards - TCP/IP protocol suite - Internetworking Devices - Classful IP Addressing – Subnetting – Supernetting – Classless Addressing

UNIT-II

ARP & RARP – Proxy ARP – ARP over ATM – ARP and RARP Protocol Format. IP Datagram – Fragmentation – Options – IP Datagram Format – Routing IP Datagrams – Checksum. ICMP – Types of Messages - Message Format – Error Reporting – Query – Checksum.

UNIT-III

Unicast Routing Protocol: Intra Domain and Inter Domain Routing – Distance Vector Routing – RIP – Link State Routing – OSPF – Path Vector Routing – BGP – Multicast Routing – Multicast Routing Protocols. Group Management – IGMP Message – IGMP Operation – Process to Process Communication – UDP Operation – TCP Services - Flow Control.

UNIT-IV

BOOTP - DHCP – Address Discovery and Binding. DNS – Name Space – DNS in Internet – Resolution – Resource Records

UNIT-V

Remote Login - FTP – SMTP – SNMP. IP over ATM Wan – Cells – Routing the Cells – ATMARP – Logical IP Subnets. VPN

4. www.w3schools.com/tcpip/default.asp

Course Objectives

- To state the basic concepts in information security, including security policies, security models, and security mechanisms.
- To provide an exposure to the spectrum of security activities methods methodologies and procedures with emphasis on practical aspects of Information Security.
- To understand principles of web security.
- To gain knowledge about securing both clean and corrupted systems, protect personal data, and secure computer networks.
- To understand key terms and concepts in cyber law, intellectual property and cybercrimes, trademarks and domain theft.
- To provide the learner will be able to examine secure software development practices.

Course Outcomes (COs)

A student who successfully completes this course should at a minimum be able to:

1. State the basic concepts in information security, including security policies, security models, and security mechanisms.
2. Explain concepts related to applied cryptography including the four techniques for crypto-analysis symmetric and asymmetric cryptography, digital signature, message authentication code, hash functions and modes of encryption operations.
3. Explain common vulnerabilities in computer programs including buffer overflow Vulnerabilities time-of-check to time-of-use flaws incomplete mediation.
4. The learner will gain knowledge about securing both clean and corrupted systems, protect personal data, and secure computer networks.
5. The learner will understand key terms and concepts in cyber law, intellectual property and cybercrimes, trademarks and domain theft.
6. The learner will be able to examine secure software development practices.

UNIT-I

Introduction to cybercrime: Introduction-Cybercrime: Definition and Information Security-who are cybercriminals? - Classification of cybercrimes. Cybercrime: The legal perspectives- cybercrimes: An Indian Perspective - cybercrime and the Indian ITA2000: Hacking and the Indian law(s) - A Global Perspective on cybercrimes: cybercrime and the Extended Enterprise - cybercrime Era: Survival Mantra for the Netizens - Concluding Remarks and Way Forward to Further Chapters.

UNIT-II

Cyberoffenses: How Criminals Plan Them: Introduction: categories of Cybercrime -How criminals Plan the Attacks: Reconnaissance, Passive Attacks, Active Attacks, Scanning and Scrutinizing Gathered Information, Attack(Gaining and Maintaining the system

Access) -social Engineering: Classification of Social Engineering - Cyberstalking: Types of stalkers, Cases Reported on Cyberstalking, How stalking Works?, real-life incident of Cyberstalking -Cybercafe and Cybercrimes - Botnets: The Fuel for cybercrime: Botnet - Attack Vector-Cloud Computing: Why cloud computing? Types of Services, Cybercrime and Cloud Computing.

UNIT-III

Cybercrime: Mobile and wireless Devices-Introduction - Proliferation of Mobile and Wireless Devices - Trends in Mobility-Credit Card Frauds in Mobile and Wireless Computing Era: Types and Techniques of Credit Card Frauds - Security challenges Posed by Mobile Devices - Registry Settings for Mobile Devices - Authentication Service security: cryptographic security, LDAP Security, RAS Security, Media Player Control Security, Networking API Security - Attacks on Mobile/Cell Phones: Mobile Phone Theft, Mobile Viruses, Mishing, Vishing, Smishing, Hacking Bluetooth.

UNIT-IV

Mobile Devices: Security Implication for Organizations – Managing Diversity and Proliferation of Hand-Held Devices, Unconventional/ Steath Storage Devices, Threats through Lost and Stolen Devices, Protecting Data on lost devices, Educating the Laptop Users - Organizational Measures for Handling Mobile devices - Related Security Issues: Encrypting Organization Databases, Including Mobile Devices in Security Strategy - Organizational Security Policies and Measures in mobile Computing Era: Importance of Security polices relating to mobile Computing Devices, Operating Guidelines for Implementing Mobile Devices Security Polices, Organizational Policies for the Use of Mobile Hand - Held Devices - Laptops: Physical Security Countermeasures.

UNIT-V

Tools and Methods Used in Cybercrime: Introduction - Proxy Servers and Anonymizers - Phishing: How Phishing Works? - Password Cracking: Online Attacks, Offline Attacks, Strong, Weak and Random Passwords, Random passwords - Keyloggers and Spywares: Software Keyloggers, Hardware Keyloggers, AntiKeylogger, Spywares - Virus and Worms: Types of Virus - Trojan Horses and Backdoors: backdoor, How to protect from Trojan Horses and Backdoors - Steganography: Steganalysis - DoS and DDoS Attacks: DoS Attacks,Classification of DoS Attacks, Types or Levels of DoS Attacks, Tools Used to Launch DoS Attacks, DDoS Attacks, How to Protect from DoS/DDoS Attacks – SQL Injection: Steps for SQL Injection Attacks, How to Prevent SQL Injection Attacks - Buffer Overflow: Types of Buffer Overflow, How to Minimize Buffer Overflow - Attacks on Wireless Networks: Traditional Techniques of Attacks on Wireless Networks, Theft of Internet Hours and Wi-fi-based Frauds and Misuses, How to Secure the Wireless Networks.

15CSP203	SOFTWARE PROJECT MANAGEMENT	Semester-II L T P C 5 0 0 5			
-----------------	------------------------------------	--	--	--	--

Course Objectives

- To introduce the concepts and methods required for the construction of large software intensive systems.
- To develop a broad understanding of the discipline of software engineering and management of software systems.
- To provide an understanding of both theoretical and methodological issues involve in modern software engineering project management and focuses strongly on Practical techniques.
- To apply proper theoretical, technical, and practical knowledge of software requirements, analysis, design, implementation, verification and validation, and documentation
- To develop appropriate design solutions to a given problem using software engineering approaches that integrates ethical, social, legal, and economic concerns.
- To express and understand the importance of negotiation, effective work habits, leadership, and good communication with stakeholders, in written and oral forms, in a typical software development environment

Course Outcomes (COs)

Upon the completion of the course students will be able to :-

1. Apply the process to be followed in the software development life-cycle models.
2. Implement communication, modeling, construction & deployment practices in software development.
3. Analyze & design the software models using unified modeling language (UML).
4. Explain the concepts of various software testing methods & be able to apply appropriate testing approaches for development of software.
5. Explain the quality management & different types of metrics used in software development.
6. Apply the concepts of project management & planning

UNIT-I

Introduction to Software Project Management – Stepwise: an overview of project planning – Project Evaluation.

UNIT-II

Selection of an appropriate project approach – Software effort estimation – Activity planning – Risk Management.

UNIT-III

Resource Allocation – Monitoring and Control – Managing Contracts.

UNIT-IV

Managing People and Organizing Teams – Software Quality – Small Projects.

UNIT-V

Prince 2 An Overview – BS 6079:1996 An Overview – Programme Management – ISO12207: An Overview.

TEXT BOOK

1. Bob Hughes and Mike Cotterell. 2010. Software Project Management, 5th Edition, Tata McGraw Hill, New Delhi:

REFERENCES

2. <http://www.onesmartclick.com/engineering/software-engineering.html>
3. http://www.cc.gatech.edu/classes/AY2000/cs3802_fall/

Course Objectives

- To understand basic software debugging methods.
- To describe the principles and need for various types of testing and understand the essential characteristics of tool used for test automation
- To understand White box and Black box testing methods and techniques.
- To design test plans.
- To differentiate between validation testing and defect testing
- To use various Quality Assurance models.

Course Outcomes (COs)

Upon the completion of the course students will be able to :-

1. Investigate the reason for bugs and analyze the principles in software testing to prevent and remove bugs.
2. Implement various test processes for quality improvement
3. Design test planning.
4. Manage the test process
5. Apply the software testing techniques in commercial environment
6. Use practical knowledge of a variety of ways to test software and an understanding of some of the tradeoffs between testing techniques.

UNIT-I

Introduction about testing, Definition about software testing-Principles of testing-Phases of software project-Difference between QC and QA-Testing, Verification and Validation. Life cycle models for Waterfall, Spiral and V model.

UNIT-II

Types of testing-White box testing- Black box testing-Performance testing- Regression testing-Adhoc testing.

UNIT-III

Test planning-Test process-Test reporting-Best practices-Test planning check list-Test plan templates-Test case writing-Techniques for SRS document.

UNIT-IV

Software test automation-Skills needed for automation-What to automate-Scope of automation-Design and architecture for automation. Process model for automation-Selecting test tool.

UNIT-V

Test metrics – Types of metrics – Project metrics-progress metrics-productivity metrics. What is win runner-Methods of testing in win runner.

Course Objectives

- To understand the scope and evolution of soft computing
- To learn the various soft computing frame works
- To be familiar with design of various neural networks
- To be exposed to fuzzy sets and fuzzy logic
- To understand fuzzy measures and reasoning
- To learn genetic programming.

Course Outcomes(COs)

1. Understand the scope and evolution of soft computing
2. Learn the various soft computing frame works
3. Be familiar with design of various neural networks
4. Be exposed to fuzzy sets and fuzzy logic
5. Understand fuzzy measures and reasoning
6. Learn genetic programming.

UNIT-I

Introduction : Evolution of Computing - Soft Computing Constituents – From Conventional AI to Computational Intelligence – Neural Networks - Scope and Evolution– Models of Neural Networks – Feed forward Networks – Supervised Learning Neural Networks – Associative memory networks – Unsupervised learning networks – Special Networks.

UNIT-II

Fuzzy Sets and Fuzzy Logic : Fuzzy Sets – Operations on Fuzzy Sets – Fuzzy Relations - Fuzzy Rules Non – interactive fuzzy sets – Fuzzification– Intuition , inference, Rank ordering – Defuzzification – Max-membership principle, centroid method, center of sums, center of largest area.

UNIT-III

Fuzzy Measures and Reasoning: Fuzzy arithmetic and measures – Fuzzy reasoning – approximate reasoning – categorical, qualitative, syllogistic, dispositional – Fuzzy inference systems – fuzzy decision making – individual, multiperson, multi objective, Bayesian – fuzzy logic control system – architecture, model and application.

UNIT-IV

Machine Learning And Genetic Algorithm : Machine Learning Techniques – Machine Learning Using Neural Nets – Genetic Algorithms (GA) – Simple and General GA – Classification of Genetic Algorithm – Messy, Adaptive, Hybrid, Parallel – Holland Classifier System.

UNIT-V

Application and Implementation Soft Computing: Genetic algorithms -. Traveling Salesperson Problem, Internet Search Techniques – Fuzzy Controllers – Bayesian Belief networks for Rocket Engine Control – Neural Network, Genetic algorithm and Fuzzy logic implementation in C++ and Matlab.

5. www.allbookez.com/soft-computing-lecture-notes/

Course Objectives

- to use an object-oriented method for analysis and design
- To analyse information systems in real-world settings and to conduct methods such as interviews and observations
- To have a general understanding of a variety of approaches and perspectives of systems development, and to evaluate other is development methods and techniques
- To know techniques aimed to achieve the objective and expected results of a systems development process
- To know different types of prototyping
- To know how to use UML for notation.

Course Outcomes (COs)

Upon the completion of the course students will be able to :-

1. Understand the concepts and terms used in the object-oriented approach to systems analysis and design
2. Use Unified Modeling Language 2.2
3. Perform object-oriented analysis and design
4. Identify the characteristics of the UML and explain UML is relevant to the process development.
5. Draw class Diagrams, Object Diagram and Interaction Diagram.
6. Construct various UML models (including use case diagrams, class diagrams, interaction diagrams, statechart diagrams, activity diagrams, and implementation diagrams) using the appropriate notation.

UNIT-I

The Object Model: The evolution of the object model – Elements of the object model – Applying object model. **Classes and Objects:** The nature of an object – Relationships among objects.

UNIT-II

Classes and Objects: The nature of the class – Relationship among classes – The Interplay of Classes and Objects – On building quality classes and objects. **Classification:** The Importance of proper classification – Identifying proper classes and objects – Key abstraction mechanism.

UNIT-III

The notation: Elements of the notation – class diagrams –state transition diagrams – object diagrams.

UNIT-IV

The Process: First principles – The micro development process – The macro development process.

UNIT-V

UML Overview: UML History – Goals of UML – UML concept areas – Syntax of Expressions and Diagrams.

Nature and purpose of Models: A Model – Levels of Models – Meaning of Model. UML Walkthrough: UML views – Static views – use case view – interaction views – state machine view – activity view – physical view – model management view- extensibility constructs.

Course Objectives

- To portray the recent trends in the field of Grid computing and creation and management of Internet-based utility computing infrastructure.
- To introduce the principles underlying the function of distributed systems and their extension to grid computing.
- To introduce students to the fundamental components of Grid environments, such as authentication, authorization, resource access, and resource discovery.
- To provide a good understanding of the concepts, standards and protocols in Grid computing
- To enable students to be able to justify the applicability, or non-applicability, of Grid technologies for a specific application.
- To perform analysis, design and implementation of ARC grid computing model.

Course Outcomes (COs)

After successful completion of this course, student will be able to

1. Understand and explain the basic concepts of Grid Computing.
2. Explain the principles underlying the function of distributed systems and their extension to grid computing
3. Explain the advantages of using Grid Computing within a given environment.
4. Identify fundamental components of Grid environments, such as authentication, authorization, resource access, and resource discovery.
5. Understand Data management and transfer in Grid environments.
6. Perform analysis, design and implementation of ARC grid computing model.

UNIT- I

Introduction: Cluster to Grid Computing – Cluster Computing Models – Grid Models – Mobile Grid Models – Applications. Parset: System-independent Parallel Programming on Distributed Systems –introduction – Semantics of the Parset Construct – Expressing Parallelism through Parsets – Implementing Parsets on a Loosely Coupled Distributed System

UNIT- II

Anonymous Remote Computing Model: Issues in Parallel Computing on Interconnected Workstations – Existing Distributed Programming Approaches – The ARC Model of Computation – The Two-tiered ARC Language Constructs – Implementation. Integrating Task Parallelism with Data Parallelism: A Model for Integrating Task Parallelism into Data Parallel Programming Platforms – Integration of the Model into ARC – Design and Implementation – Applications - Performance Analysis

UNIT- III

Anonymous Remote Computing and Communication Model: Location – Independent Inter-task Communication with DP – DP Model of Iterative Grid Computations – Design

and Implementation of Distributed Pipes. Parallel Programming Model on CORBA: Notion of Concurrency – System Support –Implementation and Performance

UNIT- IV

Sneha-Samuham Grid Computing Model: A Parallel Computing Model over Grids – Design and Implementation – Performance studies. Introducing Mobility into Anonymous Remote Computing and Communication Model – Issues in Mobile clusters and Parallel Computing on Mobile Clusters – Moset Overview – Computation Model – Implementation and Performance

UNIT- V

Distributed Simulated Annealing Algorithms for Job Shop Scheduling - Implementation. Parallel Simulated Annealing Algorithms - Simulated Annealing (SA) Technique – Clustering Algorithm for Simulated Annealing (SA) – Combination of Genetic Algorithm and Simulated Annealing (SA) Algorithm - Implementation. Epilogue : DOS Grid: Vision of Mobile Grids - Mobile Grid Monitoring System – Healthcare Application Scenario.

		Semester-II			
		L	T	P	C
15CSP204E	GEOGRAPHICAL INFORMATION SYSTEM	5	0	0	5

Course Objectives

- To have a basic, practical understanding of GIS concepts, techniques and real world applications.
- To analyse the basic components of GIS
- To classify the maps, coordinate systems and projections
- To process spatial and attribute data and prepare thematic maps
- To identify and rectify mapping inaccuracies
- To formulate and solve geospatial problems

Course Outcomes (COs)

After successful completion of this course, student will be able to

1. Understand the basic concepts of geography necessary to efficiently and accurately use GIS technology.
2. Understand basic GIS data concepts.
3. Have an ability to perform basic GIS analysis of concepts.
4. Have demonstrated a practical application of GIS.
5. Have practical experience using basic GIS tools.
6. Have an understanding of GIS and its relationship to mapping software development.

Unit I

What is a Geographical Information Systems (GIS) – Geographically referenced data – GIS operations – Geographic Coordinate systems – Map Projections – Commonly used Map Projections – Projected Coordinate Systems – Working with Coordinate systems in GIS.

Unit II

Georelational Vector Data Model – Georelational data model – Representation of simple features – Topology – Nontopological Vector data – Data models for composite features. Object based vector data model – Object based data model – The geodatabase data model – Interface – Topology rules – Advantages of Geodatabase model.

Unit III

Raster Data Model – Elements of Raster Data Model - Raster Data Structure – Data Compression – Data Conversion – Integration of Raster and Vector Data. Data Input – Existing GIS data – Meta Data – Conversion of Existing Data – Creating New Data.

Unit IV

Geometric Transformation – Root Mean Square (RMS) Error – Interpretation of RMS errors Digitized Maps – Re sampling of Pixel Values.

Spatial Data Editing – Location Errors – Spatial Data Accuracy Standards – Topological Errors – Topological Editing – Nontopological Editing – Other Editing operations

Unit V

Data Display and Cryptography – Cartographic Symbolization – Types of Maps – Typography – Map Design – Map Production.

Data Exploration – Attribute and Data Query – Spatial Data Query – Raster Data Query – GIS Applications.

		Semester-II			
		L	T	P	C
150EP201	MULTIMEDIA AND ITS APPLICATIONS	0	0	0	3

Course Objectives

- To learn and understand technical aspect of Multimedia Systems.
- To understand the standards available for different audio, video and text applications.
- To Design and develop various Multimedia Systems applicable in real time.
- To learn various multimedia authoring systems.
- To design different application in M.M and use different tools like adobe Photoshop and macromedia flash.
- To develop multimedia application and analyze the performance of the same.

Course Outcomes (COs)

1. Developed understanding of technical aspect of Multimedia Systems.
2. Understand various file formats for audio, video and text media.
3. Develop various Multimedia Systems applicable in real time.
4. Design interactive multimedia software.
5. Design different application using different tools like Adobe Photoshop and flash.
6. To evaluate multimedia application for its optimum performance.

UNIT-I

Definition of multimedia – Introduction to making multimedia: the stages of a project – Basic software tools-Using Text in multimedia - font editing and design tools – hypermedia and hypertext.

UNIT-II

Introduction to Photoshop 6: Interfaces and Navigation-Tools-Text-Working in Photoshop-Creating new documents-Saving Files.

UNIT-III

Displaying the Images- Using Rulers, Guides and Grids – Making Selections- Layers and Types-Choosing Colors-Creating Brushes- painting & editing Tools- Making and Applying Gradients.

UNIT-IV

Introduction to Flash: Variables & data types- Data types in Action Script-Creating and placing variables – Buttons with text fields.

UNIT-V

Basic Actions: Play, stop, Back & forth- Between frames and scenes – Timelines – External scripts-Loops.

15CSP211	ROUTER CONFIGURATION LAB	Semester-II			
		L	T	P	C
		0	0	4	2

Course Objectives

- To get an architectural overview of the TCP/IP Protocol Suite
- To understand about subnets using IP classes
- To understand the key features and functions of ARP Protocol.
- To understand how basic routing protocol works.
- To understand about DNS and its applications
- To understand the concepts of Remote Login and VPN

Course Outcomes (COs)

At the completion of the course, students will:

1. Have the ability to analyze and differentiate networking protocols used in TCP/IP protocol suite.
2. Understand the routing IP datagrams and checksum.
3. Exposed to unicast and multicast routing.
4. Learn about host name resolution and the Domain Name System (DNS).
5. Learn about services and operations of DHCP Servers and Domain Name Servers
6. Understand about SMTP and SNMP.

List of programs

1. Simple router configuration.
2. Access and utilize the router to set basic parameters.
3. Connect, configure, and verify operation status of a device interface.
4. Implement static and dynamic addressing services for hosts in a LAN environment.
5. Identify and correct common problems associated with IP addressing and host configurations.
6. Configure, verify, and troubleshoot RIPv2.
7. Perform and verify routing configuration tasks for a static or default route given.
8. Configure, verify and troubleshoot NAT operation on a router.
9. Configure and verify a PPP connection between routers.

		Semester-II
		L T P C
15CSP212	SOFTWARE DOCUMENTATION LAB	0 0 4 2

Course Objectives

- To introduce the concepts and methods required for the construction of large software intensive systems.
- To develop a broad understanding of the discipline of software engineering and management of software systems.
- To provide an understanding of both theoretical and methodological issues involve in modern software engineering project management and focuses strongly on Practical techniques.
- To apply proper theoretical, technical, and practical knowledge of software requirements, analysis, design, implementation, verification and validation, and documentation
- To develop appropriate design solutions to a given problem using software engineering approaches that integrates ethical, social, legal, and economic concerns.
- To express and understand the importance of negotiation, effective work habits, leadership, and good communication with stakeholders, in written and oral forms, in a typical software development environment

Course Outcomes (COs)

Upon the completion of the course students will be able to :-

1. Apply the process to be followed in the software development life-cycle models.
2. Implement communication, modeling, construction & deployment practices in software development.
3. Analyze & design the software models using unified modeling language (UML).
4. Explain the concepts of various software testing methods & be able to apply appropriate testing approaches for development of software.
5. Explain the quality management & different types of metrics used in software development.
6. Apply the concepts of project management & planning

Prepare a more detailed, organized and easy-to-read documentation, for any application software, which should describe the following:

1. User Requirement Documentation (USD)
2. Requirement Analysis Documentation. (RAD)
3. User Interfaces Specification. (UIS)
4. Object Oriented Design (OOD) or Low Level Design (LLD)
5. Code Documentation (CD)
6. Testing Documentation (TD)
7. User's Guide (UG)

15CSP301	J2EE	Semester-III			
		L T P C			
		3 1 0 4			

Course Objectives

- To Understand the In-depth concepts of JEE
- To Understand the in-depth Life cycle of servlets and JSP.
- To Learn how to communicate with databases using Java.
- To Handle Errors and Exceptions in Web Applications
- To Use NetBeans IDE for creating J2EE Applications
- To impart expertise in Web Application Development using J2EE.

Course Outcomes(COs)

1. Understand the In-depth concepts of JEE
2. Understand the in-depth Life cycle of servlets and JSP.
3. Learn how to communicate with databases using Java.
4. Handle Errors and Exceptions in Web Applications
5. Use NetBeans IDE for creating J2EE Applications
6. Understand J2EE as an architecture and platform for building and deploying web-based, n-tier, transactional, component-based enterprise applications

UNIT-I

J2EE Overview: Beginning of Java – Java Byte code – Advantages of Java –J2EE and J2SE. J2EE Multi Tier Architecture – Distributive Systems – The Tier – Multi Tier Architecture – Client Tier, Web Tier, Enterprise Java Beans Tier, Enterprise Information Systems Tier Implementation.

UNIT-II

J2EE Database Concepts: Data – Database – Database Schema. **JDBC Objects:** Driver Types – Packages – JDBC Process – Database Connection – Statement Objects – Result Set – Meta Data.

UNIT-III

Java Servlets: Benefits – Anatomy – Reading Data from Client –Reading HTTP Request Headers – Sending Data to client – Working with Cookies.

UNIT-IV

Enterprise Java Beans: Deployment Descriptors – Session Java Bean –Entity Java Bean Message Driven Bean.

UNIT-V

JSP: What is Java Server Pages? - Evolution of Dynamic Content Technologies – JSP & Java 2 Enterprise Edition; **JSP Fundamentals:** Writing your first JSP- Tag conversions-

Running JSP. **Programming JSP Scripts:** Scripting Languages – JSP tags- JSP directives – Scripting elements – Flow of Control – comments;
Java Remote Method Invocation.

Course Objectives

- To understand the concepts and principles that underlies modern operating systems
- To practice component to relate theoretical principles with operating system implementation.
- To learn about processes and processor management
- To learn about concurrency and synchronization
- To understand memory management schemes, file system and secondary storage management security and protection etc.
- To use different IPC ways in their programs like Message Queues, Semaphores, and Shared Memories.

Course Outcomes(COs)

At the end of the course the student will be in a position to –

1. Use basic fundamental utilities which are required again and again on daily basis to work on a modern operating system.
2. Write useful shell scripts which greatly and effectively enhance the usefulness of computers, from the point of view of programmers and application developers.
3. Understand basics of various OS related concepts, from programmer's point of view, like files, directories, kernel, inodes, APIs, system calls, processes, signals, etc.
4. Develop applications where several processes need to communicate with each other to complete a task.
5. Use different IPC ways in their programs like Message Queues, Semaphores, and Shared Memories.
6. Write programs which employs advanced concepts like multithreading.

UNIT-I**History and Overview Of GNU/Linux And FOSS 3**

Definition of FOSS & GNU, History of GNU/Linux and the Free Software Movement, Advantages of Free Software and GNU/Linux, FOSS usage , trends and potential—global and Indian.

UNIT-II**System Administration**

GNU/Linux OS installation--detect hardware, configure disk partitions & file systems and install a GNU/Linux distribution ; Basic shell commands -logging in, listing files, editing files, copying/moving files, viewing file contents, changing file modes and permissions, process management ; User and group management, file ownerships and permissions, PAM authentication ; Introduction to common system configuration files & log files ;

Configuring networking, basics of TCP/IP networking and routing, connecting to the Internet (through dialup, DSL, Ethernet, leased line) ; Configuring additional hardware - sound cards, displays & display cards, network cards, modems, USB drives, CD writers ; Understanding the OS boot up process ; Performing every day tasks using gnu/Linux -- accessing the Internet, playing music, editing documents and spreadsheets, sending and receiving email, copy files from disks and over the network, playing games, writing CDs ; X Window system configuration and utilities--configure X windows, detect display devices ; Installing software from source code as well as using binary packages.

UNIT-III

Server Setup And Configuration

Setting up email servers--using postfix (SMTP services), courier (IMAP & POP3 services), squirrel mail (web mail services) ; Setting up web servers --using apache (HTTP services), php (server-side scripting), perl (CGI support) ; Setting up file services --using samba (file and authentication services for windows networks), using NFS (file services for gnu/Linux / Unix networks) ; Setting up proxy services --using squid (http / ftp / https proxy services) ; Setting up printer services -using CUPS (print spooler), foomatic (printer database) ; Setting up a firewall -Using netfilter and iptables.

UNIT-IV

Programming Tools

Using the GNU Compiler Collection --GNU compiler tools ; the C preprocessor (cpp), the C compiler (gcc) and the C++ compiler (g++), assembler (gas) ; Understanding build systems --constructing make files and using make, using autoconf and autogen to automatically generate make files tailored for different development environments ; Using source code versioning and management tools --using cvs to manage source code revisions, patch & diff ; Understanding the GNU Libc libraries and linker --linking against object archives (.a libraries) and dynamic shared object libraries (.so libraries), generating statically linked binaries and libraries, generating dynamically linked libraries.

Using the GNU debugging tools --gdb to debug programs, graphical debuggers like ddd, memory debugging / profiling libraries mpatrol and valgrind ; Review of common programming practices and guidelines for GNU/Linux and FOSS ; Introduction to Bash, sed & awk scripting.

UNIT-V

Application Programming

Basics of the X Windows server architecture ; Qt Programming ; Gtk+ Programming ; Python Programming ; Programming GUI applications with localisation support.

15CSP303	DIGITAL IMAGE PROCESSING	Semester-III			
		L T P C			
		4 0 0 4			

Course Objectives

- To make the students learn the fundamental theories and techniques of digital image processing.
- To study the mathematical transforms necessary for image processing, image manipulation and a preliminary understanding of Computer Vision.
- To make students to understand the image degradation and enhancement.
- To understand the basic relationships between pixels in an image
- To know various segmentation techniques, and object descriptors.
- To implement pattern recognition to enhance an image.

Course Outcomes(COs)

1. Perform image manipulations and analysis in many different fields.
2. Apply knowledge of computing mathematics science and engineering to solve problems in multidisciplinary research.
3. Implement the understanding in sharpening the image.
4. Perform the image segmentation using the compression method.
5. Understand the image to represent in an region.
6. Analyze the basic algorithms used for image processing & image compression with morphological image processing.

UNIT-I

Introduction: Digital image processing – Origins of digital image processing- Examples of fields that use digital image processing-Fundamental steps in digital image processing- Components of an image processing system-Representing digital image.

UNIT-II

Some Basic relationships between Pixels-Basic gray level transformations- Histogram processing - Basic spatial filtering- Smoothing special filtering- Image Degradation/ Restoration process- Noise Models.

UNIT-III

Image Segmentation: Thresholding - Edge Based Segmentation – Region Based Segmentation – Matching. Image Compression: Error Criterion - Lossy Compression - Lossless Compression.

UNIT-IV

Shape Representation and Description: Region Identification - Contour Based Representation And Description – Region Based Shape Representation And Description

UNIT-V

Image Recognition: Introduction – Statistical Pattern Recognition - Neural Net-Syntactic Pattern Recognition - Graph Matching - Clustering

		Semester-III			
		L T P C			
15CSP304	NETWORK ARCHITECTURE AND MANAGEMENT	4	0	0	4

Course Objectives

- To understand the various architecture models and routing strategies of networks.
- To understand the privacy and security needs of a network and formulate a plan.
- To analyze the various case studies of network architecture and management.
- To implement the SNMP protocol in various architectures.
- To use various network management tools and understand their modules.
- To design an architecture with all the network requirements of a client with help of network management tools.

Course Outcomes(COs)

1. Understand the various architecture models and routing strategies of networks.
2. Understand the privacy and security needs of a network and formulate a plan.
3. Analyze the various case studies of network architecture and management.
4. Implement the SNMP protocol in various architectures.
5. Use various network management tools and understand their modules.
6. Design an architecture with all the network requirements of a client with help of network management tools.

UNIT-I

Introduction: Objectives - Component architectures - Reference architecture - Architectural models; Addressing and Routing Architecture: Addressing mechanisms - Routing mechanisms - Addressing strategies - Routing strategies - Architectural considerations; Network Management Architecture: Defining Network Management - Network Management Mechanism - Architectural considerations; Performance Architecture; Developing goals - Performance mechanisms - Architectural considerations

UNIT- II

Security And Private Architecture: Developing a security and privacy plan - Security and privacy Administration & Mechanism - Architectural considerations; Selecting Technologies for the Network Design: Goals - Criteria for Technology Evaluation - Guidelines and constraints on Technology Evaluation - Choices for Network Design; Interconnecting Technologies Within The Network Design: Shared medium - Switching - Routing - Hybrid mechanism - Applying Interconnection Mechanism to the Design

UNIT- III

Case history of Networking and Management: Challenges of Information Technology Managers - Goals, organization and functions - Network and System Management - Network Management System Platform; SNMP, Broadband and TMN Management: Network Management Standards & Model - Organization, Information and

Communication Model – ASN.1 – Encoding structure – Macros – Functional model; Organization and Information Model: Managed Networks – The History of Network Management – Internet Organization and standards – SNMP Model – The Organization and Information Model; Communication and Functional Model: The SNMP Communication Model – Functional Model.

UNIT- IV

SNMPv2 Management: Major changes – System architecture – Structure of Management Information – Management Information Base – SNMPv2 protocol – Compatibility; RMON: Remote monitoring – RMON1 – RMON2 – ATM remote monitoring; Broadband Network Management: ATM Networks - Network and Services – ATM Technology – ATM Network Management; Telecommunication Management Network: Operations systems – Conceptual model – Standards – Architecture – TMN Management service architecture – Integrated view of TMN – Implementation issues.

UNIT- V

Network Management Tools and Systems: Network management tools – Network statistics measurement system – Network Management Systems – System Management; Network Management Applications: Configuration Management - Fault Management - Performance Management – Security Management – Accounting Management – Report Management - Policy Based Management – Service Level Management.

TEXT BOOK

3. <https://www.cs.columbia.edu/~smb/classes/s06-4118/126.pdf>

Course Objectives

- To understand the hardware and software concepts of distributed operating systems, various design issues like transparency, flexibility etc., and communication and synchronization in distributed operating systems.
- To understand scheduling in distributed operating systems, fault tolerance, real-time distributed systems, and designing of distributed file systems.
- To understand the concept of design and implementation in the context of distributed operating systems.
- To Design and Implement Distributed applications using Technologies like RPC, threads.
- To understand How Distributed Shared Memory is managed.
- To analyze security issues in network and distributed environments

Course Outcomes(COs)

1. Understand the different Distributed Systems and the challenges involved in Design of the Distributed Systems.
2. Understand how computing power is created and synchronized in Distributed systems
3. Design and Implement Distributed applications using Technologies like RPC, threads.
4. Learn how to store data in Distributed File System.
5. Understand How Distributed Shared Memory is managed.
6. Analyze security issues in network and distributed environments

UNIT-I

Fundamentals – message passing – Remote procedure calls : Introduction – the RPC model – transparency of RPC – Implementing RPC mechanism –stub generation – RPC messages – marshaling arguments and results – server management – parameter passing semantics – call semantics.

UNIT- II

Distributed shared memory : Introduction – general architecture of DSM systems – design and implementation of DSM – granularity – structure of shared memory space – replacement strategy – heterogeneous DSM – advantages of DSM.

UNIT- III

Synchronization: Introduction – clock synchronization – event ordering – mutual exclusion. Resource management: Introduction – desirable features of a good global scheduling algorithm – task management approach – load balancing approach – load sharing approach.

UNIT- IV

Distributed file system: Introduction – desirable features of a good distributed file system – file models – file accessing models.

Naming: Introduction – desirable features of a good naming system – fundamental terminologies and concepts.

UNIT- V

Security: Introduction – potential attacks to computer system – cryptography.

TEXT BOOK

REFERENCES

1. Paul J. Fortier. 1998. Design of Distributed Operating System concepts and Technology, 1st Edition, Tata McGraw Hill, New Delhi.
2. Andrew S. Tanenbaum. 1995. Distributed Operating System. Pearson Education, New Delhi.

WEB SITES

1. <http://staff.um.edu.mt/csta1//courses/lectures/csm202/os17.html>
2. <http://www.inf.uni-konstanz.de/dbis/teaching/ss06/os/ch14-wrongNumber.pdf>
3. <https://www.cs.columbia.edu/~smb/classes/s06-4118/126.pdf>

Course Objectives

- To expose the students to the architecture, design, and implementation of massive-scale data systems.
- To understand foundational concepts of distributed database theory including design and architecture, security, integrity, query processing and optimization, transaction management, concurrency control, and fault tolerance.
- To know about parallel database systems and their architecture
- To create optimized query execution plan.
- To efficiently distribute and manage the data.
- To manage distributed access control

Course Outcomes(COs)

1. Understand the DDBMS architecture models and complicating factors.
2. Design good performing distributed database schemas.
3. Create optimized query execution plan.
4. Efficiently distribute and manage the data.
5. Manage distributed access control
6. Know how to make security to the databases.

UNIT I

Introduction: Distribute Data Processing- What is Distributed Database System?- Promises of DDBMSs -Complicating Factors -Problem -Distributed DBMS Architecture- DBMS Standardization- Architectural Models for DDBMSs - DDBMSs Architecture.

UNIT II

Distributed Database Design: Design Strategies- Top-Down Design Process- Bottom Up Design Process-Distribution Design Issues – Fragmentation-Allocation -Semantic Data Control-View Management- Data Security- Semantic Integrity Control- Centralized Semantic Integrity Control- Distributed Semantic Integrity Control.

UNIT III

Query Processing: Query Processing Problem- Objectives of Query Processing- Complexity of Relational Algebra Operations-Characterization of Query Processors- Layers of query processing-Query decomposition and data Localization- Query Optimization –Centralized query optimization –Join ordering in Fragment Queries – Distributed query optimization Algorithms.

UNIT IV

Transaction Management: Definition of a Transaction-Properties of Transaction- Types of Transaction- Distributed Concurrency Control- Serialization Theory- Taxonomy of Concurrency Control Mechanisms- Locking Based Concurrency Control Mechanisms-

Timestamp –Based Concurrency Control Mechanisms-Optimistic Concurrency Control Algorithms-Deadlock Management-Relaxed Concurrency Control-Distributed Reliability DBMS Reliability - Reliability Concepts and Measures-Failures and Fault Tolerance in Distributed Systems-Failures in Distributed DBMS-Local Reliability Protocols-Distributed Reliability Protocols –Dealing With Site Failures- Network Portioning

UNIT V

Parallel Database Systems: Database Servers-Parallel Architectures –Parallel DBMS Techniques –Parallel Execution Problems-Parallel Execution For Hierarchical Architecture-Distributed Object Database Management Systems –Fundamental Object Concepts And Object Models- Object Distribution Design-Architectural Issues- Object Management –Distributed Object Storage-Object Query Processing-Transaction Management.

WEB SITES

1. en.wikipedia.org/wiki/Distributed_computing
2. www.webopedia.com/TERM/D/distributed_computing.html
3. www.tech-faq.com/distributed-computing.shtml

Course Objectives

- To describe basic standards that enable web services: SOAP, WSDL, and UDDI
- To know the role of web services in commercial applications
- To understand the principles of web service provision
- To design of web services and applications to use them within a service-oriented architecture.
- To use of BPEL (Business Process Execution Logic) and WSDL (Web Service Description Language) for implementing web services
- To develop a web service using Apache Axis Soap Server and Tomcat application Server.

Course Outcomes(COs)

1. Understand the basic standards that enable web services: SOAP, WSDL, and UDDI
2. Analyze the role of web services in commercial applications
3. Understand the principles of web service provision
4. Design of web services and applications to use them within a service-oriented architecture.
5. Use of BPEL (Business Process Execution Logic) and WSDL (Web Service Description Language) for implementing web services
6. Develop a web service using Apache Axis Soap Server and Tomcat application Server.

UNIT-I

Introduction: What are Web Services – Importance of web services – Web services and enterprises. XML Fundamentals: XML Documents - Namespaces – Schema – Processing XML.

UNIT-II

SOAP: SOAP Model – messages – Encoding – RPC – Alternative SOAP encodings – Document, RPC, Literal, Encoded – SOAP, Web Services and the REST Architecture.

WSDL: Structure – Using SOAP and WSDL. UDDI: UDDI Business Registry – Specification – Data Structures – Life cycle Management – Dynamic Access Point Management.

UNIT-III

Advanced Web Services Technologies and Standards: Conversation – Overview – Web Services Conversation Language – WSCL Interface Components. Workflow-Business Process Management – Workflow and Workflow Management systems – BPEL.

Transaction –ACID transaction – Distributed Transaction – OASIS Business-Transaction Protocol.

UNIT-IV

Security – Security Basics – Security Issues – Types of Security Attacks – WS–Security. Mobile and Wireless – Mobile Web Services – Challenges with mobile – Proxy Based Mobile Systems -Direct Mobile Web service access - J2ME Web Services.

UNIT-V

Building Real World Enterprise Web Service and Applications: Real World Web Service Application Development – Development of Web services and Applications onto Tomcat application Server and Axis Soap Server.

Course Objectives

- To Expose students to software and hardware capabilities of wireless applications.
- To provide an overview of Wireless Communication networks area and its applications in communication engineering.
- To appreciate the contribution of Wireless Communication networks to overall technological growth.
- To explain the various terminology, principles, devices, schemes, concepts, algorithms and different methodologies used in Wireless Communication Networks.
- To enable students to compare and contrast multiple division techniques, mobile communication systems, and existing wireless networks.
- To design a wireless application using WML

Course Outcomes(COs)

1. Understand software and hardware capabilities of wireless applications.
2. Analyze Wireless Communication networks area and its applications in communication engineering.
3. Appreciate the contribution of Wireless Communication networks to overall technological growth.
4. Explain the various terminology, principles, devices, schemes, concepts, algorithms and different methodologies used in Wireless Communication Networks.
5. Compare and contrast multiple division techniques, mobile communication systems, and existing wireless networks.
6. Design and Develop a wireless application using WML

UNIT-I

Mobile Data Introduction: The Rise of Mobile Data-Key Services for the Mobile Internet- Overview of the WAP-The origins of the WAP- WAP architecture-WAP Internal Structure-Components of the WAP Standards- WAP Gateways-Network Infrastructure Services Supporting WAP Clients-WAP Architecture Design Principles – Relationship with other standards.

UNIT-II

The Wireless Markup Language: Overview-The WML Document Model-WML Authoring-URLS Identity Content-Mark Up Basics- WML Basics-Basic Content-Events, Tasks and Binding.

UNIT-III

Variables –Other Content you can include-Controls-Miscellaneous Markup- Sending Information-Application Security-Other Data; The Meta element- Document Type Declarations- Errors and browsers Limitations-Content generation- WML Version Negotiation.

UNIT-IV

User Interface Design: Making Wireless Applications, Easy to Use- Website Design- Computer Terminals Vs Mobile Terminals-Designing a usable WAP site-structured usability method-user interface design guidelines- Design guidelines for selected WML Elements.

UNIT-V

Wireless Telephony Applications: Overview of the WTA Architecture- WTA Client Frame Work –WTA Server and Security- Design Considerations- Application Creation Tool Box- Future of WTA Enhancements.

The Mobile Internet Future: Better Content- Easier Access-Beyond Browsing – Beyond Cellular- Mobile Data Unleashed.

Course Objectives

- To describe common WAN protocols and interfaces like PPP.
- To demonstrate basic routing and network troubleshooting.
- To understand Frame delay and congestion control mechanisms
- To learn about ISDN and ISDN devices
- To analyze about VPN and its mechanisms
- To understand Asynchronous Transfer Mode (ATM) and VoIP standards and Devices

Course Outcomes(COs)

Upon successful completion of this course, the student will be able to:

1. Describe common WAN protocols and interfaces.
2. Demonstrate basic routing and network troubleshooting.
3. Understand Frame delay and congestion control mechanisms
4. Learn about ISDN and ISDN devices
5. Analyze about VPN and its mechanisms
6. Understand Asynchronous Transfer Mode (ATM) and VoIP standards and Devices

Unit I

Introduction to WAN Technologies: Point To Point Links – Circuit & Packet Switching – Virtual Circuits – Dialup Services – WAN Devices. Dialup Technology: Background – Dialup Connectivity – Dialup Methods – Benefits and Drawbacks.

Unit II

Point-To-Point Protocol: PPP Encapsulation – Link Operation – LCP Packet Formats – LCP Configuration Options. X.25: Devices and Protocol Operation – Protocol Suite – LAPB Frame Format – X.21 Address Format.

Unit III

Frame Relay: Frame Relay Devices – Virtual Circuits – Congestion Control Mechanisms – Local Management Interface – Frame Format. Integrated Services Digital Network: ISDN Devices – ISDN Channels – Services – ISDN Interfaces – ISDN Specification – Signaling System 7. Virtual Private Networks: Background – Layer 2 Tunneling Protocol – Operational Mechanisms – Adding More Security.

Unit IV

Asynchronous Transfer Mode: Standards – ATM Devices and the Network Environment – Cell Header Format – ATM Services – Switching Operations – Reference Model – Addressing – Connections – ATM and Multicasting – Quality of Service – Signaling and Connection Establishment – Connection Management Messages – PNNI – Integrated

Local Management Interface – LAN Emulation – Multiprotocol Over ATM – Physical Layer Architecture. MPLS/Tag Switching: Operations – Switching Architecture – Hierarchical Routing – Multicast Routing – Label Switching With ATM – Quality of Service and Traffic Engineering.

Unit V

Voice/Data Integration Technologies: Introduction – Advances in Applications – Voice Networking – Voice Over ATM – Voice Over Frame Relay – VOIP Standards – VOIP Technology and Future Communications – SGCP – The Simple Control Interface – Gateway Control Interface – Gateway Control Functions – Encoding of the Session Description – SGCP Transmission Over UDP – Security Requirements – Cash Flows – MGCP Overview – General SIP Tutorial. Digital Subscriber Line: ADSL, Signaling and Modulation – DSL Technologies.

2. CISCO Systems. “*Internetworking Technologies Handbook*”, New Delhi: Techmedia, 2001.(Chapter 3,10,12, 15,17,18,19, 21, 27,28)

Reference Book

1. Behrouz A. Forouzan. “*Data Communication and Networking*”, 3rd Edition, New Delhi: Tata McGraw Hill, 2003

Course Objectives

- To Understand the In-depth concepts of JEE
- To Understand the in-depth Life cycle of servlets and JSP.
- To Learn how to communicate with databases using Java.
- To Handle Errors and Exceptions in Web Applications
- To Use NetBeans IDE for creating J2EE Applications
- To impart expertise in Web Application Development using J2EE.

Course Outcomes(COs)

1. Understand the In-depth concepts of JEE
2. Understand the in-depth Life cycle of servlets and JSP.
3. Learn how to communicate with databases using Java.
4. Handle Errors and Exceptions in Web Applications
5. Use NetBeans IDE for creating J2EE Applications
6. Understand J2EE as an architecture and platform for building and deploying web-based, n-tier, transactional, component-based enterprise applications

List of Programs

1. Create a sign in form in servlets.
2. Write a servlet Program to lock a server.
3. Write a servlet program that returns list of information in table format.
4. Design a counter that counts number of times user has visited the site in current browsing session.
5. Write a program to retrieve cookies information
6. Build a JAVA Bean for opening an applet from JAR file.
7. Write a program to add controls in BEAN.
8. Design a counter in JAVA BEAN.
9. Write a program to stream contents of a file using JSP.
10. Write a program to insert an applet into JSP page.

Course Objectives

- To understand the concepts and principles that underlies modern operating systems
- To practice component to relate theoretical principles with operating system implementation.
- To learn about processes and processor management
- To learn about concurrency and synchronization
- To understand memory management schemes, file system and secondary storage management security and protection etc.
- To use different IPC ways in their programs like Message Queues, Semaphores, and Shared Memories.

Course Outcomes(COs)

At the end of the course the student will be in a position to –

1. Use basic fundamental utilities which are required again and again on daily basis to work on a modern operating system.
2. Write useful shell scripts which greatly and effectively enhance the usefulness of computers, from the point of view of programmers and application developers.
3. Understand basics of various OS related concepts, from programmer's point of view, like files, directories, kernel, inodes, APIs, system calls, processes, signals, etc.
4. Develop applications where several processes need to communicate with each other to complete a task.
5. Use different IPC ways in their programs like Message Queues, Semaphores, and Shared Memories.
6. Write programs which employs advanced concepts like multithreading.

List of Programs

1. To write a Linux program to display process deadlock state.
2. To write a program to display the allocated memory.
3. To write a program to simulate the DOS Command-Copy.
4. To write a program to implement signal handling.
5. To write a simple Linux program using thread.
6. To write a program to display the date & time using TCP Sockets.
7. To write a program to display the date & time using UDP Sockets.
8. To write a program to display the cpu scheduling
9. To write a Linux program to create a lock file.
10. To write a program to display the user information

Course Objectives

- to list the defining characteristics of an intelligent agent and how an agent differs from an object
- to understanding Agent architectures at Micro and Macro level
- to Develop agent understanding with different kinds of Ontologies and how they work together
- to understand how multiagents interact using pure and mixed strategy, Nash equilibria; zero-sum and other interactions; how cooperation Occurs in the Prisoner's dilemma.
- to understanding Coalition formation in Multiagent Environment using coalitional games; coalition structure generation
- to understanding allocation of scarce resources through auction types; combinatorial auctions and winner determination

Course Outcomes(COs)

After completing the course the students should:

1. be able to use important tools and technologies used in artificial intelligence and multi agent systems
2. be able to develop intelligent multi-agent systems
3. be able to assess the value of, and to a suitable extent utilize, existing solutions as a part of a programming project
4. Be able to model, analyze and critically evaluate distributed systems using agent-based abstractions and related concepts.
5. understand how multiagents interact using pure and mixed strategy, Nash equilibria; zero-sum and other interactions; how cooperation Occurs in the Prisoner's dilemma.
6. understanding Coalition formation in Multiagent Environment using coalitional games; coalition structure generation

UNIT I

Introduction – Intelligent Agents – Environments – Intelligent agents – Agents and Objects – Agents and Expert Systems – Agents as Intentional Systems – Abstract Architectures for Intelligent Agents – How to tell an agent what to do – Synthesizing Agents

UNIT II

Deductive Reasoning Agents – Agents as Theorem Provers – Agent-Oriented Programming – Concurrent MetateM

Practical Reasoning Agents – Proactical Reasoning Equals Deliberation Plus Means-Ends Reasoning – Means-Ends Reasoning – Implementing a Practical Reasoning Agent - Homer – The Procedural Reasoning System
Reactive and Hybrid Agents- Brooks and the Subsumption Architecture – The Limitations of Reactive Agents – Hybrid Agents

UNIT III

Multiagent Interactions – Utilities and Preferences – Multiagent Encounters – Dominant Strategies and Nash Equilibria – Competitive and Zero-Sum Interactions – The Prisoner’s Dilemma – Other Symmetric 2 x 2 Interactions – Dependence Relations in Multiagent Systems

Reaching Agreements – Mechanism Design – Auctions – Negotiation – Argumentation Communication – Speech Acts – Agent Communication Languages – Ontologies for Agent Communication – Coordination Languages

UNIT IV

Cooperative Distributed Problem Solving – Task Sharing – Combining Task and Result Sharing – Handling Inconsistency – Coordination – Multiagent planning and Synchronization

UNIT V

Methodologies – Agent-Oriented Analysis and Design Techniques – Pitfalls of Agent Development – Mobile Agents, Applications of Agents

TEXT BOOK

1. Michael Wooldridge.2002. An Introduction to Multiagent Systems, John Wiley & Sons Ltd.

REFERENCE BOOKS

1. Gerhard Weiss. Multi-agent Systems – A Modern Approach to Distributed Artificial Intelligence, MIT Press
2. Walter Brenner et al, Intelligent Software agents, Springer Verlag
3. Nicholas R. Jennings, Michael Wooldridge, Agent Technology: Foundations, Applications and markets, Springer Verlag Publishing.

	Semester-IV
	L T P C
15CSP401 INTRODUCTION TO SOFTWARE ARCHITECTURE	0 0 0 4

Course Objectives

- To introduce basic concepts and principles about software design and software architecture.
- To understand design issues followed by coverage on design patterns.
- To get an overview of architectural structures and styles.
- to know practical approaches and methods for creating and analyzing software architecture are presented.
- To analyze the interaction between quality attributes and software architecture.
- To gain experiences with examples in design pattern application and case studies in software architecture.

Course Outcomes(COs)

A student who successfully completes this course should at the minimum be able to:

1. Design and motivate software architecture for large scale software systems
2. Recognize major software architectural styles design patterns and frameworks
3. Understand design issues followed by coverage on design patterns.
4. Generate architectural alternatives for a problem and select among them
5. Use well-understood paradigms for designing new systems
6. Identify and assess the quality attributes of a system at the architectural level

UNIT I

Introduction – Software Architecture – Software Design levels – An Engineering Discipline for Software – The status of Software Architecture – Architectural styles – Pipes and filters – Data Abstraction and Object-oriented organization – Event based, implicit invocation – Layered systems – Repositories – Interpreters – Process Control – Other Familiar Architecture – Heterogeneous Architectures.

UNIT II

Case studies - Key word is Context – Instrumentation Software – Mobile Robotics – Cruise Control – Three Vignettes in Mixed Style

UNIT III

Shared Information Systems – Database Integration – Integration in Software Development Environments – Integration in the Design of Buildings – Architectural structures for shared Information Systems

UNIT IV

Guidance for User-Interface Architectures – The quantified Design Space – The value of Architectural formalism – Formalizing the Architecture of a specific system –

Formalizing an Architectural Style – Formalizing an Architectural Design Space –
Towards a Theory of Software Architecture – Z Notation

UNIT V

Requirements for Architecture – Description Languages – First class connectors –
Adding Implicit Invocation to Traditional Programming Languages – Tools for
Architectural Design – UniCon – Exploiting Style in Architectural Design Environments
– Beyond definition/Use: Architectural Interconnection

TEXT BOOKS

1. Mary Shaw, David Garlan, Software Architecture – Perspectives on an Emerging Discipline, Prentice Hall of India, Eastern Economy Edition.
2. Software Architecture: Foundations, Theory and Practice, Richard N. Taylor, Nenad Medvidovic, Eric M. Dashofy, 2010, Wiley India Pvt. Limited.

15LSU101	தமிழ் முதல் தாள்	Semester-I			
		L	T	P	C
		5	-	-	5

கற்பகம்உயர்கல்விகலைக்கழகம்
பகுதி - I தமிழ்ப்பாடத்திட்டம் (2015 - 2016)
முதல்பருவம்

(இளநிலை அறிவியல் பட்டவகுப்புகளுக்குரியது)
 (For I-UG Science Degree Classes) 15LSU101

பாடத்திட்டப் பொதுநோக்கம்

- கற்றல் வழி சிந்தனைத் திறனையும், கருத்து வெளிப்பாட்டுத் திறனையும், மேம்படுத்துதல்.
- ஆய்வுநோக்கமேம்படுத்துதல்.
- இலக்கியங்கள் உணர்த்தும் வாழ்வின் நுட்பமான பகுதிகளை உணர்த்துதல்.
- மனித மனத்தினைப் பக்குவப்படுத்துதலில் இலக்கியம் தரும் பங்கினை உணர்த்துதல்.
- வளர்ந்து வரும் சமூகத்தில் அறஉணர்வு, பண்பாடு போன்றவை குறித்து அறிவூட்டல்.
- அரசுத் தேர்வுகளுக்கு மாணவர்களை ஆயத்தமாக்குதல்.

பாடத்திட்டப் பயன்விளைவு

- இந்திய குடியுரிமைப் பணி முதலான போட்டித் தேர்வுகளில், விருப்பப்பாடமாக இடம்பெறுகின்ற, 'தமிழ் இலக்கிய வரலாறு' குறித்த முழுமையான அறிமுகம் பெற்றிருத்தல்.
- கல்வெட்டியல், ஓலைச்சுவடியியல் மற்றும் தொல்லியல் சார்ந்த ஆவணத் தேடலுக்குரிய ஆய்வுமனப்பான்மையுடன், இலக்கியங்களை அணுகுதல்.
- தமிழின் வளர்ச்சித்துறையாகிய, 'அறிவியல் தமிழ்' ; 'இணையதமிழ்' குறித்த பன்னோக்கு அணுகுமுறையிலான ஆய்வுச் சிந்தனை மேம்பாடு.
- வேலைவாய்ப்புக்குரிய சுயதிறன் மேம்பாட்டுடன், படைப்பாக்கத்திறன் மேம்பாடும் பெற்றிருத்தல் .
- சமுதாய மற்றும் வாழ்வியல் மதிப்புகளைப் பேணுவதற்குக்கருவியாக இலக்கியங்களை நாடுகின்ற மனப்பான்மை வளர்ச்சி.
- மொழிபெயப்புத்துறை சார்ந்த வேலைவாய்ப்புத் திறன் பெற்றிருத்தல்

அலகு - I : இக்கால இலக்கியம்

தத்துவம் : மகாகவி பாரதியார் - பகைவனுக்கு அருள்வாய்.

கவிஞர் ந.பிச்சமூர்த்தி - கிளிக்கூண்டு

இயற்கை : பாவேந்தர் பாரதிதாசன் - அழகின் சிரிப்பு - ஞாயிறு.

சமுதாயம் : கவிக்கோ அப்துல் ரகுமான் - இன்றைய நிலை

அறிவியல் : கவிஞர் சிற்பி பாலசுப்பிரமணியன் - காலம்.

பெண்ணியம் : கவிஞர் சிவரமணி - வையகத்தை வெற்றிகொள்ள

சூழலியல் : அன்பாதவன் - மரணம்

காதல் : வைரமுத்து - காதல் உயில்

தன்னம்பிக்கை பா.விஜய் - தன்னம்பிக்கை

அலகு - II : அற இலக்கியம்

1. திருக்குறள் - தேர்த்தெடுக்கப்பட்ட குறள்கள் 20

2. நான்மணிக்கடிகை - தேர்த்தெடுக்கப்பட்ட ஐந்து பாடல்கள்

3. திரிகடுகம் - தேர்த்தெடுக்கப்பட்ட ஐந்து பாடல்கள்

அலகு - III : சிற்றிலக்கியம்

1. நரிவிருத்தம் - அறன் வலியுறுத்தல்

2. தமிழ் விடு தூது - தமிழின் சிறப்புரைத்தல்

3. மதுரை மீனாட்சியம்மைப் பிள்ளைத்தமிழ் - தொடுக்கும் கடவுள் பழம்பாடல்

அலகு - IV : சிறுகதை

1. புதுமைப்பித்தன் - நிகும்பலை

2. தனுஷ்கோடி ராமசாமி - கந்தகக் கிடங்கிலே

3. கந்தர்வன் - துண்டு

4. வாஸந்தி - வடிகால்

5. சி.ஆர். ரவீந்திரன் - வழுக்குமரம்

அலகு - V : மொழிப்பயிற்சி

1. விண்ணப்பங்கள் எழுதுதல் மற்றும் கடிதப் பயிற்சி

2. மொழிபெயர்ப்புப் பயிற்சி

பாட நூல்: கற்பகச்சோலை - தமிழ் ஏடு. கற்பகம் பல்கலைக்கழகத் தமிழ்த் துறை வெளியீடு.

15ENU101	ENGLISH - I	Semester-I			
		L	T	P	C
		4	-	-	4

Course Objectives:

- To enable the learners to acquire English language skills at a faster pace.
- To introduce different kinds of literary works
- To familiarize different genres of Literature
- To instruct moral values through literature.
- To improvise their productive and receptive skills
- To strengthen the basic knowledge about grammar.

Course Outcomes:

- Learn to reflect on the literary works and communicate flexibly.
- Reading and comprehending literary works
- Genres of literature to provide moral education
- Develop communication skills in business environment
- Interpersonal skills will be developed.
- Betterment of language competence

UNIT I:

Prose: Google Guys (Extract) – Richard L Brandt

Poetry: The Blind Pedlar – Osbert Sitwell

Short Story: A Garden So Rich – Christie Craig

Vocabulary: Prefixes, Antonyms, Sentence Completion

Grammar: Articles, Adverbs, Pronouns

Composition: Proverb Expansion

UNIT II:

Prose: Happiness 101 – Geeta Padmanabhan

Poetry: An Old Woman – Arun Kolatkar

Vocabulary: Suffixes, Analogies

Grammar: Nouns, Adjectives

Composition: Dialogue Writing

UNIT III:

Prose: Structured Procrastination – John Perry

Short Story: The Umbrella Man – Roald Dahl

One-Act Play: The Boy Who Stopped Smiling – Ramu Ramanathan

Vocabulary: Synonyms, Euphemisms, Word Definitions

Grammar: Verbs, Conjunctions and Interjection, Indirect/Reported Speech

UNIT IV:

Poetry: No Sentence – Anjum Hassan

One-Act Play: While the Auto Waits- O' Henry

Vocabulary: Words Often Confused, Anagrams

Grammar: Prepositions, Voice- Active and Passive

Composition: Letter Writing- Informal

UNIT V:

Short Story: The Bird – Amar Jalil

One-Act Play: The Cellphone Epidemic – Claudia I. Haas

Vocabulary: Portmanteau Words, One Word Substitute

Grammar: Questions, Pronunciation

Composition: Letter Writing- Formal

15ECU101	ELECTRONIC DEVICES AND CIRCUITS	Semester-I			
		L	T	P	C
		5	1	-	6

COURSE OBJECTIVES

- Ability to design different types of Electronic Circuits such as Amplifiers and Oscillators.
- To understand and implement the advanced electronic circuits such as amplifiers etc with the help of theoretical and practical problem solving.
- Ability to analyze the different types of configurations and applications of Transistor.
- Ability to determine the stability of feedback amplifiers and their steady state performance.
- To analyze the Circuits in time and frequency domain
- Calculation and measurement of parameters for electronic circuits, to introduce the students to the advanced concepts of electronics.

COURSE OUTCOMES

- Know the characteristics of diodes and transistors
- Design simple circuits and know the benefits of feedback in amplifier
- Apply their knowledge in analyzing Circuits by using network theorems.
- Measure the characteristics of electronic circuits and present experimental results
- Compare and classify oscillators
- Analyze electrical circuits and calculate the main parameters

UNIT I - Passive Circuit Components

Introduction – Resistors: Fixed & Variable resistor – Colour coding – Tolerance - Series and Parallel connection. Capacitors: Basic structure and symbol – Fixed & Variable capacitors – Dissipation factor – Series and parallel connection. Inductors: Inductance of the coil – Fixed & Variable inductors – Inductive reactance – Energy stored in an inductor – Q factor – Mutual inductance – Series and Parallel connection

UNIT II - Network Theorems

Basics of Ohm's law – Kirchoff's law– Superposition theorem – Thevenin's theorem – Thevenizing a circuit with two Voltage Source – Thevenizing a bridge circuits – Norton theorem – Thevenin's Norton conversion – Conversion of Voltage and Current source – Millman's theorem – Maximum Power transfer theorem

UNIT III - Semiconductor Devices and Special Diodes

Introduction - Atom- electron-orbit – Energy level -Conductor – Semiconductor – Insulator– Intrinsic semiconductor – Extrinsic semiconductor – P type and N type semiconductor– PN junction diode –V-I characteristics - Zener diode - V-I characteristics- Schottky diode-Tunnel diode-Varactor diode- UJT- Photo diode- Construction and Operation of transistors – Characteristics of CE , CB,CE .

UNIT IV - Wave Shaping and Switching Circuits

Introduction and Design of Wave shaping and Switching Circuits - Clipping, Clamping circuits – Half wave, full wave and bridge rectifiers – Average value – RMS value – Ripple factor – Rectification efficiency. Filters: Capacitors, Inductors, LC and PI filter Transformers - Types–Zener as Voltage Regulator - Regulated Power Supplies using Zener Diode.

UNIT V- Amplifiers and Oscillators

Introduction– Transistor as an Amplifier -Single Stage- RC coupled amplifiers- Power amplifiers: Class A, B& AB power amplifiers-Push pull amplifiers- Oscillators – RC phase shift-Hartley Oscillator- Colpitts Oscillator-Wein Bridge Oscillator.

15ECU102	ALLIED MATHEMATICS – I	Semester-I			
		L	T	P	C
		4	2	-	4

OBJECTIVE

- This course provides a deep knowledge to the learners to understand the basic concepts of Matrices, Sequences, Complex Variable, Complex Function, First Order Ordinary Differential Equations, Power series method
- To provide students with mathematics fundamentals necessary to formulate, solve and analyses complex engineering problems.
- To prepare student to apply reasoning informed by the contextual knowledge to engineering practice.
- To build the strong foundation in Mathematics of students needed for the field of electronics and Telecommunication Engineering
- Linear differential equations of higher order using analytical methods and numerical methods applicable to Control systems and Network analysis.
- Vector differentiation and integration required in Electro-Magnetics and Wave theory.

COURSE OUTCOMES

- Able to solve qualitative problems based on vector analysis and matrix analysis such as linear independence and dependence of vectors, rank etc
- Understand the concepts of limit theory and nth order differential equations and their applications to our daily life
- Able to solve the problems of differentiation of functions of two variables and know about the maximization and minimization of functions of several variables
- Come to know the applications of double and triple integration in finding the area and volume
- Know about qualitative applications of Gauss, Stoke's and Green's theorem
- Use Vector differentiation and integration required in Electro-Magnetics and Wave theory

UNIT I

Complex Numbers: Definition of complex number – Argand Diagram –rectangular form-polar form-Conversion of rectangular form into polar form and vice versa- Addition, subtraction, Multiplication and Division by using polar and Rectangular forms- Applications of Demoivre's theorem – $\cos n\theta$, $\sin n\theta$, $\tan n\theta$ - Expansions of $\cos n\theta$, $\sin n\theta$ – Expressions of $\sin\theta$, $\cos\theta$, $\tan\theta$ in powers of θ (simple problems only)

UNIT II

Vector Calculus :Concepts of vector and scalar fields- the Del operator – Divergence of a vector – Curl of a vector- Laplacian Operator – Gauss' s theorem, Green's theorem.(statements & simple problems only).

UNIT III

Matrices : Different types of matrices – Inverse of a matrix – Solution of simultaneous equations by Inverse matrix method- Unitary and Orthogonal matrices –Its properties. Cayley-Hamilton theorem (Statement only)-Verification.

UNIT IV

Differential Equations: Types of Linear Linear differential equations with constant coefficients – Simultaneous differential equations with constant coefficient.

UNIT V

Numerical Methods: Solving simultaneous equations.-Gauss Elimination method, Gauss Jordan method, Gauss – Seidel Process. Numerical Integration – Trapezoidal Rule, Simpson's

Rule.

TEXT BOOKS

1. A.Singaravelu, 2001, “Engineering Mathematics”, Meenakshi Agency, Chennai.(Unit I – IV)
- 2.Venkataraman M.K., 2001. Numerical methods in science & Engineering, National Publication co. Chennai. (Unit V)

REFERENCES

3. S. Narayanan and T.K. Manicavachagam Pillai. 2002. “ Calculus”, S.V Publications. Chennai.
4. Kandasamy, K. Thilagavathy, K.Gunavathy, 2000, “Numerical Methods”, S.Chand and Company LTD, New Delhi.

15ECU111	PRACTICAL -I ELECTRONIC DEVICES AND CIRCUITS LAB	Semester-I			
		L	T	P	C
		-	-	5	3

COURSE OBJECTIVES

- To identify and test various electronic components
- To use DSO for various measurements
- To plot the characteristics of diode and transistor
- To design and implement feedback amplifier circuits
- To measure the frequency of oscillators.
- To design and test regulated power supplies

COURSE OUTCOMES

- Verify the rectifier circuits using diodes and implement them using hardware
- Design the biasing circuits like self biasing
- Understand the construction, operation and characteristics of FET which can be used in the design of amplifiers
- Design simple circuits
- Know the benefits of feedback in amplifier
- Compare and classify oscillators.

(Any 12 Experiments)

1. Study of CRO and Colour coding of Resistors.
2. Verification of Ohms law
3. Verification of Kirchoffs Law
- 4.Verification of Thevenins Theorem
5. Verification of Superposition Theorem
6. Verification of Maximum Power transfer Theorem
7. VI Characteristics of Junction diode
8. VI Characteristics of Zener diode
9. Clipping and Clamping circuits
- 10.Half wave rectifier and Full wave rectifier.
- 11.Zener diode as Voltage regulator
- 12.RC coupled Amplifier
13. Phase shift Oscillator
14. Transistor characteristics of CE
15. Transistor characteristics of CB

15FCA101	FOUNDATION COURSE – A VALUE EDUCATION	Semester-I			
		L	T	P	C
		2	-	-	1

Instruction Hours/week: L: 2 T: 0 P: 0 Marks: Internal: 100 External: Nil Total: 100

COURSE OBJECTIVES

- To improve the integral development of human beings
- To train the students towards sustainable lifestyle
- To create awareness about the values and their significance and role
- To imbibe the concept of discipline and freedom
- To provide a backdrop for the development of their creative talents
- To give students a deeper understanding about

COURSE OUTCOMES

- Students will understand the importance of value based living
- Students will gain deeper understanding about the purpose of their life
- Students will understand and start applying the essential steps to become good leaders.
- Know about philosophy of life and individual qualities
- To learn and practice social values and responsibilities
- The students fit for the future time and to develop a sense of competitive spirit, co-operation, leadership, diligence, punctuality, and team-spirit

UNIT – I

Concept of Self, self-esteem and self-confidence. Concept of personality, determinants and disorganisation of it. Personality development – meaning.

UNIT – II

Goal setting – meaning and importance; steps in goal setting Manners and Etiquette – meaning need and importance; means to improve. Positive thinking.

UNIT – III

Discipline – meaning. Concept of Roles and Responsibility Time Management – Meaning and steps for effective time management.

UNIT – IV

Interpersonal relationship – meaning and importance; means to improve it. Healthy friendship.

UNIT – V

Family Relationship importance of it; Means to improve. Spirituality – meaning. Its relationship with Altruism, sacrifice, self control, tolerance and truthfulness.

TEXT BOOKS

1. Karpagam Academy of Higher Education, Study Material, 2015.

15SSD101	SOFT SKILL DEVELOPMENT - I	Semester-I			
		L	T	P	C
		2	-	-	-

Instruction Hours / week: L: 2 T: 0 P: 0 Marks: Internal: 100 External: Nil Total: 100

COURSE OBJECTIVES

- To improve the integral development of human beings
- To train the students towards sustainable lifestyle
- To create awareness about the values and their significance and role
- To imbibe the concept of discipline and freedom
- To provide a backdrop for the development of their creative talents
- To give students a deeper understanding about

COURSE OUTCOMES

- Effectively communicate through verbal oral communication
- Improve the listening skills
- Write precise briefs or reports and technical documents
- Actively participate in group discussion, meetings and presentations
- Become more effective individual through goal target setting , self motivation and practicing creative thinking
- To impact knowledge on both Aptitude and Soft skills to the students

UNIT - I

Introduction to Quantitative Aptitude, Speed Maths, Problems on Numbers, Averages, Ratios and Proportions, Problems on Ages

UNIT - II

Number Series, Blood Relation, Image Analysis, Direction Sense, Syllogism, Coding and Decoding

UNIT – III

Percentages, Data Interpretation, Profit and Loss, Simple Interest and Compound Interest

UNIT – IV

Parts of Speech, Tense, Subject Verb Agreement, Active and Passive Voice, Articles, Prepositions

UNIT - V

Conditional Clause, Degrees of Comparison, Goal Setting, Interpersonal Skills

15LSU201	தமிழ் இரண்டாம் தாள்	Semester-I			
		L	T	P	C
		5	-	-	5

கற்பகம்உயர்கல்விகலைக்கழகம்
தமிழ்த்துறை
பகுதி - I தமிழ்ப்பாடத்திட்டம் (2015 - 2016)
இரண்டாம்பருவம்
(இளநிலை அறிவியல் பட்டவகுப்புகளுக்குரியது)
(For I-UG Science Degree Classes) 15LSU201

பாடத்திட்டப்பொதுநோக்கம்

- கற்றல் வழி சிந்தனைத் திறனையும், கருத்து வெளிப்பாட்டுத் திறனையும், மேம்படுத்துதல்.
- ஆய்வுநோக்கைமேம்படுத்துதல்.
- இலக்கியங்கள் உணர்த்தும் வாழ்வின் நுட்பமான பகுதிகளை உணர்த்துதல்.
- மனித மனத்தினைப் பக்குவப்படுத்துதலில் இலக்கியம் தரும் பங்கினை உணர்த்துதல்.
- வளர்ந்து வரும் சமூகத்தில் அறஉணர்வு, பண்பாடு போன்றவை குறித்து அறிவூட்டல்.
- அரசுத் தேர்வுகளுக்கு மாணவர்களை ஆயத்தமாக்குதல்.

பாடத்திட்டப்பயன்விளைவு

- இந்திய குடியுரிமைப் பணி முதலான போட்டித் தேர்வுகளில், விருப்பப்பாடமாக இடம்பெறுகின்ற, 'தமிழ் இலக்கிய வரலாறு' குறித்த முழுமையான அறிமுகம் பெற்றிருத்தல்.
- கல்வெட்டியல், ஓலைச்சுவடியியல் மற்றும் தொல்லியல் சார்ந்த ஆவணத் தேடலுக்குரிய ஆய்வுமனப்பான்மையுடன், இலக்கியங்களை அணுகுதல்.
- தமிழின் வளர்ச்சித்துறையாகிய, 'அறிவியல் தமிழ்' ; 'இணையதமிழ்' குறித்த பன்னோக்கு அணுகுமுறையிலான ஆய்வுச் சிந்தனை மேம்பாடு.
- வேலைவாய்ப்புக்குரிய சுயதிறன் மேம்பாட்டுடன், படைப்பாக்கத்திறன் மேம்பாடும் பெற்றிருத்தல் .
- சமுதாய மற்றும் வாழ்வியல் மதிப்புகளைப் பேணுவதற்குக்கருவியாக இலக்கியங்களை நாடுகின்ற மனப்பான்மை வளர்ச்சி.
- மொழிபெயப்புத்துறை சார்ந்த வேலைவாய்ப்புத் திறன் பெற்றிருத்தல்

அலகு - I : பக்தி இலக்கியம்

1. சைவம் - மூவர் தேவாரத்திலிருந்து தேர்ந்தெடுக்கப்பெற்ற 15 பாடல்கள்
2. வைணவம் - ஆண்டாள் நாச்சியாரின் திருப்பாவையிலிருந்து 11 பாடல்கள்

அலகு - II : சங்கஇலக்கியம்

அ). எட்டுத்தொகை

- நற்றிணை: 1. இலை இல பிடவம், திணை - முல்லை,
ஆசிரியர் - விழிக்கட் பேதைப் பெருங்கண்ணனார்.
2. மடல் மா ஊர்ந்து, திணை - குறிஞ்சி, ஆசிரியர் - மடல் பாடிய மாதங்கீரனார்.

- குறுந்தொகை : 1. உள்ளார் கொல்லோ, திணை - பாலை, ஆசிரியர் - பெருங்கடுங்கோ.
2. யாரினும் இனியன், திணை - மருதம், ஆசிரியர் - வடமவண்ணக்கன் தாமோதரனார்.

- ஐங்குறுநூறு : 1. நுண்ணோர் புருவத்த, திணை - குறிஞ்சி, ஆசிரியர் - கபிலர்.
2. அவறொறுந் தேரை, திணை - முல்லை, ஆசிரியர் - பேயனார்.

பதிற்றுப்பத்து - ததைந்த காஞ்சி, ஆசிரியர் - பாலைக் கௌதமனார்.

பரிபாடல் - வையை - திரை இரும் பனிப் பெளவம், ஆசிரியர் - மையோடக் கோவனார்.

கலித்தொகை - கடும் புனல் கால் பட்டு, திணை - பாலை, ஆசிரியர் - பெருங்கடுங்கோ.

- அகநானூறு - 1. ஆடு அமைக் குயின்ற, திணை - குறிஞ்சி, ஆசிரியர் - கபிலர்.
2. யான் எவன் செய்கோ தோழி, திணை - பாலை, ஆசிரியர் - நோய்பாடியார்.

புறநானூறு - 1. சிறப்பில் சிதடு முறுப்பில், திணை - பொதுவியல்,

ஆசிரியர் - உறையூர் முதுகண்ணன் சாத்தனார்.

2. இளையரு முதியரும் வேறுபுலம் படா - ஆசிரியர் - கயமனார்.

ஆ). பத்துப்பாட்டு - சிறுபாண் ஆற்றுப்படை - கடையெழு வள்ளல்களின் சிறப்பு,

நல்லியக்கோடனின் சிறப்பு, ஈகைத் திறம்.

அலகு - III : காப்பியங்கள்

1. மணிமேகலை - பாத்திரம் பெற்ற காதை - தீவதிலகை, மணிமேகலைக்குச் சொல்லியது,
சிறைக்கோட்டம் அறக்கோட்டமாக்கிய காதை - மணிமேகலை வேண்ட,
மாவண்கிள்ளி, சிறைக்கோட்டத்தை அறக்கோட்டமாக்கியது.

2. கம்பராமாயணம் - இலக்கியநயம் மிக்க, தேர்ந்தெடுக்கப்பெற்ற 41 பாடல்கள்.

அலகு - IV : கட்டுரைகள்

1. திருக்குறளில் மனிதவள மேலாண்மைக் கருத்துக்கள் - திருமிகு ஹரி விஜயலட்சுமி.

2. தமிழர் வளர்த்த நுண்கலைகள்: சிற்பமும் ஓவியமும் - தொ.மு. பாஸ்கரத் தொண்டைமான்.

3. சமயமும் தமிழும் - பேராசிரியர் அ.ச. ஞானசம்பந்தன்.

4. தமிழில் அறிவியல் - ஒரு பார்வை - பேராசிரியர் சிவகுமார்.

5. இன்றைய நெருக்கடிப் பிரச்சனைகள் - நீர்வளம் - முனைவர் ச. முத்துக்குமரன்.

அலகு - V : இலக்கணமும் மொழிப்பயிற்சியும்

1. எழுத்து, சொல், பொருள் இலக்கண எழுத்துப்பயிற்சிகள்

2. பொதுக் கட்டுரைகள்

பாட நூல்: கற்பகச்சோலை - தமிழ் ஏடு. கற்பகம் பல்கலைக்கழகத் தமிழ்த் துறை வெளியீடு.

15ENU201	ENGLISH - II	Semester-II			
		L	T	P	C
		4	-	-	4

Course Objectives:

- To enable the learners to acquire English language skills through literature.
- To familiarize them with English literature.
- To acquire Grammar knowledge.
- To help learners imbibe cultural values.
- To acquire skill of making correct sentences.
- To reflect originality on the application of soft skills and express in writing their views.

Course Outcomes:

- Learn to enjoy the ecstasy of literature.
- The select literary pieces will develop the confidence level of the learners.
- To get the social values.
- To know the importance of communication
- Get sound knowledge in English
- Trained to communicate well for business purpose.

UNIT I:

Prose: The Unexpected- Robert Lynd

Poetry: The Village Schoolmaster – Oliver Goldsmith

Short Story: The Lion's Share – Arnold Bennett

Vocabulary: Homonyms

Grammar: Irregular Verbs

UNIT II:

Prose: Travel by Train – J. B. Priestly

Poetry: The Gift of India – Sarojini Naidu

Grammar: Sentence patterns

Composition: Reading Comprehension

UNIT III:

Prose: Women's Education is Almost More Important than the Education of Boys and Men – Indira Gandhi

Short Story: The Necklace – Guy De Maupassant

One-Act Play: The Referee – W.H. Andrews and Geoffrey Dearmer

Vocabulary: Similes

Grammar: Discourse Markers

Composition: Report Writing

UNIT IV:

Poetry: Ozymandias – P.B. Shelley

One-Act Play: The Pot of Broth- W.B. Yeats

Vocabulary: Collective Nouns

Grammar: Correction of Sentences

Composition: Picture Reading

UNIT V:

Short Story: The Silver Butterfly– Pearl S. Buck

One-Act Play: The Bear – Anton Chekov

Vocabulary: Acronyms

Grammar: Question Tags

Composition: Drafting Advertisement

15ECU201	DIGITAL ELECTRONICS	Semester-II			
		L	T	P	C
		5	1	-	6

COURSE OBJECTIVES

- To enable the students to represent numerical values in various number systems and perform number conversions between different number systems.
- To analyze and design digital combinational circuits like decoders, encoders, multiplexers, and de-multiplexers including arithmetic circuits (half adder, full adder, multiplier).
- To design sequential digital circuits like flip-flops, registers and counters.
- To acquaint the students with the fundamental principles of two-valued logic and various devices used to implement logical operations on variables.
- To lay the foundation for further studies in areas such as communication, computer, microprocessor.
- To understand number representation and conversion between different representation in digital electronic circuits.

COURSE OUTCOMES

- Use the basic logic gates and various reduction techniques of digital logic circuit in detail.
- Design combinational and sequential circuits.
- Design and implement hardware circuit to test performance and application.
- Implement combinational and sequential circuits
- Classify different semiconductor memories
- Analyze, design and implement sequential logic circuits

UNIT I -Number Systems & Boolean Algebra

Review of Binary, Octal, & Hexadecimal and Decimal number systems-Representation of Signed Numbers-Floating point number representation-BCD-ASCII-EBCDIC-Excess 3 codes Gray code-Error Detecting & Correcting Codes. Boolean Algebra: Postulates & Theorems of Boolean Algebra –Canonical Forms –Simplification of Logic Functions using Karnaugh map.

UNIT II- Combinational Logic Design

Logic gates –Implementation of Combinational Logic Functions – Encoders & Decoders –Multiplexers & Demultiplexers –Code Converters – Comparator - Half Adder, Full Adder – Parallel Adder – Binary Adder – Parity Generator/Checker – Implementation of Logical Functions using Multiplexers.

UNIT III -Counters &Registers

RS, JK, JK Master–slave, D&T flip flops – Level Triggering and Edge Triggering – excitation tables –Asynchronous & Synchronous Counters – Modulus Counters–Shift Register – Johnson Counter- Ring Counter – State Diagram-State Table

UNIT IV-D/A, D/A Converter and Memories

Digital to Analog Converter: Resistive Divider type and Ladder type – Accuracy and Resolution - Analog to Digital Converter: Counters - Ramp type - Simultaneous Conversion – Dual slope type – Successive Approximation type – Memories and their types.

UNIT V-Logic Families and Programmable Logic Devices

Logic Families: RTL, DTL, TTL families, Schottky– Clamped TTL, Emitter Coupled (ECL), MOS Inverters, CMOS Inverters, Comparison of performance of Various Logic families. Introduction to PLD's – PAL – PLA

TEXT BOOKS

1. Digital Electronics and its principles, Salilvahanan, McGraw Hill Education (India) Private Limited, 2014, Tenth Edition.
2. Digital Principles and Application, Albert Paul Malvino, Donald P. Leach and Goutam Saha, Tata McGraw Hill, Seventh Edition 2010.
3. Digital Design: With an Introduction to Verilog HDL, Morris Mano, Pearson Education, Fifth Edition, 2013.

REFERENCES

1. Modern Digital Electronics, Jain R.P, Tata McGraw Hill Company, Fourth Edition, 2012.
2. Integrated Circuits, Botkar K.R, Khanna Publications, 2008, Third Edition.

15ECU202	ALLIED MATHEMATICS – II	Semester-I			
		L	T	P	C
		4	2	-	4

- This course provides a deep knowledge to the learners to understand the basic concepts of Matrices, Sequences, Complex Variable, Complex Function, First Order Ordinary Differential Equations, Power series method
- To provide students with mathematics fundamentals necessary to formulate, solve and analyses complex engineering problems.
- To prepare student to apply reasoning informed by the contextual knowledge to engineering practice.
- To build the strong foundation in Mathematics of students needed for the field of electronics and Telecommunication Engineering
- Linear differential equations of higher order using analytical methods and numerical methods applicable to Control systems and Network analysis.
- Vector differentiation and integration required in Electro-Magnetics and Wave theory.

COURSE OUTCOMES

- Gain a clear knowledge about the necessity, properties and applications of Fourier series, Fourier Transform, Laplace Transform and the concept of Statistics and the usage of them
- Able to solve qualitative problems based on vector analysis and matrix analysis such as linear independence and dependence of vectors, rank etc
- Understand the concepts of limit theory and nth order differential equations and their applications to our daily life
- Able to solve the problems of differentiation of functions of two variables and know about the maximization and minimization of functions of several variables
- Know about qualitative applications of Gauss, Stoke's and Green's theorem
- Use Vector differentiation and integration required in Electro-Magnetics and Wave theory

UNIT I

Fourier series – Definition – Finding Fourier coefficients for a given periodic function with period 2π – Odd and Even functions – Half Range Series.

UNIT II

Definition of Fourier Transform - Properties of Fourier Transform - Inverse Fourier transform - Convolution theorem - Finite Fourier Sine & Cosine Transform – Parseval's theorem.

UNIT III

Definition of Laplace Transform - Properties of Laplace Transform, Inverse Laplace Transform. Application of Laplace Transform.

UNIT IV

Measures of central tendency – Arithmetic Mean, Median, Mode. Measures of dispersion – Range, Standard deviation and Coefficient of variation.

UNIT V

Probability : Concept of Probability - Addition theorem – Multiplication theorem- Binomial distribution, Poisson Distribution & Normal distribution (No derivations) and simple problems.

TEXT BOOKS

1. T.K.Manicavachagom Pillay, 1996, "Calculus Vol II", S. Viswanathan (Printers and

- Publishers), PVT., LTD. (Unit I – III).
2. R.S.N.Pillai, V.Bagavathi, 2002, “Statistics”, S. Chand & Company Ltd, New Delhi. (Unit IV and V).

REFERENCES

2. M.K.Venkataraman. 2001. “Engineering Mathematics Vol. II”. National Publishing Company. Chennai.
3. P.Kandasamy, K.Thilagavathy, K.Gunavathy, 2007, “Engineering Mathematics Vol. III”, S. Chand & Company Ltd, New Delhi.

15ECU211	PRACTICAL II - DIGITAL ELECTRONICS LAB	Semester-II			
		L	T	P	C
		-	-	5	3

COURSE OBJECTIVES

- Learn and understand the basics of digital electronics, Boolean algebra, and able to design the simple logic circuits and test/verify the functionality of the logic circuits
- Provide hands-on experience in digital circuits, which can be constructed by using standard integrated circuits (ICs)
- Investigate the operation of several digital circuits combinational and sequential
- To model complex digital systems at several level of abstractions; behavioral and structural, synthesis and rapid system prototyping.
- To develop and simulate register-level models of hierarchical digital systems
- To design and model complex digital system independently or in a team

COURSE OUTCOMES

- Identify the various digital ICs and understand their operation.
- Apply Boolean laws and K-map to simplify the digital circuits
- Understand the function of elementary digital circuits under real and simulated environment
- Describe and explain the operation of fundamental digital gates
- Analyze the operation of a flip-flop and examine relevant timing diagrams
- Analyze the operation of counters and shift registers

(Any 12 Experiments)

1. Realization of logic gates using diodes and transistors
2. Verification of Logic Gates using IC
3. Realization of logic gates using universal gates
4. Code converters
5. Realization of Multiplexer using basic gates
6. Encoder and Decoder
7. Realization Half and Full adders
8. Realization of Subtractor
9. Realization of Parity generator
10. Flip-Flop Circuit
11. 4 bit Binary adder
12. Ring Counters
13. A/D converter
14. D/A converter
15. Comparator

15FCB201	FOUNDATION COURSE – B ENVIRONMENTAL STUDIES	Semester-I			
		L	T	P	C
		2	-	-	1

COURSE OBJECTIVES

- Creating the awareness about environmental problems among people.
- Developing an attitude of concern for the environment.
- Motivating public to participate in environment protection and improvement.
- Recognize the interconnectedness of multiple factors in environmental challenges
- Engage constructively with diverse forms of knowledge and experience
- Recognize and apply methodological approaches of the social sciences, natural sciences, and humanities

COURSE OUTCOMES

- Understand key concepts in the life and physical sciences and will apply them to environmental issues
- Apply knowledge of the sciences within an interdisciplinary context in solving environmental issues such as environmental health, food and agriculture, energy, waste and pollution, and loss of biodiversity.
- Possess the intellectual flexibility necessary to view environmental questions from multiple perspectives, prepared to alter their understanding as they learn new ways of understanding.
- Solve problems systematically, creatively, and reflexively, ready to assemble knowledge and formulate strategy
- Identify, interpret, and apply basic measures (metrics and formulae) of social system variables to assess socio-environmental conditions.
- Analyze and evaluate ideological and philosophical approaches used to understand environmental relationships

NIT - I: Eco system and natural resources: Environment – Definition – components - Ecosystem -Definition, Concept, Scope, importance, structure and functions of ecosystem. Energy flow, Ecological succession. Food chains and food webs. Classification of ecosystem. Natural resources: Forest resources; water resources

UNIT - II: Environmental pollution: Cause, effects and control measures of Air pollution, water pollution, soil pollution, marine pollution, noise pollution, thermal pollution and nuclear hazards pollution. Solid waste management.

UNIT - III: Biodiversity and its conservation: Introduction- Definition, genetic, species and ecosystem diversity, biogeographical classification of India- Value of biodiversity: Consumptive, productive uses; social, ethical, aesthetic and option values. Threats to biodiversity: habitat loss, poaching of wildlife, man-wildlife conflicts.

UNIT - IV: Social issues and the environment: Urban problems related to energy- water conservation and management -Rain water harvesting- water shed management. Resettlement and Rehabilisaion. Natural resources and associated problems and sustainable utilization. Environmental Education.

UNIT - V: Environment ethics: Environmental Ethics - Gender equity, ethical basis of environment education and awareness, conservation ethic and traditional value systems of India. Valuing nature, cultures, social justice, Human heritage, equitable use of resources, preserving resources for future generation, common property resources, Ecology and its uses and its degradation, Introduction to Environmental Protection Act (EPA).

TEXT BOOKS

1. Agarwal, K.M., P.K. Sikdar and S.C. Deb, 2002. A Text Book of Environment, Mac Millan India Ltd, Kolkatta, India.
2. Kotwal, P.C. and S. Banerjee, 2002. Biodiversity Conservation – In Managed forest and protected areas, Agrobios, India.

REFERENCES

15ENU301	ENGLISH - III	Semester-III			
		L	T	P	C
		4	-	-	4

Course Objectives

- To develop confidence to respond in English during situations where the use of English is imperative.
- To develop fluency in actual conversation in the English language.
- To develop speech skills necessary for confident and intelligent participations in Group Discussions and develop skills related to teamwork in work places.
- To develop confidence to respond in English during situations where the use of English is imperative.
- To develop fluency in actual conversation in the English language.
- To develop knowledge about business communication.

Course Outcomes (COs)

- Students learnt the basics and purposes of listening skill.
- Students understand importance of speaking.
- Students developed the speaking skills on telephone, business and also in travel
- Learnt some effective vocabulary learning strategies.
- Students will able to communicate clearly and effectively and handle their day to day affairs well with their knowledge of language skills.

UNIT I

Listening: Listening comprehension – Listening for Specific Information –Note Taking – Interpreting Charts and Diagrams.

UNIT II

Speaking: Essentials of effective communication – Greeting and Introducing – Making requests – Asking for permission – Giving and Denying Permission – Offering and Accepting Help – Asking for and Declining Help – Giving Instructions and Orders - Talking about likes and dislikes.

Telephone Skills – Understanding telephone conversation – handling calls – leaving messages – making requests - giving instructions and orders

Discussion Skills – Giving your opinion – agreeing and disagreeing – Making suggestions – Interrupting – questioning – reporting – Dealing with questions.
(Completing dialogues)

UNIT III

Reading: Reading – Reading with a purpose –Skimming and Scanning – locating main points – reading critically – Sequencing of sentences – Reading comprehension.

UNIT IV

Writing: Paragraph Writing – Descriptive and Narrative. Safety Instructions/ Suggestions. Expansion of Abbreviations – Spellings- Report writing.

Translation- Translating short sentences and passages from English to Tamil and from Tamil to English.

UNIT V

Vocabulary: Improve English vocabulary: Synonyms – Antonyms – Prefixes – Suffixes – Idioms – Collocations – Different types of English – British and American (Choose the best answer type from a database of 50 words each for each topic)

Functional Grammar: Forming questions, getting answers – Articles – Parts of Speech – Punctuation – Common mistakes in English (Homophones)(Exercise based)

REFERENCES

2. Study Speaking: A course in Spoken English for Academic Purpose: Kenneth Anderson, Joan MacLean and Tony Lynch, Cambridge University Press, 2008.
3. Spoken English Part I & II (for Tamil speakers), Orient Longman Pvt. Ltd.
4. Dr. J. John Love Joy, Dr. Francis M. Peter S.J. "Let's Communicate – Basic English for Everyone", Vaigarai Publications, First Edition, Dindigul 2007.

15ECU301	PRINCIPLES OF COMMUNICATION SYSTEMS	Semester-III			
		L	T	P	C
		3	1	-	4

COURSE OBJECTIVES

- To learn the designing procedure and operation of circuits used for communication.
- To understand the basic concepts of AM, FM, and PM transmission and reception.
- To assess and evaluate different modulation and demodulation techniques.
- To evaluate the influence of noise on communications signals.
- To introduce students to various modulation and demodulation techniques of analog communication
- To analyze different parameters of analog communication techniques

COURSE OUTCOMES

- Apply or a create suitable algorithm to solve a particular problem
- Understand and identify the fundamental concepts and various components of analog communication systems
- Explain signal to noise ratio, noise figure and noise temperature for single and cascaded stages in a communication system.
- Describe analog pulse modulation techniques and digital modulation technique
- Develop the ability to compare and contrast the strengths and weaknesses of various communication systems.
- Use of different modulation and demodulation techniques used in analog communication

UNIT I -Modulation Techniques

Introduction to Communication Systems – Information – Transmitter – Channel – Noise –Receiver – Need for Modulation Band Width requirement – Amplitude Modulation: AM Theory– Frequency spectrum of AM wave – Representation of AM – Power relations in AM wave –AM Transmitter block diagram – Frequency modulation: System description – Mathematical representation – Frequency Spectrum – Generation of FM – Direct and Indirect methods.

UNIT II - Wave Propagation

EM Waves – Free Space Propagation – Surface Wave Propagation – Sky Wave Propagation – Space Wave Propagation – Tropospheric Scatter Propagation – Structure of Atmosphere – Virtual height – MUF – LUF – Skip Distance – Ionospheric abnormalities- Duct Propagation

UNIT III -Antenna Theory

Electro Magnetic radiations – Elementary doublet – Current and Voltage Distribution – Resonant antennas, Radiation patterns and Length calculations – Non resonant antennas – Antenna gain and Effective radiated power – Antenna resistance – Bandwidth, Beam width and Polarization – Grounded and Ungrounded antennas – Impedance matching – Dipole Arrays - Yagi Uda antenna – Parabolic antenna – Horn and Lens antenna .

UNIT IV- Receiver

Introduction – Super heterodyne Receiver – Choice of IF and Oscillator Frequencies – Image Rejection – Adjacent Channel Selectivity – Spurious Response - Tracking – AGC – Double conversion receiver

UNIT V - Modulation Types Analog & Digital Modulation

Introduction to PAM, PPM, PWM and PCM-Binary Phase Shift Keying - differential phase shift keying – differentially encoded PSK - Quadrature Phase Shift Keying – Quadrature amplitude shift keying – Binary frequency shift keying.

TEXT BOOKS

1. Electronic Communication Systems, Kennedy and Davis, Tata McGraw Hill, Fifth Edition, 2012.
2. Electronic Communications, Dennis Roddy and John Coolen, Pearson Education, Fourth Edition, 2008.
- 3 Antenna Wave Propagation, K.D. Prasad and Satyaprakahan, Pearson Education, Indian Reprint, Fourth Edition, 2012.

REFERENCES

15ECU302	LINEAR INTEGRATED CIRCUITS	Semester-III			
		L	T	P	C
		4	1	-	5

COURSE OBJECTIVES

- To develop an in-depth knowledge on IC fabrication technology
- To understand the basic concepts of operational amplifier and its various applications
- To understand the basics of PLL and its practical applications
- To know about analog multipliers
- To know about various analog switches and different A/D and D/A convertors
- To understand the concepts of switched capacitor filters, Voltage regulator and various amplifiers

COURSE OUTCOMES

- Learn about the basic concepts for the circuit configuration for the design of linear integrated circuits and develops skill to solve engineering problems
- Develop skills to design simple circuits using OP-AMP
- Gain knowledge about various multiplier circuits, modulators and demodulators
- Gain knowledge about PLL
- Learn about various techniques to develop A/D and D/A convertors
- Develop skills to develop simple filter circuits and various amplifiers and can solve problems related to it.

UNIT I - IC Fabrication Technology

Introduction to Integrated Circuit Fabrication – Classification – Integrated Circuit chip size and circuit complexity - Fundamentals of Monolithic Integrated Circuit technology –Basic planar process –Fabrication of a Typical circuit – Active and Passive Components Integrated Circuits - Thin and Thick film technology – Technology Trends

UNIT II - Operational Amplifier

Introduction to Operational Amplifiers – Parameters of Operational Amplifiers – Inverting and Non-Inverting amplifier– Summing Amplifier – Differential Amplifier – Integrator – Differentiator – Instrumentation Amplifier – Voltage to Current Converter –Current to Voltage Converter – Frequency to Voltage and Voltage to Frequency Converter –Wein bridge and RC Phase Shift Oscillator – Collpitts Oscillator –Triangular and Square waveform Generators - Multivibrators.

UNIT III - Comparators and Filters

Introduction to Comparator – Symbol and Characteristics – Effect of Positive Feedback – Difference between Op-amp and Comparator – Voltage Level Detector – Zero Crossing Detector - Schmitt trigger – Level Detector – Window and Peak Detectors – Sample and Hold Circuits.-Active Filters: LPF, HPF, BPF and BRN using Op-Amp.

UNIT IV - Voltage Regulator

Introduction – Series OP-AMP Regulator – IC voltage regulators – Fixed voltage series regulator – Fixed regulator using as adjustable regulator - Block schematic of regulator IC 723 - Regulated power supply using IC 723 - Switching Regulator – Regulator using 78xx, 79xx, and LM 317.

UNIT V - Timer and PLL

Introduction to Timer- Description of Functional block diagram of 555 timer – Monostable operation – Applications: – Linear ramp generator – Pulse width modulator – Frequency Divider - Astable operation – Applications: Schmitt trigger –Pulse Position Modulator - FSK Generator Introduction to Phase locked loop –Basic Principles –VCO

TEXT BOOKS

1. Linear Integrated Circuits, Roy Choudhury. D, Shail Jain, New Age International Ltd, Fourth Edition, 2014.
2. Linear Integrated Circuits, Salivahanan, Tata Mc-Graw Hill Publications, Fourth Edition, 2008.

REFERENCES

1. Integrated Circuits, Botkar K.R, Khanna Publications, 2008.
2. Linear Integrated Circuits, J.S.Chitode, Pune Technical Publications, Sixth Edition,2010.

15ECU311	PRACTICAL – III COMMUNICATION LAB	Semester-III			
		L	T	P	C
		-	-	4	2

COURSE OBJECTIVES

- Convert analog signals to digital format and describe Pulse and digital Modulation techniques
- To introduce students to various modulation and demodulation techniques of analog communication.
- To analyze different parameters of analog communication techniques
- It also focuses on pulse modulation and demodulation
- To understand the concept in communication system to use it in solving the global complex problems.
- Evaluate the performance levels (Signal-to-Noise Ratio) of AM, FM and PM systems in the presence of additive white noise.

COURSE OUTCOMES

- Able to identify and describe different analog modulation techniques.
- Able to understand basic theories of Digital communication system in practical
- Able to design and implement different modulation and demodulation techniques
- Able to analyze digital modulation techniques by using various tools.
- Able to identify and describe different techniques in modern digital communications, in particular in source coding using various tools
- Implement different types of Amplitude, Frequency, Phase and Pulse modulation and demodulation schemes

(Any 10 Experiments)

1. AM Modulation and Demodulation
2. FM Modulation and Demodulation
3. Pulse Amplitude Modulation and Detection
4. Pulse Width Modulation and Detection.
5. Pulse Position Modulation and Detection
6. Pulse Code Modulation and Detection
7. Amplitude Shift Keying and Detection
8. Frequency Shift Keying and Detection
9. Audio Amplifier using TBA 810.
10. IF Amplifier
11. Study of Yagi uda Antenna
12. IF amplifier

15ECU312	PRACTICAL – IV LINEAR INTEGRATED CIRCUITS LAB	Semester-III			
		L	T	P	C
		-	-	4	2

COURSE OBJECTIVES

- To Gain the practical hands-on experience on 741 Op-Amp applications
- To understand the basic concepts of operational amplifier and its various applications
- To Gain the practical hands-on experience on 555 Timer applications.
- To Gain the practical hands-on experience on Voltage Regulator and Three terminal voltage regulators
- To know about various analog switches and different A/D and D/A convertors
- To understand the concepts of switched capacitor filters, Voltage regulator and various Amplifiers

COURSE OUTCOMES

- Learn about the basic concepts for the circuit configuration for the design of linear integrated circuits and develops skill to solve engineering problems
- Develop skills to design simple circuits using OP-AMP
- Able to utilize items such as decibels, Bode plots, and negative feedback for circuit analysis.
- Gain knowledge about various multiplier circuits, modulators and demodulators
- Gain knowledge about PL
- Develop skills to develop simple filter circuits and various amplifiers and can solve problems related to it.

(Any 10 Experiments)

1. Op-amp: Adder and Subtractor
2. Op-amp: Integrator and Differentiator
3. Op-amp: Schmitt trigger
4. Voltage to Current Converter and Current to Voltage Converter
5. Instrumentation Amplifier
6. Low Pass and High Pass Filters using Op-amp
7. Square and Triangular wave Generator
8. Astable multivibrator using 555
9. Monostable multivibrator using 555
10. Regulated power supply using IC 723
11. VCO using IC 555.
12. Function Generator using 8038

15ECU303A	OFFICE AUTOMATION	Semester-III			
		L	T	P	C
		4	-	-	4

COURSE OBJECTIVES

- Amplifiers Learn about the basic concepts for the circuit configuration for the design of linear integrated circuits and develops skill to solve engineering problems
- Exchange of Information
- Management of Administrative Documents
- Handling of Numerical Data
- Meeting Planning and Management of Work Schedules
- Introduce the students into the various aspect of office automation from primitive method employed in the office in carrying out daily system of office management to the modern day in- office automated system

COURSE OUTCOMES

- Learn about the basic concepts for the circuit configuration for the design of linear integrated circuits and develops skill to solve engineering problems
- Working with Lists, Databases and Pivot tables
- Creating Worksheet Charts
- Analyze business data
- Formatting Forms and Reports
- Setting-Up and Publishing the slide show

UNIT I

Getting started with MS-Word - Entering and Editing Text in a word document - Formatting a word document - Customizing Styles and Templates - Arranging text in Columns and Lists - Using Word's Proofing tools - Designing pages.

UNIT II

Working with Word in Workgroups - Writing Long Documents - Using word to Automate Mailing. Menus – Tables – Windows.

UNIT III

MS-Excel: Building a Worksheet - Editing a Worksheet - Formatting a Worksheet - Using Workbooks to organize information - Customizing Excel to work the way you do - Using formulas and functions to crunch numbers - Creating Worksheet Charts -Working with Lists, Databases and Pivot tables - Analyzing business data - Using Excel to publish to the Web.

UNIT IV

Getting started using MS-PowerPoint - Entering and Editing Text - Formatting text - Inserting Tables, Graphics, and Drawings - Adding special effects and Internet Links - Perfecting your presentation – Setting-Up and Publishing the slide show -Running the slide show.

UNIT V

MS-Access: Understanding Data basics - Creating tables and relationships - Using datasheets to enter and view data - Using Forms to enter and view data – Using Queries to get answer - Using Wizards to generate reports - Formatting Forms and Reports.

TEXT BOOK

1. Running Microsoft Office2000, Halvorson. M and Young. M. First Edition, Washington: Microsoft Press, 1999.

REFERENCES

1. Taxali. R.K. PC Software for Windows Made Simple. 6th Edition, New Delhi: Tata McGraw Hill, 2000.

15ECU303B	C PROGRAMMING	Semester-III			
		L	T	P	C
		4	-	-	4

COURSE OBJECTIVES

- To understand various features in C
- To help students to understand the implementation of C language
- To gain experience about structured programming
- To help students to understand the implementation of C language
- To understand various features in C
- To understand the fundamental algorithms such as searching, and sorting

COURSE OUTCOMES

- Analyze unstructured problems and design computer solutions
- Apply or a create suitable algorithm to solve a particular problem
- An ability to apply knowledge of computing and mathematics appropriate to the discipline
- An ability to analyze a problem and identify the computing requirements appropriate for its solution
- An ability to design, implement, and evaluate a computer-based system, process, component, or program to meet desired needs, and use current techniques
- Able to design and analyze the time and space efficiency of the data structure

UNIT-I - Programming and Problem Solving

Introduction to Computer based Problem Solving- Problem definition – Problem Solving- goals and objectives – problem identification and definitions. Algorithms for Problem definition – Program design and Implementation issues. Programming Environment – Computer Programming Languages – Types of Programming Languages – Compilers – interpreters.

Construct algorithms for the following: Addition and Multiplication of Two numbers – Check for Odd or Even numbers – Check for Prime numbers – Summation of Set of Numbers.

UNIT-II - Introduction to C

Introduction - An Overview of C – Keywords and Identifier – Variables - Declarations of Variables - User Defined Type Declarations - Typedef – Enum - Constants – Data Types – Operators – Expressions - C Formatted I/O Operations. Decision Making and Branching Statements – Decision Making and Looping Statements - Arrays-Strings - String Handling Functions.

UNIT-III - Functions, Structures and Union

Functions - Introduction - Definition of Functions - Function Declaration - Category of Functions - Nesting of Functions – Recursion - Passing Arrays to Function. Structures and Unions – Introduction - Defining a Structure - Declaring Structure Variables - Accessing Structure Members - Arrays of Structure – Unions.

UNIT-IV - Pointers

Pointers – Introduction – Declaring Pointer Variables - Pointer and Arrays - Pointers and Strings – Array of Pointers - Functions and Pointers - Function Returning Pointers -Pointers to functions - Pointers and Structures

UNIT-V - File Management

File Management in C – Introduction - Opening a File - Closing a file – Input/output operations on files - Error handling during I/O Operations - Random Access to Files - Command Line Arguments.

15ECU303C	VISUAL PROGRAMMING	Semester-III			
		L	T	P	C
		4	-	-	4

COURSE OBJECTIVES

- To have a fundamental understanding of Language Basics, Programming Fundamental and OOP's Concepts
- Understanding the platform; Determinism and concurrency; Handling input and output securely; Safe error handling and logging; Engineering for security features; Software security in operations.
- Grasp the fundamentals of a programming language
- To know the basic differences between programming languages Program logics and different platforms to build effective software
- To Choose the architecture based on the problem to be solved
- To build, compile, and execute a VB program

COURSE OUTCOMES

- Students list the Visual Programming concepts
- Express constraints and arithmetic operations
- Knowledge on program logics and different platforms to build effective software Analyze unstructured problems and design computer solutions
- Apply or a create suitable algorithm to solve a particular problem
- Choose the architecture based on the problem to be solved
- Distinguish and compose events and methods

UNIT I

Introduction to Windows and visual basic - customizing forms - properties window - tool box - creating controls - name property - properties of command button - event procedures for command button - access keys - image controls - text boxes – labels - message boxes - grid.

UNIT II

Statements– variables – data types – strings – operator – constants - determinate & indeterminate loops –conditionals - built in functions - string function - numeric function - date & time function - financial function.

Function procedures - sub procedures – arrays - control arrays- - adding & removing controls in control array-using arrays with function and procedures.

UNIT III

Intrinsic controls : Pointer , Label , Frame , Checkbox, Combo box, Hscroll Bar, Timer, DirListbox , Shape , Image OLE, Picture Box. List box, Text box, Command button, Option button, Vscrollbar, Drive List box, Line controls usage and properties.Tree View Control – List View Controls.

UNIT IV

Project with multiple forms - MDI forms - list box - combo box - option button - check box - scroll bars – timers - menu editor - line & shape control - creating objects - building classes.

UNIT V

DDE – Methods, Properties, Events – Database Programming: Data Tools – DAO, ADO, OLEDB and RDO Data base Connections – ActiveX commands.

- To have a fundamental understanding of Language Basics, Programming Fundamental and OOP's Concepts
- Understanding the platform; Determinism and concurrency; Handling input and output securely; Safe error handling and logging; Engineering for security features; Software security in operations.
- Grasp the fundamentals of a programming language
- To know the basic differences between programming languages Program logics and different platforms to build effective software
- To Choose the architecture based on the problem to be solved
- To build, compile, and execute a VB program

COURSE OUTCOMES

- Students list the Visual Programming concepts
- Express constraints and arithmetic operations
- Knowledge on program logics and different platforms to build effective software Analyze unstructured problems and design computer solutions
- Apply or a create suitable algorithm to solve a particular problem
- Choose the architecture based on the problem to be solved
- Distinguish and compose events and methods

(Any 10 Programs)

MS-WORD

1. Type a paragraph and perform the following.
 - Change the font size
 - Bold, italics, underline
 - Line spacing
 - Changing of background color and text color
 - Inserting footer and header
 - Alignment – left, right, justified, center
2. Type a document and perform the following operations.
 - Change the text into THREE columns
 - Check spelling and grammar
 - Bullets and numbering list items
 - Find and replace
3. Prepare the department timetable using MS-Word.
4. Prepare the job application letter enclosing your Bio-data.
5. Using Mail Merge to prepare an interview calls letter.

MS-EXCEL

6. To link an Excel worksheet into a word document using Object.

7. An excel worksheet contains monthly sales details of five companies. Find the monthly and quarterly average sales of each company.
8. Draw a line chart showing the sales turnover of five different companies over a period of ten years.
9. Draw a pie chart showing particular class student semester result.

MS-ACCESS

10. Create a database and maintain the address of your classmates with the following constraints.
 - Roll number should be the primary key.
 - Names should not be empty
 - Maintain at least 10 records.
 - Recall information according to place, city.
11. Create an item table with the following structure.
Item number, Item name, Quantity, Net price.
 - Find the net price for all records.
 - Display only the item number, item name for net price > 10000
 - To increase the rate by 10% for all records.
 - Display all the details for item name = “nut” and quantity >10.

POWER POINT

12. Prepare a power point presentation with atleast three slides for Department Inaugural Function.
13. Draw an organization chart with minimum three hierarchical slides.
14. Design an advertisement campaign with minimum three slides.

15ECU313 B	C PROGRAMMING LAB	Semester-III			
		L	T	P	C
		3	-	-	2

COURSE OBJECTIVES

- To make the student learn a programming language and to understand various features in C
- To develop skills to design and analyze simple linear and non linear data structures
- To learn problem solving techniques.
- To write programs in C and to solve the problems.
- Gain knowledge in practical applications of data structures
- Analyze unstructured problems and design computer solutions

COURSE OUTCOMES

- Able to design and analyze the time and space efficiency of the data structure
- Be capable to identify the appropriate data structure for given problem
- Read, understand and trace the execution of programs written in C language
- Write the C code for a given algorithm
- Implement Programs with pointers and arrays, perform pointer arithmetic, and use the pre-processor.
- Write programs that perform operations using derived data types.

(Any 10 Programs)

1. Write a program to find factorial of a given number using recursive and non recursive
2. Write a program to generate Fibonacci series.
3. Write a program to print Multiplication table using for and Do While Loops
4. Write a program to find Maximum number without using arrays
5. Write a program to convert a given number into words
6. Write a program
 - (i) to find the length of a string
 - (ii) concatenation of two strings
7. Write a program to reverse the given string
8. Write a program to count the vowels in a given sentence
9. Write a program to check the given string is palindrome or not
10. Write a program to perform matrix multiplication
11. Using any one sorting method to sort given 'n' numbers using pointers.
12. Write a program to prepare an employee pay slip using structures
13. Write a program for Electricity Bill Preparation using files
14. Write a program for the Odd and even numbers are stored in separate files the original files.

15ECU313 C	VISUAL PROGRAMMING LAB	Semester-III			
		L	T	P	C
		3	-	-	2

COURSE OBJECTIVES

- To have a fundamental understanding of Language Basics, Programming Fundamental and OOP's Concepts
- Understanding the platform; Determinism and concurrency; Handling input and output securely; Safe error handling and logging; Engineering for security features; Software security in operations.
- Grasp the fundamentals of a programming language
- To know the basic differences between programming languages Program logics and different platforms to build effective software
- To Choose the architecture based on the problem to be solved
- To build, compile, and execute a VB program

COURSE OUTCOMES

- Students list the Visual Programming concepts
- Express constraints and arithmetic operations
- Knowledge on program logics and different platforms to build effective software Analyze unstructured problems and design computer solutions
- Apply or a create suitable algorithm to solve a particular problem
- Choose the architecture based on the problem to be solved
- Distinguish and compose events and methods

(Any 10 Programs)

1. Write a program to convert the number entered by the user to its equivalent decimal, octal, and hexadecimal
2. Write a program to perform arithmetic operations getting input from the user through input box.
3. Write a program to perform geometrical calculations
4. Write a program to accept user name and age .if age is greater than 18 displays “eligible to vote”, else display how many years he has to wait to vote.
5. Write a program to check whether accepted string is palindrome or not.
6. Write a program to calculate the simple interest and compound interest
7. Write a program to calculate the total marks of student and print grade.
8. Write a program to perform string operations.
9. Write a program to add, remove, clear item from the list box.
10. Write a calculator program to perform arithmetic operations.
11. Write a program to create menu bar with title color and size. color menu allows selection of color from menu and fills program with the selected color. color menu has menu items fill color and exit. when fill color menu is clicked another menu should popup with list of colors. size menu contains menu item small and large. when small & large is clicked form should be minimized and maximized.
12. Write a program to illustrate the drag and drop operations of mouse.

15SSD301	SOFT SKILL DEVELOPMENT - II	Semester-III			
		L	T	P	C
		2	-	-	1

Instruction Hours / week: L: 2 T: 0 P: 0 Marks: Internal: 100 External: Nil Total: 100

COURSE OBJECTIVES

- To impart knowledge on both Aptitude and Soft skills to the students
- To critically evaluate and demonstrate various principles involved in solving mathematical problems and to adopt new and faster methods of calculations.
- Reinforcing competencies in soft skills which are crucial in a social setting
- To train the students towards sustainable lifestyle
- To create awareness about the values and their significance and role
- To achieve the analytical and reasoning competencies and to improve their communication and presentation skills

COURSE OUTCOMES

- Effectively communicate through verbal oral communication
- Improve the listening skills
- Write precise briefs or reports and technical documents
- Actively participate in group discussion, meetings and presentations
- Become more effective individual through goal target setting , self motivation and practicing creative thinking
- To impart knowledge on both Aptitude and Soft skills to the students

UNIT - I

Time, Speed and Distance, Time and Work, Pipes and Cisterns, Geometry, Data Arrangement

UNIT – II

Analogy, Logic based Venn diagram, Probability, Permutation and Combination, Logarithms

UNIT – III

Data Sufficiency, Clocks, Calendar, Reading Comprehension, Sentence Correction, Sentence Completion, Spotting the Errors, Jumbled Sentences

UNIT – IV

Synonyms, Antonyms, Verbal Analogy, Statements and Assumptions, Group Discussion

UNIT - V

Resume Writing, Introduction to HR rounds, Time Management, Attitude and Behaviour

15ENU401	ENGLISH - IV	Semester-IV			
		L	T	P	C
		4	-	-	4

Course Objectives:

- To train the students in understanding the concepts of communication.
- To be familiar with the four basic skills of English.
- To train students in developing their written communication.
- To train students in developing their presentation skills.
- To acquire the skill of making grammatically correct sentences.
- To reflect originality on the application of soft skill views and express in writing their views.

Course Outcome:

- Students have acquired proficiency in communication.
- Students have become adept in written communication and presentation skills.
- Developed the skill of writing in English and that of public speaking.
- Establish and maintain social relationships.
- Develop communication skills in business environment.
- Enhanced communication competency through LSRW skills

UNIT I

Concept of Communication – Barrier to Communication – Body language – Personality Development – Etiquette and Manners- Soft Skills – Emotional Intelligence

UNIT II

Listening Comprehension – Reading Comprehension – Paragraph writing – Precis Writing – Writing Resume and Covering Letter -Speaking – Welcome Address, Vote of Thanks, Compering, Debates, Role Play, Dialogues – Vocal Communication Techniques. Voice, Quality, Volume, Pitch

UNIT III

Dicto Composition – Letter Writing (Informal, Letters to the Editor etc) – Term paper – Book reviews

UNIT IV

Business Correspondence – Layout of Business Letter – Formal Styles of Business Letters – Letters of Acceptance, Appointment, Resignation, Complaint, Sending E-mails.

UNIT V

Effective Presentation – Planning – Audience Analysis –Logical Sequencing – Timing of the Presentation – Conclusion – Answering Queries – Group Discussion – Interview.

PRESCRIBED TEXT

1. Juneja. P. Om and Aarati Mujumdar, “*Business Communication -Techniques and Methods*”, Orient Blackswan Pvt. Ltd., Hyderabad: 2010.

15ECU401	INDUSTRIAL AND POWER ELECTRONICS	Semester-IV			
		L	T	P	C
		5	1	-	6

COURSE OBJECTIVES

- To know the fundamental concept of Power Electronics and its Applications
- To teach fundamental principles of thyristor family.
- To become familiar with power devices and their application in various fields
- Learners are expected to understand various controllers , converters , inverters and choppers
- To familiarize students to the principle of operation, design and synthesis of different power conversion circuits and their applications
- To provide strong foundation for further study of power electronic circuits and systems

COURSE OUTCOMES

- Apply basic concept of digital fundamentals to Microprocessor based personal computer system
- Demonstrate an understanding of fundamentals of thyristor family.
- Analyze the various applications and circuits based on thyristor .
- Build and test circuits using power devices such as SCR, IGBT and MOSFET.
- Analyze and design controlled rectifier, DC to DC converters, DC to AC
- Relate basic semiconductor physics to properties of power devices, and combine circuit mathematics and characteristics of linear and non-linear devices

UNIT I - Thyristors and UJT

Principles, Construction & characteristics of SCR – Two transistor model – Rectifier circuits using SCR – Operation and Characteristics of TRIAC – DIAC – GTO – SCS – LASCR. UJT & PUT– UJT as Relaxation Oscillators.

UNIT II - Turn On/Off Mechanisms

Types of turn on methods: AC gate triggering – R triggering – RC triggering – DC gate triggering – Pulse triggering – Types of turn off methods: Natural commutation – Forced commutation: Self commutation – Complimentary commutation – Auxiliary commutation – External pulse commutation—Line commutation.

UNIT III - Controlled Rectifiers & Inverters

Half wave controlled rectifiers with resistive load – HWCR with inductive load – HWCR with Freewheeling Diode – Full wave controlled rectifiers with resistive, inductive loads – FWCR with freewheeling diode. INVERTERS: Single phase half & full bridge voltage inverters— Step-Up & Step-Down choppers.

UNIT IV - Convertors and Power MOSFET

Introduction – Single phase centre tapped step-up Cycloconverter – Single phase Bridge type step-up Cyclo-converter – Single phase centre tapped step-down Cycloconverter –N-channel planner Enhancement MOSFET – N- channel VDMOS Power MOSFET—Features and Characteristics of VDMOSFET.

UNIT V - Applications

Introduction – Electric resistance welding & types –Electric Arc welding – Sequence timer – Synchronous weld control.— SMPS & UPS – Static switches – Time delay & Fan regulator using TRIAC - Burglar alarm-Automatic lamp dimmer.

TEXT BOOKS

1. Power Electronics –Circuit, Device and application, Muhammed H.Rashid Pearson Education, Third Edition, 2014.
2. Industrial and Power Electronics, Harish C. Rai, Umesh Publications, Millennium Edition, 2013.

REFERENCES

1. Power Electronics, J.S.Chitode, Technical Publications, Fourth Edition, 2009.
2. Power Electronics, Dr.P.S.Bimbhra, Khanna Publications, Third Edition, 2012.

15ECU402	MICROWAVE AND SATELLITE COMMUNICATION	Semester-IV			
		L	T	P	C
		5	1	-	6

COURSE OBJECTIVES

- To know the fundamental concept of Power Electronics and its Applications
- To know the fundamental concepts of Microwave Waveguides.
- To Learn the Microwave Standards and RADAR Technology
- To provide a strong knowledge about of Spread Spectrum and Communication in Space.
- To represent a digital signal using several modulation methods
- Draw signal space diagrams compute spectra of modulated signals and apply redundancy for reliable communication.

COURSE OUTCOMES

- Understand the basics of information theory, source coding techniques and calculate Entropy of source
- To know the various types of noises in communication systems and reduction techniques
- Describe and determine the performance of line codes and methods to mitigate inter symbol interference
- Learn the generation and detection of base band system
- Understand the generation, detection signal space diagram, spectrum, bandwidth efficiency, and probability of error analysis of different band pass modulation techniques
- Describe and determine the performance of different error control coding schemes for the reliable transmission of digital representation of signals and information over the channel.

UNIT I – Electro-magnetics and Waveguides

Introduction to microwaves and electromagnetic – Maxwell's equation – wave equations – TEM/TE/TM/HE – Wave definitions: Waveguides: Types of Waveguides – Propagation of wave in rectangular waveguides – Propagation of TEM waves – TE and TM modes – Propagation of TM waves in rectangular waveguides – TM mode in rectangular waveguide.

UNIT II - Microwave Tube Circuits and Antennas

Microwave Transistors - Klystrons – Traveling Wave Tube (TWT) – Backward wave oscillator – Magnetrons – Microwave Antennas: Horn Antennas – Parabolic reflectors – Lens Antennas – Slot Antenna – Micro strip Antenna.

UNIT III - Radar

Introduction – Block Diagram of Simple RADAR – Classification – Free space radar range equation – Maximum unambiguous range – Pulsed RADAR system – Target detection – Scanning and Tracking with radars – Frequency diversity - Doppler Effect – CW Doppler radar – MTI Radar – Frequency modulated CW radar

UNIT IV - Orbital Mechanics and Launchers

Introduction: History of satellite communication – Overview of satellite communication – Orbital mechanics – Look angle determination – Orbital perturbations – Orbit determination – Orbital effects in communication systems performance.

UNIT V - Satellite and Link Design

Satellite subsystems – Attitude and orbital control system – Telemetry, Tracking, Command and monitoring – Power systems – Communication subsystems– Equipment

reliability and space communication.-Basic transmission Theory – Design of Downlinks – Uplink design

TEXT BOOKS

1. Microwave and Radar Engineering, M. Kulkarni, Umesh Publications, Fourth Edition, 2008.
2. Satellite Communications, Timothy Pratt, Charles Bostian and Jeremy Allnut, Wiley India Publications, Second Edition, 2012

REFERENCES

1. Fundamentals of Microwave and Radar Engineering, K. K. Sharma, S. Chand Publishers, First Edition, 2011.

15ECU411	PRACTICAL – V POWER ELECTRONICS LAB	Semester-IV			
		L	T	P	C
		-	-	5	3

COURSE OBJECTIVES

- To provide the students a deep insight in to the working of different switching devices with respect to their characteristics
- To analyze different converters and control with their applications
- To develop an overall approach for students from construction of control rectifier , inverter, choppers, study its specification, the functionality, design and practical applications
- To become familiar with power devices and their application in various fields
- To understand various controllers , converters , inverters and choppers
- To Know the advanced converters and switching techniques implemented in recent technology

COURSE OUTCOMES

- Express the design and control of rectifiers, inverters
- Design of power electronic converters in power control applications.
- Ability to express characteristics of SCR, BJT, MOSFET and IGBT
- Ability to express communication methods
- Ability design AC voltage controller and Cyclo Converter
- Ability to design Chopper circuits

(Any 12 Experiments)

1. Characteristics of SCR
2. Characteristics of TRIAC
3. Characteristics of MOSFET
4. Characteristics of UJT
5. Characteristics of DIAC
6. Commutation of Thyristors
7. Single Phase Inverter
8. Speed Control of DC Motor.
9. Burglar Alarm
10. Automatic Street Light Controller
11. UJT as Relaxation Oscillator
12. TRIAC Flashes
13. Lamp dimmer
14. Thyristor Chopper
15. Automatic battery charger

15ECU403A	WEB TECHNOLOGY	Semester- IV			
		L	T	P	C
		4	-	-	4

COURSE OBJECTIVES

- This course enables students to understand web page site planning, management and maintenance
- To evaluate website quality, learn how to create and maintain quality web pages learn to create and manipulate images.
- To have programming experience in Visual Basic & Relational Database Management System
- To gain the skills and project-based experience needed for entry into web design and development careers.
- Develop awareness and appreciation of the many ways that people access the web,
- To create standards-based websites that can be accessed by the full spectrum of web access technologies.

COURSE OUTCOMES

- Knowledge about history and development of World Wide Web and associated btechnologies
- Able to develop a dynamic webpage
- Able to write formats and languages in modern web pages
- Able to write a well framed and valid XML document
- Development of web pages and web applications
- Use of development tools

UNIT – I Introduction to HTML

Introduction-html browsers-history of html and sgml- html command tags-quotation marks-spacing-special symbols-tags with automatic line breaks-urls-understanding domain names-links-defining web page-main body of text- headers-adding paragraph-formatting text-font type, size, predefined fonts, bold, italic-setting colors-text color, superscripts and subscripts-underlining text-preformatted text-blinking text-block quotes-margins-line breaks-ordered and unordered list-links-scaling an image-images alignment

UNIT – II HTML, Forms, Frames

HTML : Working with Forms-Creating Forms-Working with Menus-Working with Radio Buttons-Check Boxes-Text Boxes-Text Areas-Password Boxes-Submit Button-Resetting the Form-Working with Frames-Creating Frameset-Creating Columns-Creating Rows and Columns-Combining Framesets-Giving Colors to the Borders-Space between Frames-Nesting Framesets-Showing or Hiding Scrollbars-Alternatives to Frames

UNIT – III eXtensive Markup Language

Introduction-Features of XML-XML Support and Usage-Compatibility of XML with Others-Structure of XML Document-Common Errors-Structures in XML-Creating Document Type Declarations-Flow Objects-Length-Colour and Background Properties

UNIT – IV ASP

How Active Server Pages Really Work?-Variables-Procedures-ASP Forms-Date Types-Operators. More on ASP: Introduction to Object Hierarchies-Getting Information from the Visitor-Sending Information to Visitors-ASP Applications-Getting in at the Top (Server Object)-Response Object Methods.

UNIT – V Java Script and VB Script

Java Script: Introduction-Operators-Assignments-Comparisons-Reserved Words-Browsers to Use-Software Requirement-Starting with Java Script-Using Quotes, Alert-Functions-Eval Function-Using Statements in Java Script-Working with Objects-Properties-Browser objects-Date object-Math Object-String Object-Defining Objects-Handling Events in Java Script-Event Handling Attributes-Window Events-Working with Forms-Form Elements-User Actions-windows and Frames.

VB Script: Introduction-Adding VB Script code to HTML- Adding VB Script code to Documents-Data Types-Getting the Message Across.

15ECU403B	C++ PROGRAMMING	Semester- IV			
		L	T	P	C
		4	-	-	4

COURSE OBJECTIVES

- To make the student learn a programming language and to understand various features in C Language
- The objective of this course is to provide the student with the fundamental knowledge and skills to become a proficient C++ programmer.
- The student will learn to transpose the physical problem domain into a hierarchy of objects.
- To learn problem solving techniques.
- To write programs in C and to solve the problems.
- Analyze unstructured problems and design computer solutions

COURSE OUTCOMES

- Able to design and analyze the time and space efficiency of the data structure
- Be capable to identify the appropriate data structure for given problem
- Read, understand and trace the execution of programs written in C language
- Write the C code for a given algorithm
- Implement Programs with pointers and arrays, perform pointer arithmetic, and use the pre-processor.
- Write programs that perform operations using derived data types.

UNIT – I Introductions

Principles of object oriented programming: Basic concepts of object oriented programming – Benefits of OOP – Applications of OOPs – Structure of C++ Program C++ Tokens – Control Statement – Decision Making Statements- Loop Statements - Inline Functions – Function Overloading.

UNIT – II Control Structure, Functions and Constructors

Classes and Objects: Specifying a class – Creating Objects – Accessing Class Members – Defining Member Functions – Static Data Members – Static Member Functions - Array of Objects – Friend Functions. Constructors and Destructors:- Constructors – Parameterized Constructors - Multiple Constructors in a Class – Constructors with Default Arguments - Copy Constructor - Dynamic Constructor – Destructors.

UNIT – III Operator Overloading and Inheritance

Operator overloading: Defining operator overloading – overloading unary operators – overloading binary operators – overloading binary operators using friends.

Inheritance: - Inheritance – defining derived classes – single, multilevel, multiple, hierarchical inheritance- hybrid inheritance – virtual base classes – abstract classes.

UNIT – IV Pointers and I/O Operations

Pointers: Pointers to objects – this pointer – pointers to derived classes – virtual functions- Pure Virtual Functions. Managing console I/O operations :- C++ streams – C++ stream classes – unformatted I/O operations – formatted console I/O operations – Managing output with manipulators.

UNIT – V File Management

Files: Classes for file stream operations – Opening and Closing a file – sequential input and output operations – updating a file random access – Command Line Arguments. Templates :- Templates – class templates – function templates – member function templates

15ECU403 C	.NET PROGRAMMING	Semester- IV			
		L	T	P	C
		4	-	-	4

COURSE OBJECTIVES

- To have a fundamental understanding of Language Basics, Programming Fundamental and OOP's Concepts
- Understanding the platform; Determinism and concurrency; Handling input and output securely; Safe error handling and logging; Engineering for security features; Software security in operations
- Understanding of Microsoft Windows 2000, XP, or Vista. Students are expected to have basic knowledge in Graphical User Interface and object oriented programming.
- Understand code solutions within .NET framework
- Design and Implement database connectivity using NET in window based application
- Identify industry defined problem and suggesting solutions using .NET application.

COURSE OUTCOMES

- Knowledge about MS.NET framework developed by Microsoft.
- Able to using XML in C#.NET specifically ADO.NET and SQL server 3
- Able to understand use of C# basics, Objects and Types, Inheritance
- Develop, implement and creating Applications
- Develop, implement, and demonstrate Component Services, Threading, Remoting, Windows services
- Understand and be able to explain Security in the .NET framework and Deployment in the .NET.

(Any 8 Experiments)

UNIT-I

Introduction to .NET, .NET Framework features & architecture, CLR, Common Type System, MSIL, Assemblies and class libraries. Introduction to visual studio, Project basics, types of project in .Net, IDE of VB.NET- Menu bar, Toolbar, Solution Explorer, Toolbox, Properties Window, Form Designer, Output Window, Object Browser.

The environment: Editor tab, format tab, general tab, docking tab. visual development & event drive Programming -Methods and events.

UNIT-II

The VB.NET Language- Variables -Declaring variables, Data Type of variables, Forcing variables declarations, Scope & lifetime of a variable, Constants, Arrays, types of array, control array, Collections, Subroutines, Functions, Passing variable Number of Argument Optional Argument, Returning value from function – Message box – Input box.. Control flow statements: conditional statement, loop statement. MsgBox & Inputbox.

UNIT – III

Working with Forms : Loading, showing and hiding forms, controlling One form within another. GUI Programming with Windows Form: Textbox, Label, Button, Listbox, Combobox, Checkbox, PictureBox, RadioButton, Panel, scroll bar, Timer, ListView, TreeView, toolbar, StatusBar. There Properties, Methods and events. OpenFileDialog, SaveFileDialog, FontDialog, ColorDialog, PrintDialog. Link Label. Designing menus : ContextMenu, access & shortcut keys.

UNIT-IV

Object oriented Programming: Classes & objects, fields Properties, Methods & Events, constructor, inheritance. Access Specifiers: Public Private, Protected. Overloading, My Base &

My class keywords. Menus , Dialog box

Files : Introduction – Classification of files – Processing files – handling files and folder using class – Directory class – file class.

UNIT–V

Database programming with ADO.NET – Overview of ADO, from ADO to ADO.NET, Accessing Data using Server Explorer. Creating Connection, Command, Data Adapter and Data Set with OLEDB and SQLDB. Display Data on data bound controls, display data on data grid. Generate Reports Using CrystalReportViwer.

15ECU412A	WEB TECHNOLOGY LAB	Semester- IV			
		L	T	P	C
		-	-	3	2

COURSE OBJECTIVES

- This course enables students to understand web page site planning, management and maintenance
- To evaluate website quality, learn how to create and maintain quality web pages learn to create and manipulate images.
- To have programming experience in Visual Basic & Relational Database Management System
- To gain the skills and project-based experience needed for entry into web design and development careers.
- Develop awareness and appreciation of the many ways that people access the web,
- To create standards-based websites that can be accessed by the full spectrum of web access technologies.

COURSE OUTCOMES

- Knowledge about history and development of World Wide Web and associated technologies
- Able to develop a dynamic webpage
- Able to write formats and languages in modern web pages
- Able to write a well framed and valid XML document
- Development of web pages and web applications
- Use of development tools

(Any 10 Programs)

1. Create a simple HTML document about yourself or a topic of your choice using the basic tags such as Bold, Italic, Heading, images, horizontal rule and images.
2. Create a HTML document which includes an unordered list, ordered list, definition list to your document and create a link to Yahoo
3. Develop static pages (using only HTML) of an online Book store. The pages should resemble: www.amazon.com . The website should consist the following pages.
 - a. Home page
 - b. Registration and user login
 - c. User profile page
 - d. Items catalog
 - e. Shopping cart
 - f. Payment by credit card
 - g. Order confirmation
4. Create a table in HTML document with following formats
 - table with no borders
 - display table headers
 - to handle cells that have no content

- table cells that span more than one row or one column

- Adding background image to a table

5. Create and save an XML document at the server, which contains 10 users information. Write a program, which takes User Id as an input and returns the user details by taking the user information from the XML document.
6. Creation of a XML document of 20 students of III IT. Add their roll numbers, marks obtained in 5 subjects, total and percentage and save this XML document at the server. Write a program that takes students' roll number as an input and returns the students marks, total and percentage by taking the students' information from the XML document.
7. Write an XML file which will display the Book information which includes the following:
 - a. Title of the book
 - b. Author Name
 - c. ISBN number
 - d. Publisher name
 - e. Edition
 - f. Price

Write a Document Type Definition (DTD) to validate the above XML file.

8. Develop a Web page using Java script to perform the following information
 - Input student information.
 - Display student results for a given roll number.
9. Develop a web page for online exam using Java Script
10. Create a web page using two image file which switch between one another as the mouse pointer moves over the image. Use the On Mouse over and On Mouse event handler
11. Using VBScript create a calculator.
12. Create a HTML form that has number of text boxes when the form runs in the browser fill the textboxes with data. Write a Java script that verifies that all text boxes have been filled, if a text box has been left empty pop up an alert message indicating which box has been left empty. When Alerts OK button is clicked, set focus to that specific text box. If all the text boxes are filled, display thank you.

15ECU412 B	C++ PROGRAMMING LAB	Semester-IV			
		L	T	P	C
		-	-	3	2

COURSE OBJECTIVES

- To make the student learn a programming language and to understand various features in C
- To develop skills to design and analyze simple linear and non linear data structures
- To learn problem solving techniques.
- To write programs in C and to solve the problems.
- Gain knowledge in practical applications of C Language
- Analyze unstructured problems and design computer solutions

COURSE OUTCOMES

- Able to design and analyze the time and space efficiency of the data structure
- Be capable to identify the appropriate data structure for given problem
- Read, understand and trace the execution of programs written in C language
- Write the C code for a given algorithm
- Implement Programs with pointers and arrays, perform pointer arithmetic and use the pre-processor.
- Write programs that perform operations using derived data types.

(Any 10 Programs)

1. Create a class **Patient** with necessary data members. In the main () program, have the facility to
 - Store the details of n inpatients and outpatients
 - Display the details in a neat format
2. Create two classes **British** and **Metric** to store the measurements of distance in the British (feet and inches) and Metric (meters and centimeters) systems respectively.
In the main () program, perform the following:
 - Get two measurements: one in British and the other in Metric
 - Ask the user in which system (British or Metric) (s) he wants the output.
3. Add two input measurements and print the result according to the user's choice Create a class **Date** whose data members are Day, month, and Year. Write necessary member functions and perform the following operations using overload operator.
 - Increment a date by a day
4. Create a class **Date** whose data members are Day, month, and Year. Write necessary member functions and perform the following operations using overload operator.
 - Compares two dates
5. Create a class **String** that has a character array as a data member and perform the following operations using overloaded operators.
 - '+' To add two strings

- '==' To compare two strings
6. Create a class **Computer** and derive two classes **Client** and **Server** from it. In the main () program, get the data about n clients and servers and print it back in a neat format.
 7. Create a class **Shape** that contains two data members of type double to hold the two dimensions of the shape. Derive 3 more classes' **Circle**, **Rectangle** and **Triangle** from the class Shape. Using appropriate member functions, get the values, calculate and print the area of different shapes using dynamic binding.
Hint:- Write 2 member functions in all the derived classes: one to set the data and the other to calculate and display the area.
 8. Create a class **Staff** that contains the name, designation, and years of experience of a staff member of a college. Using containership, create two more classes **TeachingStaff** and **NonTeachingStaff** according to the following specifications. In addition to the properties of the staff class, the TeachingStaff class should contain the highest qualification, the staff member possesses and the departments he belongs to. The NonTeachingStaff class needs to contain the properties of Staff only. In the main (), get data about some of the teaching and NonTeachingStaff members of your college and print the details in neat format.
 9. Create a class Address as whose data members are Name, Street, City, Pincode and Phone Number of a person. In the main () program, using array of pointers, get addresses of n persons, sort it in alphabetical order of names and display it back in a neat format.
 10. Create a class that copies the content of a text file into another file. Write the program in such a way that the program accepts command line arguments and make the program to execute in a way exactly the copy command in DOS.
 11. Create a class **Student** that could have the name, register number and marks in the subjects of the semester. Have the program to perform the following operations:
 - Store the data about n students in a data file.
 - Print the mark list of each student whenever requested.
 - Add details about some more students at any time.
 12. Sort an integer and a floating –point array using function template.

15ECU412C	.NET PROGRAMMING LAB	Semester-IV			
		L	T	P	C
		-	-	3	2

COURSE OBJECTIVES

- To have a fundamental understanding of Language Basics, Programming Fundamental and OOP's Concepts
- Understanding the platform; Determinism and concurrency; Handling input and output securely; Safe error handling and logging; Engineering for security features; Software security in operations
- Understanding of Microsoft Windows 2000, XP, or Vista. Students are expected to have basic knowledge in Graphical User Interface and object oriented programming.
- Understand code solutions within .NET framework
- Design and Implement database connectivity using NET in window based application
- Identify industry defined problem and suggesting solutions using .NET application.

COURSE OUTCOMES

- Knowledge about MS.NET framework developed by Microsoft.
- Able to using XML in C#.NET specifically ADO.NET and SQL server 3
- Able to understand use of C# basics, Objects and Types, Inheritance
- Develop, implement and creating Applications
- Develop, implement, and demonstrate Component Services, Threading, Remoting, Windows services, web 6
- Understand and be able to explain Security in the .NET framework and Deployment in the .NET. 7.

(Any 10 programs)

1. Write a VB.NET program to calculate Simple interest and compound Interest
2. Write a VB.NET program to find mouse events and coordinates where the mouse is clicked.
3. Write a VB.NET program to implement Calculator.
4. Write a VB.NET program to implement Notepad
5. Write a VB.NET program to draw several shapes and fill with color.
6. Write a VB.NET program to perform the following in list box
 - a) Add an item
 - b) Delete an item
 - c) List count
 - d) Clear the List
7. Write a VB.NET program to calculate the days elapsed between the given two dates.
8. Write a VB.NET program to create Menu and link multiple forms with different colors.
9. Write a VB.NET program to animate the picture using animation control.
10. Write a VB.NET program to check whether given string is a Palindrome or not.
11. Write a VB.NET program to generate Fibonacci series for the input given using Input box.

12. Write a program to calculate the total marks of the student and print the grade
13. Write a VB.NET Program to maintain details of students. Use Crystal Report to generate report.
14. Write a VB.NET Program to implement Employee Payroll.
15. Write a VB.NET program to create and manipulate a File.

15ECU501	MICROPROCESSOR AND MICROCONTROLLER	Semester-V			
		L	T	P	C
		4	1	-	5

COURSE OBJECTIVES

- To know the fundamental concept of microprocessor 8085 and microcontroller architecture and to program in assembly language.
- To learn the interfacing of different peripherals for various typical applications
- To develop background knowledge and core expertise of microcontroller
- To know the importance of different peripheral devices and their interfacing to microcontrollers
- To know the design aspects of microcontrollers.
- To provide a strong practical knowledge in the application areas.

COURSE OUTCOMES

- Apply basic concept of digital fundamentals to Microprocessor based personal computer system.
- Identify a detailed s/w & h/w structure of the Microprocessor.
- Illustrate how the different peripherals (8255, 8253 etc.) are interfaced with Microprocessor.
- Distinguish and analyze the properties of Microprocessors & Microcontrollers.
- Analyze the data transfer information through serial & parallel ports
- Train their practical knowledge through laboratory experiments.

UNIT I – Introduction To 8085

Pin Diagram – Architecture – Instruction set – Addressing modes – Demultiplexing the bus – Generation of control signals – Bus structure – Simple programs.

UNIT II – 8085 Peripheral Devices

Introduction to Programmable Peripheral Interface 8255 —Programmable Interval Timer 8254 -8259 Interrupt Controller – 8237 DMA Controller – 8279 Keyboard Display Interface- 8251 USART.

UNIT III – 8051 Microcontroller

Introduction to microcontrollers – Pin Diagram – Architecture – 8051 Instruction Set - Addressing Modes- Introduction to 8051 Assembly–I/O Port Programming.

UNIT IV - 8051 Interrupts & Peripherals

Basic registers of Timer – Programming 8051 Timer – Counter Programming – Basics of Serial Communication –8051 Serial Communication Programming – 8051 Interrupts – Programming External Hardware Interrupts.

UNIT V – Real World Applications

Interfacing LCD to 8051 – Interfacing ADC to 8051 – Interfacing DAC to the 8051- interfacing sensors to 8051 – interfacing Stepper motor to the 8051 –interfacing keyboard to 8051.

TEXT BOOKS

1. Microprocessor Architecture, Programming & Application, R.Gaonkar, Wiley Publications, Fourth Edition, 2009.
2. The 8051 Microcontroller, Kenneth Ayala, PI Publications, Third Edition, 2007.
3. Microprocessor Architecture, Programming and its Applications with 8085, Ramesh S.

Gaonkar, Penram International Publishing, Fifth Edition Reprint, 2011.

4. The 8051 Microcontroller and Embedded Systems, Muhammed Ali Mazidi, Janice Gillispie Mazidi, Rolin D. Mckinlay, Third Edition, 2011.

REFERENCES

1. Microprocessors and Microcontrollers, Nagoor Kani.A, Tata Mc Graw Hill Publications, Second Edition, 2012.
2. Advanced Microprocessor & Peripherals, Ray & Bhurchnadi, Tata Mc-Graw Hill Publications, Sixth Edition, 2008.

15ECU502	DIGITAL AND FIBER OPTIC COMMUNICATION	Semester-V			
		L	T	P	C
		5	-	-	5

COURSE OBJECTIVES

- To enable the students to learn the digital and cellular technology
- To identify the functions of different components
- Learn about theoretical bounds on the rates of digital communication system
- To represent a digital signal using several modulation methods
- To know the fundamental concept of Digital and Fiber Optic Communications and Shift keying operations.
- To learn the operations of the circuits used for Digital and Fiber Optic Communications and Network Protocols.

COURSE OUTCOMES

- Understand the basics of information theory, source coding techniques and calculate Entropy of source
- To know the various types of noises in communication systems and reduction techniques
- Describe and determine the performance of line codes and methods to mitigate inter symbol interference
- Learn the generation and detection of base band system
- Understand the generation, detection signal space diagram, spectrum, bandwidth efficiency, and probability of error analysis of different band pass modulation techniques
- Describe and determine the performance of different error control coding schemes for the reliable transmission of digital representation of signals and information over the channel.

UNIT I – Data Communication

Introduction to Networks – Protocol and Standards – Network Models – Layered tasks – The OSI model – Different types of layers – TCP/IP Protocol - Analog and Digital Signals – Transmission Impairments – Data rate limits.

UNIT II – Digital and Analog Transmission

Basics of Digital - to – Digital Conversions – Line Coding – Line coding schemes – Block coding - Scrambling – Analog – to – Digital Conversions – PCM – DM – Transmission Modes - Introduction to Multiplexing – FDM – WDM –TDM.

UNIT III – Wireless LAN's

Introduction to Wireless LAN technology: Overview-Infrared LANs-Spread Spectrum LANs-Narrowband Microwave LANs. IEEE 802.11 Wireless LAN Standard: IEEE 802 Protocol architecture-IEEE 802.11 Architecture and services-IEEE 802.11 Medium Access control-IEEE 802.11 Physical layer-Bluetooth

UNIT IV – Optical Fiber communication

A basic fiber optic system – Frequencies – Fiber optic Cables – Refraction – Numerical Aperture – Graded index cables – Single mode – Multi mode – Cable Constructions – Cable Losses – Connectors – Light Sources – Light Detector – System Components – Advantages and Disadvantages.

UNIT V – Optical Sources and Detectors

Laser –Basic Concepts-Optical Emission from Semiconductors - Semiconductor Injection Laser. LED – LED power and efficiency - LED structures-LED characteristics. Photo

Detectors – Photo Detector Noise – Response Time - Double Hetero Junction Structure - Photo Diodes – Compare of Photo Detectors.

TEXT BOOKS

1. Electronic Communication Systems , Kennedy and Davis, Tata McGraw Hill, Fifth Edition, 2012
2. Wireless Communications and Networks, William Stallings, Pearson Education Singapore Ltd. Second Edition, 2009

REFERENCES

1. Principles of Communication Engineering, Anok Singh & A.K.Chhabra ,S.chand Publications, Seventeenth Edition, 2010
2. Optical Fiber Communication, Gerg Keiser, Tata McGraw Hill Publishing Company Ltd, Fourth Edition. 2008.

15ECU503	BIOMEDICAL INSTRUMENTATION	Semester-V			
		L	T	P	C
		5	-	-	5

COURSE OBJECTIVES

- To know the fundamental concept of origin of Bio-electric signals and recording it with highly precision equipment.
- To learn the various medical equipment used for diagnosis and therapeutic purpose.
- To provide a large number of quality trained Medical Electronics professionals for preventive and maintenance work needed to maintain hi-tech medical equipments in hospitals to ensure good health care.
- To explore the human body parameter measurements setups
- To give basic ideas about how multimedia evidences are useful in crime investigation.
- Understanding basic principles and phenomena in the area of medical diagnostic instrumentation, theoretical and practical preparation enabling students to maintain medical instrumentation.

COURSE OUTCOMES

- Understand the fundamental concept of origin of Bio-electric signals and recording it with highly precision equipment.
- Differentiate and analyze the biomedical signal sources.
- Identify common biomedical signals and distinguish characteristic features.
- Ability to study various transducers
- Identify common signal artifacts, their sources and formulate strategies for their suppression.
- Familiarize with patient safety issues related to biomedical instrumentation

UNIT I - Bioelectric Signals

Physiological Systems of the body – Man Instrument System – Bioelectric signals – Cells and their structures - Transport of ions through cell membrane - Resting and Action Potential – Propagation of Action potential – Bioelectric potentials (ECG, EEG, EMG)

UNIT II –Electrodes and Transducers

Basic Electrode Theory – Bio-potential Electrodes – Biochemical Electrodes – Electrical Conductivity of electrode jellies and creams – Transducers and Transduction Principles: Transducers for Biomedical Applications – Biosensors and Smart Sensors

UNIT III - Biomedical Recording and Patient Monitoring System

Electrocardiography (ECG) – ECG Lead Configuration – ECG Amplifiers – ECG Recorder – Electro Encephalo Graphy (EEG) – EEG Recorder – Electro Myo Graph (EMG) – Electro Retino Graphy(ERG) – Electro Oculo Graphy (EOG) Patient Monitoring System Concepts –Measurement of Heart Rate – Blood Pressure Measurement – Respiration Measurement

UNIT IV - Diagnostic and Therapeutic Equipments

X-ray imaging - Radio fluoroscopy - Image Intensifiers - Angiography - Endoscopy – Pacemakers – Energy requirements to excite hear muscle – Methods of stimulation – Different modes of operation – Pacemaker batteries – Defibrillators – Different type of defibrillators. - Anesthesia Machine – Ventilators - Diathermy.

UNIT V - Advancements in Medical Instrumentation

Lasers in Medicine - Computerized Axial Tomography (CAT) Scanner - Ultrasonic

scanner - Magnetic Resonance Imaging - Computer based Patient Monitoring System.
Biotelemetry - Elements of telemetry system - Radio telemetry system.

TEXT BOOKS

1. Introduction to Biomedical Instrumentation, Mandeep Singh, PHI Learning Private Limited, 2010.
2. Electronics and Medicine and Biomedical Instrumentation, Nandini.K.Jog, Prentice Hall of India, Private Limited, First Edition, 2013
3. Biomedical Instrumentation and Measurements, Leslie Cromwell, Fred. J. Weibell, Erich A. P. Feiffer, Prentice Hall of India, Second Edition, 2010

REFERENCES

1. Biomedical Instrumentation Application and Design, John G Webster, Wiley India Pvt Ltd 2012.
2. Handbook of Biomedical Instrumentation, R.S.Khandpur, Tata McGraw Hill, 2004.

15ECU504	VHDL Programming	Semester-V			
		L	T	P	C
		4	1	-	5

COURSE OBJECTIVES

- To learn the basics of language elements.
- To provide a strong knowledge about the VHDL Modeling.
- To introduce a hardware description language (HDL) for the specification, simulation, synthesis
- Implementation of digital logic systems.
- Design practice sessions and implementing digital logic systems with commercial electronic design (EDA) tools
- To know the features of programming and simulation techniques.

COURSE OUTCOMES

- Building simulation module as per system specification for e.g. VHDL model for ASIC design
- Understanding types of design such as high level design, operative part design, control part design, memory design etc
- Functioning and specifying the tools used for design as per requirement
- Creation of code, verification, testing software
- Testing various examples on the system
- Understanding the synthesis and simulation process of code

UNIT I – Introduction And Basic Terminology

VHDL - History-Capabilities-Hardware Abstraction –Basic Terminology-Entity Declaration-Architecture Body-Configuration Declaration-Package Body-Model Analysis-Simulation.

UNIT II –Basic Language Elements

Identifiers-Numbers-Characters-Strings-Bit Strings-Data Objects-Data Types- Integer Types-Physical Types-Floating Point Types-Enumeration Types-Arrays-Operators: Arithmetic Operators-Relational Operators-Logical Operators.

UNIT III – Behavioral Modeling

Entity Declaration-Architecture Body-Process Statements-Variable Assignment Statement-Signal Assignment Statement-Wait Statement-If Statement-Case Statement-Null Statement-Loop Statement-Exit Statement-Assertion Statement-Report Statement.

UNIT IV – Dataflow Modeling

Concurrent Signal Assignment statement-Concurrent Versus sequential Signal Assignment-Delta Delay Revisited-Multiple Drivers-Conditional Signal Assignment Statement-Selected Signal Assignment Statement –The Unaffected Value-Block Statement-Concurrent Assertion Statement-Value of a signal.

UNIT V – Structural Modeling

An Example of Component declaration - Component Instantiation - Other Examples-Resolving Signal Values – Signal Packages.

TEXT BOOKS

1. A VHDL Primer, J.Bhasker , Pearson Education. Third Edition, 2008.
2. Digital Logic Design and VHDL, A.A.Phadke, S.M.Deokar, Tata Mc-Graw Hill Publications, Fourth Edition, 2009.
3. Fundamentals of Digital Logic with VHDL Design, Stephen Brown,Zvonko Vranesic , Tata

Mc-Graw Hill Publications, Fourth Edition,2008.

REFERENCES

1. Principles of VLSI Design, S.Sumathi, Scitech Publications (India) Pvt., Ltd, 2005.
2. VHDL, Douglas L.Perry, Tata McGraw Hill Publications, Fifth Edition, 2011.
3. VLSI Design, K. Lal Kishore, and V. S. V. Prabhakar, I.K. International Publishing House Pvt Ltd, Third Edition, 2008.

15ECU505A	VLSI DESIGN	Semester-V			
		L	T	P	C
		4	1	-	5

COURSE OBJECTIVES

- To learn the fabrication techniques of Integrated Circuits.
- To know the fundamental rules of layout design.
- To design the fundamental blocks of a VLSI circuits, both by circuit schematic and physical layout
- Importance of CMOS and Mixed Signal VLSI design in the field of Electronics and Telecommunication
- Underlying methodologies for analysis and design of fundamental CMOS Analog and Mixed signal Circuits like Current and Voltage references, Single stage Amplifiers, Operational Amplifiers, Data Converters
- The issues associated with Mixed Signal VLSI Circuits.

COURSE OUTCOMES

- Realize logic circuits with different design styles.
- Understand working principle of operation of different types of memories.
- Familiarize with the fabrication techniques of Integrated Circuits.
- Design the fundamental blocks of a VLSI circuits, both by circuit schematic and physical layout.
- Express the layout of simple MOS Circuit using Lambda based design rules.
- Design an application using Verilog HDL

UNIT I - Introduction to MOS Technology

MOS technology & VLSI – Basic MOS transistor – Depletion & enhancement type – NMOS & CMOS Transistors fabrications – Electrical properties of MOS circuits – characteristics – Threshold voltage – transconductance – Pass transistors – NMOS Inverter – pull-up pull-down ratio for NMOS Inverter driven by NMOS Inverter & through one or more pass transistors – CMOS Inverter.

UNIT II -Layout Design

Mos & cmos layers – stick diagram – design rules & layout – subsystems design: switch logic – gate logic – other forms of logic – combinational logic design example: passing generator – bus arbitration logic multiplexers – gray to binary code converter –sequential circuit example: two phase clocking – dynamic shift register – pre charged bus concept .

UNIT III -Design of System

PLA – Finite state machine – PLA based finite state machine design – design of 4-bit shifter – design of ALU subsystem: adders – multiplexers – memory: dynamic shift register – dynamic RAM cells – one transistor dynamic memory cell – 4*4 bit register array – RAM array.

UNIT IV -Tools for Design

Grounds rules for successful design – design styles & philosophy – CAD tools for design & simulation: textual entry layout language – graphical entry layout – design verification – design rule checkers – simulators – tests & testability.

UNIT V -CMOS Design Projects & Fast VLSI Circuits

Incremental/decremental – left/right – serial/parallel shift register – comparator – GaAs device – layout design for GaAs devices.

TEXT BOOKS

1. Basic VLSI Design, Pucknell D.A., & Eshraghian K., PHI, Third Edition, 2009.
2. Principles of VLSI Design, S.Sumathi, ScitechPublications,2011.

REFERENCES

1. VLSI Design, K. Lal Kishore, and V. S. V. Prabhakar, I.K. International Publishing House Pvt Ltd, Third Edition, 2008.
2. Digital Logic Design and VHDL, A.A.Phadke, S.M.Deokar, Tata Mc-Graw Hill Publications, Fourth Edition, 2009.

15ECU505B	PCB DESIGN AND FABRICATION	Semester-V			
		L	T	P	C
		4	1	-	5

COURSE OBJECTIVES

- To make familiar with PCB design and various processes involved.
- To provide in-depth core knowledge in design, performance analysis and fabrication of Printed Circuit Boards.
- To gain knowledge on PCB fabrication process and factors affecting PCB performance
- Understand the need for PCB Design and steps involved in PCB Design and Fabrication process.
- Familiarize Schematic and layout design flow using Electronic Design Automation (EDA) Tools
- Recognize the technologies used in electronic industry through the practical experience gained in the course

COURSE OUTCOMES

- Students can explore different aspect of Printed Circuit Board Design and fabrication
- Students can learn various types of PCBs. Schematic Design. entry Rules for Schematic Entry, Component Layout methods
- Placement Rules, Routing Techniques for Single Sided Board.
- Post Processing of design and Fabrication documents.
- After completing this course students can design and fabricate their own PCB for their Project and can also work in PCB Designing and Fabrication area
- Understand the steps involved in schematic, layout, fabrication and assembly process of PCB design

UNIT I - Types of PCB

Single sided board – double sided – Multilayer boards – Plated through holes technology – Benefits of Surface Mount Technology (SMT) – Limitation of SMT – Surface mount components: Resistors, Capacitor, Inductor, Diode and IC's.

UNIT II - Layout and Artwork

Layout Planning – General rules of Layout – Resistance, Capacitance and Inductance – Conductor Spacing – Supply and Ground Conductors – Component Placing and Mounting – Cooling requirement and Package Density – Layout check - Basic artwork approaches – Artwork taping guidelines – General artwork rules –Artwork check and Inspection.

UNIT III -Laminates and Photo Printing

Manufacture of copper clad laminates – Properties of laminates – Types of Laminates – Manual cleaning process – Basic printing process for double sided PCB's – Photo resists – wet film resists – Coating process for wet film resists – Exposure and further process for wet film resists – Dry film resists.

UNIT IV - Etching and Soldering

Introduction – Etching machine – Etchant system. Soldering: Principles of Solder connection – Solder joints – Solder alloys – Soldering fluxes. Soldering Tools: Soldering, De soldering tools and Techniques – Man Soldering – Solder mask – Safety, health and medical aspects in Soldering practice.

UNIT V - Design Rules and Automation

Reflection – Crosstalk – Ground and Supply line noise – Electromagnetic interference from pulse type EM fields and automation – Automated artwork drafting – CAD.

TEXT BOOKS

1. PCB Design and Technology, Walter C.Bosshart, Tata McGraw Hill Publications, 2007
2. Printed circuits Handbook, Clyde F.Coombs, Tata McGraw Hill Publications, Sixth Edition, 2008

REFERENCES

1. Printed Circuit Board, Lambert M. Surhone, Miriam T. Timpledon, Susan F. Marseken, Vdm Verlag Dr. Mller Ag & Co. Kg, 2010.

15ECU505C	PSPICE PROGRAMMING	Semester-V			
		L	T	P	C
		4	1	-	5

COURSE OBJECTIVES

- To gain familiarity with PSPICE, and to review in greater detail.
- To investigate the use of the industry-standard circuit simulation tool PSpice.
- To impart practical working knowledge of Electrical and Electronics Simulation and Analysis
- To Solve, Simulate and Analyze basic Electrical and Electronics Circuits and Applications by writing Ohm's law, KCL and KVL Mathematical Equations and Programs
- To develop hands on working experience with reference to Solve, Simulate and Analyze Electrical & Electronics Circuits
- Recognize the technologies used in electronic industry through the practical experience gained in the course

COURSE OUTCOMES

- Understand the main features and importance of the PSpice Programming environment
- Apply working knowledge of PSpice package to simulate and solve Electrical, Electronics circuits and Applications
- Solve, Simulate and Analyze various DC circuits
- Solve, Simulate and Analyze various Analog and Digital Electronics circuits.
- Solve, Simulate and Analyze simple Transformer and DC Generator circuits
- Design and Simulate circuits

UNIT I - Introduction

Introduction – Descriptions of Spice – Types of Spice – Types of Analysis – Simulation software tools – Pspice Platform – Pspice schematic Vs OrCAD Capture – Limitations of PSpice. – Circuit Description: Input files –Element values – Nodes – Circuit Elements – Sources

UNIT II - DC Circuit Analysis

Output Variables – PSpice Output Commands – Format of Output Files – Examples of Spice Simulation – OrCAD Capture – Layout – PSpice A/D – Probe – Importing – DC Circuit Analysis: Resistors – Modeling of Elements – Operating Temperature – Independent DC Sources – Dependent Sources – DC Output Variables – Types of Output – Types of DC Analysis

UNIT III - Transient Analysis

Capacitors and Inductors – Modeling of Transient Sources - Transient Sources – Transient Output Variable – Commands – Transient Analysis – Switches - AC Circuit Analysis: AC Output Variables – Independent AC Sources – AC Analysis.

UNIT IV - Semiconductor Devices

Diode Characteristics in SPICE – BJT Characteristics in SPICE – JFET Characteristics in SPICE - MOSFET Characteristics in SPICE.

UNIT V - Operational Amplifier

Inverting and Non-inverting Amplifier – Active Filters: Low Pass Filters - High Pass Filters – Band Pass Filters – Band Reject Filters.

TEXT BOOKS

1. Introduction to PSpice using OrCAD for Circuits and Electronics, Muhammad H. Rashid, Prentice Hall of India Private Limited, New Delhi, Third Edition, 2005.
2. PSpice: Introduction with Applications, Amos Gilat, Siversion(WSE Series), Fourth Edition,

2012.

REFERENCES

1. Fundamentals of Electric Circuits with Pspice, Dr. A.S Aravina murthy, Pearson Education, 2011.
2. Introduction to PSpice and its Applications, M.S.Tyagi, Third Edition, 2008.

15ECU511	PRACTICAL – VI MICROPROCESSOR AND MICROCONTROLLER LAB	Semester-V			
		L	T	P	C
		-	-	5	3

COURSE OBJECTIVES

- To expose students to the operation of typical microprocessor and microcontroller.
- To prepare the students to be able to solve different problems by developing different programs
- To develop the quality of assessing and analyzing the obtained data
- To illustrate the architecture of 8085 a microprocessors.
- To understand the interfacing circuits for various applications of 8051 microcontroller
- To introduce the architecture of advanced microprocessors and microcontrollers

COURSE OUTCOMES

- Identify relevant information to supplement to the Microprocessor and Microcontroller course
- Set up programming strategies and select proper mnemonics and run their program on the training boards
- Practice different types of programming keeping in mind technical issues
- Develop testing and experimental procedures on Microprocessor and Microcontroller analyze their operation under different cases
- Prepare professional quality textual and computational results, incorporating accepted data analysis and synthesis methods, simulation software, and word-processing tools
- Illustrate the organization of registers and memory in microprocessors

(Any 12 Experiments)

Microprocessor Lab

1. Addition of 8/16-bit and array of data.
2. Multiplication and Division.
3. Fill and transfer an array of data.
4. Ascending/Descending of an array.
5. Data Transfer using Parallel Ports.
6. DC Motor Controller.
7. Counter using Seven Segment Display.
8. Digital to Analog Converter Interface.

Microcontroller Lab

9. Digital Clock.
10. LCD Interfacing.
11. A/D converter interface.
12. Stepper motor interface.
13. Traffic light controller.
14. Wave Generation.
15. Lamp Dimmer.

150EU501	BASIC ELECTRONICS	Semester-IV			
		L	T	P	C
		-	-	-	3

COURSE OBJECTIVES

- To learn the fundamentals of operation of the basic electronic devices.
- To understand the basic parameters of electronic devices, their performance, and limiting factors.
- To understand the basic principles of electronic device operation with emphasis on bipolar transistors, and unipolar microwave devices.
- Acquire the fundamental knowledge and expose to the field of semiconductor theory and devices and their applications.
- To give knowledge about semiconductor and discuss working and applications of basic devices, including p-n junctions, BJTs and FETs
- Introduce students to the physics of semiconductors and the inner working of semiconductor devices.

COURSE OUTCOMES

- Apply the knowledge of basic circuit law and simplify the network using reduction techniques
- Apply the knowledge of semiconductors to illustrate the functioning of basic electronic devices.
- Demonstrate the switching and amplification application of the semiconductor devices.
- Demonstrate the control applications using electronic devices.
- Apply concepts of semiconductor devices to design and analyze circuits.
- Ability to understand and analyze the inner working of semiconductor p-n diodes

UNIT I – Passive Components

Introduction – Resistors: Fixed & Variable resistor – Colour coding – Tolerance - Series and Parallel connection. Capacitors: Basic structure and symbol – Fixed & Variable capacitors – Dissipation factor – Series and parallel connection. Inductors: Inductance of the coil – Fixed & Variable inductors

UNIT II - Semiconductor Devices and Special Diodes

Introduction – Atom - Electron - orbit – Energy level - Conductor – Semiconductor – Insulator – Intrinsic semiconductor – Extrinsic semiconductor – P type and N type semiconductor – PN junction diode –V-I characteristics - Zener diode - V-I characteristics- Schottky diode -Tunnel diode - Varactor diode- UJT- Photo diode

UNIT III - Digital Electronics

Review of binary, octal, & hexadecimal and decimal number systems - Representation of signed numbers - Floating point number representation – BCD – ASCII – EBCDIC - Excess 3 codes gray code - Error detecting & Correcting codes. Boolean Algebra –Simplification of logic functions using Karnaugh map.

UNIT IV - Amplifiers & Oscillators

Classification of amplifiers- Single stage RC coupled amplifier - Oscillators –Types of oscillators: Hartley oscillator, Colpitts Oscillator & RC Phase shift oscillator.

UNIT V -.Operational Amplifiers

Introduction to Op-amp- Inverting and Non-Inverting configuration - Applications – Adder – Subtractor – Integrator - Differentiator and Comparator.

TEXT BOOKS

1. Electronic Devices and Circuits, S.Salivahanan, N.Suresh Kumar & A.Vallavaraj, Tata Mc Graw-Hill publishing Company Limited,Third Edition,2012.
2. Electronic Devices and Circuits, David.A. Bell, Oxford University Press Fifth Edition, 2008.
3. Digital Electronics and its principles, Salilvahanan, McGraw Hill Education (India) Private Limited, 2014, Tenth Edition.

REFERENCES

1. Electronic Devices and Circuits, Jacob Millman,Christos.C.Halkias&Satyabrata Jit,Tata Mc Graw –Hill Edition ,Third Edition,2010.
2. Electronic Devices and Circuits I.U.A.Bakshi.A.P.Godse,Technical Publications 01-Jan-2010.

15ECU601	EMBEDDED SYSTEMS	Semester-VI			
		L	T	P	C
		4	1	-	5

COURSE OBJECTIVES

- Ability to design an Embedded System, component or process to meet desired needs within realistic constraints.
- To develop the next generation technologies, methods and tools for modeling, design, implementation and operation of hardware/software systems embedded in intelligent devices
- To provide a broad overview of both theoretical and practical aspects of a design flow for To understand the need and applications of Microcontrollers n embedded system.
- To understand architecture and features of typical Microcontroller.
- Learn interfacing of real world input and output devices
- To study various hardware and software tools for developing applications embedded systems

COURSE OUTCOMES

- Understand hardware and software design requirements of embedded systems.
- Acquire knowledge about embedded processors and their applications
- Analyze the embedded systems specification and develop software programs.
- Ability to design an Embedded System, component or process to meet desired needs within realistic constraint
- Evaluate the requirements of programming embedded systems and tool chain for embedded systems.
- Explore the features of the microcontroller and provide solutions for embedded applications

UNIT I – PIC 16F87x Microcontrollers

Device overview – architecture – memory organization – status register – option register –INTCON register – PCON register – I/O ports – data EEPROM – instruction set: Byte oriented operations – Bit oriented operations – Literal and Control operations- Addressing Modes.

UNIT II – Peripheral Features of 16F87x Microcontrollers

TIMER0 Module – TIMER1 Module – TIMER2 Module – Capture/Compare/PWM Modules –Protocols: I²C,SPI , USART – ADC Module - Special features of the CPU : oscillator selection – power on reset – power up timer – oscillator start up timer – brown out reset – interrupts – watchdog timer – SLEEP

UNIT III - Introduction to PIC Peripherals and Interfacing

Introduction to PIC Peripherals and Interfacing: PIC16imer programming in assembly and C - Serial Port programming in assembly and C - Interrupt programming in assembly and C - ADC and DAC interfacing - CCP and ECCP programming - DC Motor interfacing and PWM.

UNIT IV - ARM Processor Fundamentals

ARM Design philosophy - Embedded System Hardware - Embedded System Software - Registers, Program Status Register – Pipeline – Exceptions – Interrupts - and the Vector table - Core Extensions - Architecture revisions - ARM Processor families.

UNIT V – Real Time Operating Systems

Survey of Software Architecture: Round Robin- Round Robin with Interrupts-Function –

Queue Scheduling Architecture-Introduction of RTOS-RTOS Architecture-Task and Task States – Task and Data – Semaphores and Shared Data – Message Queues, Mailboxes and Pipes-Timer Function-Events-Memory Management-Device Management-System Organization & Implementation.

TEXT BOOKS

- 1 Programming and Customizing the PIC Microcontroller, Myke Predko, Tata McGraw - Hill Education, Third Edition, 2010.
2. Arm Microcontroller Interfacing: Hardware and Software, Warwick A Smith, Gazelle Book Services, 2010.

REFERENCES

1. 123 PIC Microcontroller Experiments for the Evil Genius, Myke Predko, Tata McGraw - Hill Education, First Edition, 2005.
2. ARM System Developer's Guide –Designing and Optimizing System Software, Andrew N. Sloss, Dominic Symes & Chris Wright, Morgan – Kaufmann Publishers, First Edition, 2011.

15ECU602	MOBILE COMMUNICATION	Semester-VI			
		L	T	P	C
		5	-	-	5

COURSE OBJECTIVES

- To know the fundamental concept of Mobile Communication.
- To understand the concept of Protocol standards and security tasks.
- Provides the concept of Cellular Networks, GPRS, Wi-Fi, WiMax Systems
- Encompasses the various Mobile Communication Technologies and the Structure of Protocols
- To make students familiar with fundamentals of mobile communication systems 2. To choose system (TDMA/FDMA/CDMA) according to the complexity, installation cost, speed of transmission, channel properties etc
- To identify the requirements of mobile communication as compared to static communication

COURSE OUTCOMES

- Understand hardware and software design requirements of embedded systems
- To make students familiar with various generations of mobile communications
- To understand the concept of cellular communication
- To understand the basics of wireless communication
- Knowledge of GSM mobile communication standard, its architecture, logical channels, advantages and limitations
- Acquire knowledge about embedded processors and their applications

UNIT I – Cellular Networks

Cellular systems -Frequency Management and Channel Assignment - Types of handoff and their characteristics - FDMA – TDMA – CDMA –Cellular Wireless Networks.

UNIT II - GPRS

Introduction-GPRS and Packet-Data Network - GPRS Network Architecture - GPRS Network operations – Data Service in GPRS - Applications for GPRS - Limitations of GPRS - Billing and Charging in GPRS.

UNIT III - WiFi and WLL

Introduction WiFi-802.11b-802.11g-802.11a-802.16-WLL –overview –WLL Configurations-Benefits-Highlights-Propagation Considerations-Standards of IEEE 802.16.

UNIT IV - WiMax

Introduction-WiMax Architecture-MAC layer-IEEE 802.16 Protocol –channel Acquisition –IP Connectivity –Radio Link Control (RLC) –Interferences –Security in WiMax Networks-PKM Protocol.

UNIT V - Data Services

SMS: Strength of SMS –SMS Architecture:SMMT-SMMO –SMS as an information bearer-Operator –Centric full-Operator Independent pull-Value added service through SMS.

MMS: MMs Architecture – MMS Transaction flows-SMIL –MMS Inter connection.Interoperability and Roaming-MMs device management and configurations-GPRS application.

TEXT BOOKS

1. Mobile Communications, Jochen Schiller, Second Edition, Pearson Education, 2010.
2. Wireless Communications and Networks, William Stallings, Pearson Education, 2002.

REFERENCES

1. Principles of Wireless Networks, Kaveh Pahlavan, Prasanth Krishnamoorthy, First Edition, Pearson Education, 2009
2. Principles of Mobile Computing, Uwe Hansmann, Lothar Merk, Martin S. Nicklons and Thomas Stober, Springer, 2010
3. AdHoc Mobile Wireless Networks, C.K.Toh, First Edition, Pearson Education, 2002.
4. Mobile Computing ,Asoke K.Talukder and Roopa R Yavagal, 2005, Tat McGraw –Hill Publishing Company Ltd.New Delhi.
5. Mobil Computing and Wireless Communications ,Amjad Umar , ,NGS Solutions.
6. 3G Wireless Networks ,Clint Smith ,P.E Daniel Collins, ,Second Edition,McGraw Hill International Edition.

15ECU603A	ROBOTICS AND AUTOMATION	Semester-VI			
		L	T	P	C
		4	1	-	5

COURSE OBJECTIVES

- To learn the basic configuration of Robotics
- To understand the various types of Robots.
- To get an exposure in Robot control systems
- To acquire the knowledge on advanced algebraic tools for the description of motion
- To develop the ability to analyze and design the motion for articulated systems.
- To develop an ability to use software tools for analysis and design of robotic systems

COURSE OUTCOMES

- Understand the relationship between mechanical structures of industrial robots and their operational workspace characteristics.
- Illustrate the kinematics and dynamics of robotics.
- Implementation of related instrumentation and control in robotics
- Ability to solve inverse kinematics of simple robot manipulators
- Able to do the path planning for a robotic system
- Identify a Robot for a specific application.

UNIT I - Fundamentals of Robotic Technology

Robot Anatomy – Work Volume – Robot drive System – Control System and dynamic performance – Precision of Movement – end effectors – Robotic Sensors – Robot Programming and work cell control

UNIT II – Control System and Components

Basic control system concept and models – Controllers – Robot activation and feedback components – Position Sensor – Velocity Sensor – actuators – Power transmission System.

UNIT III - Robot Effectors

Types of end effectors – Mechanical grippers – Tools as End effectors – The Robot / End effectors interface.

UNIT IV – Sensors and Vision Systems

Sensors – Transducers and Sensors – Sensors in Robotics – Tactile Sensor – Proximity Sensor and sensor based system – Use of sensor in robotics – Introduction to Vision system - The sensing and digitizing function in machine vision.

UNIT V - Robot Motion Analysis and Control

Introduction to manipulator kinematics – Robot dynamics configuration of a robot controller – Flexible Manufacturing System Concept – Transfer system – Processing operation – Assembly and inspection

TEXT BOOKS

1. Industrial Robotics: Technology, Programming, and Applications, Mikell P Groover, Tata McGraw Hill Publishing Company Limited. Second Edition, 2012.
2. Introduction to Robotics Mechanics and Control, John J. Craig, Tata McGraw Hill Publishing Company Limited. Third Edition, 2008.

REFERENCES

1. Introduction to Robotics: Analysis, Control, Applications, Saeed B. Niku, Wiley India Pvt Ltd, Second Edition, 2012.

15ECU603B	INSTRUMENTATION AND CONTROL SYSTEMS	Semester-VI			
		L	T	P	C
		4	1	-	5

COURSE OBJECTIVES

- To know the fundamental concept of signals and production for controlling equipment or machines.
- To learn the various closed loop control systems current output is taken into consideration and corrections are made based on feedback
- To introduce different types of system and identify a set of algebraic equations to represent and model a complicated system into a more simplified form to interpret different physical and mechanical systems in terms of electrical system to construct equivalent electrical models for analysis
- To employ time domain analysis to predict and diagnose transient performance parameters of the system for standard input functions
- Identify the needs of different types of controllers and compensator to ascertain the required dynamic response from the system
- Formulate different types of analysis in frequency domain to explain the nature of stability of the system

COURSE OUTCOMES

- Understand the concept of time response and frequency response of the system.
- Analyze feedback characteristics of linear control systems to reduced the disturbance.
- Analyze time response of first and second order control systems for different standard test signals.
- Perform frequency domain analysis of linear control system using nyquist stability criterion.
- Identify the needs of different types of controllers and compensator to ascertain the required dynamic response from the system.
- Employ time domain analysis to predict and diagnose transient performance parameters of the system for standard input functions.

UNIT I - Transducers and Measurements

Transducer: Resistive transducer- Inductive transducer –Capacitive transducer – Load cell-Piezoelectric – Photo electric transducers – Temperature Transducer. Measurement: Measurement standards-Measurement of Linear Displacement using LVDT –Measurement of rotary displacement using RVDT – Hall Effect Principle, Operation and Application.

UNIT II - Digital Instruments

Performance Characteristics of instruments- Digital Multi meter – Digital frequency meter – Digital measurement of time - Digital measurement of mains frequency – Digital taco meter – Digital phase meter – Digital capacitance meter- Storage Oscilloscope.

UNIT III - Concepts of Control Systems

Introduction to Control Systems-Human elements in control systems-block diagram fundamentals -open loop control system-closed loop control systems- Linear and Nonlinear Systems- Effect of feedback on Overall gain, Stability, Sensitivity and Noise.

UNIT IV - Introduction to Block diagrams

Block diagram reduction-Signal flow graph-Signal flow graph algebra-construction of signal flow graph from block diagram- Mason's gain formula-Time Response Analysis of First and second order systems-Steady state Error.

UNIT-V - Stability Analysis of Control System

Bode plot- Routh Hurwitz criterion-Root Locus-Nyquist Criterion- Principles of P – PI – PD - PID Controllers - Cascade and feedback compensation, lag, lead, lag-lead Compensation.

TEXT BOOKS

1. Electronic Instrumentation, H.S.Kalsi, Tata McGraw Hill, Third Edition, 2010.
2. A Course in Electrical and Electronic Measurements & Instrumentation, A.K.Sawhney, Dhanpat Rai Publication, 2013.
3. Control Systems Engineering, R.Ananada Natrajan, P. Ramesh Babu, SCITECH Publications, Fourth Edition, 2010

REFERENCES

1. Automatic Control Systems, Anoop K.JaiRath,ANE Publications, 2013.
2. Control Systems Engineering, R.Ananada Natrajan, P. Ramesh Babu, SCITECH Publications, Fourth Edition, 2010

15ECU603C	MATLAB PROGRAMMING	Semester-VI			
		L	T	P	C
		4	1	-	5

COURSE OBJECTIVES

- To introduce the MATLAB for numerical computations to know the basic concepts.
- To familiarize basic commands through the Command window and output through the Graph window
- Introduce the MATLAB software environment
- Apply a variety of common numeric techniques to solve and visualize engineering-related computational problems
- To program scripts and functions using the Matlab development environment.
- To use basic flow controls (if-else, for, while).

COURSE OUTCOMES

- Understand the concept of time response and frequency response of the system
- Use MATLAB effectively to analyze and visualize data
- Apply numeric techniques and computer simulations to solve engineering-related problems
- Apply a top-down, modular, and systematic approach to design, write, test, and debug sequential MATLAB programs to achieve computational objectives
- Design and document computer programs and analyses in a careful and complete manner so as to effectively communicate results,
- Demonstrate understanding and use of fundamental data structures (classes). 6. Create and control simple plot and user-interface graphics objects in MATLAB.

UNIT I - Introduction

Matlab environment – Help future – Types of files – Platform – Search path – Matlab commands – Constants, Variables and Expressions: Character set – Data types – Constants and Variables – Operators – Hierarchy of operators – Built-in functions – Assignment statement.

UNIT II - Vectors and Matrices

Scalars and vectors – Entering data in matrices – Line continuation – matrix subscripts/indices – Multidimensional matrices and arrays – Matrix manipulation – Generation of special matrices – Matrix and array operations – Functions with array inputs – Structure arrays – Cell arrays.

UNIT III - I/O Statements and Graphics

Data input – Interactive inputs – Reading/Storing file data – Output commands – Low level input-output functions - Mat lab Graphics: Two dimensional plots – Multiple plots – Style options – Sub plots – Specialized two dimensional plots – Three dimensional plots.

UNIT IV - Control Structures and MATLAB Programming

Loops – Branches control structures – Matlab Programming: Matlab Editor – Matlab Programming – Function Subprograms – Types of functions – Function handling – Errors and Warnings – Matlab debugger.

UNIT V - Simulink

Introduction – Starting simulink – Simulink modelling – Solvers – Simulating a model – Using variables from matlab – Data import/export – State space modelling and simulation – Simulation of non-linear systems – obtaining state space model – Creating subsystems – Masked subsystems.

TEXT BOOKS

1. MATLAB and its Applications in Engineering, Rajkumar Bansal, Ashok Kumar Goel, Manoj Kumar Sharma, Pearson Education, First Edition, 2009.
2. Technology and Engineering Applications Simulink, Subhas Chakravarty, Intech, Third Edition, 2012.
3. MATLAB Programming for Engineers, Chapman, Cengage Learning India PVT Ltd, Fourth Edition, 2011.

REFERENCES

1. Matlab Applications for the Practical Engineer, Kelly Bennett, InTech, Tenth Edition, 2014.
2. Matlab: An Introduction with Applications, Amos Gilat, Siversio(WSE Series), Fourth Edition, 2012.

15ECU611	PRACTICAL – VII EMBEDDED SYSTEMS LAB	Semester-VI			
		L	T	P	C
		-	-	5	3

COURSE OBJECTIVES

- Demonstrate the sensing of different physical parameters
- Explain the calibration of parameters measured and displayed
- Evaluate the data transfer
- To understand the need and applications of Microcontrollers and ARM Processors in embedded system.
- To understand architecture and features of typical Microcontroller
- To learn interfacing of real world input and output devices

COURSE OUTCOMES

- Define the arithmetical and logical assembly language for microcontroller
- Know the downloading procedure on hardware into flash ROM and show the testing data on defined port wish board
- Competent to evaluate the data transfer response
- Able to describe the microcontroller and ARM Processor Architecture and its Features
- Learn importance of microcontroller and ARM Processor in designing embedded applications
- Learn use of hardware and software tools. 4. Develop interfacing to real world devices.

(Any 12 Experiments)

1. Writing and testing programs involving arithmetic, logical and BIT oriented instructions
2. LED interfacing
3. Data transfer program with parallel port
4. Key interfacing and Seven segment display interface
5. Stepper motor controller interface
6. Speed control of DC motor
7. PWM generation
8. Waveform generation
9. A/D converter interface
10. D/A converter
11. LCD interface
12. Programming using interrupts
13. Solid State Relay
14. I2C Interface
15. Serial Communication Interface

15ECU506	ELECTRONIC INSTRUMENTATION	Semester-VI			
		L	T	P	C
		-	-	-	4

COURSE OBJECTIVES

- To understand operation of different instruments
- To provide basic knowledge about the various sensors. and data acquisition systems applied in Wireless sensor network
- To provide fundamental concepts of control system.2 such as mathematical modeling, time response and frequency response
- To develop concepts of stability and its assessment.3 criteria.
- Explain basic concepts and definitions in measurement
- to find transfer functions for given system

COURSE OUTCOMES

- Able to understand operation of different instruments.
- Understand the principles of various types of transducers and sensors
- Able to calculate time domain and frequency domain parameter for given system
- Able to predict stability of given system using appropriate criteria
- Identify the various parameters that are measurable in electronic instrumentation
- Practice the construction of testing and measuring set up for electronic systems.

UNIT I - Electronic Test Instruments

Analog Meters D.C and A.C Voltmeters – Ammeters – Multimeter - Power meter - Q-meter -True RMS meter, Vector Impedance Meter, Vector Voltmeter, Component Measuring Instrument.

UNIT II - Signal Sources Sine wave generator-Frequency synthesized sine wave generator-

Sweep frequency generator, pulse and square wave generator-Function generator-Wave analyzer-Applications - Harmonic distortion analyzer-Spectrum analyzer-Applications-Audio Frequency generator-Noise generator.

UNIT III - Oscilloscopes

General purpose oscilloscope-Screens for CRT graticules-Vertical & horizontal deflection systems- Time base operation, triggers – sweep control, z axis input - Delay lineMultiple trace-Dual beam & dual trace-Probes-Oscilloscope techniques-special oscilloscopes - Storage oscilloscope-sampling oscilloscope-digital CRO.

UNIT IV - Digital Instruments

Digital method for measuring frequency, period, phase difference, pulse width, time interval, total count-Digital voltmeter-Types-Automatic polarity indication, automatic ranging, and auto zeroing-DMM-Microprocessor based DMM-DPM-swept – spectrum analyzer-network analyzer-discharge analyzer- logic probes-logic analyzer.

UNIT V - DISPLAY AND RECORDING DEVICES

Bar graph display-Segmental and dot matrix display-X-Y recorders, magnetic tape recorders-Digital recording-Data loggers-Interference and screening-Electrostatic and electromagnetic interference & earth loops.

TEXT BOOKS

1. Modern Electronic Instrumentation & Measurement Techniques, Albert D. Helfrick &

- William D. Cooper, Prentice Hall of India, 2002.
2. A Course in Electrical and Electronic Measurements & Instrumentation, A.K.Sawhney, Dhanpat Rai Publication, 2013
 3. Digital Instrumentation, A.J.Bouwens, Tata Mc Graw Hill, 1997.
 4. Electronic Test Instruments, Theory and applications, Robert A.Witte, Prentice Hall, 1993.

REFERENCES

1. Electronic Measurements & Instrumentation, B.M.Oliver and J.M.Cage, Mc Graw Hill International Edition, 1975.

4. Electronic Instrumentation and Measurements, D.A.Bell, Prentice Hall of India, 2002.
5. Electronic Measurements and Instrumentation, Rajendra Prasad, Khanna Publishers, Delhi, 2003.
6. Electronics and Instrumentation, B.R.Gupta, S.Chand Co. (P)Ltd., Delhi, 2003.

15ECU604	PROGRAMMABLE LOGIC AND DISTRIBUTED CONTROL SYSTEMS	Semester-VI			
		L	T	P	C
		-	-	-	4

COURSE OBJECTIVES

- To identify logical process control in automation
- To connect PLC peripherals with PLC for logical functioning.
- To get strong knowledge in the developing of basic PLC programs
- To understand the components of a PLC system To understand how PLCs are used
- To understand the H&S requirements of a PLC- controlled system
- To understand different methods of interfacing with a PLC

COURSE OUTCOMES

- Identify the main parts of programmable logic controller
- Develop logic gate circuits for Boolean expressions
- Able to state basic PLC Terminology
- Identify logical process control, in automation.
- Describe how a programmable logic controller is programmed.
- Describe switching elements on input/output modules

UNIT I - Review of Computers In Process Control

Data loggers: Data acquisition systems (DAS): alarms, computer control hierarchy levels. Direct Digital control (DDC). Supervisory digital control (SCADA). Characteristics of digital data. Controller software. Linearization. Digital Controller modes, Error, Proportional, Integral, Derivative and Composite Controller Modes.

UNIT II - Programmable Logic Controller (PLC) Basics

Definition- overview of PLC systems - Input/ Output modules - Power supplies –ISO slots. General PLC programming procedures - Programming on-off outputs-Auxiliary commands and functions - Creating Ladder Diagrams from process control descriptions. PLC basic functions - Register basics - Timer functions - Counter functions.

UNIT III - PLC Intermediate Functions

Arithmetic functions - number comparison functions - Skip and MCR functions - Data move systems - PLC Advanced intermediate functions- utilizing digital bits - sequencer functions - PLC Advanced functions: alternate-programming languages - operation. PLC-PID functions - PLC installation - trouble shooting and maintenance

UNIT IV - Interface and Backplane Bus Standards for Instrumentation Systems

Field bus: Introduction - concept - international field bus standards. HART protocol: method of operation - structure - operating conditions and applications.

UNIT V - Distributed Control Systems (DCS)

Evolution of DCS - building blocks - detailed descriptions and functions of field control UNITS- operator stations - data highways - redundancy concepts. DCS - supervisory computer tasks and configuration - DCS- system integration with PLC and computers.

TEXT BOOKS

1. Computer based Industrial Control, Krishna Kant, Prentice Hall India, 2010.
2. Programmable Logic Controllers Principles and Applications, John Webb. W. and Ronald Reis, A. Prentice hall Inc, Fifth Edition 2003.

REFERENCES

1. Programmable Logic Controllers, Frank D. Petruzella, Tata McGraw Hill, Third Edition, 2010.

15ECU507	MEMS AND CONTROL ENGINEERING	Semester-II			
		L	T	P	C
		-	-	-	5

COURSE OBJECTIVES

- To identify logical process control in automation
- To learn the various micro fabrication technologies for MEMS
- Understand unique requirements for MEMS fabrication
- To know about the merging of mechanical devices with circuits
- To know about the current trends and future technology for MEMS
- Identify problems and suggest suitable MEMS material/ Devices/Process to get the Requisite Solution for a given application Fundamental Devices and Processes for MEMS

COURSE OUTCOMES

- Identify the main parts of programmable logic controller
- Develop logic gate circuits for Boolean expressions
- Able to state basic PLC Terminology
- Apply fundamental concepts of MEMS to solve real life engineering problems
- Apply advanced MEMS techniques to solve future engineering problems.
- Know about the merging of mechanical devices with circuits

UNIT I - Overview and Working Principles of MEMS

MEMS and Microsystems – Typical MEMS and Microsystems Products – Microsystems and Microelectronics – Miniaturization – Applications of Microsystems – Micro Sensors, Micro Actuation, Micro Grippers, Micro Motors, Micro Accelerometer.

UNIT II - Fabrication & Microsystems Design

Ions and Ionization – Doping – Diffusion Process – Scaling Laws For Electrical Design – Substrate and Wafers – Silicon as a Substrate – Silicon Compounds – Piezo Resistors – Piezo Crystals - Photolithography – Ion Implantation – Diffusion – Oxidation – PVD – Etching – Surface Micro Matching – LIGA Process – Micro System Design Considerations

UNIT III - Concepts of Control System

Introduction – Open and Closed Loop Systems – Examples – Elements of Closed Loop Systems – Linear and Nonlinear System - Effect of Feedback on Overall Gain, Stability, Sensitivity and Noise – Transfer Function of Closed Loop System – Block Diagram Algebra and Reduction – Mason's Gain Formula.

UNIT IV -Time Response Analysis & Stability in Time and Frequency Domain

First Order System: Impulse and Step Input Analysis – Second Order System Analysis – Steady State Error – Stability Analysis: Routh Hurwitz Criterion – Root Locus Method – Construction and Application - Nyquist Stability Criterion – Bode Diagrams – Polar Plot.

UNIT V - Design of Digital Control System

Z Plane Specifications of Control System Design – Digital Compensator Design – Frequency Response Method - State Feedback – Pole Placement Design – State Observers – Digital Filter Properties – Frequency Response – Kalman's Filter.

TEXT BOOKS

1. MEMS & Microsystems Design & Manufacture and Nano Scale Engineering, Tai-Ran Hsu, Wiley Publications, Second Edition, 2011.

2. Control Systems Engineering, R. Ananada Natrajan, P. Ramesh Babu, SCITECH Publications, Fifth Edition, 2012

REFERENCES

1. Digital Control Engineering, M. Gopal, New age International (p) Ltd, Fifth Edition, 2012.

15ECU605	DIGITAL SIGNAL PROCESSING	Semester-III			
		L	T	P	C
		-	-	-	5

COURSE OBJECTIVES

- To understand the fundamental concepts and theory of Discrete Fourier Series and Discrete Fourier Transform.
- To get an exposure on Discrete Fourier Transforms (DFT), its applications and implementation by FFT techniques.
- To apply design technique for FIR type digital filters
- Understand fundamentals of Digital Signal Processing
- Analyze & compare different signal processing strategies.
- Become aware of some applications of DSP.

COURSE OUTCOMES

- Understand the fundamental concepts and theory of Discrete Fourier Series and Discrete Fourier Transform
- Ability to compute various transform analysis of Linear Time Invariant Systems.
- Implement problem solving strategies to DSP Problems.
- Able to test signal processing algorithms for various applications
- Ability to understand Various applications of DSP such as signal processing and telecommunication.
- Apply design techniques for FIR type digital filters

UNIT I - Structures For Discrete Time Systems

Introduction – Block Diagram and Signal Flow Graph Representation of Linear Co-Efficient Difference Equation – Basic Structures for IIR Systems – Basic Network Structures for FIR Systems – Lattice Structures – Zero Input Cycles in Fixed Point Realization of IIR Digital Filters.

UNIT II - Filter Design Techniques

Introduction – Design of Discrete Time IIR Filters from Continuous Time Filters – Frequency Transformation of Low Pass IIR Filters – Design of FIR Filters by Windowing - Comments on IIR and FIR Digital Filters.

UNIT III - Computation of Discrete Fourier Transform

Introduction – Efficient Computation of DFT – Decimation in Time FFT Algorithms – Decimation in Frequency Algorithms – Implementations of FFT Algorithms – FFT Algorithms for Composite N.

UNIT IV TMS 320 C 6713 Overview

Introduction – TMS320C6713 Overview – Key Features – Architectural Overview – Functional Block Diagram - Internal Memory Organization – CALU – System Control – PLU – Interrupts – Addressing Modes – Instruction Set.

UNIT V -Introduction to MATLAB

Introduction To M-Files – Inline Functions – Control Flow – Relations & Logical Operators – Strings – Cell Arrays – Functions – MATLAB Graphics: - 2d Graphics – 3d Graphics – Animations.

TEXT BOOKS

1. Discrete Time Signal Processing, Oppenheim A.V and Schaffer RW, Buck .C, Prentice Hall

India, Second Edition, 2013.

2. Digital Signal Processing – A computer Based Approach, Sanjith K.Mitra, McGraw Hill, Fourth Edition, 2013.

3. TMS 320 C 671x users guide, Texas instruments, 1993.

REFERENCES

1. Digital Signal Processing, Nagoor Kani.A, Tata McGraw Hill Pvt Ltd, Second Edition, 2012.

15ECP101	ADVANCED DIGITAL SYSTEM DESIGN	Semester-I			
		L	T	P	C
		3	1	-	4

COURSE OBJECTIVES

- To provide strong knowledge on Programmable Logic Devices and its usage in industrial automation.
- To understand number representation and conversion between different representation in digital electronic circuits.
- To analyze logic processes and implement logical operations using combinational logic circuits.
- To understand concepts of sequential circuits and to analyze sequential systems in terms of state machines
- To understand concept of Programmable Devices, PLA, PAL, CPLD and FPGA and implement digital system using VHDL
- To implement combinational and sequential circuits using VHDL

COURSE OUTCOMES

- Develop a digital logic and apply it to solve circuit problems
- Analyze, design and implement combinational logic circuits
- Classify different semiconductor memories
- Analyze, design and implement sequential logic circuits
- Analyze digital system design using PLD
- Simulate and implement combinational and sequential circuits using VHDL systems

UNIT I - Sequential Logic Circuits

Introduction to Sequential Logic Circuits - Mealy Machine- Moore Machine - State Diagrams - State Table Minimization - Incompletely Specified Sequential Machines - State Assignments - Design of Synchronous and Asynchronous Sequential Logic Circuits - Working in Fundamental and Pulse Mode.

UNIT II - Synchronous Sequential Circuit Design

Introduction of Clocked Synchronous Sequential Networks (CSSN) - Modeling of CSSN - State Table Assignment and Reduction – Design of CSSN - ASM Chart - ASM Realization.

UNIT III - Asynchronous Sequential Circuit Design

Introduction of Asynchronous Sequential Circuits (ASC)-Flow Table Reduction - Races in ASC - State Assignment - Problem and the Transition Table - Design of ASC - Static and Dynamic Hazards -Mixed Operating Mode Asynchronous Circuits.

UNIT IV - Programmable Logic Devices

Basic Concepts - Programming Technologies - Programmable Logic Element(PLE), Programmable Logic Array(PLA) - Programmable Array Logic(PAL) - Complex PLD's(CPLD) - System Design using PLD's - Design of Combinational and Sequential Circuits using PLD's.

UNIT V - Study of FPGA and XILINX

Introduction to Field Programmable Gate Arrays - Types of FPGA – Xilinx XC3000 Series - Logic Cell Array (LCA) - Configurable Logic Blocks (CLB) - Input/Output Block (IOB) - Programmable Interconnect Point (PIP).

TEXT BOOKS

1. Digital Principles and Design, Donald G.Givone, Tata McGraw Hill, First Edition, 2012.
2. Digital Systems: Principles and Applications, Gregory L. Moss, Ronald J. Tocci, Neal S. Widmer, Pearson Education, Tenth Edition, 2013

REFERENCES

1. Logic Design Theory, Nripendra N Biswas Prentice Hall of India, First Edition.2013.

15ECP102	MODERN COMMUNICATION SYSTEMS	Semester-I			
		L	T	P	C
		4	-	-	4

COURSE OBJECTIVES

- To learn the designing procedure and operation of circuits used for communication.
- To know the elements of modern communication systems
- To understand the basics and to identify the issues in today's communication systems, including satellite communication, Optical Fiber Communication and Digital cellular systems and cellular networks.
- To understand the basic concepts of AM, FM, and PM transmission and reception.
- To assess and evaluate different modulation and demodulation techniques.
- To evaluate the influence of noise on communications signals.

COURSE OUTCOMES

- Apply or create suitable algorithm to solve a particular problem
- Understand and identify the fundamental concepts and various components of analog communication systems
- Explain signal to noise ratio, noise figure and noise temperature for single and cascaded stages in a communication system.
- Describe analog pulse modulation techniques and digital modulation technique
- Develop the ability to compare and contrast the strengths and weaknesses of various communication systems.
- Use of different modulation and demodulation techniques used in analog communication

UNIT I -Wave Propagation

EM Waves – Free Space Propagation – Surface Wave Propagation – Sky Wave Propagation – Space Wave Propagation – Tropospheric Scatter Propagation – Structure of Atmosphere – Characteristics of Ionized Regions – Virtual Height – Maximum Usable Frequency - Lowest Usable Frequency – Skip Distance – Optimum Working Frequency – Ionospheric Abnormalities – Duct Propagation.

UNIT II - Satellite Communication

System Description – Telemetry, Tracking and Command – Communication Space Craft – Satellite Orbit – GEO – LEO – MEO – Satellite Position – Linkage – Frequencies – Inside the Satellite: Transponder – Antenna Systems – Power Packages – Station Keeping – Ground Station – Aligning the Satellite Dish.

UNIT III - Optical Fiber Communication

Basic Fiber Optic System – Frequencies – Fiber Optic Cables – Refraction – Numerical Aperture – Graded Index Cables – Single Mode – Multimode – Cable Constructions – Cable Losses – Connector – Light Sources – Light Detector - System Components – Advantages And Disadvantages.

UNIT IV - Digital Cellular Systems

GSM Architecture – Layer Modeling – Transmission – Data Service – Multiple Access Scheme – Channel Coding Interleaving – Radio Resource Management – Mobility Management – Communication Management – Network Management – TDMA Architecture – Transmission and Modulation – CDMA – Terms of CDMA Systems – Call Processing – Handover Procedures.

UNIT V - Intelligent Network for Wireless Communication

Intelligent Cell Concept – Intelligent Micro Cell Operation – Applications – Advanced Intelligent Network (AIN): Evaluation – Architecture – ISDN for AIN – AIN for Mobile – Asynchronous Transfer Mode (ATM) Technology: TM Network Concept – Applications – Wireless Information Super Highway.

TEXT BOOKS

1. Electronic Communication Systems, Kennedy and Davis, Tata McGraw Hill, fifth Edition, 2012.
2. Mobile Cellular Telecommunications, Willian C.Y. Lee, McGraw Hill, Second Edition, 2012

REFERENCES

1. Electronic Communications Modulation and Transmission, Robert J Schoenbeck, PHI, Second Edition, 2011.

15ECP103	SIGNALS AND SYSTEMS	Semester-I			
		L	T	P	C
		4	-	-	4

COURSE OBJECTIVES

- To understand the process of convolution between signals and able to solve differential equation using Laplace transform techniques.
- To understand the intuitive meaning of frequency domain and the importance of analyzing and processing signals in the frequency domain.
- Able to compute the Fourier series or Fourier transform Z-transform
- To introduce students the concept and theory of signals and systems needed in electronics and telecommunication engineering fields
- Knowledge about basic signal and system modeling concept and definitions
- Knowledge about the application and use of mathematical transforms and state-variables in order to solve electrical engineering problems

COURSE OUTCOMES

- Understand about various types of signals and systems, classify them, analyze them and perform various operations.
- Understand the use of transform to analysis of signals and systems in continuous and discrete time domain
- Implement the concept and theory of signals and systems in electronics and communication field.
- Ability to have idea of signal and system analysis and its characterization in time and frequency domain
- Students can perform mathematical and graphical convolution of signals and systems.
- Compute the Fourier series or Fourier transform Z-transform

UNIT I - Signals and systems

Introduction - CT and DT Signals – Transformation of the Independent Variable – CT and DT Systems – Basic System Properties. LTI System: - Introduction – DT LTI Systems – CT LTI Systems – Properties of LTI System.

UNIT II - Fourier series representation of Periodic signals

Introduction – Fourier Series Representation of CT Periodic Signals – Properties of CT Fourier Series – Fourier Series Representation of DT Periodic Signals – Properties of DT Fourier Series – Fourier Series and LTI System – Filtering.

UNIT III - CT and DT Fourier Transform

Introduction – Representation of Periodic Signals in Continues Time Fourier Transform – Fourier Transforms for Periodic Signals - Properties of the CT Fourier Transform – Convolution Property – Multiplication Property - Discrete Time Fourier Transform - Introduction – Representation of Periodic Signals in DT Fourier Transform – Fourier Transform for Period Signals – Properties of Discrete Time Fourier Transform - Convolution Property – Multiplication Property – Duality.

UNIT IV - Sampling

Introduction - Sampling Theorem – Reconstruction of a Signal From its Samples using Interpolation – Aliasing – DT Processing of a CT Signals – Sampling of DT Signals.

UNIT V - Laplace and Z transform

Introduction – Laplace Transform – Region of Convergence For LT – Inverse Laplace Transform – Properties of Laplace Transform - Z-Transform:- Introduction – Z-Transform – Region of Convergence for Z-Transform – Inverse Z–Transform – Properties of Z-Transform.

TEXT BOOKS

1. Signals and Systems, Alen V. Oppenheim Alan S. Wilsky and Hamid Nawab S, PHI, Second Edition, 2012.
2. Signals and Systems, Simon Haykin and Barry Van Veen, John Wiley & sons Inc. Second Edition, 2012

REFERENCES

1. Signals and Systems, Anand Kumar.A, PHI Learning Press, Third Edition, 2013.

15ECP104	EMBEDDED SYSTEMS	Semester-I			
		L	T	P	C
		3	1	-	4

COURSE OBJECTIVES

- Ability to design an Embedded System, component or process to meet desired needs within realistic constraints.
- To develop the next generation technologies, methods and tools for modeling, design, implementation and operation of hardware/software systems embedded in intelligent devices
- To understand the need and applications of Microcontrollers in embedded system.
- To understand architecture and features of typical Microcontroller.
- Learn interfacing of real world input and output devices
- To study various hardware and software tools for developing applications embedded systems

COURSE OUTCOMES

- Understand hardware and software design requirements of embedded systems.
- Acquire knowledge about embedded processors and their applications
- Analyze the embedded systems specification and develop software programs.
- Ability to design an Embedded System, component or process to meet desired needs within realistic constraint
- Evaluate the requirements of programming embedded systems and tool chain for embedded systems.
- Explore the features of the microcontroller and provide solutions for embedded applications

UNIT I - PIC 18F Microcontroller

Introduction to Microcontroller: Brief History of The PIC Microcontroller – PIC18 Features and Block Diagram – PIC18 Architecture - Addressing Modes – Instruction Set – PIC I/O Port Programming.

UNIT II – Embedded C Programming

Introduction to C Programming: Data Types in C - I/O Port Programming in C - Bit-Addressable I/O Programming - Logic Operations in C - Data Conversion Programs in C.

UNIT III - PIC Peripherals and Interfacing

Introduction to PIC Peripherals and Interfacing: PIC18 Timer Programming in Assembly and C - Serial Port Programming in Assembly and C - Interrupt Programming in Assembly and C - ADC and DAC Interfacing - CCP and ECCP Programming - DC Motor Interfacing and PWM.

UNIT IV - Introduction to Embedded Systems

Introduction to Embedded Systems Characteristics of Embedded Systems - Software Embedded into a Systems - Device Drivers and Interrupt Servicing Mechanisms - Inter-Process Communication and Synchronization of Process - Tasks and Threads: Multiple Processes in an Application – Data Sharing by Multiple Tasks and Routines – Inter Process Communication.

UNIT V - Embedded Design Process

Embedded Design Life Cycle – Product Specification – Hardware / Software Partitioning – Detailed Hardware and Software Design – Integration – Product Testing – Selection Processes – Microprocessor Vs Micro Controller – Performance Tools – Bench Marking –RTOS Micro Controller Tool Chain Availability – Other Issues in Selection Processes.

TEXT BOOKS

1. Programming and Customizing the PIC Microcontroller, Myke Predko, Tata McGraw - Hill Education, Third Edition, 2010.
2. Embedded Systems Architecture Programming and Design, Rajkamal, Tata McGraw Hill Publications. Third Edition, 2014.

REFERENCES

1. PIC Microcontroller and Embedded Systems using assembly and C for PIC18 –Muhammad Ali Mazidi, Roind D. Mckinay, Danny Causey, Pearson Education, First Edition, 2010.

15ECP105	ADVANCED ELECTRONIC CIRCUIT THEORY	Semester-I			
		L	T	P	C
		4	-	-	4

COURSE OBJECTIVES

- Ability to design different types of Electronic Circuits such as Amplifiers and Oscillators.
- To understand and implement the advanced electronic circuits such as amplifiers etc with the help of theoretical and practical problem solving.
- Ability to analyze the different types of configurations and applications of Transistor.
- Ability to determine the stability of feedback amplifiers and their steady state performance.
- To analyze the Circuits in time and frequency domain
- Calculation and measurement of parameters for electronic circuits, to introduce the students to the advanced concepts of electronics.

COURSE OUTCOMES

- Know the characteristics of diodes and transistors
- Design simple circuits and know the benefits of feedback in amplifier
- Apply their knowledge in analyzing Circuits by using network theorems.
- Measure the characteristics of electronic circuits and present experimental results
- Compare and classify oscillators
- Analyze electrical circuits and calculate the main parameters

UNIT I - Semiconductor Devices

Conductor – Semiconductor – Intrinsic Semiconductor – Extrinsic Semiconductor – P Type and N Type Semiconductor – PN Junction Diode – V-I Characteristics - Zener Diode – V-I Characteristics Construction of NPN and PNP Transistors – Operation of NPN, PNP Transistors – Characteristics of CE and CB Transistor Configurations

UNIT II - Circuit Analysis

Mesh Analysis - Mesh Equation by Inspection Method - Nodal Analysis – Source Transformation Technique – Star to Delta Transformation. Network Theorems: Superposition Theorem - Thevenis's Theorem - Norton's Theorem – Reciprocity Theorem – Maximum Power Transfer Theorem – Millman's Theorem.

UNIT III - Analog Electronics

Detailed Analysis of BJT and FET Biasing Circuits - Stability Considerations - Analysis of Single and Multistage Amplifiers - Amplifier with Different types of Feedbacks - Power Amplifiers - Tuned Amplifiers and Oscillators - Linear Integrated Circuits - Process Technology - Differential Amplifiers and Current Mirrors - Op-Amp Details. Op-Amp Circuits and Applications - Active Filters - Functional Amplifiers.

UNIT IV - Thyristors and Special diodes

SCR - Construction – Characteristics – Two Transistor Version – Thyristor ratings -LASER – TRIAC – DIAC - Zener Diode - Avalanche Break Down – Zener Breakdown – Application of Zener - Varactor Diode – Schottky Diode - Tunnel Diode - Gunn Diode – IMPATT Diode - PIN Diode – LASER Diode.

UNIT V - AC Fundamentals

Electrical Sources - AC Waveforms - Frequency, Phase, Amplitude, Peak, RMS, Calculation of Power, Response of Passive Components on AC Waveforms – Impedance in RLC Circuit - Transient Analysis of Electric Circuits - Steady State Analysis of Circuits - Network Theorems(Ac Circuits) - Two Port Networks – Resonance.

TEXT BOOKS

1. Electronic Devices and Circuits, David.A. Bell, Oxford University Press 5th Edition, 2008.
2. Circuit Theory : Analysis and Synthesis, Abhijit Chakrabarti, Dhanpat Rai & Co. Sixth Edition, 2014

REFERENCES

1. Electronic Devices and Circuits, S.Salivahanan, N.Suresh Kumar & A.Vallavaraj, Tata Mc Graw-Hill publishing Company Limited, Fourth Edition, 2013.

.15ECP111	PRACTICAL – I ADVANCED ELECTRONIC CIRCUITS AND COMMUNICATION LAB	Semester-I			
		L	T	P	C
		-	-	4	2

COURSE OBJECTIVES

- To identify and test various electronic components
- To use DSO for various measurements
- To plot the characteristics of diode and transistor
- To design and implement feedback amplifier circuits
- To measure the frequency of oscillators.
- To design and test regulated power supplies

COURSE OUTCOMES

- Verify the rectifier circuits using diodes and implement them using hardware
- Design the biasing circuits like self biasing
- Understand the construction, operation and characteristics of FET which can be used in the design of amplifiers
- Design simple circuits
- Know the benefits of feedback in amplifier
- Compare and classify oscillators.

(Any 10 Experiments)

1. Design of Double stage RC coupled amplifier
2. Design of Common Source FET Amplifier
3. Design of Feedback amplifier
4. Design of Wein bridge oscillator
5. Design of Phase shift oscillator
6. Design of Colpitts and Hartley oscillator
7. Design of Schmitt trigger
8. Design of AM Modulation
9. Design of FM Modulation
10. Design of PAM Modulation
11. Design of PPM Modulation
12. Design of PWM Modulation

15ECP112	PRACTICAL – II EMBEDDED SYSTEMS LAB	Semester-I			
		L	T	P	C
			-	4	2

COURSE OBJECTIVES

- Demonstrate the sensing of different physical parameters
- Explain the calibration of parameters measured and displayed
- Evaluate the data transfer
- To understand the need and applications of Microcontrollers and ARM Processors in embedded system.
- To understand architecture and features of typical Microcontroller
- To learn interfacing of real world input and output devices

COURSE OUTCOMES

- Define the arithmetical and logical assembly language for microcontroller
- Know the downloading procedure on hardware into flash ROM and show the testing data on defined port with board
- Competent to evaluate the data transfer response
- Able to describe the microcontroller and ARM Processor Architecture and its Features
- Learn importance of microcontroller and ARM Processor in designing embedded applications
- Learn use of hardware and software tools.

(Any 10 Experiments)

1. Writing and testing programs involving arithmetic, logical and BIT oriented instructions.
2. LED interfacing
3. Data transfer program with parallel port
4. Key interfacing and Seven segment display interface
5. Stepper motor controller interface
6. Speed control of DC motor
7. PWM generation
8. Temperature monitoring and control
9. Waveform generation
10. A/D converter interface
11. D/A converter
12. LCD interface

15ECP201	VLSI DESIGN AND VHDL PROGRAMMING	Semester-II			
		L	T	P	C
		4	1	-	5

COURSE OBJECTIVES

- To learn the basics of language elements.
- To provide a strong knowledge about the VHDL Modeling.
- To introduce a hardware description language (HDL) for the specification, simulation, synthesis
- Implementation of digital logic systems.
- Design practice sessions and implementing digital logic systems with commercial electronic design (EDA) tools
- To know the features of programming and simulation techniques.

COURSE OUTCOMES

- Building simulation module as per system specification for e.g. VHDL model for ASIC design
- Understanding types of design such as high level design, operative part design, control part design, memory design etc
- Functioning and specifying the tools used for design as per requirement
- Creation of code, verification, testing software
- Testing various examples on the system
- Understanding the synthesis and simulation process of code

UNIT I - Introduction and Basic Concepts of VHDL

History of VHDL – Capabilities of VHDL – Hardware Abstraction – Basic Terminology – Entity Declaration - Architecture Body Declaration – Basic Language Elements – Identifiers – Data Objects – Data Type Operators.

UNIT II - Behavioral Modeling Techniques of VHDL

Behavioral Modeling: Entity Declaration – Architecture Declaration – Process Statements Variable Assignment Statements – Signal Assignments Statements – Wait Statement – IF Statement – Case Statement – Null Statement – Loop Statement – Exit Statement – Next Statement – Assertion Statement – Report Statements – More On Signal Assignment Statement – Multiple Process – Postponed Process.

UNIT III - Data Flow Modeling Techniques of VHDL

Data Flow Style of Modeling: Concurrent Signal Assignment Statement versus Signal Assignment – Delta Delay Revisited – Multiple Drivers – Conditional Signal Assignment Statement – Selected Signal Assignment Statement – Unaffected Value – Block Statement - Concurrent Assertion Statement.

UNIT IV - Structural Modeling

Component Declaration – Component Instantiation – Resolving Signal Value – Examples – Half Adder – Full Adder – Four to One Multiplexers – Decoders and Encoders.

UNIT V - Advanced Features in VHDL

Generics – Configuration – Configuration Specification – Configuration Declaration – Default Rules – Conversion Functions – Direct Instantiation – Incremental Binding – Sub Programs – Sub Program Overloading - Operator Overloading – Signatures.

TEXT BOOKS

1. A VHDL Primer, J. Bhasker, Pearson Education. Third Edition, 2010.
2. VHDL: Programming by Examples, Douglas.P.Perry,Mc Graw Hill Publications, Fourth Edition,2014.

REFERENCES

1. HDL Programming VHDL and Verilog, Nazeih M. Botros, Wiley India Pvt. Ltd, First Edition, 2012
2. Introductory VHDL: From Simulation to Synthesis, Yalamanchili, 1st Edition, 2011.

15ECP202	ARM MICROCONTROLLER	Semester-II			
		L	T	P	C
		4	1	-	5

COURSE OBJECTIVES

- Demonstrate the sensing of different physical parameters
- Explain the calibration of parameters measured and displayed
- Evaluate the data transfer
- To understand the need and applications of Microcontrollers and ARM Processors in embedded system.
- To understand architecture and features of typical Microcontroller
- To learn interfacing of real world input and output devices

COURSE OUTCOMES

- Define the arithmetical and logical assembly language for microcontroller
- Know the downloading procedure on hardware into flash ROM and show the testing data on defined port wish board
- Able to describe the microcontroller and ARM Processor Architecture and its Features
- Learn importance of microcontroller and ARM Processor in designing embedded applications
- Learn use of hardware and software tools.
- Develop interfacing to real world devices.

UNIT I - Introduction to Embedded System and LPC 2148 ARM Controller

Definition of Embedded System – Features of Embedded System – Types of Embedded System - LPC 2148 ARM Controller – Block Diagram – Memory and On Chip Peripheral Devices – ARM 7 TDMI - S CPU Registers – Modes of Operation – PSW.

UNIT II - Embedded C basics, GPIO (Slow), Timer and Interrupts

Embedded C Basics – GPIO (Slow) Register Map - Pin Connect Block - 8 Bit LED'S – 8 Bit Switches – Buzzer – Relay – Stepper Motor Interfaces -Timer/Counter – Block Diagram – Register Map – Program for Time Delay and Counter Operation - Register Map – External Interrupts - Timer/Counter based Interrupt.

UNIT III - PWM, ADC, DAC and RTC

PWM Features – Block Diagram – Register Map – Program for Generating Single Ended PWM - ADC Feature – Block Diagram – Register Map – Program for ADC and Temperature Sensor LM 35 Interface - DAC Feature – Block Diagram – Register Map – Program for Generating Analog Output - RTC Feature – Block Diagram – Register Map – Program for displaying the Time in LCD Display.

UNIT IV - Serial and Parallel Communication

UART Feature – UART0 Block Diagram – Register Map – Transmission and Reception of Messages for PC – SSP Feature – Register Map.

UNIT V - I2C

Introduction to I2C – I2C Feature in LPC 2148 – Block Diagram – Register Map – I2C Master Mode Operation – Interfacing I2C based I/O Expander PCF 8574 – Interfacing LED – 7 Segment Display – Interfacing I2C based EEPROM – Programs.

TEXT BOOK

1. ARM Microcontroller Interfacing: Hardware and Software, Warwick A. Smith, Gazelle Books Services, Second Edition, 2010.

REFERENCES

1. ARM Microcontroller, B. Shantha Kumar Naik, Sapna Books House, First Edition, 2013.

15ECP203	TELECOMMUNICATION SYSTEMS	Semester-II			
		L	T	P	C
		5	-	-	5

COURSE OBJECTIVES

- To learn the designing procedure and operation of circuits used for communication.
- To understand the basic concepts of AM, FM, and PM transmission and reception.
- To assess and evaluate different modulation and demodulation techniques.
- To evaluate the influence of noise on communications signals.
- To introduce students to various modulation and demodulation techniques of analog communication
- To analyze different parameters of analog communication techniques.

COURSE OUTCOMES

- Apply or a create suitable algorithm to solve a particular problem
- Understand and identify the fundamental concepts and various components of analog communication systems
- Explain signal to noise ratio, noise figure and noise temperature for single and cascaded stages in a communication system.
- Describe analog pulse modulation techniques and digital modulation technique
- Develop the ability to compare and contrast the strengths and weaknesses of various communication systems.
- Use of different modulation and demodulation techniques used in analog communication

UNIT I - Overview of Telecommunication

Introduction-History of Telecommunication-Telecommunication Network Internet - Classification of Data Network-Telecommunication Standards.

UNIT II - Electronics for Telecommunication

Introduction - Communication System Parameters - FDM – TDM - WDM. Transmission Media: Introduction – Fiber Optic Cables - Cabling Architecture.

UNIT III - Voice Communication

Introduction - Public Telephone Network - Telephone Types - Circuit – Out Going – Incoming Calls - Line Signaling – Intelligent Network Services - Business Telephone Systems.

UNIT IV - Wide Area Network and Broad Band Technologies

Introduction – Packet Switching Network - X.25 Frame Relay – SMDS – ISDN – SONET – ATM – POS – DTM - DSL – CM's - PON.

UNIT V - Network Management

Introduction - Policy Management - Evolution of Network Hardware and Software - Network Administration and Maintenance - Network Security Configuration Management – Telecommunication Management Network.

TEXT BOOK

1. Introduction to Telecommunication, Gokhale, Delmar Publications, First Edition, 2011.

REFERENCES

1. Telecommunication Switching, Traffic Networks, JE Flood, Pearson Education, Tenth Edition, 2011.
2. Telecommunication Switching Systems and Networks, Thiyagarajan Viswanath, Prentice Hall of India, Second Edition, 2010.

15ECP204A	MEMS AND CONTROL ENGINEERING	Semester-II			
		L	T	P	C
		5	-	-	5

COURSE OBJECTIVES

- To learn the various micro fabrication technologies for MEMS
- To understand unique requirements for MEMS fabrication
- To know about the current trends and future technology for MEMS
- To employ time domain analysis to predict and diagnose transient performance parameters of the system for standard input functions
- Identify the needs of different types of controllers and compensator to ascertain the required dynamic response from the system
- Formulate different types of analysis in frequency domain to explain the nature of stability of the system

COURSE OUTCOMES

- Ability to describe MEMS fabrication technologies
- Apply fundamental concepts of MEMS to solve real life engineering problems
- Identify problems and suggest suitable MEMS material/ Devices/Process to get the Requisite Solution for a given application
- Apply advanced MEMS techniques to solve future engineering problems. Capability to critically analyze microsystems technology for technical feasibility as well as practicality
- Understand the concept of time response and frequency response of the system.
- Analyze feedback characteristics of linear control systems to reduced the disturbance
- Perform frequency domain analysis of linear control system using nyquist stability criterion

UNIT I - Overview and Working Principles of MEMS

MEMS and Microsystems – Typical MEMS and Microsystems Products – Microsystems and Microelectronics – Miniaturization – Applications of Microsystems – Micro Sensors, Micro Actuation, Micro Grippers, Micro Motors, Micro Accelerometer.

UNIT II - Fabrication and Microsystems Design

Ions and Ionization – Doping – Diffusion Process – Scaling Laws For Electrical Design – Substrate and Wafers – Silicon as a Substrate – Silicon Compounds – Piezo Resistors – Piezo Crystals - Photolithography – Ion Implantation – Diffusion – Oxidation – PVD – Etching – Surface Micro Matching – LIGA Process – Micro System Design Considerations

UNIT III - Concepts of Control System

Introduction – Open and Closed Loop Systems – Examples – Elements of Closed Loop Systems – Linear and Nonlinear System - Effect of Feedback on Overall Gain, Stability, Sensitivity and Noise – Transfer Function of Closed Loop System – Block Diagram Algebra and Reduction – Mason's Gain Formula.

UNIT IV -Time Response Analysis and Stability in Time and Frequency Domain

First Order System: Impulse and Step Input Analysis – Second Order System Analysis – Steady State Error – Stability Analysis: Routh Hurwitz Criterion – Root Locus Method – Construction and Application - Nyquist Stability Criterion – Bode Diagrams – Polar Plot.

UNIT V - Design of Digital Control System

Z Plane Specifications of Control System Design – Digital Compensator Design – Frequency Response Method - State Feedback – Pole Placement Design – State Observers – Digital Filter Properties – Frequency Response – Kalman's Filter.

TEXT BOOKS

1. MEMS & Microsystems Design & Manufacture and Nano Scale Engineering, Tai-Ran Hsu, Wiley Publications, Second Edition, 2011.
2. Control Systems Engineering, R. Ananada Natrajan, P. Ramesh Babu, SCITECH Publications, Fifth Edition, 2012

REFERENCES

1. Digital Control Engineering, M. Gopal, New age International (p) Ltd, Fifth Edition, 2012.

15ECP204B	LOW POWER VLSI DESIGN	Semester-III			
		L	T	P	C
		5	-	-	5

COURSE OBJECTIVES

- To learn the fabrication techniques of Integrated Circuits.
- To know the fundamental rules of layout design.
- To design the fundamental blocks of a VLSI circuits, both by circuit schematic and physical layout
- Importance of CMOS and Mixed Signal VLSI design in the field of Electronics and Telecommunication
- Underlying methodologies for analysis and design of fundamental CMOS Analog and Mixed signal Circuits like Current and Voltage references, Single stage Amplifiers, Operational Amplifiers, Data Converters
- The issues associated with Mixed Signal VLSI Circuits.

COURSE OUTCOMES

- Realize logic circuits with different design styles.
- Understand working principle of operation of different types of memories.
- Familiarize with the fabrication techniques of Integrated Circuits.
- Design the fundamental blocks of a VLSI circuits, both by circuit schematic and physical layout.
- Express the layout of simple MOS Circuit using Lambda based design rules.
- Design an application using Verilog HDL

UNIT I - Power Dissipation in CMOS

Hierarchy of Limits of Power – Sources of Power Consumption – Physics of Power Dissipation in CMOS FET Devices - Basic Principle of Low Power Design.

UNIT II - Power Optimization

Logical Level Power Optimization – Circuit Level Low Power Design – Circuit Techniques for Reducing Power Consumption in Adders and Multipliers.

UNIT III - Design of Low Power CMOS Circuits

Computer Arithmetic Techniques for Low Power Systems – Reducing Power Consumption in Memories – Low Power Clock, Interconnect and Layout Design – Advanced Techniques – Special Techniques

UNIT IV - Power Estimation

Power Estimation Techniques – Logic Level Power Estimation – Simulation Power Analysis – Probabilistic Power Analysis.

UNIT V - Synthesis and Software Design for Low Power

TEXT BOOKS

1. Low Power CMOS VLSI Circuit Design, K.Roy and S.C. Prasad, Wiley Publications, 2011,
2. Low Voltage CMOS VLSI Circuits, Kuo J.B. and Lou J.H, Wiley Publications, 2008.

REFERENCES

1. Low Power Digital CMOS Design, Chandrakasan A.P. and Broadersen R.W. Wiley Publications, 2008.

15ECP204C	REAL TIME OPERATING SYSTEMS	Semester-V			
		L	T	P	C
		5	-	-	5

COURSE OBJECTIVES

- To know the Fundamental elements of real-time multitasking embedded application software design and development. Processor and operating system concepts
- To provides a broad introduction to real time systems and their programming.
- To make the students to understand the fundamental problems, concepts, and approaches in the design and analysis of real-time systems
- To provides a broad introduction to real time systems and their programming.
- To make the students to understand the fundamental problems, concepts, and approaches in the design and analysis of real-time systems.
- To study issues related to the design and analysis of systems with real-time constraints.

COURSE OUTCOMES

- Program the Arduino microcontroller to make the circuits work
- Compare different scheduling algorithms and the schedulability criteria.
- Determine schedulability of a set of periodic tasks given a scheduling algorithm.
- Develop algorithms to decide the admission criterion of sporadic jobs
- To know the schedule of aperiodic jobs.
- Integrate resource access mechanisms with the scheduling techniques and develop integrated schedulability criteria.
- Enumerate the need and the challenges in the design of hard and soft real time systems.

UNIT I - Introduction

Real-Time Computation – Structure of A Real-Time System – Task Classes – Performance Measures For Real-Time Systems – Estimating Program Run Times – Task Assignment and Scheduling – Classical UniProcessor Scheduling Algorithms – Uniprocessor Scheduling of IRIS Tasks – Task Assignment – Mode Changes – Fault Tolerant Scheduling

UNIT II - Real-Time Models

Event-Based, Process-Based and Graph-Based Models – Pertinent Models –Real-Time Languages – System Performance Analysis – Optimization of Time Loading and Memory Loading Models of Multiprocessor Systems and Distributed Systems – Task Assignment – End to End Tasks in Heterogeneous Systems – Temporal Distance Constraints – Resource Contention – Resource Access Control – Priority Ceiling – Multiple Unit Resource Access.

UNIT III - RTOS Concepts

Foreground and Background Process – Resources – Tasks–Multitasking – Priorities – Schedulers – Kernel – Exclusion – Inter-Task Communication – Interrupts – Clock Tick – Micro C/OS II Kernel Structure – Micro C/OS II Initialization – Starting Micro C/OS II

UNIT IV - RTOS Functions

Task Management – Time Management – Semaphore Management – Mutual Exclusion - Semaphore – Event Management – Message Management – Memory Management – Porting Micro C/OS II

UNIT V - Real-Time Kernel and RTOS Applications

Principles – Design Issues – Polled Loop Systems – RTOS Porting to a Target – Comparison and Study of QNX, Vx works and PSOS – RTOS for Image Processing – Embedded RTOS for VOIP – RTOS for Fault - Tolerant Applications .

TEXT BOOKS

1. Real-Time Systems, Krishna, and Kang Shin, McGraw Hill, First Edition, 2009.
2. Real-Time Systems: Theory and Practice, Rajib Mall, Pearson Education, First Edition, 2009.

REFERENCES

1. Real-Time Design and Analysis – An Engineer's Handbook, Philip Laplante, John Wiley Publications, 2003
2. Micro C/OS II - The Real-Time Kernel, Jean Labrosse, CMP Books, Second Edition, 2002.

15ECP204D	AUTOMOTIVE ELECTRONICS	Semester-II			
		L	T	P	C
		5	-	-	5

COURSE OBJECTIVES

- To understand the concept of automotive systems, vehicles dynamics, electrical and electronic systems used in automobiles
- To know the concepts and develop basic skills necessary to diagnose in an automatic electronic systems
- To analyze and design the electronic systems for controlling mechanical systems in automobiles
- To test and validate automotive electronic systems
- To apply state-of-art software and hardware tools and techniques for development of automotive electronic systems
- To design modern embedded software and electronic hardware based products for automotive applications.

COURSE OUTCOMES

- Enumerate the construction, characteristics and maintenance of different accessories in a typical automobile system
- Explain the construction characteristics and maintenance of ignition system and diagnose the ignition system fault of any vehicle
- List out the principles and characteristics of charging system components and demonstrate their working with suitable tools
- Describe the principle and architecture of electronic systems and its components present in an automobile related to instrumentation, control and security systems
- Knowledge about handling of industrial automated control systems and working of automotive communication systems.
- Enumerate the principles, application construction and specification of different sensors and actuators

UNIT I - Power Train Engineering and fundamentals of Automotive

Fundamentals of Petrol, Diesel and Gas Engines - Electric Motors and Control Systems - Basic Automotive System - System Components - Evolution of Electronics in Automotive - Alternators and Charging - Battery Technology - Ignition Systems.

UNIT II - Sensor technologies in Automotive

In-Vehicle Sensors: Working Principles – Characteristics – Limitations - Distance Sensing- Velocity Sensing - Vibration Sensing – Airbags - Flow Sensing and Measurement.

UNIT III - Automotive Control Systems

Control System Approach in Automotive: Analog and Digital Control Methods - Stability Augmentation - Control Augmentation - Transmission Control - Motion Equations - Modeling of Linear and Non-Linear Systems - Spark Ignition and Compression Ignition Engines.

UNIT IV - Electronic Control Unit Design

Architecture of 8 /16 Bit Microcontrollers – Ports - Timer/Counters – Interrupts - Watch-Dog Timers - PWM, - High-Level Language Programming: Operators - Control Constructs.

UNIT V - Automotive Communication Systems

Communication Interface with ECU's: Interfacing Techniques -Wireless LAN's Standards- CAN - LIN - Application of Telemetries in Automotive: Global Positioning Systems (GPS) - General Packet Radio Service (GPRS).

TEXT BOOKS

1. Understanding Automotive Electronics, Ribbens William and B Ribbens, Elsevier Science, Seventh Edition, 2012.
2. Mechatronics: Integrated Mechanical and Electronic System, K.P.Ramchandran, G.K.Vijayraghavan, M.S. Balsundaram, Wiley India Publications, Eighth Edition, 2010.

REFERENCES

1. Fundamentals of Automotive Electronics, V.A.W.Hiller, Trans Atlantic Publications, Fifth Edition, 2010

15ECP204E	ANDROID AND ITS APPLICATIONS	Semester-II			
		L	T	P	C
		5	-	-	5

COURSE OBJECTIVES

- Ability to design an Embedded System, component or process to meet desired needs within realistic constraints.
- To develop the next generation technologies, methods and tools for modeling, design, implementation and operation of hardware/software systems embedded in intelligent devices.
- To provide a broad overview of both theoretical and practical aspects of a design flow for embedded systems.
- To learn the basics of electronics, including reading schematics (electronics diagrams)
- To learn how to prototype circuits with a breadboard
- To learn the Arduino programming language and IDE

COURSE OUTCOMES

- Program the Arduino microcontroller to make the circuits work
- Understand the value and importance of learning a coding language
- Transform a physical input into a digital input and analyze it
- Connect the Arduino microcontroller to a serial terminal
- To understand communication and stand-alone use Program basic Arduino examples
- Explore the provided example code and online resources for extending knowledge about the capabilities of the Arduino microcontroller

UNIT I - Introduction

About Android - Smart Phones Future - Android Architecture - Android Stack - Android Application Structure - Smart Phone's Future.

UNIT II - Java Concept

Oops Concepts - Inheritance in Detail - Exception Handling - Packages & Interfaces - JVM & .Jar File Extension - Multi Threading (Thread Class & Runnable Interface).

UNIT III - Basic UI design

Introduction to UI Design - Form Widgets: Text Fields – Layouts – [DIP, DP, SIP, SP] Versus PX – Examples. Time and Date - Images and Media – Composite – Alert Dialogs & Toast – Popup – Examples.

UNIT IV – Menu and Intents

Menu : Option Menu - Context Menu - Sub Menu - Menu From Xml - Menu Via Code – Examples. Intents : Explicit Intents - Implicit Intents – Examples.

UNIT V - Animation and Network Communication

Introduction to Animation and Network Communication - View Animation - Drawable Animation

TEXT BOOK

1. Android Apps for Absolute Beginners, Wallace Jackson, Wiley India Pvt. Ltd, Second Edition, 2013.

REFERENCES

1. Android Programming: Pushing the Limits, Erik Hellman, Wiley India Pvt Ltd, First Edition, 2014.

15ECP211	PRACTICAL – III VLSI LAB	Semester-II			
		L	T	P	C
		-	-	4	2

COURSE OBJECTIVES

- Introduced digital integrated circuits
- Introduce CMOS devices and manufacturing technology.
- Introduce CMOS logic gates and their layout.
- Ability to find Propagation delay, noise margins, and power dissipation in the digital VLSI circuits.
- Ability to design Combinational (e.g., arithmetic) and sequential circuit.
- Ability to design Memory in VLSI circuits.

COURSE OUTCOMES

- Analyze the CMOS layout levels, how the design layers are used in the process sequence, and resulting device structures (i.e. cross-sectional views).
- Design and implementation of logic gates
- Implement digital logic designs of various types (i.e. combinational logic, multiplexers).
- Analyze performance issues and the inherent trade-offs involved in system design (i.e. power vs. speed).
- Complete a moderately complex design project involved with data path operators, data registers, serial/parallel conversion, clocking/timing details and feedback.
- Identify the interactions between process parameters, device structures, circuit performance, and system design.

(Any 10 Experiments)

1. Design and implementation of logic gates
2. Design and implementation of half adder & full adder
3. Design and implementation of half Subtractor & full Subtractor
4. Design and implementation of Encoder & decoder
5. Design and implementation of 4 bit & 8 bit multiplexer
6. Design and implementation of flip flops
7. Design and implementation of up/down counters
8. Design and implementation of shift register
9. Design and implementation of ALU
10. Design and simulation of Programmable Logic Array
11. Design and simulation of Traffic light Controller
12. Design and simulation of Real time clock

15ECP212	PRACTICAL – IV ARM MICROCONTROLLER LAB	Semester-II			
		L	T	P	C
		-	-	4	2

COURSE OBJECTIVES

- Demonstrate the sensing of different physical parameters
- Explain the calibration of parameters measured and displayed
- Evaluate the data transfer
- To understand the need and applications of Microcontrollers and ARM Processors in embedded system.
- To understand architecture and features of typical Microcontroller
- To learn interfacing of real world input and output devices

COURSE OUTCOMES

- Define the arithmetical and logical assembly language for microcontroller
- Know the downloading procedure on hardware into flash ROM and show the testing data on defined port wish board
- Able to describe the microcontroller and ARM Processor Architecture and its Features
- Learn importance of microcontroller and ARM Processor in designing embedded applications
- Learn use of hardware and software tools.
- Develop interfacing to real world devices.

(Any 10 Experiments)

1. Arranging the numbers in ascending and descending order in an array using a simulator.
2. LED Interfacing
3. LCD Interfacing.
4. Stepper Motor Interfacing.
5. PWM generation.
6. ADC interface.
7. DAC interface
8. Digital Clock
9. LCD Interfacing
10. A/D converter interface
11. Interfacing PWM
12. Interfacing serial port

15OEP201	DATA COMMUNICATION NETWORKS	Semester-III			
		L	T	P	C
		-	-	-	3

COURSE OBJECTIVES

- To understand the communication protocols and layered network architectures.
- To explain conventional computer system interfacing standards and peer to peer data link communication protocols.
- To know the designing concepts of basic network systems and various components in a data communication system.
- To represent a digital signal using several modulation methods
- Draw signal space diagrams compute spectra of modulated signals and apply redundancy for reliable communication.
- To make students familiar with fundamentals of mobile communication systems

COURSE OUTCOMES

- Understand the basics of information theory, source coding techniques and calculate Entropy of source
- To know the various types of noises in communication systems and reduction techniques
- Describe and determine the performance of line codes and methods to mitigate inter symbol interference
- Learn the generation and detection of base band system
- Understand the generation, detection signal space diagram, spectrum, bandwidth efficiency, and probability of error analysis of different band pass modulation techniques
- Describe and determine the performance of different error control coding schemes for the reliable transmission of digital representation of signals and information over the channel.

UNIT 1 - Introduction

Definition of Networks – Classification of Networks – LAN, MAN, WAN, Internet – Network Topology – Protocols and Standards – Network Models – OSI, TCP/IP Models of Networking – Internet

UNIT II - Physical Layer and the Media

Review of Signals – Data Rate Limits – Performance Issues – Bandwidth, Throughput, Latency, Bandwidth - Delay Product- Jitter-Digital Transmission - Analog Transmission: Line Coding Techniques- PCM - Delta Modulation Techniques – ASK, FSK, PSK, and QAM Techniques – Bandwidth Utilization: Multiplexing and Spreading - Data Transmission using Telephone Networks – Dial-Up MODEMS.

UNIT III - Data Link Layer

Error Detection and Correction Techniques – Data Link Control: Framing, Flow and Error Control – HDLC and PPP Protocols. Multiple Access Techniques – CSMA, CSMA/CD, CSMA/CA – Channelization – TDMA-FDMA- CDMA

UNIT IV – LAN’S

Wired LAN’s– IEEE 802 Standards - Ethernet – IEEE 802.3 MAC Frame – Token Ring LAN - IEEE 802.5 MAC Frame – Wireless LAN’s – IEEE 802.11 Standard – Bluetooth Technology – Interconnection of LAN’s.

UNIT V - Internetworking

Internetworking – Tunneling – IP Addressing Scheme – Structure of IP Datagram – IP Routing – TCP as Transport Layer Protocol – Structure of TCP Segment – TCP Connection: Establishment and Closing – SMTP Protocol for E-Mail Application.

TEXT BOOKS

1. Data Communications and Networking, Behrouz A. Forouzan , Tata McGraw-Hill, Fourth Edition, 2009
2. Computer Networks: A Systems Approach, Larry L. Peterson and Bruce S. Davie, Elsevier Publications, Fourth Edition, 2007.

REFERENCES

1. Computer Networking, Stanford H. Rowe and Marsha L. Schuh, Pearson Education, First Edition, 2007.
2. Computer Networking: Top Down Approach featuring the Internet, James Kurose and Keith Ross, Pearson Education, Fifth Edition, 2012.

15ECP301	DIGITAL SIGNAL PROCESSING	Semester-III			
		L	T	P	C
		3	1	-	4

COURSE OBJECTIVES

- To understand the fundamental concepts and theory of Discrete Fourier Series and Discrete Fourier Transform.
- To get an exposure on Discrete Fourier Transforms (DFT), its applications and implementation by FFT techniques.
- To apply design technique for FIR type digital filters
- Understand fundamentals of Digital Signal Processing
- Analyze & compare different signal processing strategies.
- Become aware of some applications of DSP.

COURSE OUTCOMES

- Understand the fundamental concepts and theory of Discrete Fourier Series and Discrete Fourier Transform
- Ability to compute various transform analysis of Linear Time Invariant Systems.
- Implement problem solving strategies to DSP Problems.
- Able to test signal processing algorithms for various applications
- Ability to understand Various applications of DSP such as signal processing and telecommunication.
- Apply design techniques for FIR type digital filters

UNIT I - Structures For Discrete Time Systems

Introduction – Block Diagram and Signal Flow Graph Representation of Linear Co-Efficient Difference Equation – Basic Structures for IIR Systems – Basic Network Structures for FIR Systems – Lattice Structures – Zero Input Cycles in Fixed Point Realization of IIR Digital Filters.

UNIT II - Filter Design Techniques

Introduction – Design of Discrete Time IIR Filters from Continuous Time Filters – Frequency Transformation of Low Pass IIR Filters – Design of FIR Filters by Windowing - Comments on IIR and FIR Digital Filters.

UNIT III - Computation of Discrete Fourier Transform

Introduction – Efficient Computation of DFT – Decimation in Time FFT Algorithms – Decimation in Frequency Algorithms – Implementations of FFT Algorithms – FFT Algorithms for Composite N.

UNIT IV - TMS 320 C 6713 Overview

Introduction – TMS320C6713 Overview – Key Features – Architectural Overview – Functional Block Diagram - Internal Memory Organization – CALU – System Control – PLU – Interrupts – Addressing Modes – Instruction Set.

UNIT V - Introduction to MATLAB

Introduction To M-Files – Inline Functions – Control Flow – Relations & Logical Operators – Strings – Cell Arrays – Functions – MATLAB Graphics: - 2d Graphics – 3d Graphics – Animations.

TEXT BOOKS

1. Discrete Time Signal Processing, Oppenheim A.V and Schaffer RW, Buck .C, Prentice Hall India, Second Edition, 2013.
2. Digital Signal Processing – A computer Based Approach, Sanjith K.Mitra, McGraw Hill, Fourth Edition, 2013.
3. TMS 320 C 671x users guide, Texas instruments, 1993.

REFERENCES

1. Digital Signal Processing, Nagoor Kani.A, Tata McGraw Hill Pvt Ltd, Second Edition, 2012.

15ECP302	DIGITAL IMAGE PROCESSING	Semester-III			
		L	T	P	C
		4		-	4

COURSE OBJECTIVES

- To get an exposure on Discrete Fourier Transforms (DFT), its applications and implementation by FFT techniques.
- To understand the fundamental concepts and theory of Discrete Fourier Series and Discrete Fourier Transform.
- To acquire the fundamental concepts of a digital image processing system
- To identify and exploit analogies between the mathematical tools.
- To design and implement with MATLAB algorithms for digital image process.
- Discuss techniques specific to 2D system

COURSE OUTCOMES

- Understand the need for image transforms different types of image transforms and their properties.
- Develop any image processing application.
- Learn different techniques employed for the enhancement of images.
- Learn different causes for image degradation and overview of image restoration techniques.
- Understand the need for image compression and to learn the spatial and frequency
- Apply design techniques for FIR type digital filters

UNIT I - Digital Image Fundamentals

Introduction to Elements of A Digital Image Processing System – Structure of the Human Eye – Image Formation and Contrast Sensitivity – Sampling and Quantization – Neighbors of Pixel – Distance Measure – Photographic Film Structure and Exposure – Film Characteristics – Image Processing Applications.

UNIT II - Image Transforms

Introduction to Fourier Transform – DFT – Properties of Two-Dimensional FT – Separability, Translation, Periodicity, Rotation, Average Value – FFT Algorithm – Walsh Transform – Hadamard Transform – Discrete Cosine Transform.

UNIT III - Image Enhancement

Definition – Spatial Domain Methods – Frequency Domain Methods – Histogram – Modification Techniques – Neighborhood Averaging – Median Filtering – Low Pass Filtering – Averaging of Multiple Images – Image Sharpening by Differentiation and High Pass Filtering.

UNIT IV - Image Encoding

Introduction to Image Encoding - Objective and Subjective Fidelity Criteria – Basic Encoding Process – Mapping – Quantizer – Coder – Encoding – Contour Encoding – Run Length Encoding - Image Encoding – Relative to Fidelity Criterion – Differential Pulse Code Modulation.

UNIT V - Application of Image Processing

Introduction to Image Classification – Image Recognition – Image Understanding – Image Fusion – Image Compression - Colour Image Processing.

TEXT BOOKS

1. Digital Image Processing, Rafael C. Gonzalez, Richard E Woods, Pearson Education, Third Edition, 2014.
2. Fundamentals of Digital Image Processing, Anil K.Jain, Pearson Education, Second Edition, 2010.

REFERENCES

1. Digital Image Processing, S. Sridhar, Oxford University Press, First Edition, 2011

15ECP303	PROGRAMMABLE LOGIC CONTROLLER	Semester-III			
		L	T	P	C
		3	1	-	4

COURSE OBJECTIVES

- To identify logical process control in automation
- To connect PLC peripherals with PLC for logical functioning.
- To get strong knowledge in the developing of basic PLC programs
- To understand the components of a PLC system To understand how PLCs are used
- To understand the H&S requirements of a PLC- controlled system
- To understand different methods of interfacing with a PLC

COURSE OUTCOMES

- Identify the main parts of programmable logic controller
- Develop logic gate circuits for Boolean expressions
- Able to state basic PLC Terminology
- Identify logical process control, in automation.
- Describe how a programmable logic controller is programmed.
- Describe switching elements on input/output modules

UNIT I - Introduction to Programmable Logic Controller

PLC Evolution – Hardwire Control System Compared with PLC System - Advantages of PLC's – Criteria for Selection of Suitable PLC - Block Diagram of PLC – Principle of Operation – CPU – Memory Organization – I/O Modules – Input Types – Logic, Analog – Pulse Train – Expansion Modules – Power Supplies to PLC – Modular PLC's .

UNIT II - Input Modules

Discrete Input Module – AC Input Module – DC Input Module – Sinking and Sourcing – Sensor Input – Special Input Modules – Sensors – Limit Switch, Reed Switch, Photo Electric Sensor, and Inductive Proximity Sensor – Input Addressing Scheme in Important Commercial PLC's.

Output Modules Discrete Output Module – TTL Output Module – Relay Output – Isolated Output Module – Surge Suppression in Output – Analog Outputs – Open Collector Output.

UNIT III - PLC Programming

Symbols Used – Relays and Logic Functions – OR, AND, Comparator - Programming Devices – Programming Methods – STL and CSF, FBD and Ladder Methods – Simple Instructions – Programming NC and NO Contacts - EXAMINE ON and EXAMINE OFF Instructions - Online, Offline Methods – Latch and Unlatch Outputs – Pulse Edge Evaluation – Timer Instructions – ON Delay and OFF-Delay Timer-Counter Instructions – UP / DOWN Counters – Timer and Counter Applications- Program Control Instructions – Data Manipulating Instructions – Math Instructions - Converting Simple Relay Ladder Diagram into PLC Relay Ladder Diagram – PID and PWM Functions.

UNIT IV - Networking

Levels of Industrial Control – Types of Networking – Network Communications – Principles – Transmission Media – Field Bus – Introduction, Concepts, International Field Bus Standards – Networking with TCP / IP Protocol – Network Architecture – Physical Addressing – LAN Technologies – Ethernet – Token Ring – Sub-Netting – Subnet Mask – Transport Layer – Ports – Sockets Network Services – File Transfer Protocol.

UNIT V - Data Acquisition Systems

Computers in Process Control – Data Loggers – Data Acquisition Systems (DAS) – Alarms – Direct Digital Control (DDC) - Characteristics of Digital Data – Controller Software – Computer Process Interface for Data Acquisition and Control –Supervisory Digital Control (SCADA) - Introduction and Brief History of SCADA – SCADA Hardware and Software.

TEXT BOOK

1. Introduction to Programmable Logic Controllers, Gary Dunning, Thomson Delmar Learning, Third Edition, 2007.

REFERENCES

1. Programmable Logic Controllers: Principles and Applications, Webb John W , A, Prentice Hall of India, Fifth Edition, 2009

15ECP304	MOBILE COMPUTING	Semester-III			
		L	T	P	C
		4		-	4

COURSE OBJECTIVES

- To build knowledge on various Mobile Computing algorithms.
- To provide application skills in working with Wireless Application Protocols to develop mobile content applications.
- To explore the characteristics of different types of mobile networks on the performance of a pervasive computing system
- To develop applications that are mobile-device specific and demonstrate current practice in mobile computing
- To have knowledge in the comprehension and appreciation of the design and development of context-aware solutions for mobile devices.
- To enable students to compare and contrast multiple division techniques, mobile communication systems, and existing wireless networks.

COURSE OUTCOMES

- Understand fundamentals of wireless communications.
- Know the various terminology, principles, devices, schemes, concepts, algorithms and different methodologies used in Wireless Communication Networks.
- Analyze security, energy efficiency, mobility, scalability, and their unique characteristics in wireless networks.
- Demonstrate basic skills for cellular networks design.
- Apply knowledge of TCP/IP extensions for mobile and wireless networking.
- Analyze different parameters of wireless communication techniques

UNIT I -Wireless Communication

Introduction – Wireless transmission – Frequencies for radio transmission – Signals – Antennas – Signal Propagation – Multiplexing – Modulations – Cellular Wireless Networks.

UNIT II - Satellite Systems and Broadcast Systems

Introduction – Applications – Basics –Routing –Localization – Handover – Examples – Cyclic repetition of data - Digital audio broadcasting - Digital video broadcasting - Convergence of Broadcasting and mobile

UNIT III - Wireless LAN

Infrared vs. Radio Transmission - Infrastructure and Adhoc Network – IEEE 802.11 – HYPERLAN – Bluetooth.

UNIT IV - Mobile Network Layer

Mobile Network layer - Mobile IP – Dynamic Host Configuration Protocol – Mobile Adhoc Networks.

UNIT V - Mobile Transport Layer

Traditional TCP - Classical TCP Improvements – TCP over 2.5/3G Wireless Networks -3G NETWORKS: Introduction-Principles of WCDMA - UMTS Network Architecture and Protocols.

TEXT BOOK

1. Mobile Computing, Hasan Ahmed , Roopa Yavagal , Asoke K, McGraw Hill Education (India) Private Limited, 2nd Edition, 2011

REFERENCES

1. Mobile communications, Jochen Schiller, Pearson Education, New Delhi, Second Edition, 2008.
2. 3G Networks, Architecture, Protocols and Procedures, SumitKasera and NishitNarang, Tata McGraw Hill Professional networks Series, New Delhi, 2008.

15ECP305A	ANALOG VLSI DESIGN	Semester-III			
		L	T	P	C
		4		-	4

COURSE OBJECTIVES

- To learn the fabrication techniques of Integrated Circuits.
- To know the fundamental rules of layout design.
- To design the fundamental blocks of a VLSI circuits, both by circuit schematic and physical layout
- Importance of CMOS and Mixed Signal VLSI design in the field of Electronics and Telecommunication
- Underlying methodologies for analysis and design of fundamental CMOS Analog and Mixed signal Circuits like Current and Voltage references, Single stage Amplifiers, Operational Amplifiers, Data Converters
- The issues associated with Mixed Signal VLSI Circuits.

COURSE OUTCOMES

- Realize logic circuits with different design styles.
- Understand working principle of operation of different types of memories.
- Familiarize with the fabrication techniques of Integrated Circuits.
- Design the fundamental blocks of a VLSI circuits, both by circuit schematic and physical layout.
- Express the layout of simple MOS Circuit using Lambda based design rules.
- Design an application using Verilog HDL

UNIT 1 - Device Modeling

Introduction to Analog Design - MOS Device Model- DC, Small Signal and High Frequency Model- Diode Model: DC, Small Signal and High Frequency Model- BJT: DC, Small Signal and High Frequency Model - Measurement of Model Parameters.

UNIT II - Analog Circuit Building Blocks

Switches- Active Resistors- Current Sources and Sinks- Current Mirrors – Simple, Wilson, Cascode- Folded – Cascode - Voltage and Current. References – Band gap Voltage references, Comparators-Multipliers.

UNIT III - Single Stage Amplifiers

MOS and BJT inverting amplifier- Improving the performance of Inverting amplifier - Single stage BJT and MOS amplifiers.

UNIT IV - Multistage Amplifiers

CMOS and BJT differential amplifiers - Darlington Amplifiers - Cascode Amplifiers- Characteristics of Operational amplifiers – Types -Two stage BJT and CMOS - Cascode - Folded Cascode - Transconductance.

UNIT V - Data Converters

Data Converter fundamentals- DAC Architectures- Current Switched-Resistive-Charge redistribution- Hybrid -Segmented D/A Converters - ADC architectures: Flash, Pipeline, Integrating, Successive Approximation and folding A/D Converters - Over sampling Converters

TEXT BOOKS

1. Analog Integrated Circuit Design, David A. Johns, Ken Martin, John Wiley & Sons, Second Edition, 2013.
2. CMOS Circuit Design, Layout and Simulation, Jacob Baker, Harry W.Li and David E Boyce, John Wiley & Sons, Second Edition, 2009.

REFERENCES

1. CMOS Analog Circuit Design, Phillip E. Allen and Douglas R. Holdberg, Oxford University Press, Third Edition, 2013.
2. Design of CMOS Integrated Circuits, Behzad Razavi, Tata McGraw Hill, First Edition, 2008.

15ECP305B	CRYPTOGRAPHY AND NETWORK SECURITY	Semester-III			
		L	T	P	C
		4		-	4

COURSE OBJECTIVES

- To describe and analyze existing authentication protocols.
- To analyze key agreement algorithms to identify their weakness
- To develop knowledge on system level security and misuse of computer security
- Acquire background on well known network security protocols
- Learn fundamentals of cryptography and its application to network security
- Acquire background on hash functions; authentication; firewalls; intrusion• detection techniques

COURSE OUTCOMES

- Understand various Cryptographic Techniques
- Apply various public key cryptography techniques
- Implement Hashing and Digital Signature techniques
- Understand the various Security Applications
- Implement system level security applications
- Understand network security threats, security services, and countermeasures

UNIT I - Introduction

OSI Security Architecture - Classical Encryption Techniques – Cipher Principles – Data Encryption Standard – Block Cipher Design Principles and Modes of Operation -Evaluation Criteria for AES – AES Cipher – Triple DES – Placement of Encryption Function – Traffic Confidentiality

UNIT II - Public Key Cryptography

Key Management – Diffie-Hellman Key Exchange – Elliptic Curve Architecture and Cryptography - Introduction To Number Theory – Confidentiality Using Symmetric Encryption – Public Key Cryptography and RSA.

UNIT III - Authentication and Hash Function

Authentication Requirements – Authentication Functions – Message Authentication Code - Hash Functions – Security of Hash Functions and MAC's – MD5 Message Digest Algorithm - Secure Hash Algorithm – RIPEMD – HMAC Digital Signatures – Authentication Protocols.

UNIT IV - Network Security

Authentication Applications: Kerberos – X.509 Authentication Service – Electronic Mail Security – PGP – S/MIME - IP Security – Web Security.

UNIT V - System Level Security

Intrusion Detection – Password Management – Viruses and Related Threats – Virus Counter

TEXT BOOKS

1. Cryptography and Network Security – Principles and Practices, William Stallings, Pearson Education, Sixth Edition, 2013.
2. Cryptography and Network Security, Behrouz A. Foruzan, Tata McGraw-Hill Publications, Second Edition, 2011.

REFERENCES

1. Applied Cryptography, Bruce Schneier, John Wiley & Sons Inc, Second Edition, 2010.
2. Security in Computing, Charles B. P fleeger, Shari Lawrence P fleeger, Pearson Education, Fourth Edition, 2006.

15ECP305C	PRINCIPLES OF ROBOTICS	Semester-III			
		L	T	P	C
		4	-	-	4

COURSE OBJECTIVES

- To learn the basic configuration of Robotics
- To understand the various types of Robots.
- To get an exposure in Robot control systems
- To acquire the knowledge on advanced algebraic tools for the description of motion
- To develop the ability to analyze and design the motion for articulated systems.
- To develop an ability to use software tools for analysis and design of robotic systems

COURSE OUTCOMES

- Understand the relationship between mechanical structures of industrial robots and their operational workspace characteristics.
- Illustrate the kinematics and dynamics of robotics.
- Implementation of related instrumentation and control in robotics
- Ability to solve inverse kinematics of simple robot manipulators
- Able to do the path planning for a robotic system
- Identify a Robot for a specific application

UNIT I - Introduction and Terminologies

Definition-Classification- History - Robots Components - Degrees of Freedom-Robot Joints- Coordinates- Reference Frames-Workspace-Robot Languages-Actuators-Sensors- Position, Velocity and Acceleration Sensors-Torque Sensors-Tactile and Touch Sensors-Proximity and Range Sensors-Social Issues

UNIT II - Kinematics

Mechanism - Matrix Representation - Homogenous Transformation - Inverse Kinematics-Solution and Programming - Degeneracy and Dexterity

UNIT III - Differential Motion & Velocities

Jacobian - Differential Motion of Frames - Interpretation - Calculation of Jacobian - Inverse Jacobian – Design - Lagrangian Mechanics - Dynamic Equations - Static Force Analysis

UNIT IV - Robot Control System

Sensor Characteristics- Hydraulic, Pneumatic and Electric Actuators - Trajectory Planning-Decentralized PID Control - Non-Linear Decoupling Control

UNIT V - Image Processing & Vision Systems

Two and Three Dimensional Images - Spatial and Frequency Domain Representation - Noise and Edges - Convolution Masks - Processing Techniques – Thersholding - Noise Reduction - Edge Detection-Segmentation - Image Analysis and Object Recognition

TEXT BOOKS

1. Introduction to Robotics: Analysis, Control, Applications, Saeed B. Niku, Wiley India Pvt Ltd, Second Edition, 2012.
2. Introduction to Robotics Mechanics and Control, John J. Craig, Tata McGraw Hill Publishing Company Limited. Third Edition, 2008.

REFERENCES

1. Industrial Robotics: Technology, Programming, and Applications, Mikell P Groover, Tata McGraw Hill Publishing Company Limited, Second Edition, 2012.

15ECP305D	MATLAB AND SIMULINK PROGRAMMING	Semester-III			
		L	T	P	C
		4	-	-	4

COURSE OBJECTIVES

- To introduce the MATLAB for numerical computations to know the basic concepts.
- To familiarize basic commands through the Command window and output through the Graph window
- Introduce the MATLAB software environment
- Apply a variety of common numeric techniques to solve and visualize engineering-related computational problems
- To program scripts and functions using the Matlab development environment.
- To use basic flow controls (if-else, for, while).

COURSE OUTCOMES

- Understand the concept of time response and frequency response of the system
- Use MATLAB effectively to analyze and visualize data
- Apply numeric techniques and computer simulations to solve engineering-related problems
- Apply a top-down, modular, and systematic approach to design, write, test, and debug sequential MATLAB programs to achieve computational objectives
- Design and document computer programs and analyses in a careful and complete manner so as to effectively communicate results,
- Demonstrate understanding and use of fundamental data structures (classes).

UNIT I

MATLAB Basics – Variables - Arrays - Multidimensional Sub Arrays - Special Values - Displaying Output Data-Data Files- Scalar and Array Operations - Hierarchy of Operations -Built-In MATLAB Functions- Introduction to Plotting- Debugging MATLAB Programs.

UNIT II

Branching Statements - Logical Data type - Vectorization.

UNIT III

User-Defined & I/O Functions-Introduction to MATLAB Functions- Variable Passing in MATLAB-Three Optional Arguments- Sharing Data Using Global Memory- Preserving Data Between Calls to a Function- Sub Functions-Private Functions-Nested Functions- Complex Data- String Functions-Text Read Function-Load And Save Commands- MATLAB File Processing-File Opening and Closing- Binary I/O Functions-Formatted I/O Functions- Comparing Formatted and Binary I/O Function- File Positioning and Status Functions.

UNIT IV

Handle Graphics & GUI - Graphics System-Object Handles-Examining and Changing Object Properties- User-Defined Data- Finding Objects- Selecting Objects -Object Properties-Graphical User Interface Components-Dialog Boxes- Menus.

UNIT V

Simulink Basics: Introduction-Simulink Modeling-Solvers- Simulating Model Using Variables from MATLAB-Data Import/Export - State – Space Modeling & Simulation- Creation of Subsystems-Mass Subsystem.

TEXT BOOKS

1. MATLAB programming for Engineers, Stephen J. Chapman, Cengage Learning Fourth Edition, 2014.
2. MATLAB & its Application in Engineering, Rajkumar Bansal, Ashokkumar Good, Manoj kumar Sharma, Person Education. First Edition, 2010.

REFERENCES

1. MATLAB and Simulink – Introduction to Applications, Partha S.Mallick, Scitech Publications, Fourth Edition, 2011.

15ECP305E	NANO ELECTRONICS	Semester-III			
		L	T	P	C
		4	-	-	4

COURSE OBJECTIVES

- To discuss about the latest technology on nano systems based Nanoelectronics.
- To know the various methods to fabricate and measure Nanoscale features.
- To identify the critical parameters that one must evaluate when considering any new Nanoelectronics device.
- Know the types of nanotechnology, atomic structure, molecular technology and preparation of nano materials
- Understand the fundamentals of nano electronics and its properties.
- Know the Silicon MOSFET's, QTD and carbon nano tubes

COURSE OUTCOMES

- Understand the fundamentals of Nano Electronics and its properties.
- Gain the concepts of quantum theory.
- Understand the latest technology on nano systems based Nano electronics
- Identify the various methods to fabricate and measure Nanoscale features.
- Evaluate the critical parameters when considering any new Nano electronics device.
- Understand the applications of Nano Electronics

UNIT I - Introduction

The Development of Microelectronics – The Region of Nanoelectronics - The Complexity Problem – The Challenge Initiated by Nanoelectronics. Basics of Nanoelectronics: Electromagnetic Fields and Photons – Quantization of Action, Charge, and Flux – Electrons Behaving as Waves – Electrons in Potential Wells – Diffusion Process.

UNIT II - Biochemical and Quantum-Mechanical Computers

DNA Computer – Information Processing with Chemical Reactions – Nanomachines – Parallel Processing - Quantum Computers – Bit and Q bit – Coherence and Entanglement – Quantum Parallelism.

UNIT III - Parallel Architectures for Nanosystems

Mono and Multiprocessor Systems – Some Considerations to Parallel Processing – Influence of Delay Time – Power Dissipation - Architecture for Processing in Nanosystems: Classic Systolic Arrays – Processor with Large Memory – Processor Array with SIMD and PIP Architectures.

UNIT IV - Soft Computing and Nanoelectronics

Methods of Soft Computing – Fuzzy Systems – Evolutionary Algorithms – Connectionist Systems – Computationally Intelligent Systems – Characteristics of Neural Networks in Nanoelectronics - Local Processing – Distributed and Fault-Tolerant Storage – Self-Organization.

UNIT V - Nanosystems as Information Processing Machines

Nanosystems as Functional Machines – Information Processing as Information Modification – System Design and its Interfaces – Requirements of Nanosystems - Uncertainties: Removal of Uncertainties by Nanomachines – Uncertainties in Nanosystems – Uncertainties in the development of Nanoelectronics.

TEXT BOOK

1. Basics of Nano Electronics, G. P. Singh, Animol Publications Pvt. Ltd., First Edition, 2011

REFERENCES

1. Nanoelectronics and Nanosystems: From Transistors to Molecular and Quantum devices, Karl Goser Springer, New Delhi, First Edition, 2005.

15ECP311	PRACTICAL – V DIGITAL SIGNAL PROCESSING LAB	Semester-III			
		L	T	P	C
		-	-	4	2

COURSE OBJECTIVES

- To implement Linear and Circular Convolution
- To implement FIR and IIR filters
- Familiar with the most important methods in DSP, including digital filter design, transform-domain processing and importance of Signal Processors.
- Aware about implications of the properties of systems and signals
- To design FIR filters and IIR Filters
- Analyze discrete-time filter banks and multi-rate signal processing system

COURSE OUTCOMES

- Analyze the CMOS layout levels, how the design layers are used in the process sequence, and
- Understand the handling of discrete/digital signals using MATLAB
- Understand the basic operations of Signal processing
- Analyze the spectral parameter of window functions
- Design IIR, and FIR filters for band pass, band stop, low pass and high pass filters
- Design the signal processing algorithm using MATLAB

(Any 10 Experiments)

USING TMS320C5X/TMS320C54XX/TMS320C67XX/MATLAB

1. Study of addressing Modes of DSP using simple examples
2. Arithmetic operations
3. DFT computations
4. FFT Computations
5. Convolution of two discrete signals
6. Correlation of two discrete signals
7. Quantization noise
8. Waveform generation
9. FIR Filter design
10. IIR filter design
11. Discrete Cosine Transform
12. Kalman filter

15ECP312	PRACTICAL – VI DIGITAL IMAGE PROCESSING LAB	Semester-III			
		L	T	P	C
		-	-	4	2

COURSE OBJECTIVES

- To get an exposure on Discrete Fourier Transforms (DFT), its applications and implementation by FFT techniques.
- To understand the fundamental concepts and theory of Discrete Fourier Series and Discrete Fourier Transform.
- To acquire the fundamental concepts of a digital image processing system
- To identify and exploit analogies between the mathematical tools.
- To design and implement with MATLAB algorithms for digital image process.
- To treat the 2D systems as an extension of 1D system design
- Discuss techniques specific to 2D system

COURSE OUTCOMES

- Understand the need for image transforms different types of image transforms and their properties.
- Develop any image processing application.
- Learn different techniques employed for the enhancement of images.
- Learn different causes for image degradation and overview of image restoration techniques.
- Understand the need for image compression and to learn the spatial and frequency
- Apply design techniques for FIR type digital filters

(Any 10 Experiments)

1. Generation of Signals
2. Amplitude Modulation & FFT response
3. Impulse, Step, Exponential & Ramp functions
4. Frequency sampling method
5. Image Sampling – Zooming & Shrinking Operations
6. Basic Gray Level Transformations: Image Negative, Power law and log transforms
7. 2-D Discrete Fourier Transform
8. Walsh Transform
9. Image Contrast Enhancement by Histogram Equalization Technique
10. Spatial Image Filtering: Low pass and high pass filtering
11. 2-D Wavelet Transform
12. Image Compression.

15ECP306	ANALYSIS AND DESIGN OF ANALOG INTEGRATED CIRCUITS	Semester-III			
		L	T	P	C
		-	-	-	4

COURSE OBJECTIVES

- To develop an in-depth knowledge on IC fabrication technology
- To understand the basic concepts of operational amplifier and its various applications
- To understand the basics of PLL and its practical applications
- To know about analog multipliers
- To know about various analog switches and different A/D and D/A convertors
- To understand the concepts of switched capacitor filters, Voltage regulator and various amplifiers

COURSE OUTCOMES

- Learn about the basic concepts for the circuit configuration for the design of linear integrated circuits and develops skill to solve engineering problems
- Develop skills to design simple circuits using OP-AMP
- Gain knowledge about various multiplier circuits, modulators and demodulators
- Gain knowledge about PL
- Learn about various techniques to develop A/D and D/A convertors
- Develop skills to develop simple filter circuits and various amplifiers and can solve problems related to it.

UNIT I - Single Stage Amplifiers

Common Source Stage-Source Follower-Common Gate Stage-Cascade Stage-Single Ended and Differential Operation-Basic Differential Pair-Differential Pair with MOS Loads.

UNIT II - Frequency Response and Noise Analysis

Miller Effect - Association of Poles With Nodes - Frequency Response of Common Source Stage - Source Followers - Common Gate Stage - Cascode Stage - Differential Pair - Statistical Characteristics of Noise - Noise in Single Stage Amplifiers - Noise in Differential Amplifiers.

UNIT III - Operational Amplifiers

Concept of Negative Feedback- Effect of Loading in Feedback Networks-Operational Amplifier Performance Parameters- One-Stage Op Amps- Two-Stage Op Amps- Input Range Limitations-Gain Boosting- Slew Rate- Power Supply Rejection- Noise in Op Amp's.

UNIT IV - Stability and Frequency Compensation

General Considerations- Multipole Systems - Phase Margin - Frequency Compensation - Compensation of Two Stage Op-Amps - Slewing In Two Stage Op- Amps - Other Compensation Techniques.

UNIT V - Biasing Circuits

Basic Current Mirrors- Cascode Current Mirrors- Active Current Mirrors- Voltage References- Supply Independent Biasing- Temperature Independent References- PTAT Current Generation- Constant-Gm Biasing.

TEXT BOOK

1. Analysis and Design of Analog Integrated Circuits, Paul R. Gray, Paul J. Hurst, Stephen H. Lewis, Robert G. Meyer, Wiley India Pvt Ltd, Fifth Edition, 2010.

REFERENCES

1. Analog Integrated Circuit Design, David A. Johns, Ken Martin, John Wiley & Sons, Second Edition, 2013.
2. CMOS Circuit Design, Layout and Simulation, Jacob Baker, Harry W.Li and David E Boyce, John Wiley & Sons, Second Edition, 2009.

15ECP401	HIGH PERFORMANCE COMMUNICATION NETWORKS	Semester-III			
		L	T	P	C
		-	-	-	4

COURSE OBJECTIVES

- To develop a comprehensive understanding of multimedia networking.
- To know the various types of Networks.
- To provide strong knowledge in ultra wideband networks and other types of UWB.
- To have knowledge on broadband networks, ATM networks and high performance networks.
- Understand the overview of Communication Networks, Network Services and layered Architecture.
- Understand the ATM and Wireless Networks.

COURSE OUTCOMES

- Know the communication networks principles and future networks.
- Know the network services and layered architectures.
- Explain the wireless networks, Internet and different protocols.
- Understand the circuit switched networks and ATM.
- Apply the concepts of Random Process to the design of Communication systems
- Gain knowledge in sampling and quantization

UNIT I - Introduction

Networking Principles - Digitalization Service and Layered Architecture - Traffic Characterization and QOS - Network Services - Network Elements - Network Monitoring - Network Control-Network Mechanisms - Network Element Management

UNIT II - Broadband Networks

Introduction – Multi-hop Wireless Broadband Networks-Mesh Networks - Importance of Routing Protocols - Routing Metrics - Packet Scheduling-Admission Control - Classification of Routing - Protocols - MANET Routing Protocols .

UNIT III - IP Networks

Technology Trends in IP Networks- Internet Protocol- IP Packet Communications in Mobile Communication Networks -TCP and VDP- Performance of TCP/IP Networks- Circuits Switched Networks- SONET-DWDM-DSL-Intelligent Network (IN) Scheme-Comparison with Conventional Systems -Merits of the IN Scheme -CATV.

UNIT IV - ATM Networks

Introduction to ATM- Reference Model - ATM Layer- ATM Adaptation Layer (AAL) - AAL1 - AAL2 - AAL3/4 - AAL5 -Traffic Classes - Traffic Management and Quality of Service - Traffic Descriptor - Traffic Shaping-ABR and Traffic Congestion -Network Management - Layer Management- ATM Signaling-ATM Addressing Format-Connection Establishment - IP/ATM

Internetworking - IP Multicast over ATM

UNIT V - High Performance Networking With WIMAX and Ultra Wideband (WPAN)

Introduction - WIMAX Overview - Competing Technologies - Overview of The Physical Layer - PMP Mode - Mesh Mode -Multihop Relay Mode- Introduction- Time-Hopping Ultra wideband - Direct Sequence Ultra wideband – Multiband- Other Types Of UWB.

TEXT BOOK

1. High Performance Communication Networks, Jean warland and Pravin Varaiya, , Morgan Kanffman Publishers, London, 2nd Edition ,2010.

REFERENCES

1. ATM Networks, Sumit Kasera and Pankaj Sethi, Tata McGraw Hill Publications, Second Edition, 2005.

பகுதி - I தமிழ்ப் பாடத்திட்டம் (2015 - 2016)
(முதல்பருவம்)
(இளநிலை அறிவியல் பட்ட வகுப்புகளுக்குரியது)
(For I-UG Science Degree Classes)

15LSU101

பாடத்திட்டப் பொதுநோக்கம்

- கற்றல் வழி சிந்தனைத் திறனையும், கருத்து வெளிப்பாட்டுத் திறனையும், மேம்படுத்துதல்.
- ஆய்வுநோக்கை மேம்படுத்துதல்.
- இலக்கியங்கள் உணர்த்தும் வாழ்வின் நுட்பமான பகுதிகளை உணர்த்துதல்.
- மனித மனத்தினைப் பக்குவப்படுத்துதலில் இலக்கியம் தரும் பங்கினை உணர்த்துதல்.
- வளர்ந்து வரும் சமூகத்தில் அறஉணர்வு, பண்பாடு போன்றவை குறித்து அறிவூட்டல்.
- அரசுத் தேர்வுகளுக்கு மாணவர்களை ஆயத்தமாக்குதல்.

பாடத்திட்டப் பயன் விளைவு

- இந்திய குடியுரிமைப் பணி முதலான போட்டித் தேர்வுகளில், விருப்பப் பாடமாக இடம்பெறுகின்ற, 'தமிழ் இலக்கிய வரலாறு' குறித்த முழுமையான அறிமுகம் பெற்றிருத்தல்.
- கல்வெட்டியல், ஓலைச்சுவடியியல் மற்றும் தொல்லியல் சார்ந்த ஆவணத் தேடலுக்குரிய ஆய்வுமனப்பான்மையுடன், இலக்கியங்களை அணுகுதல்.
- தமிழின் வளர்ச்சித் துறையாகிய, 'அறிவியல் தமிழ்' ; 'இணைய தமிழ்' குறித்த பன்னோக்கு அணுகுமுறையிலான ஆய்வுச் சிந்தனை மேம்பாடு.
- வேலைவாய்ப்புக்குரிய சுயதிறன் மேம்பாட்டுடன், படைப்பாக்கத்திறன் மேம்பாடும் பெற்றிருத்தல் .
- சமுதாய மற்றும் வாழ்வியல் மதிப்புகளைப் பேணுவதற்குக் கருவியாக இலக்கியங்களை நாடுகின்ற மனப்பான்மை வளர்ச்சி.
- மொழிபெயப்புத் துறைசார்ந்த வேலைவாய்ப்புத் திறன் பெற்றிருத்தல்

அலகு - I : இக்கால இலக்கியம்

தத்துவம் : மகாகவி பாரதியார் - பகைவனுக்கு அருள்வாய்.

கவிஞர் ந.பிச்சமூர்த்தி - கிளிக்கூண்டு

இயற்கை : பாவேந்தர் பாரதிதாசன் - அழகின் சிரிப்பு - ஞாயிறு.

சமுதாயம் : கவிக்கோ அப்துல் ரகுமான் - இன்றைய நிலை

அறிவியல் : கவிஞர் சிற்பி பாலசுப்பிரமணியன் - காலம்.

பெண்ணியம் : கவிஞர் சிவரமணி - வையகத்தை வெற்றிகொள்ள

சூழலியல் : அன்பாதவன் - மரணம்

காதல் : வைரமுத்து - காதல் உயில்

தன்னம்பிக்கை பா.விஜய் - தன்னம்பிக்கை

அலகு - II : அற இலக்கியம்

1. திருக்குறள் - தேர்ந்தெடுக்கப்பட்ட குறள்கள் 20

2. நான்மணிக்கடிகை - தேர்ந்தெடுக்கப்பட்ட ஐந்து பாடல்கள்

3. திரிகடுகம் - தேர்ந்தெடுக்கப்பட்ட ஐந்து பாடல்கள்

அலகு - III : சிற்றிலக்கியம்

1. நரிவிருத்தம் - அறன் வலியுறுத்தல்

2. தமிழ் விடு தூது - தமிழின் சிறப்புரைத்தல்

3. மதுரை மீனாட்சியம்மைப் பிள்ளைத்தமிழ் - தொடுக்கும் கடவுள் பழம்பாடல்

அலகு - IV : சிறுகதை

1. புதுமைப்பித்தன் - நிகும்பலை

2. தனுஷ்கோடி ராமசாமி - கந்தகக் கிடங்கிலே

3. கந்தர்வன் - துண்டு

4. வாஸந்தி - வடிகால்

5. சி.ஆர். ரவீந்திரன் - வழுக்குமரம்

அலகு - V : மொழிப்பயிற்சி

1. விண்ணப்பங்கள் எழுதுதல் மற்றும் கடிதப் பயிற்சி

2. மொழிபெயர்ப்புப் பயிற்சி

பாட நூல்: கற்பகச்சோலை - தமிழ் ஏடு. கற்பகம் பல்கலைக்கழகத் தமிழ்த் துறை வெளியீடு.

Course Objectives:

- To enable the learners to acquire English language skills at a faster pace.
- To introduce different kinds of literary works
- To familiarize different genres of Literature
- To instruct moral values through literature.
- To improvise their productive and receptive skills
- To strengthen the basic knowledge about grammar.

Course Outcomes:

- Learn to reflect on the literary works and communicate flexibly.
- Reading and comprehending literary works
- Genres of literature to provide moral education
- Develop communication skills in business environment
- Interpersonal skills will be developed.
- Betterment of language competence

UNIT I:

Prose: Google Guys (Extract) – Richard L Brandt

Poetry: The Blind Pedlar – Osbert Sitwell

Short Story: A Garden So Rich – Christie Craig

Vocabulary: Prefixes, Antonyms, Sentence Completion

Grammar: Articles, Adverbs, Pronouns

Composition: Proverb Expansion

UNIT II:

Prose: Happiness 101 – Geeta Padmanabhan

Poetry: An Old Woman – Arun Kolatkar

Vocabulary: Suffixes, Analogies

Grammar: Nouns, Adjectives

Composition: Dialogue Writing

UNIT III:

Prose: Structured Procrastination – John Perry

Short Story: The Umbrella Man – Roald Dahl

One-Act Play: The Boy Who Stopped Smiling – Ramu Ramanathan

Vocabulary: Synonyms, Euphemisms, Word Definitions

Grammar: Verbs, Conjunctions and Interjection, Indirect/Reported Speech

UNIT IV:

Poetry: No Sentence – Anjum Hassan

One-Act Play: While the Auto Waits- O' Henry

Vocabulary: Words Often Confused, Anagrams

Grammar: Prepositions, Voice- Active and Passive

Composition: Letter Writing- Informal

UNIT V:

Short Story: The Bird – Amar Jalil

One-Act Play: The Cellphone Epidemic – Claudia I. Haas

Vocabulary: Portmanteau Words, One Word Substitute

Grammar: Questions, Pronunciation

Composition: Letter Writing- Formal

Text Book

Rao, G. Chandralekha and et al. 2013, *Spring*, Emerald Publishers: Chennai.

Reference

Syamala, V, 2006, English for Communication., Emerald Publishers: Chennai

Course Objectives (CO)

- To impart adequate knowledge on the need of programming languages and problem solving techniques.
- To develop programming logic.
- To develop programming skills using the fundamentals and basics of C Language.
- To enable effective usage of arrays, structures, functions, pointers and to implement the memory management concepts.
- To understand memory allocation concepts through pointers
- To teach the issues in file organization and the usage of file systems

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Gain experience about structured programming
2. Develop efficient algorithms for solving a problem.
3. Use the various constructs of a programming language viz. conditional, iteration and recursion.
4. Implement the algorithms in C” language.
5. Use simple data structures like arrays, stacks and linked list in solving problems.
6. Handle file in C.

UNIT-I

Computer Concepts and Problem Solving: Computer Fundamentals: Definition, Block diagram along with computer components, Characteristics & classification of computers, Hardware & software, Types of software, Firmware.

Introduction to Computer based Problem Solving- Problem definition – Problem Solving- goals and objectives – problem identification and definitions. Algorithms for Problem definition – Program design and Implementation issues. Programming Environment – Computer Programming Languages – Types of Programming Languages – Compilers – interpreters.

UNIT-II

Introduction to C: Introduction - An Overview of C – Keywords and Identifier – Variables - Declarations of Variables - User Defined Type Declarations - Typedef – Enum - Constants – Data Types – Operators – Expressions - C Formatted I/O Operations. Decision Making and Branching Statements – Decision Making and Looping Statements - Arrays-Strings - String Handling Functions.

UNIT-III

Functions, Structures and Union: Functions - Introduction - Definition of Functions - Function Declaration - Category of Functions - Nesting of Functions – Recursion - Passing Arrays to Function. Storage Classes – Auto-extern-static-register. Structures and Unions – Introduction - Defining a Structure - Declaring Structure Variables - Accessing Structure Members - Arrays of Structure – Unions.

UNIT-IV

Pointers: Pointers – Introduction – Declaring Pointer Variables - Pointer and Arrays - Pointers and Strings – Array of Pointers - Functions and Pointers - Function Returning Pointers -Pointers to functions - Pointers and Structures

UNIT-V

File Management : File Management in C – Introduction - Opening a File - Closing a file – Input/output operations on files - Error handling during I/O Operations - Random Access to Files - Command Line Arguments - Dynamic Memory Allocation

Course Objectives (CO)

- To impart adequate knowledge on the need of programming languages and problem solving techniques.
- To develop programming logic
- To develop programming skills using the fundamentals and basics of C Language.
- To enable effective usage of arrays, structures, functions, pointers and to implement the memory management concepts.
- To understand memory allocation concepts through pointers
- To teach the issues in file organization and the usage of file systems

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Gain experience about structured programming
 2. Develop efficient algorithms for solving a problem.
 3. Use the various constructs of a programming language viz. conditional, iteration and recursion.
 4. Implement the algorithms in C language.
 5. Use simple data structures like arrays, stacks and linked list in solving problems.
 6. Handle file in C.
-
1. Write a C program to find the area of a circle using the formula.
Area = $PI * r^2$
 2. Write a C program to convert decimal to binary.
 3. Write a program to print Multiplication table using for and Do While Loops
 4. Write a program to find the roots of quadratic equation
 5. Write a program to find Maximum number without using arrays
 6. Write a C program to arrange the accepted numbers in ascending order and descending order.
 7. Write a program to calculate SIN(x) without using library function
 8. Write a program
 - (i) to find the length of a string
 - (ii) concatenation of two strings
 9. Write a program to reverse the given string
 10. Write a program to check the given string is palindrome or not
 11. Write a program to perform matrix multiplication
 12. Using any one sorting method to sort given 'n' numbers using pointers.

13. Write a program to prepare an employee pay slip using structures
14. Write a program for Electricity Bill Preparation using files
15. Write a program for the Odd and even numbers are stored in separate files the original files.

Course Objectives (CO)

- To enable the students to gain knowledge on the architecture of modern computer.
- To understand how computer stores positive and negative numbers and to perform arithmetic operation of positive and negative numbers.
- To learn about logic gates and solve problems using Boolean algebra.
- To understand the simplification of circuits like adders, subtractors, multiplexers, encoders.
- To understand the basic computer organization and design.
- To learn Cache memory and its importance

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. To provide a strong foundation in construction of Sequential and Combinational Circuits.
2. To familiarize with the function of Gates, Flip Flops, Shift Registers, Counters, A/D & D/A Converters and its Applications.
3. Solve the problems using Boolean algebra
4. Understand the basic computer organization and design.
5. learn about Cache memory and its importance
6. Solve the binary arithmetic problems and conversion among the number systems

UNIT I – Number System and Codes

Introduction to Digital concepts – Number Systems: Decimal, Binary, Octal and Hexadecimal Numbers – Conversion – 1's and 2's Complements of Binary Numbers – Binary Arithmetic with Signed and Unsigned Numbers – Codes: Binary Coded Decimal (BCD) — Excess-3 – Gray Code — ASCII Codes — Error Detection and Correction Codes.

UNIT II – Logic Gates and Boolean Algebra

Introduction to Logic Gates – OR, AND, NOT, NAND, NOR, EX-OR and EX-NOR Gates. Boolean Logic and Expression, Laws and Rules of Boolean Algebra, DeMorgan's Theorem – Simplification using Boolean Algebra – Karnaugh Map.

UNIT III – Combinational Logic Circuits

Basic overview of Logic functions – Basic Adders & Subtractor – Parallel Binary Adder – 4-bit Binary Adder/Subtractor – Comparators – Encoders and Decoders – Code Converters – Multiplexers and Demultiplexers — Parity Generators/Checkers.

UNIT IV – Sequential Logic Circuits

Flip-flops: RS – Clocked RS – Edge-triggered RS, D, and JK – JK Master-Slave flip flops – Registers and its Types – SISO, SIPO, PISO, PIPO – Shift Registers and its Types – Ring Counters – Asynchronous and Synchronous Counter – UP/DOWN Counter- Ring Counter.

UNIT V – D/A, A/D Converters

Digital to Analog converters: Resistor Networks – Binary Ladder – Analog to Digital converters: Counter type – Ramp type – Successive Approximation Type.

(Any 8 Experiments)**Course Objectives (CO)**

- To enable the students to gain knowledge on the architecture of modern computer.
- To understand how computer stores positive and negative numbers and to perform arithmetic operation of positive and negative numbers.
- To learn about logic gates and solve problems using Boolean algebra.
- To understand the simplification of circuits like adders, subtractors, multiplexers, encoders.
- To understand the basic computer organization and design.
- To learn Cache memory and its importance

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. To provide a strong foundation in construction of Sequential and Combinational Circuits.
2. To familiarize with the function of Gates, Flip Flops, Shift Registers, Counters, A/D & D/A Converters and its Applications.
3. Solve the problems using Boolean algebra
4. Understand the basic computer organization and design.
5. learn about Cache memory and its importance
6. Solve the binary arithmetic problems and conversion among the number systems

1. Verification of basic gates
2. Realization of Logic Gates Using Universal Gates
3. Adder using Gates
4. Subtractor using Gates.
5. Multiplexer
6. Demultiplexer
7. Encoder
8. Decoder
9. Study of Flip-flops
10. Binary to Gray and Gray to Binary Converter

Instruction Hours/week: L: 2 T: 0 P: 0 Marks: Internal: 100 External: Nil Total: 100

Course Objectives (CO)

- To teach and inculcate the importance of value based living and sustainable lifestyle.
- To give students a deeper understanding about the purpose of life.
- To teach and inculcate the essential qualities to become a good leader.
- To be responsible citizens with clear conviction to practice values and ethics in life.
- To create awareness about the values and their significance and role
- To imbibe the concept of discipline and freedom

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Students will understand the importance of value-based living.
2. Students will gain deeper understanding about the purpose of their life.
3. Students will understand and start applying the essential steps to become good leaders.
4. Students will emerge as responsible citizens with clear conviction to practice values and ethics in life.
5. Students will become value-based professionals
6. Students will contribute in building a healthy nation

UNIT – I

Concept of Self, self-esteem and self-confidence. Concept of personality, determinants and disorganisation of it. Personality development – meaning.

UNIT – II

Goal setting – meaning and importance; steps in goal setting Manners and Etiquette – meaning need and importance; means to improve. Positive thinking.

UNIT – III

Discipline – meaning. Concept of Roles and Responsibility Time Management – Meaning and steps for effective time management.

UNIT – IV

Interpersonal relationship – meaning and importance; means to improve it. Healthy friendship.

UNIT – V

Family Relationship importance of it; Means to improve. Spirituality – meaning. Its relationship with Altruism, sacrifice, self control, tolerance and truthfulness.

TEXT BOOKS

1. Karpagam Academy of Higher Education, Study Material, 2015.

15SSD101	Soft Skill Development - I	Semester-I
		L T P C
		2 0 0 0

Instruction Hours / week: L: 2 T: 0 P: 0 Marks: Internal: 100 External: Nil Total: 100

Course Objectives (CO)

- Students will be able to apply quantitative reasoning and mathematical analysis methodologies to understand and solve problems.
- To achieve the analytical and reasoning competencies and to improve their communication and presentation skills
- To impart knowledge on both Aptitude and Soft skills to the students
- To actively do mathematics—such as analyzing data, constructing hypotheses, solving problems, reflecting on their work, and making connections.
- To critically evaluate and demonstrate various principles involved in solving mathematical problems and to adopt new and faster methods of calculations.
- To reinforce competencies in soft skills which are crucial in a social setting

Course Outcomes (COs)

On successful completion of the course the students will be able to:

1. Understand the basic concepts of QUANTITATIVE ABILITY
2. Understand the basic concepts of LOGICAL REASONING Skills
3. Acquire satisfactory competency in use of VERBAL REASONING
4. Actively do mathematics—such as analyzing data, constructing hypotheses, solving problems, reflecting on their work, and making connections.
5. Solve campus placements aptitude papers covering Quantitative Ability, Logical Reasoning and Verbal Ability
6. Compete in various competitive exams like CAT, CMAT, GATE, GRE, GATE, UPSC, GPSC etc.

UNIT - I

Introduction to Quantitative Aptitude, Speed Maths, Problems on Numbers, Averages, Ratios and Proportions, Problems on Ages

UNIT - II

Number Series, Blood Relation, Image Analysis, Direction Sense, Syllogism, Coding and Decoding

UNIT – III

Percentages, Data Interpretation, Profit and Loss, Simple Interest and Compound Interest

UNIT – IV

Parts of Speech, Tense, Subject Verb Agreement, Active and Passive Voice, Articles, Prepositions

UNIT - V

Conditional Clause, Degrees of Comparison, Goal Setting, Interpersonal Skills

□ □ □ □ □ □ □ □ □ □ □ □ □ □

பொதுநோக்கம்

- கற்றல் வழி சிந்தனைத் திறனையும், கருத்து வெளிப்பாட்டுத் திறனையும், மேம்படுத்துதல்.
- ஐந்தாம் வகுப்பு மேம்படுத்துதல்.
- இலக்கியங்கள் உணர்த்தும் வாழ்வின் நுட்பமான பகுதிகளை உணர்த்துதல்.
- மனித மனத்தினைப் பக்குவப்படுத்துதலில் இலக்கியம் தரும் பங்கினை உணர்த்துதல்.
- வளர்ந்து வரும் சமூகத்தில் அறஉணர்வு, பண்பாடு போன்றவை குறித்து அறிவூட்டல்.
- அரசுத் தேர்வுகளுக்கு மாணவர்களை ஆயத்தமாக்குதல்.

☐ ☐ ☐ ☐ ☐ ☐ ☐ ☐ ☐ ☐ ☐ ☐ ☐ ☐ ☐ ☐ ☐ ☐ ☐ ☐ ☐

- [illegible]

பகுதி - I, தமிழ்

15LAU201 :

தமிழ் இரண்டாம் தாள்

பருவம் II

5-H,5-C

அலகு - I : பக்தி இலக்கியம்

1. சைவம் - மூவர் தேவாரத்திலிருந்து தேர்ந்தெடுக்கப்பெற்ற 15 பாடல்கள்
2. வைணவம் - ஆண்டாள் நாச்சியாரின் திருப்பாவையிலிருந்து 11 பாடல்கள்

அலகு - II : சங்கஇலக்கியம்

அ). எட்டுத்தொகை

- நற்றிணை. 1. இலை இல பிடவம், திணை - முல்லை,
ஆசிரியர் - விழிக்கட் பேதைப் பெருங்கண்ணனார்.
2. மடல் மா ஊர்ந்து, திணை - குறிஞ்சி, ஆசிரியர் - மடல் பாடிய மாதங்கீரனார்.

- குறுந்தொகை : 1. உள்ளார் கொல்லோ, திணை - பாலை, ஆசிரியர் - பெருங்கடுங்கோ.
2. யாரினும் இனியன், திணை - மருதம், ஆசிரியர் - வடமவண்ணக்கன் தாமோதரனார்.

- ஐங்குறுநூறு : 1. நுண்ணேர் புருவத்த, திணை - குறிஞ்சி, ஆசிரியர் - கபிலர்.
2. அவறொறுந் தேரை, திணை - முல்லை, ஆசிரியர் - பேயனார்.

பதிற்றுப்பத்து - ததைந்த காஞ்சி, ஆசிரியர் - பாலைக் கௌதமனார்.

பரிபாடல் - வையை - திரை இரும் பனிப் பெளவம், ஆசிரியர் - மையோடக் கோவனார்.

கலித்தொகை - கடும் புனல் கால் பட்டு, திணை - பாலை, ஆசிரியர் - பெருங்கடுங்கோ.

புறநானூறு - 1. சிறப்பில் சிதடு முறுப்பில், திணை - பொதுவியல்,

ஆசிரியர் - உறையூர் முதுகண்ணன் சாத்தனார்.

2. இளையரு முதியரும் வேறுபுலம் படா - ஆசிரியர் - கயமனார்.

ஆ). பத்துப்பாட்டு - சிறுபாண் ஆற்றுப்படை - கடையெழு வள்ளல்களின் சிறப்பு,

நல்லியக்கோடனின் சிறப்பு, ஈகைத் திறம்.

அலகு - III : காப்பியங்கள்

1. மணிமேகலை - பாத்திரம் பெற்ற காதை - தீவதிலகை, மணிமேகலைக்குச் சொல்லியது,
சிறைக்கோட்டம் அறக்கோட்டமாக்கிய காதை - மணிமேகலை வேண்ட,
மாவண்கிள்ளி, சிறைக்கோட்டத்தை அறக்கோட்டமாக்கியது.

2. கம்பராமாயணம் - இலக்கியநயம் மிக்க, தேர்ந்தெடுக்கப்பெற்ற 41 பாடல்கள்.

அலகு - IV : கட்டுரைகள்

1. திருக்குறளில் மனிதவள மேலாண்மைக் கருத்துக்கள் - திருமிகு ஹரி விஜயலட்சுமி.

2. தமிழர் வளர்த்த நுண்கலைகள்: சிற்பமும் ஓவியமும் - தொ.மு. பாஸ்கரத் தொண்டைமான்.

3. சமயமும் தமிழும் - பேராசிரியர் அ.ச.ஞானசம்பந்தன்.

4. தமிழில் அறிவியல் - ஒரு பார்வை - பேராசிரியர் சிவகுமார்.

5. இன்றைய நெருக்கடிப் பிரச்சனைகள் - நீர்வளம் - முனைவர் ச. முத்துக்குமரன்.

அலகு - V : இலக்கணமும் மொழிப்பயிற்சியும்

1. எழுத்து, சொல், பொருள் இலக்கண எழுத்துப்பயிற்சிகள்

2. பொதுக் கட்டுரைகள்

பாட நூல்: கற்பகச்சோலை - தமிழ் ஏடு. கற்பகம் பல்கலைக்கழகத் தமிழ்த் துறை வெளியீடு.

Part I TAMIL 2015. Karpagam University, Coimbatore - 21, India

Course Objectives (CO)

- To enable the learners to acquire English language skills through literature.
- To familiarize them with English literature.
- To acquire Grammar knowledge.
- To help learners imbibe cultural values.
- To acquire skill of making correct sentences.
- To reflect originality on the application of soft skills and express in writing their views.

Course Outcome (COs)

After the completion of this course, a successful student will be able to:

1. Learn to enjoy the ecstasy of literature.
2. The select literary pieces will develop the confidence level of the learners.
3. To get the social values.
4. To know the importance of communication
5. Get sound knowledge in English
6. Trained to communicate well for business purpose.

UNIT I:

Prose: The Unexpected- Robert Lynd

Poetry: The Village Schoolmaster – Oliver Goldsmith

Short Story: The Lion's Share – Arnold Bennett

Vocabulary: Homonyms

Grammar: Irregular Verbs

UNIT II:

Prose: Travel by Train – J. B. Priestly

Poetry: The Gift of India – Sarojini Naidu

Grammar: Sentence patterns

Composition: Reading Comprehension

UNIT III:

Prose: Women's Education is Almost More Important than the Education of Boys and Men – Indira Gandhi

Short Story: The Necklace – Guy De Maupassant

One-Act Play: The Referee – W.H. Andrews and Geoffrey Dearmer

Vocabulary: Similes

Grammar: Discourse Markers

Composition: Report Writing

UNIT IV:

Poetry: Ozymandias – P.B. Shelley

One-Act Play: The Pot of Broth- W.B. Yeats

Vocabulary: Collective Nouns

Grammar: Correction of Sentences

Composition: Picture Reading

UNIT V:

Short Story: The Silver Butterfly– Pearl S. Buck

One-Act Play: The Bear – Anton Chekov

Vocabulary: Acronyms

Grammar: Question Tags

Composition: Drafting Advertisement

Text Book

Board of Directors, 2014, Wings of Communication, Emerald Publishers: Chennai

Reference

Syamala, V, 2006, English for Communication, Emerald Publishers: Chennai.

15CTU201	Object Oriented Programming with C++	Semester – II			
		L	T	P	C
		5	0	0	5

Course Objectives (CO)

- To understand how C models ++ improves C with object-oriented feature.
- To learn how transpose the physical problem domain into a hierarchy of objects.
- To learn the syntax and semantics of classes in C++ programming language.
- Objects, their behaviors, and their relationships, will be modeled and these will be programmed into a functional application that the student will compile, modify, enhance and run.
- The student will program in a structured style whereby reinforcing the concepts of software quality, reliability and maintainability.
- To learn file handling in C++.

Course Outcomes (COs)

After completion of this course the students will be able to :

1. Understand the difference between top-down and bottom-up approach.
2. Apply the concepts of object-oriented programming in constructor and destructor.
3. Understand how to apply the major object-oriented concepts to implement inheritance and polymorphism.
4. Apply pointer concepts in C++
5. Understand how to manage console I/O operations.
6. Use the concepts of preprocessor directives and macros.

UNIT – I

Introduction: Principles of object oriented programming: Basic concepts of object oriented programming – Benefits of OOP – Applications of OOPs – Structure of C++ Program C++ Tokens – Control Statement – Decision Making Statements- Loop Statements - Inline Functions – Function Overloading.

UNIT – II

Control Structure, Functions and Constructors: Classes and Objects: Specifying a class – Creating Objects – Accessing Class Members – Defining Member Functions – Static Data Members – Static Member Functions - Array of Objects – Friend Functions. Constructors and Destructors:- Constructors – Parameterized Constructors - Multiple Constructors in a Class – Constructors with Default Arguments - Copy Constructor - Dynamic Constructor – Destructors.

UNIT – III

Operator Overloading and Inheritance: Operator overloading: Defining operator overloading – overloading unary operators – overloading binary operators – overloading binary operators using friends – type conversions. Inheritance :- Inheritance – defining derived classes – single, multilevel, multiple, hierarchical inheritance- hybrid inheritance – virtual base classes – abstract classes.

UNIT – IV

Pointers and I/O Operations: Pointers: Pointers to objects – this pointer – pointers to derived classes – virtual functions- Pure Virtual Functions. Managing console I/O operations :- C++ streams – C++ stream classes – unformatted I/O operations – formatted console I/O operations – Managing output with manipulators.

UNIT – V

File Management: Files: Classes for file stream operations – Opening and Closing a file – sequential input and output operations – updating a file random access – Command Line Arguments. Templates and Exceptions:- Templates – class templates – function templates – member function templates – exception handling.

Course Objectives (CO)

- To understand how C models ++ improves C with object-oriented feature.
- To learn how transpose the physical problem domain into a hierarchy of objects.
- To learn the syntax and semantics of classes in C++ programming language.
- Objects, their behaviors, and their relationships, will be modeled and these will be programmed into a functional application that the student will compile, modify, enhance and run.
- The student will program in a structured style whereby reinforcing the concepts of software quality, reliability and maintainability.
- To learn file handling in C++.

Course Outcomes (COs)

Upon completion of this course the students will be able to :

1. Understand the difference between top-down and bottom-up approach.
2. Apply the concepts of object-oriented programming in constructor and destructor.
3. Understand how to apply the major object-oriented concepts to implement inheritance and polymorphism.
4. Apply pointer concepts in C++
5. Understand how to manage console I/O operations.
6. Use the concepts of preprocessor directives and macros.

Write a C++ Program for the Following Concepts

Object and classes:

1. Create a class to implement the data structure STACK . Write a constructor to initialize the top of the stack to zero .Write a member function PUSH() to insert an element and a member function POP() to delete an element.
2. Create a class ARITH which consists of a FLOAT and an INTEGER variable. Write member functions ADD(),SUB(),MUL(),DIV(),MOD() to perform addition, subtraction, multiplication, division and modulus respectively. Write member functions to get and display MAT() object values.

Operator overloading:

3. Create a class MAT as a 2D matrix and R, C represents rows and columns of the matrix. Overload the operators +,-,* to add, subtract, multiply two matrices. Write member functions to get and display MAT() object values.
4. Create a class STRING. Write member functions to initialize to get and display strings. Overload the operator + to concatenate two strings, == to compare two strings and a member function to find the length of the strings.

Inheritance:

5. Create a class which consist of EMPLOYEE detail like eno, ename, dept, basic salary, grade. Write member functions to get and display them. Derive a class PAY from the above class and Write member functions to calculate da , hra, pf depending on the grade and display the pay slip in a neat format using console I/O.

6. Create a class SHAPE which consist of two virtual functions cal_Area() and cal_Peri() to calculate area & perimeter of various figures. Derive three classes SQUARE, RECTANGLE and TRIANGLE from the class SHAPE and calculate area and perimeter of each class separately and display the result.
7. Create two classes which consist of two private variables, one integer and one float variable in each class. Write member functions to get and display them. Write a FRIEND function common to both classes which takes the object of the above two classes as arguments and the integer and float values of both the objects separately and display the result.

Console I/O:

8. Write a user-defined function USERFUN() which has the formatting commands like setw(), showpos(), precision(). Write a program which prints a multiplication table and uses userfun() for formatting.

Files:

9. Write a program to perform insertion, deletion and updation of records using files.
10. Write a program which takes a file as argument and copies into another file with line numbers using command line arguments.

Templates:

11. Write a Program to swap the numbers using the concept of function template.

Course Objectives (CO)

- To have knowledge about the basic working of a microcontroller system and its programming in assembly language.
- To provide experience to integrate hardware and software for microcontroller applications systems.
- To learn the various Concepts of Embedded System
- To acquire knowledge about microcontrollers embedded processors and their applications.
- To develop the Programming Skills in 8051 Microcontroller.
- To provide a strong knowledge in the field of Real Time Operating System.

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Ability to understand the internal architecture and interfacing of different peripheral devices with Microcontrollers.
2. Ability to write the programs for microcontroller.
3. Understand the concepts of embedded systems
4. Understand the role of embedded systems in industry.
5. Understand the design concept of embedded systems
6. Integrate hardware and software for microcontroller applications systems.

UNIT I – 8051 Microcontroller

Introduction to Microcontroller and Embedded Processors – Microcontroller for Embedded Systems – Overview of 8051 Family – 8051 Architecture – 8051 flag bits and PSW Register - Register Bank and Stack.

UNIT II –8051 Programming

8051 Assembly and C Programming – Instruction Set –Address Modes - Loop and Jump Instructions - Arithmetic Instruction - Logic Instructions - Single Bit Instructions. Data Types and Directives - I/O Port Programming.

UNIT III – Internal Peripherals of 8051

Basic Registers of Timer - Programming 8051 Timer-Counter Programming – Basics of Serial Communication – 8051 Connection to RS232 - 8051 Serial Communication Programming – 8051 Interrupts - Programming External Hardware Interrupts.

UNIT IV – Applications

Interfacing LCD to the 8051 – Interfacing ADC – Sensors to 8051- Interfacing Stepper Motor - 8051 Interfacing to the Keyboard - Interfacing DAC to the 8051.

UNIT V – Real-Time Operating System

Survey of Software Architecture: Round Robin-Round Robin with Interrupts-Function – Queue Scheduling Architecture - Introduction of RTOS - RTOS Architecture -Task and Task

States - Task and Data - Semaphores and Shared Data - Message Queues, Mailboxes and Pipes - Timer Function – Events - Memory Management.

15CTU202B	Allied Elective I - PC hardware and Trouble shooting	Semester II			
		L	T	P	C
		4	0	0	4

Course Objectives (CO)

- To learn the fundamentals of PC Hardware.
- To develop base knowledge in the installation of peripheral devices.
- To get a detailed knowledge of all the hardware components that make up a computer
- To understand the different interfaces required for connecting the hardware devices.
- To understand the components on the motherboard
- To provide a strong knowledge in Trouble shooting of PC

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Understand the modern computer organization, processor and memory concept, Peripherals and recent system architecture
2. Identify the existing configuration of the computers and peripherals for upgrading the same as and when required.
3. Develop base knowledge in the installation of peripheral devices.
4. Learn the hardware components that make up a computer
5. Understand the different interfaces required for connecting the hardware devices.
6. Trouble shoots PC when required.

UNIT I – Micro Computer System

Introduction to Micro Computer System – Computer Organization – Number Systems and Codes Memory – Arithmetic and Logic Unit – Control Unit.

UNIT II – Peripheral Devices

Introduction to Peripheral Devices – Keyboard – CRT Display monitor – Printer – Magnetic Storage Devices – Floppy Disk Drive – Hard Disk Drive – Peripherals Interfaces and Controller – Keyboard Interface

UNIT III – Display Adapter

CRT Display — CRT Controller –Auxiliary Subsystems – Data Communication fundamentals – Serial Port in PC – Real time clock (RTC) – Magnetic Tape Subsystems – LAN – Memory Expansion Options

UNIT IV – Installation and Preventive Maintenance

Pre Installation Planning – Installation Practice – Routine Checks – Special Configurations – Memory Up Gradation

UNIT V – Trouble shooting

Troubleshooting – Computer faults – Nature of faults – Types of Faults Diagnostic Programs and Tools — Faults in Elimination Process – Systematic Troubleshooting – POST (Power on Self Test)

				Semester II
				L T P C
15CTU202C	Allied Elective I – Microprocessor and its Application			4 0 0 4

Course Objectives (CO)

- To apply the fundamentals of assembly level programming of microprocessors.
- To build a program on a microprocessor using arithmetic & logical instruction set of 8086.
- To develop the assembly level programming using 8086 loop instruction set.
- To write programs based on string and procedure for 8086 microprocessor.
- To analyze abstract problems and apply a combination of hardware and software to address the problem
- To make use of standard test and measurement equipment to evaluate digital interfaces

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Apply the fundamentals of assembly level programming of microprocessors.
2. Build a program on a microprocessor using arithmetic & logical instruction set of 8086.
3. Develop the assembly level programming using 8086 loop instruction set.
4. Write programs based on string and procedure for 8086 microprocessor.
5. Analyze abstract problems and apply a combination of hardware and software to address the problem
6. Make use of standard test and measurement equipment to evaluate digital interfaces

UNIT I – Introduction to 8-bit Microprocessor

Introduction to 8085 – Pin Diagram –Architecture – Demultiplexing the Bus –Generation of Control Signals – Fetching, Decoding and Execution of Instruction – Instruction Timing and Status Flag.

UNIT II – Addressing Modes

Instruction Set – Addressing Modes – Instruction Format – Simple Program – Memory Read Machine Cycle – Memory Unit s Machine Cycle.

UNIT III- Interfacing Concepts

Peripheral I/O Instructions – Device Selection And Data transfer – Types of Data Transfer - Input Interfacing – Input Interfacing Using Decoders – Output Interfacing: LED and 7 Segment Display – Interfacing Memory.

UNIT IV Peripheral Devices

Introduction to Programmable Peripheral Interface 8255 – Pin Diagram –Architecture – Modes of Operation: I/O and BSR – Architecture and Operation of 8251(USART). Architecture and Operation of Programmable Interrupt Controller (8259) – Architecture of 8254(8253) Programmable Interval Timer/Counter –DMA Controller(8279).

UNIT V- Applications

Time Delay Program – Traffic Light Control System – Water Level Controller – Stepper Motor Control – Interfacing DAC –Interfacing ADC – Temperature Measurement.

		Semester II
		L T P C
15CTU212A	Allied Elective Practical I Embedded Systems Lab	0 0 3 2

Course Objectives (CO)

- To have knowledge about the basic working of a microcontroller system and its programming in assembly language.
- To provide experience to integrate hardware and software for microcontroller applications systems.
- To learn the various Concepts of Embedded System
- To acquire knowledge about microcontrollers embedded processors and their applications.
- To develop the Programming Skills in 8051 Microcontroller.
- To provide a strong knowledge in the field of Real Time Operating System.

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Understand the internal architecture and interfacing of different peripheral devices with Microcontrollers.
2. Write the programs for microcontroller.
3. Understand the concepts of embedded systems
4. Understand the role of embedded systems in industry.
5. Understand the design concept of embedded systems
6. Integrate hardware and software for microcontroller applications systems.

(Any 8 Experiments)

1. Addition of 8/16 Bit Array of Data
2. Subtract of 8/16 Bit Array of Data
3. Multiplication & Division
4. Ones and Two's Compliment
5. Data Transfer using Parallel Port
6. Sorting of Numbers
7. Stepper Motor Interface
8. Wave Form Generation
9. Biggest and Smallest Number in an Array
10. D/A Converter

15CTU212B	Allied Elective Practical I PC Hardware Trouble Shooting Lab	Semester II L T P C 0 0 3 2
------------------	---	--

Course Objectives (CO)

- To learn the fundamentals of PC Hardware.
- To develop base knowledge in the installation of peripheral devices.
- To get a detailed knowledge of all the hardware components that make up a computer
- To understand the different interfaces required for connecting the hardware devices.
- To understand the components on the motherboard
- To provide a strong knowledge in Trouble shooting of PC

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Understand the modern computer organization, processor and memory concept, Peripherals and recent system architecture
2. Identify the existing configuration of the computers and peripherals for upgrading the same as and when required.
3. Develop base knowledge in the installation of peripheral devices.
4. Learn the hardware components that make up a computer
5. Understand the different interfaces required for connecting the hardware devices.
6. Trouble shoots PC when required.

(Any 8 Experiments)

1. Identifying External Ports and Interfacing
2. Identifying PC cards and Interfacing.
3. Assembling of PC
4. Preventive Maintenance of a PC
5. Trouble Shooting of SMPS
6. Keyboard Servicing
7. Study of CRT
8. Communication and Bus Interfacing
9. Partitioning and Formatting Hard disks.
10. Installing System And Application Software

Course Objectives (CO)

- To apply the fundamentals of assembly level programming of microprocessors.
- To build a program on a microprocessor using arithmetic & logical instruction set of 8086.
- To develop the assembly level programming using 8086 loop instruction set.
- To write programs based on string and procedure for 8086 microprocessor.
- To analyze abstract problems and apply a combination of hardware and software to address the problem
- To make use of standard test and measurement equipment to evaluate digital interfaces

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Apply the fundamentals of assembly level programming of microprocessors.
2. Build a program on a microprocessor using arithmetic & logical instruction set of 8086.
3. Develop the assembly level programming using 8086 loop instruction set.
4. Write programs based on string and procedure for 8086 microprocessor.
5. Analyze abstract problems and apply a combination of hardware and software to address the problem
6. Make use of standard test and measurement equipment to evaluate digital interfaces

(Any 8 Experiments)

MICROPROCESSOR LAB

1. Addition of 8/16-bit and Array of Data
2. Subtraction of 8/16-Bit Number
3. Multiplication of 8-Bit Number
4. Division of 8-bit Number
5. Fill and Transfer an Array of Data.
6. Ascending and Descending of an Array.
7. Data Transfer using Parallel Ports.
8. Stepper Motor Interface
9. Traffic Light Controller
10. A/D Convertor and D/A Convertor

15FCB201

**FOUNDATION COURSE - B
ENVIRONMENTAL STUDIES**

2H - 1C

Total hours/week: L:2 T:0 P:0**Marks: Internal: 100 External: -****Total:100****Course Objectives (CO)**

- To create the awareness about environmental problems among people.
- To develop an attitude of concern for the environment.
- To motivate public to participate in environment protection and improvement.
- To understand the transnational character of environmental problems and ways of addressing them, including interactions across local to global scales.
- To apply systems concepts and methodologies to analyze and understand interactions between social and environmental processes.
- To reflect critically about their roles and identities as citizens, consumers and environmental actors in a complex, interconnected world.

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Master core concepts and methods from ecological and physical sciences and their application in environmental problem solving.
2. Master core concepts and methods from economic, political, and social analysis as they pertain to the design and evaluation of environmental policies and institutions.
3. Appreciate the ethical, cross-cultural, and historical context of environmental issues and the links between human and natural systems.
4. Understand the transnational character of environmental problems and ways of addressing them, including interactions across local to global scales.
5. Apply systems concepts and methodologies to analyze and understand interactions between social and environmental processes.
6. Reflect critically about their roles and identities as citizens, consumers and environmental actors in a complex, interconnected world.

UNIT - I: Eco system and natural resources: Environment – Definition – components - Ecosystem -Definition, Concept, Scope, importance, structure and functions of ecosystem. Energy flow, Ecological succession. Food chains and food webs. Classification of ecosystem. Natural resources: Forest resources; water resources

UNIT - II: Environmental pollution: Cause, effects and control measures of Air pollution, water pollution, soil pollution, marine pollution, noise pollution, thermal pollution and nuclear hazards pollution. Solid waste management.

UNIT - III: Biodiversity and its conservation: Introduction- Definition, genetic, species and ecosystem diversity, biogeographical classification of India- Value of biodiversity: Consumptive, productive uses; social, ethical, aesthetic and option values. Threats to biodiversity: habitat loss, poaching of wildlife, man-wildlife conflicts.

UNIT - IV: Social issues and the environment: Urban problems related to energy- water conservation and management -Rain water harvesting- water shed management. Resettlement and Rehabililisaion. Natural resources and associated problems and sustainable utilization. Environmental Education.

UNIT - V: Environment ethics: Environmental Ethics - Gender equity, ethical basis of environment education and awareness, conservation ethic and traditional value systems of India. Valuing nature, cultures, social justice, Human heritage, equitable use of resources, preserving resources for future generation, common property resources, Ecology and its uses and its degradation, Introduction to Environmental Protection Act (EPA).

Semester – II

15SSD101	Soft Skill Development – I	L T P C
		2 0 0 1
Instruction Hours / week: L: 2 T: 0 P: 0 Marks: Internal: 100 External: Nil Total: 100		

Course Objectives (CO)

- Students will be able to apply quantitative reasoning and mathematical analysis methodologies to understand and solve problems.
- To achieve the analytical and reasoning competencies and to improve their communication and presentation skills
- To impart knowledge on both Aptitude and Soft skills to the students
- To actively do mathematics—such as analyzing data, constructing hypotheses, solving problems, reflecting on their work, and making connections.
- To critically evaluate and demonstrate various principles involved in solving mathematical problems and to adopt new and faster methods of calculations.
- To reinforce competencies in soft skills which are crucial in a social setting

Course Outcomes (COs)

On successful completion of the course the students will be able to:

1. Understand the basic concepts of QUANTITATIVE ABILITY
2. Understand the basic concepts of LOGICAL REASONING Skills
3. Acquire satisfactory competency in use of VERBAL REASONING
4. Actively do mathematics—such as analyzing data, constructing hypotheses, solving problems, reflecting on their work, and making connections.
5. Solve campus placements aptitude papers covering Quantitative Ability, Logical Reasoning and Verbal Ability
6. Compete in various competitive exams like CAT, CMAT, GATE, GRE, GATE, UPSC, GPSC etc.

UNIT - I

Introduction to Quantitative Aptitude, Speed Maths, Problems on Numbers, Averages, Ratios and Proportions, Problems on Ages

UNIT - II

Number Series, Blood Relation, Image Analysis, Direction Sense, Syllogism, Coding and Decoding

UNIT – III

Percentages, Data Interpretation, Profit and Loss, Simple Interest and Compound Interest

UNIT – IV

Parts of Speech, Tense, Subject Verb Agreement, Active and Passive Voice, Articles, Prepositions

UNIT - V

Conditional Clause, Degrees of Comparison, Goal Setting, Interpersonal Skills

Course Objectives (CO)

- To develop confidence to respond in English during situations where the use of English is imperative.
- To develop fluency in actual conversation in the English language.
- To develop speech skills necessary for confident and intelligent participations in Group Discussions and develop skills related to teamwork in work places.
- To develop confidence to respond in English during situations where the use of English is imperative.
- To develop fluency in actual conversation in the English language.
- To develop knowledge about business communication.

Course Outcome (COs)

After the completion of this course, a successful student will be able to:

- Learn the basics and purposes of listening skill.
- Understand importance of speaking.
- Develop the speaking skills on telephone, business and also in travel
- Learnt some effective vocabulary learning strategies.
- Communicate clearly and effectively and handle their day to day affairs well with their knowledge of language skills.

UNIT I

Listening: Listening comprehension – Listening for Specific Information –Note Taking – Interpreting Charts and Diagrams.

UNIT II

Speaking: Essentials of effective communication – Greeting and Introducing – Making requests – Asking for permission – Giving and Denying Permission – Offering and Accepting Help – Asking for and Declining Help – Giving Instructions and Orders - Talking about likes and dislikes.

Telephone Skills – Understanding telephone conversation – handling calls – leaving messages –making requests - giving instructions and orders

Discussion Skills – Giving your opinion – agreeing and disagreeing – Making suggestions – Interrupting – questioning – reporting – Dealing with questions.
(Completing dialogues)

UNIT III

Reading: Reading – Reading with a purpose –Skimming and Scanning – locating main points – reading critically – Sequencing of sentences – Reading comprehension.

UNIT IV

Writing: Paragraph Writing – Descriptive and Narrative. Safety Instructions/ Suggestions. Expansion of Abbreviations – Spellings- Report writing.

Translation- Translating short sentences and passages from English to Tamil and from Tamil to English.

UNIT V

Vocabulary: Improve English vocabulary: Synonyms – Antonyms – Prefixes – Suffixes – Idioms – Collocations – Different types of English – British and American (Choose the best answer type from a database of 50 words each for each topic)

Functional Grammar: Forming questions, getting answers – Articles – Parts of Speech – Punctuation – Common mistakes in English (Homophones)(Exercise based)

15CTU301	Algorithm Analysis and Data Structures	Semester – III L T P C 5 0 0 5			
----------	--	--------------------------------------	--	--	--

Course Objectives (CO)

- To assess how the choice of data structures and algorithm design methods impacts the performance of programs
- To choose the appropriate data structure and algorithm design method for a specified application.
- To study the systematic way of solving problems, various methods of organizing large amounts of data.
- To employ the different data structures to find the solutions for specific problems.
- To solve problems using data structures such as linear lists, stacks, queues.
- To understand the usage of Tree and Binary tree and search operations.

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Choose appropriate data structure as applied to specified problem definition.
2. Handle operations like searching, insertion, deletion, traversing mechanism etc. on various data structures.
3. To design and apply appropriate data structures for solving computing problems
4. To analyze algorithms and to determine algorithm correctness and time efficiency class.
5. Use linear and non-linear data structures like stacks, queues, linked list etc.
6. Illustrate various technique to for searching and Sorting

UNIT-I

Analysis of Algorithms : Introduction to Data Structures: Introduction to the Theory of Data Structures Data Representation-Abstract Data Types-Data Types-Primitive Data Types-Difference between Abstract Data Types, Data Types, Data Structures.

Analysis of Algorithms: Introduction – Best, Worst and Average Cases - Asymptotic analysis – Upper bounds – Lower bounds - Notations , Simplified rules –Classifying functions – Calculating running time of a program – Analyzing problems..

UNIT-II

Arrays and Linked Lists: Arrays: Introduction to Linear and Non-linear Data Structures-Arrays in C- One Dimensional Arrays-Array Operations-Two Dimensional Arrays-Multi Dimensional Arrays-Pointers and Arrays. Linked List: Introduction to Lists and Linked Lists-Dynamic Memory Allocation-Basic Operations-Double Linked Lists-Circular Linked Lists-Linked List in arrays-Linked Lists versus Arrays.

Polynomials and Sparse Matrix: Introduction-Representation of Polynomials.

UNIT- III

Stack and Queues: Stack: Introduction- Representation of Stack using Arrays and Linked List-Applications of Stack-Stack and Recursion.

Queues: Introduction- Representation of Queue-Circular Queue-Double Ended Queue-Priority Queue-Application of Queue.

UNIT-IV

Searching and Trees: Searching: Introduction-Sequential Search-Binary Search -Indexed Sequential Search. Trees: Introduction-Types-Basic Definition-Properties-Representation-Operation on Binary Tree – Application of Binary Trees – Recursive Traversal of Binary Tree.

UNIT-V

Graphs and Sorting: Graphs: Introduction-Sequential Representation-Linked Representation-Traversal of Graphs-Spanning Trees-Shortest Path. Sorting: Introduction – Selection Sort – Insertion sort – Bubble- Quick- Merge- Radix-Shell- Heap-Comparison of Time Complexity

		Semester – III
		L T P C
15CTU302	Relational Database Management System	5 0 0 5

Course Outcomes (COs)

- To describe a sound introduction to the discipline of database management systems.
- To give a good formal foundation on the relational model of data and usage of Relational Algebra.
- To introduce the concepts of basic SQL as a universal Database language.
- Ability to use PL/SQL
- To demonstrate the principles behind systematic database design approaches by covering conceptual design, logical design through normalization.
- To provide an overview of physical design of a database system, by discussing Database indexing techniques and storage techniques.

Course Outcomes (COs)

Upon completion of the course, students will be able to

1. Explain the features of database management systems and Relational database.
2. Design conceptual models of a database using ER modeling for real life applications and also construct queries in Relational Algebra.
3. Create and populate a RDBMS for a real-life application, with constraints and keys, using SQL.
4. Retrieve any type of information from a data base by formulating complex queries in SQL.
5. Analyze the existing design of a database schema and apply concepts of normalization to design an optimal database.
6. Build indexing mechanisms for efficient retrieval of information from a database

UNIT - I

Understanding Database Fundamentals: Origin of Database – Database elements – Design concepts – components of DBMS – Advantages and Disadvantages of DBMS. Database Models: Flat-file-hierarchical model – network model – relational model – object oriented model – Features of Object oriented Database Management system – Features of distributed DBMS – Comparison of DBMS & DDBMS - Object relational model. ER-model: entities – relationships – ERD symbols – cardinalities – sample ERD.

UNIT – II

Entities and Entity Relationships: Relational Model: Introduction – Relational database: attributes and domains – Tuples – Relation and their schemes – Relation representation – keys – relationships – relational operations – Integrity rules. Relational Algebra: Basic operations – Additional relational algebraic operations – some Relational algebra queries. Functional dependency: Reasoning about FD's – closure of set of FD's – Attribute closure.

UNIT – III

Objects: Relational database manipulation: Introduction – SQL: Data definition – Data manipulation: Basic data retrieval – condition specification – Arithmetic and aggregate

operations. SQL joins – Set manipulation – categorization – updates – views – index. Data Control language: grant – revoke – simple privileges. Simple flashback queries.

UNIT – IV

Overview of PL/SQL: Declaration section – executable command section: conditional logic, loops, CASE statements – exception handling section: predefined and user defined exceptions. Triggers: definition – types: row level, statement level, before and after, instead of – syntax – enabling and disabling triggers - replacing and dropping triggers. Cursors – definition – open – fetch – close – cursor attributes- select for update – types : implicit, explicit. Procedures, Functions: Local and global – procedures vs. functions – stored procedures, functions – create procedure syntax - create function syntax – calling procedures, functions. Replacing and dropping procedures, functions.

UNIT - V

Packages: Package header – package body – calling package members - Replacing and dropping package. Overview of Normalization: advantages - disadvantages. Normal forms: first normal form – second normal form – third normal form – denormalization. Parallel Databases: Introduction – Design of Parallel Databases – Advantages and Disadvantages of Parallel Database.

Case study

Project: University System

Project: Course Registration System

Project: Airline Reservation System

Web Sites

www.databasedir.com

www.rdbms.org

Course Outcomes (COs)

- To describe a sound introduction to the discipline of database management systems.
- To give a good formal foundation on the relational model of data and usage of Relational Algebra.
- To introduce the concepts of basic SQL as a universal Database language.
- Ability to use PL/SQL
- To demonstrate the principles behind systematic database design approaches by covering conceptual design, logical design through normalization.
- To provide an overview of physical design of a database system, by discussing Database indexing techniques and storage techniques.

Course Outcomes (COs)

Upon completion of the course, students will be able to

1. Explain the features of database management systems and Relational database.
2. Design conceptual models of a database using ER modeling for real life applications and also construct queries in Relational Algebra.
3. Create and populate a RDBMS for a real life application, with constraints and keys, using SQL.
4. Retrieve any type of information from a data base by formulating complex queries in SQL.
5. Analyze the existing design of a database schema and apply concepts of normalization to design an optimal database.
6. Build indexing mechanisms for efficient retrieval of information from a database

List of Programs

1. Create a table with following fields:

Employee table:

Field name	Constraint	Type	Size
Employee_no	Primary key	Character	6
Employee_name		Character	30
Address		Character	25
Designation		Character	15
Dob		Date	
Gender	Check	Character	1
Doj		Date	
Salary		Number	10,2

Queries:

- a) Display name of the employees whose salary is greater than “10,000”.
- b) Display the details of employees in ascending order according to Employee Code
- c) Display the details of the employee earning the highest salary.
- d) Display the names of the employees who earn more than “Ravi”

2. Create a table named **Student** with the following fields and insert the values:

Field name	field type	field size
Student Name	character	15
Gender	character	6
Roll No.	character	10
Department Name	character	15
Address	character	25
Percentage of Marks	number	4 , 2

Queries:

- Calculate the average mark percentage of the students.
- Display the names of the students whose percentage marks are greater than 80%
- Display the details of the student who got the highest percentage of marks.
- Display the details of the students whose mark percentage is between 50 and 70.
- Display the details of the students whose mark percentage is greater than the mark percentage of Roll No = 12CA01

3. Create a table with following fields:

Staff table:

Field name	Constraint	Type	Size
Staff_no	Primary key	Character	6
Staff_name		Character	30
Dob		Date	
Dept_code	Foreign key	Character	4
Designation		Character	15
Basic Salary		Number	7,2

Department table:

Field name	constraint	Type	Size
Dept_code	Primary key	Character	4
Dept_name		Character	30

Execute the following queries:

- To list the staff who joined 2 years back.
- To list the staff in computer science dept.
- To list the staff_name and the dept_name in which he/she works.
- To list the maximum and minimum salary in each dept.
- To list the dept along with the total amount spent on salary
- To list the name of the employees who draw the salary more than the average salary.

4. Create a table with the following fields:

Book table:

Field name	Constraint	Type	Size
Access_no	Primary key	Character	6
Title		Character	30
Author		Character	30
Publisher		Character	30
Subject		Character	10
Price		Number	6,2

Execute the following queries:

- The title of C and C++ books.
- The books written by a particular author.

3. The books which cost between Rs.300/- and Rs.500/-
4. The number of books available in each subject.
5. The books in the decreasing order of the cost.

5. Create a table with the following fields:

Account table:

Field name	Constraint	Type	Size
Acc_no	Primary key	Number	4
Cust_name		Varchar2	30
Branch_name		Varchar2	30
Cust_city		Varchar2	30

Borrower table:

Field name	Constraint	Type	Size
Acc_no	Foreign key	Number	30
Branch_name		Varchar2	30
Amount		Number	8,2

Write a Query to perform different types of Join.

6. Create two tables course & batch with following fields:

COURSE: coursecodeno number(5),course name varchar(20), syllabus varchar(20)

BATCH: bcode number(5), coursecode number(5),starting_date date, duration number(3),coursefee number(10,2)

Perform the following queries:

- ☐ ☐ Insert the details for course and batch tables with 10 records
- ☐ ☐ Show the description of the two tables
- ☐ ☐ Select all the fields from course & batch tables
- ☐ ☐ Select all the fields from course & batch tables where coursecode=10
- ☐ ☐ Select all the fields from batch table where starting date=march 10th
- ☐ ☐ Select batch code from batch table where net income>50000
- ☐ ☐ Select course name, batch code & starting date from batch & course tables where course code in batch table and course code in course table are equal
- ☐ ☐ Select a syllabus from course where coursecode=5

7. Create table with following fields:

Product table:

Field name	Constraint	Type	Size
Product_code	Primary key	Varchar2	7
Product_name		Varchar2	30
Price		Number	6,2
Quantity		Number	4

Vendor table:

Field name	Constraint	Type	Size
Vendor_name		Varchar2	30
Vendor address		Varchar2	30
Product_code	Foreign Key	Varchar2	7

Create a trigger to fire when the Record is deleted and inserted.

8. Write a PL/SQL trigger to update the records while deleting the one record in another table.

voters_master:

Field name	Constraint	Type	Size
voterid	Primary key	Number	5
name		Varchar2	30
Ward_no	Primary key	Number	4
dob		Date	
address		Varchar2	150

new_list

Field name	Constraint	Type	Size
voterid		Number	5
ward_no		Number	4
name		Varchar2	30
Description		Character	50

9. Create a table to store the salary details of the employees in a company. Declare the cursor id to contain empno, employee name and net salary. Use cursor to update the employee details.

Salary:

Field name	Constraint	Type	Size
emp_no	Primary key	Number	4
emp_name		Varchar2	30
designation		Varchar2	25
dept		Varchar2	30
basic		Number	5

10. Write the PL/SQL program to find the factorial and Fibonacci series of given number.

Implement the Following programs using C

11. To perform the operations of Linked List.
12. To perform Stack operations using arrays
13. To perform Infix-postfix operations
14. To search an element in an array using Linear Search
15. To Sort an array using Bubble Sort.

Course Objectives (CO)

- To understand the basic concepts of numerical methods
- To develop the mathematical skills in the areas of numerical methods.
- To understand numerical techniques as powerful tool in scientific computing.
- To provide suitable and effective methods called Numerical Methods, for obtaining approximate representative numerical results of the problems.
- To solve problems in the field of Applied Mathematics, Theoretical Physics and Engineering which requires computing of numerical results using certain raw data.
- To solve complex mathematical problems using only simple arithmetic operations. The approach involves formulation of mathematical models of physical situations that can be solved with arithmetic operations.

Course Outcomes (COs)

On completion of the course students will be able to

1. Apply Numerical analysis which has enormous application in the field of Science
2. Familiar with numerical integration and differentiation, numerical solution of ordinary differential equations.
3. Familiar with calculation and interpretation of errors in numerical method.
4. Develop and apply the appropriate numerical techniques for the problem, interpret the results, and assess accuracy.
5. Understand the basics of Numerical Differentiation & Integration and numerical solutions of ordinary differential equations.
6. Understand the concepts of difference operators and the use of Interpolation.

UNIT I

Relations: Properties of Binary relations – Equivalence relations - composition of relations, Closure of relations – Order relations – Partial order relations.

Functions: one-to-one, onto, one-to-one-onto functions – composition of functions, Inverse functions.

UNIT II

Mathematical Logic: Connectives, well-formed formulae, tautology, equivalence of formulas, tautological implications, duality law, normal forms, predicates, variables, quantifiers, Free and bound variables. Theory of inference for statement calculus and predicate calculus.

UNIT III.

Transcendental and polynomial equation – Bisection method, Regula Falsi method, Newton – Raphson method. Polynomial equation – Graffe's root squaring method.

UNIT -IV

System of linear algebraic equations – Gauss Elimination, Gauss Jordan and Gauss Seidel methods.

Interpolation – Newton's Forward and Backward formula – Lagrange's interpolation formula.

UNIT- V

Numerical Differentiation : Newton's Forward Difference and Backward Difference.
Numerical Integration: Trapezoidal rule and Simpson's rule.

Veerarajan T., 2007, Discrete mathematics with graph theory and combinatorics, Tata Mcgraw hill companies, New Delhi.

Course Objectives (CO)

- To learn how to use Cloud Services.
- To implement Virtualization
- To implement Task Scheduling algorithms.
- To apply Map-Reduce concept to applications.
- To build Private Cloud.
- To know the impact of engineering on legal and societal issues involved

Course Outcomes (COs)

Upon completion of this course, the students will be able to

1. Analyze the Cloud computing setup with its vulnerabilities and applications using different architectures.
2. Design different workflows according to requirements and apply map reduce programming model.
3. Apply and design suitable Virtualization concept, Cloud Resource Management and design scheduling algorithms.
4. Create combinatorial auctions for cloud resources and design scheduling algorithms for computing clouds
5. Assess cloud Storage systems and Cloud security, the risks involved, its impact and develop cloud application
6. Broadly educate to know the impact of engineering on legal and societal issues involved in addressing the security issues of cloud computing.

UNIT I

Introduction to Cloud Computing -Characteristics of Cloud Computing -Paradigm shift - Benefits of cloud computing - Disadvantages of cloud computing- Role of Open Standards- Cloud Computing Architecture: Cloud computing stack-Public cloud -Private cloud -Hybrid cloud -Community cloud

UNIT II

Virtualization Technologies -Load Balancing and Virtualization -Advanced load balancing - The Google cloud - Hypervisors -Virtual machine types -VMware vSphere - Machine Imaging -Porting Applications -The Simple Cloud API - AppZero Virtual Application Appliance

UNIT III

Infrastructure as a Service (IaaS) -Platform as a Service (PaaS) -Software as a Service (SaaS) -Identity as a Service (IDaaS) -Compliance as a Service (CaaS)- Cloud storage.

UNIT IV

Cloud Information Security Objectives -Confidentiality, Integrity, and Availability -Cloud Security Services - Relevant Cloud Security Design Principles -Cloud Computing Risk Issues -The CIA Triad Privacy and Compliance Risks -Threats to Infrastructure, Data, and Access Control -Cloud Access Control Issues -Database Integrity Issues -Cloud Service Provider

Risks Architectural Considerations General Issues- Trusted Cloud Computing -Identity Management and Access Control

UNIT V

Case Study on Open Source and Commercial Clouds: Microsoft Azure- Amazon EC2- Google Web services.

Text Books

Barrie Sosinsky, 2010, Cloud Computing Bible, Wiley- India.

Ronald L. Krutz, Russell Dean Vines, 2010, Cloud Security: A Comprehensive Guide to Secure Cloud Computing, Wiley –India.

Course Objectives (CO)

- To know the basic concepts involved in mobile development environment
- To describe the limitations and challenges of working in a mobile and wireless environment
- To facilitate students to understand android SDK
- To help students to gain a basic understanding of Android application development.
- To inculcate working knowledge of Android Studio development tool
- To integrate multimedia, camera and Location based services in Android Application.

Course Outcomes (COs)

After completion of this course, the students will be able to:

1. Identify various concepts of mobile programming that make it unique from programming for other platforms,
2. Critique mobile applications on their design pros and cons
3. Utilize rapid prototyping techniques to design and develop sophisticated mobile interfaces
4. Describe and work within the capabilities and limitations of a range of mobile computing devices.
5. Program mobile applications for the Android operating system that use basic and advanced phone features
6. Understand various Mobile security issues.

UNIT I

Introduction to Mobile Development: What is mobile computing? History of mobile environments – early mobile phones to smartphones and tablets, Development for mobile environments, Differences from traditional application development, Trends in mobile development.

UNIT II

Mobile Development : Introduction, Advantages, Limitations, Features useful for mobiles – Geolocation, offline web applications, offline web storage, animations, 2D/3D graphics, Audio/Video etc. , Frameworks -- HTML5 , Phone Gap (Apache Cordova) framework and jQuery Mobile framework.

UNIT III

Introduction to Android : Android Overview -- Features, Architecture, Applications, Application frameworks, Libraries, Runtime, Kernel, Android Ecosystem – Application stores, publishing, Android Development Tools – Android SDK, Android emulator, Development on hardware devices

UNIT IV

Basic Android Development: Writing Android Applications, Activity Lifecycle, Multi device support, Fragments, Data storage, Intents, Data sharing, Audio playback, Photo capture

UNIT V

Advanced Android Development : Animations. OpenGL ES, Wireless connections, Data syncing, Location aware applications, Best practices for development, Security, Distribution and Monetizing

Lab: Exercises using PhoneGap and the Android SDK using various features of Android.

Text Book

Course Objectives (CO)

- To know the need, advantages and disadvantages of Open Source software.
- To know the basic concepts of Open Source Database
- To understand how server-side programming works on the web.
- To receive and process form submission data by creating session
- To learn Open Source Server Applications and Open Source Desktop Applications
- To introduce the concepts of basic SQL as a universal Database language

Course Outcomes (COs)

After completion of this course, the students will be able to:

1. To understand the history and characteristics of open source software.
2. To understand the architecture and life cycle of OSS
3. To know the applications of Open source software.
4. To understand the basic concepts of PHP and MySQL programming.
5. Analyze and solve SQL database tasks using the PHP language.
6. Analyze and solve common Web application tasks by writing PHP programs

UNIT I

Overview of Free Open Source Software: The Open Source Definition - Examples of OSD Compliant Licenses - Examples of Open Source Software Product – The Open Source Software Development Process – A History of Open Source software: The Berkeley Software Distribution – The Free Software Foundation – Linux – Apache – Mozilla – Open Source Software.

UNIT II

Qualification: Defining Open Source Software – Categorizing Defining Open Source Software – Specific Characteristics of Open Source Software Transformation: The OSS Development Process – Taboos and Norms in OSS Development – The OSS development Life Cycle – Deriving a Framework for Analyzing OSS – Zachmans Framework for IS Architecture – CATWOE and Soft System Method – Deriving the Analytical Framework for OSS.

UNIT III

Environment: The “where” of OSS – the “when” of OSS – World View: A Framework for classifying OSS Motivations – Technological Micro-level (individual) motivation – Economic Micro-level and Macro-level (individual) Motivation – Socio-political Micro-level and Macro-level (individual) Motivation. Open Source Server Applications: Infrastructure Services – Web Services – Database Servers – Mail Servers – Systems Management – Open Source Desktop Applications: Introduction – Graphical Desktops – Web Browsers – The Office Suite – Mail and Calendar Clients – Personal Software – Cost of OSS: Total Cost of Ownership – Types of Costs Licensing: Types of Licenses – Licenses in Use – Mixing Open and Close Code – Dual Licensing.

UNIT IV

PHP Programming Basics - PHP - Introduction, PHP Basics: - Syntax- Variables- Controls and functions - Strings. Arrays: - Using Arrays, Manipulating Arrays, Associative Arrays. OOP with PHP –Advanced Array functions-Sessions-cookies and HTTP.

UNIT V

MySQL: Introduction-Connecting to and Disconnecting from the Server-Entering Queries. Creating and Using a Database-Creating and Selecting a Database-Creating a Table- Loading Data into a Table-Retrieving Information from a Table-Selecting All Data-Selecting Particular Rows-Selecting Particular Columns-Sorting Rows-Date Calculation-Working with NULL Values-Pattern Matching-Counting Rows-Using More Than one Table.

15SSD301	Soft Skill Development – II	Semester – III			
		L	T	P	C
		2	0	0	0

Instruction Hours / week: L: 2 T: 0 P: 0 Marks: Internal: 100 External: Nil Total: 100

Course Objectives (CO)

- Students will be able to apply quantitative reasoning and mathematical analysis methodologies to understand and solve problems.
- To achieve the analytical and reasoning competencies and to improve their communication and presentation skills
- To impact knowledge on both Aptitude and Soft skills to the students
- To actively do mathematics—such as analyzing data, constructing hypotheses, solving problems, reflecting on their work, and making connections.
- To critically evaluate and demonstrate various principles involved in solving mathematical problems and to adopt new and faster methods of calculations.
- To reinforce competencies in soft skills which are crucial in a social setting

Course Outcomes (COs)

On successful completion of the course the students will be able to:

1. Understand the basic concepts of QUANTITATIVE ABILITY
2. Understand the basic concepts of LOGICAL REASONING Skills
3. Acquire satisfactory competency in use of VERBAL REASONING
4. Actively do mathematics—such as analyzing data, constructing hypotheses, solving problems, reflecting on their work, and making connections.
5. Solve campus placements aptitude papers covering Quantitative Ability, Logical Reasoning and Verbal Ability
6. Compete in various competitive exams like CAT, CMAT, GATE, GRE, GATE, UPSC, GPSC etc.

UNIT - I

Time, Speed and Distance, Time and Work, Pipes and Cisterns, Geometry, Data Arrangement

UNIT – II

Analogy, Logic based Venn diagram, Probability, Permutation and Combination, Logarithms

UNIT – III

Data Sufficiency, Clocks, Calendar, Reading Comprehension, Sentence Correction, Sentence Completion, Spotting the Errors, Jumbled Sentences

UNIT – IV

Synonyms, Antonyms, Verbal Analogy, Statements and Assumptions, Group Discussion

UNIT - V

Resume Writing, Introduction to HR rounds, Time Management, Attitude and Behaviour

Objectives

- To train the students in understanding the concepts of communication.
- To train the students in developing their written communication and
- presentation skills.

UNIT I – Concept of Communication – Barrier to Communication –Body language – Personality Development – Etiquette and Manners- Soft Skills – Emotional Intelligence

UNIT II – Listening Comprehension – Reading Comprehension – Paragraph writing – Precise Writing – Writing Resume and Covering Letter -Speaking – Welcome Address, Vote of Thanks, Compering, Debates, Role Play, Dialogues – Vocal Communication Techniques. Voice, Quality, Volume, Pitch

UNIT III – Dicto Composition – Letter Writing (Informal, Letters to the Editor etc) – Term paper – Book reviews

UNIT IV – Business Correspondence – Layout of Business Letter – Formal Styles of Business Letters – Letters of Acceptance, Appointment, Resignation, Complaint, Sending E-mails.

UNIT V – Effective Presentation – Planning – Audience Analysis –Logical Sequencing – Timing of the Presentation – Conclusion – Answering Queries – Group Discussion – Interview.

Course Objectives (CO)

- To understand the main components of an OS & their functions.
- To study the process management and scheduling.
- To understand various issues in Inter Process Communication (IPC) and the role of OS in IPC. To understand the concepts and implementation Memory management policies and virtual memory.
- To understand the working of an OS as a resource manager, file system manager, process manager, memory manager and I/O manager and methods used to implement the different parts of OS
- To understand the structure and organization of the file system
- To learn case studies based on different operating system.

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Describe the important computer system resources and the
2. Perform the role of operating system in their management policies and algorithms.
3. Understand the process management policies and scheduling of processes by CPU
4. Evaluate the requirement for process synchronization and coordination handled by operating system
5. Describe and analyze the memory management and its allocation policies.
6. Identify use and evaluate the storage management policies with respect to different storage management technologies, identify the need to create the special purpose operating system.

UNIT – I

Introduction: What is an OS? – Mainframe systems Desktop Systems – Multiprocessor systems – distributed systems – real time systems. Process: - Process concepts – Operation on process – cooperation process - Inter process Communication - - Mutual Exclusion - Critical sections- primitives – Semaphores – Deadlock: Deadlock prevention, avoidance, detection, recovery from deadlock.

UNIT – II

Storage management: Memory Management - swapping- Contiguous memory allocation – paging, segmentation – segmentation with paging – Virtual memory :Virtual storage organization – Demand Paging, Process Creation – Page replacement – Thrashing.

UNIT – III

Processor Scheduling: preemptive scheduling : - Scheduling Criteria – Scheduling Algorithms – FCFS- SJF- Priority – RoundRobin –Multilevel Queue – Multilevel Feedback Queue .

UNIT – IV

File systems: Introduction – File System Concepts – Access Methods – Directory structure – File Sharing – Allocation Methods – Free space management –Efficiency and performance –

Recovery Disk Performance Optimization: Introduction – Disk structure – Disk scheduling – Disk management.

UNIT – V *Case studies*

LINUX, Windows 2000, Windows XP : History- Design principles- File systems- Memory.

Course Objectives (CO)

- To design, formulate, and construct applications with VB.NET
- To integrate variables and constants into calculations applying VB.NET
- To determine logical alternatives with VB.NET decision structures
- To implement lists and loops with VB.NET controls and iteration
- To separate operations into appropriate VB.NET procedures and functions
- To assemble multiple forms, modules, and menus into working VB.NET solutions

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Grasp the fundamentals of a programming language and know the basic differences between programming languages
2. Choose the architecture based on the problem to be solved.
3. Differentiate between the types of applications supported by .Net
4. Build, compile and execute a VB .Net program
5. Apply techniques to develop error-free software
6. To build integrated VB.NET solutions using files and structures with printing capabilities. Translate general requirements into data-related solutions using database concepts

UNIT - I

Introduction to .NET: .NET Framework features & architecture, CLR, Common Type System, MSIL, Assemblies and class libraries. Introduction to visual studio, Project basics, types of project in .Net, IDE of VB.NET- Menu bar, Toolbar, Solution Explorer, Toolbox, Properties Window, Form Designer, Output Window, Object Browser. The environment: Editor tab, format tab, general tab, docking tab. visual development & event driven Programming -Methods and events.

UNIT - II

The VB.NET Language: The VB.NET Language- Variables -Declaring variables, Data Type of variables, Forcing variables declarations, Scope & lifetime of a variable, Constants, Arrays, types of array, control array, Structure Programming – Modularity – Information Hiding – Abstraction – Events – subroutines and functions– Message box – Input box. Control flow statements: conditional statement, loop statement.

UNIT - III

Working with WPF: Introduction : Understanding Windows Graphics - WPF: A Higher-Level API - The Architecture of WPF. – ,XAML: Basics, Properties and Events in XAML – Loading and compiling -Layout-.Classic Controls: The Control Class - Content Controls - Text Controls - List Controls - Range-Based Controls.

UNIT – IV

Objects and collections: Understanding objects, Properties, Methods. Understanding collections. Files : Introduction – Classification of files – Processing files – handling files and folder using class – Directory class – file class.

UNIT - V

Database programming with ADO.NET: Overview of ADO, from ADO to ADO.NET, Accessing Data using Server Explorer. Creating Connection, Command, Data Adapter and Data Set with OLEDB and SQLDB. Display Data on data bound controls, display data on data grid. Generate Reports Using CrystalReportViewer.

 3. Differentiate between the types of applications supported by .Net
 4. Build, compile and execute a VB .Net program
 5. Apply techniques to develop error-free software
 6. To build integrated VB.NET solutions using files and structures with printing capabilities. Translate general requirements into data-related solutions using database concepts
-
1. Write a VB.NET program to calculate Simple interest and compound Interest
 2. Write a VB.NET program to implement Calculator.
 3. Write a VB.NET program to implement Notepad
 4. Write a VB.NET program to draw several shapes and fill with color.
 5. Write a VB.NET program to perform the following in list box
 - a) Add an item
 - b) Delete an item
 - c) List count
 - d) Clear the List
 6. Write a program to calculate the total marks of the student and print the grades
 7. Write a VB.NET Program to implement Employee Payroll System.
 8. Write a VB.NET program to create and manipulate a File.
 9. Write a Program to implement a Web Browser
 10. Write a program to maintain the details of doctors in a hospital with their specialization.
 11. Write a program to animate the picture using Timer Control.
 12. Write a program to move the object from one location to another. Change the color and size of object at different time interval.

13. Write a program to place ten pictures in the list box. Using timer control take the picture from List box and change the form background after specific time interval.
14. Write a program to implement speaking program. Get the text input from the user and convert into voice.
15. Write a program to implement chatting.

Course Objectives (CO)

This course enables the students to

- To learn the basic concepts and applications of linear programming.
- To impart knowledge in concepts and tools of Operations Research.
- To know the constructive techniques to make effective business decisions
- Define and formulate linear programming problems and appreciate their limitations
- To Identify and develop operational research models from the verbal description of the real system
- To Solve network models like the shortest path, minimum spanning tree, and maximum flow problems

Course Outcomes (COs)

On successful completion of the course, students will be able to

1. Understand the basic concepts and application of operation research in various fields.
2. Understand and analyze managerial problems in industry so that they are able to use resources (capitals, materials, staffing, and machines) more effectively
3. Define and formulate linear programming problems and appreciate their limitations
4. Recognize the importance and value of Operations Research and mathematical modeling in solving practical problems in industry
5. Identify and develop operational research models from the verbal description of the real system
6. Solve network models like the shortest path, minimum spanning tree, and maximum flow problems

UNIT I

Linear Programming: Formulation of LPP – Graphical solution to LPP –Simplex method – Big M method and Duality in LPP.

UNIT II

Transportation model: Introduction – Mathematical Formulation –Finding initial Basic Feasible solutions – Optimum solution for non degeneracy and degeneracy model - Unbalanced Transportation problems and Maximization case in Transportation problem

UNIT III

The Assignment problem - Mathematical formulation of the problem – Hungarian method – Unbalanced Assignment problem- Maximization case in Assignment problem.

Queuing theory : Introduction – Characteristics of queuing system. Problems in (M/M/1):(∞/FIFO) and (M/M/1):(N/FIFO) models .

UNIT IV

Inventory Control: Introduction – Costs involved in inventory – Deterministic EOQ models – Purchasing Model without and with shortage, Manufacturing Model without and with shortage -Price break.

UNIT V

PERT and CPM: Network representation – Calculation of Earliest expected time, latest allowable occurrence time. CPM - various floats for activities – critical path.

PERT –Time estimates in PERT- Probability of meeting scheduled date of completion of projects .

		Semester – IV			
		L	T	P	C
15CTU403 B	Allied Elective II – Statistical Methods	4	2	0	4

Course Objectives (CO)

- To recognize the error in the number generated by the solution.
- To compute solution of algebraic and transcendental equation by numerical methods like Bisection method and Newton Rapshon method.
- To apply method of interpolation and extrapolation for prediction.
- To recognize elements and variable in statistics and summarize qualitative and quantitative data.
- To calculate mean, median and mode for individual series.
- To outline properties of correlation and compute Karl-Pearson's coefficient of correlation.

Course Outcomes (COs)

Upon completion of the course students shall be able to:

1. Recognize the error in the number generated by the solution.
2. Compute solution of algebraic and transcendental equation by numerical methods like Bisection method and Newton Rapshon method.
3. Apply method of interpolation and extrapolation for prediction.
4. Recognize elements and variable in statistics and summarize qualitative and quantitative data.
5. Calculate mean, median and mode for individual series.
6. Outline properties of correlation and compute Karl-Pearson's coefficient of correlation.

UNIT-I

Meaning and definition of statistics – Classification of data - Frequency distribution - Diagrammatic Presentation – Bar diagram and Pie diagram – Graphic Presentation – Histogram, Frequency Polygon, Frequency curve and Ogives.

UNIT – II

Measures of central tendency – Arithmetic mean, median and mode. Measures of dispersion- Range, standard deviation, Coefficient of variation.

UNIT – III

Correlation – Meaning and definition - Scatter diagram –Karl pearson's correlation coefficient. Rank correlation.

Regression: Regression in two variables – Regression coefficient problems – uses of regression.

UNIT – IV

Probability theory : Axioms of Probability–Addition theorem – Multiplication theorem– conditional Probability.

Theoretical Distribution: Basic Concepts - Binomial distribution, Poisson Distribution & Normal distribution (No derivations) and simple problems.

UNIT – V

Test of significance: Tests based on Means only-Both Large sample and Small sample tests - Chi square test - goodness of fit.

		Semester – IV			
		L	T	P	C
15CTU403 C	Allied Elective II – Discrete Mathematics	4	2	0	4

Course Objectives (CO)

- To learn the basic concepts of sets, types of sets, functions and relations
- To understand about Pigeonhole principle, Permutation and Combination, Mathematical Induction
- To solve the problems using Recurrence relations and generating functions.
- To know the basic concepts of Logical Connectives, Graphs and Trees.
- To express ideas using mathematical notation
- To solve problems with the help of tools of mathematical analysis.

Course Outcomes

On successful completion of the course, students will be able to

1. Familiar with elementary algebraic set theory.
2. Acquire a fundamental understanding of the core concepts in growth of functions.
3. Describe the method of recurrence relations.
4. Get wide knowledge about graphs and trees
5. Initiate to knowledge from inference theory
6. Solve problems with the help of tools of mathematical analysis.

UNIT-I

Mathematical logic: Connections well formed formulas, Tautology, Equivalence of formulas, Tautological implications, Duality law, Normal forms, Predicates, Variables, Quantifiers, Free and bound Variables.

UNIT-II

Relations: Properties of Binary relations – Equivalence relations - composition of relations, Closure of relations – Order relations – Partial order relations.

Functions: one-to-one, onto, one-to-one-onto functions – composition of functions, Inverse functions.

UNIT-III

Formal languages and Automata: Grammars: Phrase–structure grammar, context-sensitive grammar, context-free grammar, regular grammar. Finite state automata- Deterministic finite automata and Non deterministic finite automata-conversion of non deterministic finite automata to deterministic finite automata.

UNIT-IV

Lattices and Boolean algebra: Partial ordering, Poset, Lattices, Boolean algebra, Boolean functions, Theorems, Minimization of Boolean functions.

UNIT-V

Graph Theory: Directed and undirected graphs, Paths, Reachability, Connectedness, Matrix representation, Euler paths, Hamiltonian paths, Trees, Binary trees simple theorems, and applications.

Text Books

Veerarajan T.,2007, Discrete mathematics with graph theory and combinatorics, Tata McGraw hill companies, New Delhi.

Sharma.J.K, 2005 , Discrete Mathematics, Second Edition , Macmillan India Ltd.

Course Objectives (CO)

- Students will be able to apply quantitative reasoning and mathematical analysis methodologies to understand and solve problems.
- To achieve the analytical and reasoning competencies and to improve their communication and presentation skills
- To impart knowledge on both Aptitude and Soft skills to the students
- To actively do mathematics—such as analyzing data, constructing hypotheses, solving problems, reflecting on their work, and making connections.
- To critically evaluate and demonstrate various principles involved in solving mathematical problems and to adopt new and faster methods of calculations.
- To reinforce competencies in soft skills which are crucial in a social setting

Course Outcomes (COs)

On successful completion of the course the students will be able to:

1. Understand the basic concepts of QUANTITATIVE ABILITY
2. Understand the basic concepts of LOGICAL REASONING Skills
3. Acquire satisfactory competency in use of VERBAL REASONING
4. Actively do mathematics—such as analyzing data, constructing hypotheses, solving problems, reflecting on their work, and making connections.
5. Solve campus placements aptitude papers covering Quantitative Ability, Logical Reasoning and Verbal Ability
6. Compete in various competitive exams like CAT, CMAT, GATE, GRE, GATE, UPSC, GPSC etc.

UNIT - I

Time, Speed and Distance, Time and Work, Pipes and Cisterns, Geometry, Data Arrangement

UNIT – II

Analogy, Logic based Venn diagram, Probability, Permutation and Combination, Logarithms

UNIT – III

Data Sufficiency, Clocks, Calendar, Reading Comprehension, Sentence Correction, Sentence Completion, Spotting the Errors, Jumbled Sentences

UNIT – IV

Synonyms, Antonyms, Verbal Analogy, Statements and Assumptions, Group Discussion

UNIT - V

Resume Writing, Introduction to HR rounds, Time Management, Attitude and Behaviour

15CTU501	Advanced JAVA Programming	Semester V			
		L	T	P	C
		5	0	0	5

Course Objectives (CO)

- To understand the fundamentals of programming such as variables, conditional and iterative execution, methods, etc.
- To understand fundamentals of object-oriented programming in Java, including defining classes, invoking methods, using class libraries, etc.
- To use the Java SDK environment to create, debug and run simple Java programs.
- To use Java in various technologies in different platforms.
- To understand the fundamental of Packages and access modifiers and interface in java.
- To understand the fundamental of Exception Handling and SWING component and classes.

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Obtain knowledge of the structure and model of the Java programming language
2. Understand the benefits of Multithreading and Portability
3. Develop robust, object oriented, dynamic and scalable java applications.
4. Develop GUI based applications that responds to user events. Using Java
5. Employ a hierarchy of Java classes to provide a solution to a given set of requirements
6. Understand various Java Utilities Package and JDBC connectivity

UNIT - I

Introduction to Java Applications and Applets: Printing a line of text – Displaying text in a Dialog Box – Adding integers – Arithmetic – Decision Making – Drawing a String – Adding Floating Point Numbers. Control Statements: Pseudocode – Control Structures - if, if/else, while – Formulating Algorithms: Case studies: 1, 2 & 3 – Compound Assignment – Increment and Decrement Operators – Primitive types – for, do/while – switch –break and continue statements (simple & labeled) – Logical Operators - selection statements. Methods: Program Modules in Java – Method Declarations – Argument Promotion - Java API Packages – Scope of Declarations – Method Overloading – Recursion. Arrays: Declaring and Creating Arrays – Reference Parameters – Passing Arrays to Methods – Multidimensional Arrays.

UNIT - II

Object-Based Programming: Implementing a Time Abstract Data Type with a Class – Class Scope – Controlling Access to members – ‘this’- Constructors – Overloaded Constructors – set and get methods – Composition – Static Class Members – Creating Packages – Package Access. Object-Oriented Programming: Superclasses and Subclasses – protected Members – Constructors and Finalizers in Subclasses – Invoking Superclass Method from Subclass Objects - Using Superclass with Subclass-Type Variables – Subclass Method Calls via Superclass-Type Variables – Inheriting Interface and Implementation – final Methods and classes Nested Classes – Type-Wrapper Classes for Primitive Types. String and Characters: Fundamentals – Class String – Class StringBuffer – class Character – class StringTokenizer – Regular Expressions, Class Pattern and Class Matcher.

UNIT - III

Graphics and Java2D: Graphics Contexts and graphics Objects – Color Control – Font Control – Drawing Lines, Rectangles, Ovals, Arcs, Polygons and Polylines – Java2D API. Graphical User Interface Components: Overview of Swing Components- JLabel – EventHandling – Textfields – How event handling works – JButton – JCheckBox and JRadioButton – JComboBox – JList – Multiple-Selection Lists – Mouse Event Handling – Adapter classes – Key Event Handling – Layout Managers – Panels – JTextArea – JPanel – JSlider – Using Menus with Frames – JPopupMenu – Pluggable Look-and-Feel. Exception Handling: Java Exception Hierarchy – Rethrowing and Exception – finally Clause – printStackTrace, getStackTrace and getMessage – Chained Exceptions.

UNIT - IV

Multithreading: Life Cycle of a Thread – Thread Priorities and Thread Scheduling – Creating and Executing Thread – Thread Synchronization – Daemon Threads – Runnable Interface. Files and Streams: Data Hierarchy – Files and Streams – Class File – Creating a Sequential-Access File – Reading Data from a Sequential-Access File – Random-Access Files – Creating/Writing/Reading Random-Access Files – New I/O APIs for the Java Platform. Networking: Manipulating URLs – Reading a File on a Web Server –Client/Server Interaction with Stream Socket Connections. Multimedia: Loading, Displaying and Scaling Images – Animating a series of Images – Image Maps – Loading and Playing Audio Clips.

UNIT - V

Java Utilities Package and Bit Manipulation: Vector Class and Enumeration Interface – Stack Class of Package java.util – Hashtable Class – Properties Class – Bit Manipulation and the Bitwise Operators – BitSet Class. Collections: Collections Overview – Class Arrays – Interface Collection and Class Collections – Lists – Sets – Maps. Java Database Connectivity with JDBC: Relational Database Overview – SQL – Manipulating Databases with JDBC – Stored Procedures. Servlets: Servlet Overview and Architecture – Handling HTTP get /post Requests - Redirecting Requests to other Resources – Multi-Tier Applications. JavaServer Pages: JavaServer Pages Overview – Implicit Objects – Scripting – Standard Actions – Directives.

15CTU502	Internetworking with TCP/IP	Semester V			
		L	T	P	C
		5	0	0	5

Course Objectives (CO)

- To understand fundamental concepts of computer networking.
- To familiarize with the basic taxonomy and terminology of the computer networking area.
- To understand the function of each layer of the TCP/IP protocol suite
- To understand why a protocol is essential for communication between computers
- To familiarize the functions of IP protocol
- To learn the requirements of IP routing and choose appropriate routing methods

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Independently understand basic computer network technology.
2. Understand and explain Data Communications System and its components.
3. Identify the different types of network topologies and protocols.
4. Identify the different types of network devices and their functions within a network.
5. Understand and building the skills of subnetting and routing mechanisms.
6. Able to analyze IP addressing requirements and design an addressing scheme

UNIT - I

Introduction: History of internet – Interconnecting devices - Protocols and Standards - TCP/IP protocol suite - Internetworking Devices – Routing Concept - Classful IP Addressing – Subnetting – Supernetting – Classless Addressing

UNIT - II

ARP & RARP – Proxy ARP – ARP over ATM – ARP and RARP Protocol Format. IP Datagram – Fragmentation – Options – IP Datagram Format – Routing IP Datagrams – Checksum. ICMP – Types of Messages - Message Format – Error Reporting – Query – Checksum .

UNIT - III

Group Management – IGMP Message – IGMP Operation – Process to Process Communication – UDP Operation – TCP Services - Flow Control.

UNIT - IV

BOOTP - DHCP – Address Discovery and Binding. DNS – Name Space – DNS in Internet – Resolution – Resource Records.

UNIT - V

Remote Login - FTP – SMTP – SNMP. IP over ATM Wan – Cells – Routing the Cells – ATMARP – Logical IP Subnets-VPN.

Course Objectives (CO)

- To learn the behavior and flow of the software
- To learn the essential and fundamental aspects of object-oriented concepts along with their applications
- To analyze, design and implement object oriented software systems
- To learn various modelling techniques to model different perspectives of object-oriented software design (UML)
- Understand the fundamental Software engineering Concepts like Analyzing, coding, and Testing.
- To learn applications of software architectures in various setting including the application of design patterns, frameworks and toolkits

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Identify and select suitable process model for the application
2. Understand software development life cycle development activities
3. Understand various aspects involved in analyzing and design software development process
4. Work effectively as leader/member of a development team to deliver quality software artifacts.
5. Analyze, specify and document software requirements for a software system.
6. Design, select and apply the most appropriate software engineering process for a given project, plan for a software project, identify its objectives and risks, and estimate its cost and time.

UNIT I

Introduction: System Concepts – Software Engineering Concepts - Software Life Cycle– Development Activities – Managing Software Development – Unified Modeling Language – Project Organization – Communication.

UNIT II

Analysis: Requirements Elicitation – Use Cases – Unified Modelling Language, Tools – Analysis Object Model (Domain Model) – Analysis Dynamic Models – Non-functional requirements – Analysis Patterns.

UNIT III

System Design: Overview of System Design – Decomposing the system -System Design Concepts – System Design Activities – Addressing Design Goals – Managing System Design.

UNIT IV

Implementation and Managing Change : Programming languages and coding- Human computer interaction-Reusing Pattern Solutions – Specifying Interfaces – Mapping Models to Code – Testing Rationale Management – Configuration Management – Project Management -real time interface design(eg: mobile design)

UNIT V

Aspect Oriented Software Development : Design Principles -Separations of Concerns, Subject Oriented Decomposition, Traits, Aspect Oriented Decomposition, Theme Approach, Designing Base and Crosscutting Themes, Aspect-Oriented Programming using Aspect-J.

Course Objectives(CO)

- To understand the basic animation principles,
- To analyze of the multimedia streaming,
- To perform and establish multimedia communication terminals,
- To present multimedia communications
- To Explore adobe and flash software in creating 3D animation and content creation,
- To Analyze instructional and informational media (print materials, audio/visual materials and/or web-based materials, games/simulations, etc.)

Course Outcomes (COs)

After completion of this course, the students will be able to:

- Understand basic Animation concepts.
- Acquire basic knowledge on Multimedia devices.
- Understand current trends in multimedia by experiencing a variety of applications and development packages.
- Be able to design different application in multimedia and use different tools like adobe Photoshop and macromedia flash.
- understand and explore drawing and basic animation within the Flash interface

Objectives

The main objective of this course is to have students develop an understanding of fundamental techniques used for computer animation. At the end of this course, students will be able to identify the advantages and disadvantages of using simulation, procedural animation, motion capture, and hand designed animations, with respect to both online and offline applications. The student also will be able to implement animation techniques, using common software languages and tools. Finally, in addition to an understanding of current practices in computer animation, a general objective is for students to better recognize current important challenges in computer animation.

UNIT-I

Introduction to Animation – History of Animation – Uses of Animation – Types of Animation – Principles of Animation – Some Techniques of Animation – Animation on the WEB – 3D Animation – Special Effects - Creating Animation.

UNIT-II

Creating Animation in Flash: Introduction to Flash Animation – Introduction to Flash – Working with the Timeline and Frame-based Animation - Working with the Timeline and Tween-based Animation – Understanding Layers - Action script.

UNIT-III

3D Animation & its Concepts – Types of 3D Animation – Skeleton & Kinetic 3D Animation – Texturing & Lighting of 3D Animation – 3D Camera Tracking – Applications & Software of 3D Animation.

UNIT-IV

Motion Caption – Formats – Methods – Usages – Expression – Motion Capture Software's – Script Animation Usage – Different Language of Script Animation Among the Software.

UNIT-V

Concept Development –Story Developing –Audio & Video – Color Model – Device Independent Color Model – Gamma and Gamma Correction - Production Budgets - 3D Animated Movies.

Course Objectives (CO)

- To understand the fundamentals of programming such as variables, conditional and iterative execution, methods, etc.
- To understand fundamentals of object-oriented programming in Java, including defining classes, invoking methods, using class libraries, etc.
- To use the Java SDK environment to create, debug and run simple Java programs.
- To use Java in various technologies in different platforms.
- To understand the fundamental of Packages and access modifiers and interface in java.
- To understand the fundamental of Exception Handling and SWING component and classes.

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Obtain knowledge of the structure and model of the Java programming language
2. Understand the benefits of Multithreading and Portability
3. Develop robust, object oriented, dynamic and scalable java applications.
4. Develop GUI based applications that responds to user events. Using Java
5. Employ a hierarchy of Java classes to provide a solution to a given set of requirements
6. Understand various Java Utilities Package and JDBC connectivity

List of Programs

1. Write a program to find the sum of series $1+x+x^2+x^3+\dots$
2. Define a class for Employee with name and date of appointment. Create employee objects and sort them as per their date of appointment.
3. Write a program to find factorial of number using recursion.
4. Write a program to find maximum and sum of an array.
5. Write a program to perform string operations.
6. Write a program to accept more strings and arrange them in alphabetical order.
7. Write a program to create a window and draw cross lines.
8. Write a program to create an applet and draw the shapes.
9. Write a program to create a window with a background color and display a message.
10. Write a program for multiplication tables by multithreading.
11. Write a program to create an exception for marks out of bounds. If mark is greater than 100 throw an exception.
12. Write an applet program to create menus.
13. Write an applet program to perform operations in list box

15CTU505 A	Core Elective II - Spatial Databases	Semester V L T P C 5 0 0 5
-------------------	---	---

Course Objectives (CO)

- To distinguish between various spatial distance metrics.
- To use SQL operations to query databases
- To learn Query language for graphs
- To inculcate knowledge on data mining query languages.
- To know in detail about data mining algorithms
- To learn the special nature of spatial data and how they are different from non-spatial data

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Develop a sound understanding of the principles and techniques of database design and development as they apply to geospatial data
2. Understand the strengths and limitations of various database and non-database structures for spatial data
3. Use SQL fragments and/or statements as appropriate, to interrogate (geo)databases
4. Collect and manage spatial data in both file formats and databases
5. Identify appropriate data mining algorithms to solve real world problems
6. use geospatial databases to perform common types of queries and geospatial analyses; and publish spatial data to the internet

UNIT I

Introduction to Spatial Databases: Overview – GIS and SDBMS – Query Language – Query Processing – File Organization – Data Mining – Spatial Concepts and Data Models – Models of Spatial Information – Fixed based models – Object based models – Spatial data Types – Operations in Spatial objects – Dynamic spatial Operations Mapping spatial objects into java.

UNIT II

Spatial Query Languages: Standard Database Query Languages – World Database – The Select and project operations – Basic SQL Primer – DDL – DML – Extending SQL for Spatial Data – Object Relational SQL – Spatial Storage and Indexing – Storage disk and files – Buffer Manager – Clustering.

UNIT III

Query Processing: Query Processing and Optimization – Evaluation of Spatial Operation – Spatial operations – Techniques for spatial selection – General spatial selection – Query Optimization – Analysis of Spatial Index Structure – Distributed DBMS architecture – Parallel spatial database systems.

UNIT IV

Spatial Networks: Spatial Networks – Query language for graphs – graph algorithms – access methods – Graph algorithms

UNIT V

Introduction to Spatial Data Mining: Pattern discovery – the data mining concepts – Statistics and Data Mining – Data Mining as a search problems – features – classification techniques- Association rule discovery Techniques – Clustering – Trends in Spatial databases

Text Book

Shashi Shekhar Sanjay Chawla, 2009, Spatial Databases – A Tour Prentice Hall publication.

15CTU505 B	Core Elective II - Ethical Hacking	Semester V			
		L T P C			
		5 0 0 5			

Course Objectives (CO)

- To learn terminologies, types and phases involved in ethical Hacking.
- Learn about basic system defense infrastructure
- Learn about the hacker mindset and the history of hackers
- To learn web application vulnerabilities involved in web server hacking
- To learn computer network threat and vulnerability and overview of digital crime.
- To learn the interrelationships among elements that comprise a modern security system, including hardware, software, policies, and people

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Understand the core foundations of ethics in regards to computer security
2. Identify information security goals, classical encryption techniques and acquire fundamental knowledge on the concepts of finite fields and number theory.
3. Understand basic networking and security technologies
4. Gain a basic understanding of security policy
5. Understand how intruders escalate privileges.
6. Understand the cryptography and its application and some of the important terms used in information security

UNIT I

Introduction To Ethical Hacking : Introduction-Ethical hacking Terminology-types of hacking technologies-phases of ethical hacking-Foot printing-Social Engineering-Scanning and enumeration.

UNIT II

System Hacking : Understanding the password hacking techniques-Rootkits-Trojans-Backdoors-Viruses and worms-sniffers-denial of service-Session hijacking.

UNIT III

Web Server Hacking : Hacking web servers-web application vulnerabilities –Buffer overflow-Wireless hacking Physical Security.

UNIT IV

Wireless Hacking Wep: WPA Authentication mechanism-wireless sniffers-Physical Security-factors affecting physical security-honeypots-Firewall types.

UNIT V

Penetration Testing Cryptography-overview of MD5, SHA, RC4-penetration testing methodologies- steps-pen test legal framework-penetration testing tools.

Text Book

15CTU505C	Core Elective II-Virtual Reality and Virtual Environment	Semester V L T P C 5 0 0 5
-----------	---	----------------------------------

Course Objectives (CO)

- To learn the basic categories of virtual reality technology.
- To learn about different theoretical foundations of virtual reality.
- To learn about existing and potential virtual reality applications in education and training.
- To learn about basic components of virtual environment
- To learn emerging possibilities of environmentally sensed information.
- To learn basic system concept and definitions of system simulation and modeling

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Understand the basic concepts of computer graphics and virtual reality environment
2. Understand and apply the concepts of 3D modeling and VR
3. Understand the principles within computer modelling and simulation
4. Analyze key performance factors in virtualized systems.
5. Compare and contrast traditional e-learning environments with virtual environments
6. Understand the process of creating virtual environments, by developing a complete VR application

UNIT I

Introduction – Computer graphics – Real time computer graphics – Flight Simulation – Virtual environments –requirement – benefits of virtual reality- **3D Computer Graphics** : Introduction – The Virtual world space – positioning the virtual observer – the perspective projection – human vision – stereo perspective projection – 3D clipping – Colour theory – Simple 3D modeling – Illumination models – Reflection models – Shading algorithms.

UNIT II

Geometric Modeling : Introduction – From 2D to 3D – 3D space curves – 3D boundary representation - **Geometrical transformations**: Introduction – Frames of reference – Modeling transformations – Instances – Picking – Flying – Scaling the VE – Collision detection - **A Generic VR system**: Introduction – The virtual environment – the Computer environment – VR Technology – Model of interaction – VR System.

UNIT III

Virtual Environment: Animating the Virtual Environment: Introduction – The dynamics of numbers – Linear and Non-linear interpolation - The animation of objects – linear and non-linear translation - shape & object in-betweening – freeform deformation – particle system- **Physical Simulation** : Introduction – Objects falling in a graphical field –Rotating wheels – Elastic collisions – projectiles – simple pendulum – springs – Flight dynamics of an aircraft.

UNIT IV

VR Hardware & Softwares : Human factors : Introduction – the age- the ear- the somatic senses - **VR Hardware** : Introduction – sensor hardware – Head-coupled displays –Aquatic hardware – Integrated VR systems-**VR Software**: introduction – Modeling virtual world – Physical simulation- VR toolkits – Introduction to VRML.

UNIT V

VR Application : Introduction – Engineering – Entertainment – Science – Training – **The Future:** Introduction – Virtual environments – modes of interaction.

		Semester – V
		L T P C
150EU501	Open Elective – Intranet Technology	0 0 0 3

Course Objectives (CO)

- Able to share and view information within the organization
- To have access to the intranet all the time.
- Promote fundamental concepts within the company over intranet
- Cost effective, saves money - this is one of the greatest benefits of the intranet.
- Messages, event and information can be placed on the intranet as they are quick. This saves time.
- To learn to maintain database and its applications

Course Outcomes (COs)

After completion of this course, the students will be able to:

1. Understand the advantage of intranet over groupware technologies
2. Understand the concept of sharing of files over Intranet
3. Work on Intranet chat tools and Intranet phones
4. Gain knowledge over the Intranet usage of Group scheduling, Message boards, News Feeds and other applications
5. Understand how to integrate intranet with existing applications
6. Understand impact to f security issues and its mechanisms

UNIT – I

Introducing Intranets: Internet Definition – The Internet in Action – Intranets Versus traditional Groupware – Client server basics and Theory. Building Intranet – Server Software – Starting with the Server – Connectivity – wide area networks – Selecting an Intranet Service Provider – Client Issues – Security..

UNIT – II

Applications: Business applications – Viewing corporate Information with HTML – Authoring Tool – Creating a Dynamic & Functional site – Presentations: PDF – SGML-Audio – Video.

UNIT – III

Intranet: Intranet Corporate data – Sharing files – using databases – Direct access. Communication – E-Mail – Intranet chat tools – Intranet phones.

UNIT – IV

Intranet applications : Developing Intranet applications – Intranet tools – Creating real word applications – Group scheduling – Message boards – Contact Databases – Alert messaging and real time chat – News Feeds – Group Document creation and Editing – Private Messaging areas – Document submission – Search functions – Help Desk – Reference Desk.

UNIT – V

Administering Intranet: Integrating existing applications – Maintaining a user Databases – Designing a successful file structure – Maintaining Security – Hardware and software upgrades – the Future of Intranets.

Text Book

David Garrett, 1998, Intranet Unleashed. 2nd Edition, New Delhi: Techmedia publication.[Unit-I(3-220), Unit-II(299-390), Unit-III(393-499), Unit-IV(513-698), Unit-V(701-802)]

References

Dasgupta, Subhasish. 2001. Managing Internet and Intranet Technologies in Organizations: Challenges and opportunities, 1st Edition, Idea Group Publishing.

Rolf Oppliger, 2002, Internet and Intranet Security, 2nd edition, Artech House Inc.

Course Objectives (CO)

- To learn client and server-side scripting languages
- Understand the technologies used in Web designing.
- Know the importance of object-oriented aspects of Scripting.
- To understand and practice embedded dynamic scripting on client-side Internet Programming
- To master the theory behind scripting and its relationship to classic programming
- To gain some fluency programming in HTML, ASP, JavaScript and related languages, to design and implement one's own scripting language.

Course Outcomes (COs)

After completion of this course, the students will be able to:

1. Choose, understand, and analyze any suitable real time web application
2. Design simple web pages using markup languages like HTML and XHTML
3. Create dynamic web pages using ASP and java script that is easy to navigate and use.
4. Program server-side web pages that have to process request from client-side web pages.
5. Develop web pages using ASP, JSP and VBScript.
6. Develop embedded dynamic scripting on client-side Internet Programming

UNIT – I

Introduction to HTML: Introduction-HTML Browsers-History of HTML and SGML-HTML Command Tags-Quotation Marks-Spacing-Special Symbols-Tags with Automatic Line Breaks-URLs-Understanding Domain Names-Links-Defining Web Page-Main Body of Text- Headers-Adding Paragraph-Formatting Text-Font Type, Size, Predefined Fonts, Bold, Italic-Setting Colors-Text Color, Superscripts and Subscripts-Underlining Text-Preformatted Text-Blinking Text-Block Quotes-Margins-Line Breaks-Ordered and Unordered List-Links-Scaling an Image-Images Alignment

More on HTML: Creating Table-Dividing Table into Columns-Dividing Table into Rows-Creating Headers- Adding Border –Putting a Background Image- Heading across two or More Columns-Changing Color of a Cell-Aligning the Contents of a Cell-Display of Tables.

UNIT – II

HTML, Forms, Frames and Style Sheets: HTML : Working with Forms-Creating Forms-Working with Menus-Working with Radio Buttons-Check Boxes-Text Boxes- Text Areas-Password Boxes-Submit Button-Resetting the Form-Working with Frames-Creating Frameset-Creating Columns-Creating Rows and Columns-Combining Framesets-Giving Colors to the Borders-Space between Frames-Nesting Framesets-Showing or Hiding Scrollbars-Alternatives to Frames

Cascading Style Sheets: Introduction to CSS-Creating Style Sheets-Common Tasks with CSS-Colors-The Font Family-Assigning Classes-The Layer Tag-CSS Tags

UNIT – III

eXtensive Markup Language: Introduction-Features of XML-XML Support and Usage-Compatibility of XML with Others-Structure of XML Document-Common Errors-Structures in XML-Creating Document Type Declarations-Flow Objects-Length-Colour and Background Properties

UNIT – IV

ASP: How Active Server Pages Really Work?-Variables-Procedures-ASP Forms-Date Types-Operators. More on ASP: Introduction to Object Hierarchies-Getting Information from the Visitor-Sending Information to Visitors-ASP Applications-Getting in at the Top (Server Object)-Response Object Methods.

UNIT – V

Java Script and VB Script : Java Script: Introduction-Operators-Assignments-Comparisons-Reserved Words-Browsers to Use-Software Requirement-Starting with Java Script-Using Quotes, Alert-Functions-Eval Function-Using Statements in Java Script-Working with Objects-Properties-Browser objects-Date object-Math Object-String Object-Defining Objects-Handling Events in Java Script-Event Handling Attributes-Window Events-Working with Forms-Form Elements-User Actions-windows and Frames-Window Object-Frame Object-Document Object-Navigator Object-Screen Object-Using Images and Math-Images and Animation-Area Object-Math Object-Java Script Objects.

VB Script: Introduction-Adding VB Script code to HTML- Adding VB Script code to Documents-Data Types-Getting the Message Across.

Course Objectives (CO)

- To learn the concepts of classical encryption techniques and concepts of finite fields and number theory.
- To explore the working principles and utilities of various cryptographic algorithms including secret key cryptography, hashes and message digests, and public key algorithms
- To explore the design issues and working principles of various authentication protocols, PKI standards.
- To explore various secure communication standards including Kerberos, IPsec, and SSL/TLS and email.
- To learn the ability to use existing cryptographic utilities to build programs for secure communication.
- To know the concepts of cryptographic utilities and authentication mechanisms to design secure applications

Course Outcomes (COs)

After successful completion the student will be able to:

1. Identify information security goals, classical encryption techniques and acquire fundamental knowledge on the concepts of finite fields and number theory.
2. Understand, compare and apply different encryption and decryption techniques to solve problems related to confidentiality and authentication
3. Apply the knowledge of cryptographic checksums and evaluate the performance of different message digest algorithms for verifying the integrity of varying message sizes
4. Apply different digital signature algorithms to achieve authentication and create secure applications
5. Apply network security basics, analyze different attacks on networks and evaluate the performance of firewalls and security protocols.
6. Apply the knowledge of cryptographic utilities and authentication mechanisms to design secure applications

UNIT I

Introduction to Cryptography – Security Attacks – Security Services – Security Algorithm – Stream cipher and Block cipher – Symmetric and Asymmetric – Key Cryptosystem; Symmetric Key Algorithms: Introduction – DES – Triple DES – AES – IDEA – Blowfish – RC5.

UNIT II

Public Key Cryptosystem: Introduction to Number Theory – RSA Algorithm – Key Management – Diffie-Hell man key exchange – Introduction to Elliptic Curve Cryptography; Message Authentication and Hash functions – Hash and Mac Algorithm – Digital Signatures and Authentication Protocol.

UNIT III

Network Security Practice: Authentication Applications – Kerberos – X.509 Authentication Services and Encryption Techniques;; E-mail security – PGP – s/MIME – IP Security.

UNIT IV

Web Security – Secure Socket Layer – Secure Electronic Transaction; System Security – Intruders and Viruses – Firewalls – Password Security.

UNIT V

Case Study: Implementation of Cryptographic Algorithms – RSA – DSA – ECC (C / JAVA Programming). Network Forensic – Security Audit; Other Security Mechanism: Introduction to Stenography – Quantum Cryptography – Water Marking – DNA Cryptography

Course Objectives (CO)

- To study the basic taxonomy and terminology of the computer networking and enumerate the layers of OSI model and TCP/IP model.
- To acquire knowledge of Application layer and Presentation layer paradigms and protocols.
- To study Session layer design issues, Transport layer services, and protocols.
- To gain core knowledge of Network layer routing protocols and IP addressing.
- To study data link layer concepts, design issues, and protocols.
- To read the fundamentals and basics of Physical layer, and will apply them in real time applications.

Course Outcomes (COs)

After successful completion the student will be able to:

1. Describe the functions of each layer in OSI and TCP/IP model.
2. Explain the functions of Application layer and Presentation layer paradigms and Protocols.
3. Describe the Session layer design issues and Transport layer services.
4. Classify the routing protocols and analyze how to assign the IP addresses for the given network.
5. Describe the functions of data link layer and explain the protocols.
6. Explain the types of transmission media with real time applications

Implement the following Program

1. To print the IP Address of the Machine
2. Implementation Of TCP/IP Echo
3. To convert Binary notation to Hexa Decimal
4. To simulate Sliding Window Protocol
5. To perform PC to PC communication using RS232 port.
6. To capture the Packets in the Network
7. Concurrent TCP/IP Day-Time Server
8. To implement Chatting using TCP Protocol
9. Design TCP Client and Server application to transfer file.
10. Design UDP Client Server to transfer a file.
11. Program to set and get socket options
12. To simulate ICMP Protocol

15CTU603 A	Core Elective III Satellite Communications	Semester VI			
		L T P C			
		5 0 0 5			

Course Objectives (CO)

- To provide an in-depth treatment of satellite communication systems operation and planning.
- To provide in-depth understanding of modern satellite multiple access, modulation and coding schemes.
- To learn the basics of satellite Networks
- To Review the state of the art in new research areas such as speech and video coding, satellite networking and satellite personal communications.
- To Understand the Digital carrier modulation and Quantization
- To Enhance the knowledge in communication with satellite and network systems

Course Outcomes (COs)

After completion of this course, the students will be able to:

1. Understand the background components required for efficient satellite communications
2. Analyze the satellite orbits
3. Understand Wave Propagation and Polarization
4. Analyze the earth segment and space segment
5. Analyze the satellite Link design
6. Understand the applications of satellites

UNIT I

Introduction: General background, frequency allocations for satellite services, basic satellite system, system design considerations, applications.

UNIT II

Satellite Orbits: Introduction, laws governing satellite motion, orbital parameters, orbital perturbations, Doppler effects, geostationary orbit, antenna look angles, antenna mount, limits of visibility, Earth eclipse of satellite, sun transit outage, inclined orbits, sun-synchronous orbit, launching of geostationary satellites.

UNIT III

Wave Propagation and Polarization: Introduction, atmospheric losses, ionospheric effects, rain attenuation, other impairments, antenna polarization, polarization of satellite signals, cross polarization discrimination, ionospheric depolarization, rain depolarization, ice depolarization.

UNIT IV

Satellite Antenna: Antenna basics, aperture antennas, parabolic reflectors, offset feed, double reflector antennas, shaped reflector systems.

UNIT V

Link Design: Introduction, transmission losses, link power budget equation, system noise, carrier to noise ratio for uplink and downlink, combined uplink and downlink carrier to noise ratio, inter modulation noise

Text Books

Dennis Roddy, 2002, Satellite Communications, 3rd edition, Mc-Graw Hill publication.

Michael Olorunfunmi Kolawole, 2014, Satellite Communication Engineering, Second Edition, CRC Press.

Reference

				Semester VI
				L T P C
15CTU603 B	Core Elective III	Geographical Information System	5	0 0 5

Course Objectives (CO)

- To learn about the key components of a GIS, including users, databases, software, and networks
- To learn basic to advanced spatial analytical methods, including interpolation and clustering
- To provide details of spatial data structures and input, management and output processes.
- To learn the need of data quality and standards to be followed in GIS
- To learn Vector Based GIS Data Processing method
- To learn the basic concepts of Principles of Electro Magnetic Remote Sensing

Course Outcomes (COs)

After completion of this course, the students will be able to:

1. Understand the basic concepts and components of GIS
2. Analyze various techniques used for storage of spatial data and data compression
3. Understand how to provide for input, manage and get output of spatial data
4. Concepts of spatial data quality and data standards
5. Understand integration of remote sensing and GIS model
6. Understand Digital Terrain Modeling

UNIT I

Definition of GIS And Related Terminology – The Evolution of GIS – Components of GIS – Approaches To The Study Of GIS. Maps and GIS: Map Scale – Classes of Map – The Mapping Process – Plane Coordinate Systems And Transformations – Geographic coordinate System of Earth – Map Projection - Establishing For A Spatial Frame Work For Mapping Locations on Earth : Geo referencing – Attribute Data For Thematic Mapping Digital Representation of Geographic Data Technical Issues Pertaining to Digital Representation of Geographic Data – Database And Database Management .

UNIT II

Data Quality And Data Standards: Introduction – Concepts and Definitions of Data Quality - Components of Geographic Quality – Assessment Of Data quality – Managing Spatial Errors – Geographic Data Standards – Geographic Data Standards And GIS Developments
Raster Based GIS Data Processing: Introduction – Acquiring And Handling Raster Geographic Data – Raster Based GIS Based Analysis – Output Functions Of Raster Data Processing – Cartographic Modeling

UNIT III

Vector Based GIS Data Processing: Introduction – Characteristics Of Vector Based GIS Data Processing – Vector Data Input Functions – Non topological GIS Analysis Function – Feature Based Topological Functions – Layer Based Topological Functions – Vector Based Output Functions – Application Programming

UNIT IV

Remote Sensing And GIS Integration : Introduction – Principles Of Electro Magnetic Remote Sensing –Remote Sensing System Classifications – Imaging Characteristics Of Remote Sensing Systems – Extraction Of Metric Information From Remotely Sensed Images –

Extraction Of Thematic (Descriptive Attribute) Information From Remotely Sensed Images – Integration Of Remote Sensing And GIS

UNIT V

Digital Terrain Modeling : Introduction – Definitions And Terminology – Approaches To Digital Terrain Data Sampling – Acquisition Of Digital Terrain Data – Applications Of Digital Terrain Models Spatial Analysis And Modeling : Introduction – Descriptive Statistics – Spatial Autocorrelation – Quadrant Counts And Nearest Neighbor Analysis – Trend Surface Analysis – Gravity Models – Network Analysis – GIS Modeling

15CTU603 C Core Elective III Real Time System Design	Semester VI			
	L	T	P	C
	5	0	0	5

Course Objectives (CO)

- To develop an understanding of various Real Time systems Application
- To obtain a broad understanding of the technologies and applications for the emerging and exciting domain of real-time systems
- To get in-depth hands-on experience in designing and developing a real operational system.
- To acquire knowledge about concepts related to OS such as Scheduling techniques, threads, memory management.
- To learn design techniques and perform Intertask communication.
- To learn role on real time database in various applications

Course Outcomes (COs)

After completion of this course, the students will be able to:

1. Understand concepts of Real-Time systems and modeling
2. Recognize the characteristics of a real-time system
3. Understand and develop document on an architectural design of a real-time system
4. Develop and document task scheduling, resource management, real-time operating systems and fault tolerant applications of Real-Time Systems.
5. Understand how synchronization can be done in real-time based system
6. Analyze evaluation techniques applied over Realtime system to measure its performance

UNIT I

Real Time Specification And Design Techniques: Introduction– Structure of a Real Time System –Task classes – Performance Measures for Real Time Systems – Estimating Program Run Times – Issues in Real Time Computing – Task Assignment and Scheduling – Classical uniprocessor scheduling algorithms –Fault Tolerant Scheduling.

UNIT II

Real Time Specification And Design Techniques: Natural languages – mathematical specification – flow charts – structured charts – pseudocode and programming design languages – finite state automata – data flow diagrams – petri nets – Warnier Orr notation – state charts – polled loop systems – phase / state driven code – coroutines – interrupt – driven systems – foreground/background system – full featured real time operating systems.

UNIT III

Intertask Communication And Synchronization: Buffering data – mailboxes – critical regions – semaphores – deadlock – process stack management – dynamic allocation – static schemes – response time calculation – interrupt latency – time loading and its measurement – scheduling is NP complete – reducing response times and time loading – analysis of memory requirements – reducing memory loading – I/O performance.

UNIT IV

Real Time Databases: Real time Databases – Basic Definition, Real time Vs General Purpose Databases, Main Memory Databases, Transaction priorities, Transaction Aborts, Concurrency control issues, Disk Scheduling Algorithms, Two – phase Approach to improve

Predictability – Maintaining Serialization Consistency – Databases for Hard Real Time Systems.

UNIT V

Evaluation Techniques: Reliability Evaluation Techniques – Obtaining parameter values, Reliability models for Hardware Redundancy – Software error models. Clock Synchronization – Clock, A Nonfault – Tolerant Synchronization Algorithm – Impact of faults – Fault Tolerant Synchronization in Hardware – Fault Tolerant Synchronization in software.

Text Books

Rajib Mall, 2007, Real-time systems: theory and practice, Pearson Education.

Hermann Kopetz, 2011, Real-Time Systems: Design Principles for Distributed Embedded Applications, Springer.

References

Philip.A.Laplante, 2004, Real Time System Design and Analysis, 3rd Edition, Prentice Hall of India.

Allen Burns, Andy Wellings, 2003, Real Time Systems and Programming Languages, Pearson Education.

Course Objectives(CO)

- To develop an understanding of the modern network technologies in common use today
- To identify potential and actual limitations with existing networks and identify advances in technology that may solve them
- To appreciate how computer networks can format and transfer data at high speed and over both the local and wide area
- To know the design principles of internetworking protocols
- To know the implementation details of IPv4, IPv6, and TCP
- To adapt the IP for Mobile applications

Course Outcomes (COs)

After completion of this course, the students will be able to:

1. Familiarize with the basic taxonomy and terminology of the computer networking area.
2. Understand various transmission media, their comparative study, fiber optics and wireless media
3. Understanding the concepts of IPv6, and how is it better than IP v4
4. Describe the devices and services used to support communications in data networks and the Internet
5. Understand the importance of security over internet and how IPv6 provide security mechanism to handle various vulnerabilities
6. Understand the role of Ipv6 over mobile computing technology.

UNIT I

The History of IPv6 - What's New in IPv6? - Why Do We Need IPv6? - Common Misconceptions - IPv6 Status and Vendor Support IPv6 Addressing - The IPv6 Address Space - Address Types - Unicast, Multicast and Anycast Addresses - Some General Rules - Address Notation - Prefix Notation - Global Routing Prefixes- Global Unicast Address - International Registry Services and Current Address Allocations - The Interface ID - Address Privacy - Special Addresses - IPv6 Addresses with Embedded IPv4 Addresses - 6to4 Addresses

UNIT II

The Structure of the IPv6 Protocol : General Header Structure - The Fields in the IPv6 Header - Extension Headers - Hop-by-Hop Options Header - Routing Header - Fragment Header - Destination Options Header - New Extension Header Format - Processing of Extension Headers and Header Chain Length ICMPv6 - General Message Format - ICMP Error Messages - Destination Unreachable - Packet Too Big - Time Exceeded - Parameter Problem - ICMP Informational Messages - Echo Request Message - Echo Reply - Router Solicitation and Router Advertisement - Neighbor Solicitation and Neighbor Advertisement - The ICMP Redirect Message - Inverse Neighbor Discovery - Neighbor Discovery Options - Secure Neighbor Discovery

UNIT III

Security with IPv6: General Security Concepts - General Security Practices - IPsec Basics - Security Associations - Key Management - IPv6 Security Elements - Authentication Header -

Encapsulating Security Payload Header - Combination of AH and ESP - Interaction of IPsec with IPv6 Elements - IPv6 Security “Gotchas” - Native IPv6 - Transition and Tunneling Mechanisms - Enterprise Security Models for IPv6 - The New Model - Using Directory Services for Controlling Access - IPv6 Firewall Filter Rules

UNIT IV

Transition Technologies - Dual-Stack - Tunneling Techniques - How Tunneling Works - Automatic Tunneling Configured Tunneling - Encapsulation in IPv6 - Tunneling Mechanisms - Network Address and Protocol Translation - Stateless IP/ICMP Translation - NAT to Extend IPv4 Address Space - NAT as an IPv6 Translation Mechanism - NPTv6 and NAT66 - Other Translation Techniques - Load Balancing - Comparison - Dual-Stack - Tunneling - Translation

UNIT V

Mobile IPv6: Overview – Mobile Ipv6 Terms – How Mobile Ipv6 Works – The Mobile Ipv6 Protocol – Mobility Header and Mobility Messages – The Binding Update Message – The Binding Acknowledgment – The Binding Revocation – Mobility Options – Routing Header Type 2 – ICMPv6 and Mobile Ipv6 – Home Agent Address Discovery – Mobile Prefix Solicitation – Changes in Neighbor Discovery (ND) – Mobile Ipv6 Communication – Binding Cache – Binding Update List – Return Routability Procedure – Home Agent Operation – Mobile Node Operation – Security – Extensions to Mobile Ipv6

Text Book

References

Rick Graziani, 2013, IPv6 Fundamentals: A Straightforward Approach to Understanding IPv6, 1st Edition, Cisco Press, United States of America

Peter Loshin, 2004, IPv6: Theory, Protocol, and Practice, 2nd Edition, Elsevier Publication.

Course Objectives (CO)

- To provide students with basic concepts in information system and the benefits with these systems in modern society
- To differentiate between data, information, and knowledge
- To understand systems definition, systems requirements, and information needed for decision maker
- To understand several requirement and operations that the analyst needed to analyze, design, and implement the systems in what is called system development life cycle (SDLC)
- Appraise the interrelationships among elements that comprise a modern security system, including hardware, software, policies, and people
- Assess the role of strategy and policy in determining the success of information security

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. The students can understand the basic of computer network threat and vulnerability and overview of digital crime.
2. The students can understand the various types of cyber-attacks and criminals planning activities for cracking the system.
3. The students can understand the cryptography and its application and some of the important terms used in information security
4. Understand various Information Security Policies
5. Identify, Assess and control risk that occur while handling information transmission
6. Understand various security technologies available to handle different types of threats

UNIT I

INTRODUCTION : History, What is Information Security?, Critical Characteristics of Information, NSTISSC Security Model, Components of an Information System, Securing the Components, Balancing Security and Access, The SDLC, The Security SDLC

UNIT II

SECURITY INVESTIGATION : Need for Security, Business Needs, Threats, Attacks, Legal, Ethical and obstacles to security, Ten steps to building a secure organization.

UNIT III

SECURITY ANALYSIS : Risk Management: Identifying and Assessing Risk, Assessing and Controlling Risk

UNIT IV

LOGICAL DESIGN : Blueprint for Security, Information Security Policy, Standards and Practices, ISO 17799/BS 7799, NIST Models, VISA International Security Model, Design of Security

Architecture, Planning for Continuity

UNIT V

PHYSICAL DESIGN : Security Technology, IDS, Scanning and Analysis Tools, Cryptography, Access Control Devices, Physical Security, Security and Personnel

Text books

Michael E Whitman and Herbert J Mattord, 2003, Principles of Information Security, Vikas Publishing House, New Delhi.

Micki Krause, Harold F. Tipton, 2004, Handbook of Information Security management”, Vol 1-3, CRC Press LLC.

Stuart Mc Clure, Joel Scrambray, George Kurtz, 2003, Hacking Exposed, Tata McGraw-Hill.

Matt Bishop, 2002, Computer Security Art and Science, Pearson/PHI.

Course Objectives (CO)

- To know the fundamentals of Knowledge Managements and its applications.
- To understand the basics of Information Security
- To know the legal, ethical and professional issues in Information Security
- To know the aspects of risk management
- To learn the Evolution of Knowledge management.
- To learn and assess various types of security threats in information security

Course Outcomes (COs)

After the completion of this course, a successful student will be able to

1. Identify and analyze the applications of knowledge management (KM)
2. Understand knowledge management models and technologies to business situations.
3. Create a KM system to capture and evaluate knowledge of Expert
4. Understand the basic concepts in information system and the benefits with these systems in modern society
5. Analyze information security needs of an organization.
6. Understand the need of security mechanism and risk management.

UNIT I

Knowledge Management Km Myths – KM Life Cycle – Understanding Knowledge – Knowledge, intelligence – Experience – Common Sense – Cognition and KM – Types of Knowledge – Expert Knowledge – Human Thinking and Learning.

UNIT II

Knowledge Management System Life Cycle Challenges in Building KM Systems – Conventional Vs KM System Life Cycle (KMSLS) – Knowledge Creation and Knowledge Architecture – Nonaka's Model of Knowledge Creation and Transformation. Knowledge Architecture.

UNIT III

Capturing Knowledge Evaluating the Expert – Developing a Relationship with Experts – Fuzzy Reasoning and the Quality of Knowledge – Knowledge Capturing Techniques, Brain Storming – Protocol Analysis – Consensus Decision Making – Repertory Grid- Concept Mapping – Blackboarding

UNITIV

Information Security History, What is Information Security ?, Critical Characteristics of Information, NSTISSC Security Model, Components of an Information System, Securing the Components, Balancing Security and Access, The SDLC, The Security SDLC.

UNIT V

Security Investigation Need for Security, Business Needs, Threats, Attacks, Legal, Ethical and Professional Issues – Risk Management: Identifying and Assessing Risk, Assessing and Controlling Risk

Text Books

Elias.M. Award & Hassan M. Ghaziri, 2008, Knowledge Management, 2nd Edition Pearson Education , India.

C.W. Holsapple, 2009, Handbooks on Knowledge Management, 1st Edition, International Handbooks on Information Systems.

Guus Schreiber, 2001, Knowledge Engineering and Management, 3rd Edition University Press .

Course Objectives (CO)

- To learn basic system concept and definitions of system simulation and modeling
- To learn various methods to generate and test random variable
- Techniques to model and to simulate various systems
- The ability to analyze a system and to make use of the information to improve the performance.
- To learn Discrete, Poisson, Geometric, Gamma distribution methods to design a simulation model
- To learn simulation language and generate model

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Understand the principles within computer modelling and simulation
2. Generate and test random number by applying various techniques
3. Understand and evaluate various distribution models
4. Create a manual simulation even scheduling
5. Design and evaluate simulation experiments
6. Implement simulation case studies and analyze the result

UNIT I

Principle of computer modeling and simulation, Monte Carlo simulation. Nature of computer modelling and simulation. Limitations of simulation, areas of application. System and environment – components of a system – Discrete and continuous systems. Models of a system – A variety of modelling approaches.

UNIT II

Random number generation, technique for generating random numbers – Midsquare method – The midproduct method – Constant multiplier technique – Additive congruential method – Linear congruencies method – Tests for random number – The Kolmogorov Smirnov test – The chi-square test. Random variable generation – Inverse transform technique – Exponential distribution – Uniform distribution – Weibull distribution, empirical continuous distribution – Generating approximate normal variates.

UNIT III

Empirical discrete distribution – Discrete uniform distribution – Poisson distribution – Geometric distribution – Acceptance – Rejection technique for Poisson distribution – Gamma distribution.

UNIT IV

Design and evaluation of simulation experiments – Input – Output analysis – Variance reduction technique – Verification and validation of simulation models. Discrete event simulation – Concepts in discrete – event simulation – Manual simulation using event scheduling, single channel queue, two server queue, simulation of inventory problems.

UNIT V

Simulation languages – GPSS – SIMSCRIPT – SIMULA – Programming for discrete

event systems in GPSS and C. Case Study : Simulation of LAN – Manufacturing system – Hospital management system.

பகுதி - I தமிழ்ப் பாடத்திட்டம் (2015 - 2016)
முதல்பருவம்
(இளநிலை அறிவியல் பட்ட வகுப்புகளுக்குரியது)
(For I-UG Science Degree Classes)

15LSU101

பாடத்திட்டப் பொதுநோக்கம்

- கற்றல் வழி சிந்தனைத் திறனையும், கருத்து வெளிப்பாட்டுத் திறனையும், மேம்படுத்துதல்.
- ஆய்வுநோக்கை மேம்படுத்துதல்.
- இலக்கியங்கள் உணர்த்தும் வாழ்வின் நுட்பமான பகுதிகளை உணர்த்துதல்.
- மனித மனத்தினைப் பக்குவப்படுத்துதலில் இலக்கியம் தரும் பங்கினை உணர்த்துதல்.
- வளர்ந்து வரும் சமூகத்தில் அறஉணர்வு, பண்பாடு போன்றவை குறித்து அறிவூட்டல்.
- அரசுத் தேர்வுகளுக்கு மாணவர்களை ஆயத்தமாக்குதல்.

பாடத்திட்டப் பயன் விளைவு

- இந்திய குடியுரிமைப் பணி முதலான போட்டித் தேர்வுகளில், விருப்பப் பாடமாக இடம்பெறுகின்ற, 'தமிழ் இலக்கிய வரலாறு' குறித்த முழுமையான அறிமுகம் பெற்றிருத்தல்.
- கல்வெட்டியல், ஓலைச்சுவடியியல் மற்றும் தொல்லியல் சார்ந்த ஆவணத் தேடலுக்குரிய ஆய்வுமனப்பான்மையுடன், இலக்கியங்களை அணுகுதல்.
- தமிழின் வளர்ச்சித் துறையாகிய, 'அறிவியல் தமிழ்' ; 'இணைய தமிழ்' குறித்த பன்னோக்கு அணுகுமுறையிலான ஆய்வுச் சிந்தனை மேம்பாடு.
- வேலைவாய்ப்புக்குரிய சுயதிறன் மேம்பாட்டுடன், படைப்பாக்கத்திறன் மேம்பாடும் பெற்றிருத்தல் .
- சமுதாய மற்றும் வாழ்வியல் மதிப்புகளைப் பேணுவதற்குக் கருவியாக இலக்கியங்களை நாடுகின்ற மனப்பான்மை வளர்ச்சி.
- மொழிபெயப்புத் துறைசார்ந்த வேலைவாய்ப்புத் திறன் பெற்றிருத்தல்

அலகு - I : இக்கால இலக்கியம்

தத்துவம் : மகாகவி பாரதியார் - பகைவனுக்கு அருள்வாய்.

கவிஞர் ந.பிச்சமூர்த்தி - கிளிக்கூண்டு

இயற்கை : பாவேந்தர் பாரதிதாசன் - அழகின் சிரிப்பு - ஞாயிறு.

சமுதாயம் : கவிக்கோ அப்துல் ரகுமான் - இன்றைய நிலை

அறிவியல் : கவிஞர் சிற்பி பாலசுப்பிரமணியன் - காலம்.

பெண்ணியம் : கவிஞர் சிவரமணி - வையகத்தை வெற்றிகொள்ள

சூழலியல் : அன்பாதவன் - மரணம்

காதல் : வைரமுத்து - காதல் உயில்

தன்னம்பிக்கை பா.விஜய் - தன்னம்பிக்கை

அலகு - II : அற இலக்கியம்

1. திருக்குறள் - தேர்ந்தெடுக்கப்பட்ட குறள்கள் 20

2. நான்மணிக்கடிகை - தேர்ந்தெடுக்கப்பட்ட ஐந்து பாடல்கள்

3. திரிகடுகம் - தேர்ந்தெடுக்கப்பட்ட ஐந்து பாடல்கள்

அலகு - III : சிற்றிலக்கியம்

1. நரிவிருத்தம் - அறன் வலியுறுத்தல்

2. தமிழ் விடு தூது - தமிழின் சிறப்புரைத்தல்

3. மதுரை மீனாட்சியம்மைப் பிள்ளைத்தமிழ் - தொடுக்கும் கடவுள் பழம்பாடல்

அலகு - IV : சிறுகதை

1. புதுமைப்பித்தன் - நிகும்பலை

2. தனுஷ்கோடி ராமசாமி - கந்தகக் கிடங்கிலே

3. கந்தர்வன் - துண்டு

4. வாஸந்தி - வடிகால்

5. சி.ஆர். ரவீந்திரன் - வழுக்குமரம்

அலகு - V : மொழிப்பயிற்சி

1. விண்ணப்பங்கள் எழுதுதல் மற்றும் கடிதப் பயிற்சி

2. மொழிபெயர்ப்புப் பயிற்சி

பாட நூல்: கற்பகச்சோலை - தமிழ் ஏடு. கற்பகம் பல்கலைக்கழகத் தமிழ்த் துறை வெளியீடு.

Course Objectives:

- To enable the learners to acquire English language skills at a faster pace.
- To introduce different kinds of literary works
- To familiarize different genres of Literature
- To instruct moral values through literature.
- To improvise their productive and receptive skills
- To strengthen the basic knowledge about grammar.

Course Outcomes:

- Learn to reflect on the literary works and communicate flexibly.
- Reading and comprehending literary works
- Genres of literature to provide moral education
- Develop communication skills in business environment
- Interpersonal skills will be developed.
- Betterment of language competence

UNIT I:

Prose: Google Guys (Extract) – Richard L Brandt

Poetry: The Blind Pedlar – Osbert Sitwell

Short Story: A Garden So Rich – Christie Craig

Vocabulary: Prefixes, Antonyms, Sentence Completion

Grammar: Articles, Adverbs, Pronouns

Composition: Proverb Expansion

UNIT II:

Prose: Happiness 101 – Geeta Padmanabhan

Poetry: An Old Woman – Arun Kolatkar

Vocabulary: Suffixes, Analogies

Grammar: Nouns, Adjectives

Composition: Dialogue Writing

UNIT III:

Prose: Structured Procrastination – John Perry

Short Story: The Umbrella Man – Roald Dahl

One-Act Play: The Boy Who Stopped Smiling – Ramu Ramanathan

Vocabulary: Synonyms, Euphemisms, Word Definitions

Grammar: Verbs, Conjunctions and Interjection, Indirect/Reported Speech

UNIT IV:

Poetry: No Sentence – Anjum Hassan

One-Act Play: While the Auto Waits- O' Henry

Vocabulary: Words Often Confused, Anagrams

Grammar: Prepositions, Voice- Active and Passive

Composition: Letter Writing- Informal

UNIT V:

Short Story: The Bird – Amar Jalil

One-Act Play: The Cellphone Epidemic – Claudia I. Haas

Vocabulary: Portmanteau Words, One Word Substitute

Grammar: Questions, Pronunciation

Composition: Letter Writing- Formal

Problem Solving Using C

5 0 0 5

Course Objectives (CO)

- To impart adequate knowledge on the need of programming languages and problem solving techniques.
- To develop programming logic.
- To develop programming skills using the fundamentals and basics of C Language.
- To enable effective usage of arrays, structures, functions, pointers and to implement the memory management concepts.
- To understand memory allocation concepts through pointers
- To teach the issues in file organization and the usage of file systems

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Gain experience about structured programming
2. Develop efficient algorithms for solving a problem.
3. Use the various constructs of a programming language viz. conditional, iteration and recursion.
4. Implement the algorithms in C” language.
5. Use simple data structures like arrays, stacks and linked list in solving problems.
6. Handle file in C.

UNIT-I

Programming and Problem Solving: Introduction to Computer based Problem Solving- Problem definition – Problem Solving- goals and objectives – problem identification and definitions. Algorithms for Problem definition – Program design and Implementation issues. Programming Environment – Computer Programming Languages – Types of Programming Languages – Compilers – interpreters. Construct algorithms for the following: Addition and Multiplication of Two numbers – Check for Odd or Even numbers – Check for Prime numbers – Summation of Set of Numbers.

UNIT-II

Introduction to C: Introduction - An Overview of C – Keywords and Identifier – Variables - Declarations of Variables - User Defined Type Declarations - Typedef – Enum - Constants – Data Types – Operators – Expressions - C Formatted I/O Operations. Decision Making and

Branching Statements – Decision Making and Looping Statements - Arrays-Strings - String Handling Functions.

UNIT-III

Functions, Structures and Union: Functions - Introduction - Definition of Functions - Function Declaration - Category of Functions - Nesting of Functions – Recursion - Passing Arrays to Function. Storage Classes – Auto-extern-static-register. Structures and Unions – Introduction - Defining a Structure - Declaring Structure Variables - Accessing Structure Members - Arrays of Structure – Unions.

UNIT-IV

Pointers: Pointers – Introduction – Declaring Pointer Variables - Pointer and Arrays - Pointers and Strings – Array of Pointers - Functions and Pointers - Function Returning Pointers -Pointers to functions - Pointers and Structures

UNIT-V

File Management: File Management in C – Introduction - Opening a File - Closing a file – Input/output operations on files - Error handling during I/O Operations - Random Access to Files - Command Line Arguments - Dynamic Memory Allocation.

Course Objectives (CO)

- To impart adequate knowledge on the need of programming languages and problem solving techniques.
- To develop programming logic
- To develop programming skills using the fundamentals and basics of C Language.
- To enable effective usage of arrays, structures, functions, pointers and to implement the memory management concepts.
- To understand memory allocation concepts through pointers
- To teach the issues in file organization and the usage of file systems

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Gain experience about structured programming
2. Develop efficient algorithms for solving a problem.
3. Use the various constructs of a programming language viz. conditional, iteration and recursion.
4. Implement the algorithms in C language.
5. Use simple data structures like arrays, stacks and linked list in solving problems.

Handle file in C.

1. Write a program to find factorial of a given number using recursive and non recursive
2. Write a program to generate Fibonacci series.
3. Write a program to print Multiplication table using for and Do While Loops
4. Write a program to find the roots of quadratic equation
5. Write a program to find Maximum number without using arrays
6. Write a program to convert a given number into words
7. Write a program to calculate SIN(x) without using library function
8. Write a program
 - (i) to find the length of a string
 - (ii) concatenation of two strings
9. Write a program to reverse the given string
10. Write a program to count the vowels in a given sentence
11. Write a program to check the given string is palindrome or not
12. Write a program to perform matrix multiplication
13. Write a program to perform Stack Operations

14. Write a program to sort and search the number using Binary search.
15. Using any one sorting method to sort given 'n' numbers using pointers.
16. Write a program to prepare an employee pay slip using structures
17. Write a program for Electricity Bill Preparation using files
18. Write a program for the Odd and even numbers are stored in separate files the original files.

Course Objectives (CO)

- To enable the students to gain knowledge on the architecture of modern computer.
- To understand how computer stores positive and negative numbers and to perform arithmetic operation of positive and negative numbers.
- To learn about logic gates and solve problems using Boolean algebra.
- To understand the simplification of circuits like adders, subtractors, multiplexers, encoders.
- To understand the basic computer organization and design.
- To learn Cache memory and its importance

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. To provide a strong foundation in construction of Sequential and Combinational Circuits.
2. To familiarize with the function of Gates, Flip Flops, Shift Registers, Counters, A/D & D/A Converters and its Applications.
3. Solve the problems using Boolean algebra
4. Understand the basic computer organization and design.
5. Learn about Cache memory and its importance
6. Solve the binary arithmetic problems and conversion among the number systems

UNIT I – Number System and Codes

Introduction to Digital concepts – Number Systems: Decimal, Binary, Octal and Hexadecimal Numbers – Conversion – 1's and 2's Complements of Binary Numbers – Binary Arithmetic with Signed and Unsigned Numbers – Codes: Binary Coded Decimal (BCD) — Excess-3 – Gray Code — ASCII Codes — Error Detection and Correction Codes.

UNIT II – Logic Gates and Boolean Algebra

Introduction to Logic Gates – OR, AND, NOT, NAND, NOR, EX-OR and EX-NOR Gates. Boolean Logic and Expression, Laws and Rules of Boolean Algebra, DeMorgan's Theorem – Simplification using Boolean Algebra – Karnaugh Map.

UNIT III – Combinational Logic Circuits

Basic overview of Logic functions – Basic Adders & Subtractor – Parallel Binary Adder – 4-bit Binary Adder/Subtractor – Comparators – Encoders and Decoders – Code Converters – Multiplexers and Demultiplexers — Parity Generators/Checkers.

UNIT IV – Sequential Logic Circuits

Flip-flops: RS – Clocked RS – Edge-triggered RS, D, and JK – JK Master-Slave flip flops – Registers and its Types – SISO, SIPO, PISO, PIPO – Shift Registers and its Types – Ring Counters – Asynchronous and Synchronous Counter – UP/DOWN Counter- Ring Counter.

UNIT V – D/A, A/D Converters

Digital to Analog converters: Resistor Networks - Binary Ladder – Analog to Digital converters: Counter type – Ramp type – Successive Approximation Type.

(Any 8 Experiments)**Course Objectives (CO)**

- To enable the students to gain knowledge on the architecture of modern computer.
- To understand how computer stores positive and negative numbers and to perform arithmetic operation of positive and negative numbers.
- To learn about logic gates and solve problems using Boolean algebra.
- To understand the simplification of circuits like adders, subtractors, multiplexers, encoders.
- To understand the basic computer organization and design.
- To learn Cache memory and its importance

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. To provide a strong foundation in construction of Sequential and Combinational Circuits.
 2. To familiarize with the function of Gates, Flip Flops, Shift Registers, Counters, A/D& D/A Converters and its Applications.
 3. Solve the problems using Boolean algebra
 4. Understand the basic computer organization and design.
 5. Learn about Cache memory and its importance
 6. Solve the binary arithmetic problems and conversion among the number systems
-
1. Verification of basic gates
 2. Realization of Logic Gates Using Universal Gates
 3. Adder using Gates
 4. Subtractor using Gates.
 5. Multiplexer
 6. Demultiplexer
 7. Encoder
 8. Decoder
 9. Study of Flip-flops
 10. Binary to Gray and Gray to Binary Converter

Instruction Hours/week: L: 2 T: 0 P: 0 Marks: Internal: 100 External: Nil Total: 100**Course Objectives (CO)**

- To teach and inculcate the importance of value based living and sustainable lifestyle.
- To give students a deeper understanding about the purpose of life.
- To teach and inculcate the essential qualities to become a good leader.
- To be responsible citizens with clear conviction to practice values and ethics in life.
- To create awareness about the values and their significance and role
- To imbibe the concept of discipline and freedom

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Students will understand the importance of value-based living.
2. Students will gain deeper understanding about the purpose of their life.
3. Students will understand and start applying the essential steps to become good leaders.
4. Students will emerge as responsible citizens with clear conviction to practice values and ethics in life.
5. Students will become value-based professionals
6. Students will contribute in building a healthy nation

UNIT – I

Concept of Self, self-esteem and self-confidence. Concept of personality, determinants and disorganisation of it. Personality development – meaning.

UNIT – II

Goal setting – meaning and importance; steps in goal setting Manners and Etiquette – meaning need and importance; means to improve. Positive thinking.

UNIT – III

Discipline – meaning. Concept of Roles and Responsibility Time Management – Meaning and steps for effective time management.

UNIT – IV

Interpersonal relationship – meaning and importance; means to improve it. Healthy friendship.

UNIT – V

Family Relationship importance of it; Means to improve. Spirituality – meaning. Its relationship with Altruism, sacrifice, self control, tolerance and truthfulness.

TEXT BOOKS

1. Karpagam Academy of Higher Education, Study Material, 2015.

15SSD101	Soft Skill Development - I	Semester-I L T P C 2 0 0 0
-----------------	-----------------------------------	---

Instruction Hours / week: L: 2 T: 0 P: 0 Marks: Internal: 100 External: Nil Total: 100

Course Objectives (CO)

- Students will be able to apply quantitative reasoning and mathematical analysis methodologies to understand and solve problems.
- To achieve the analytical and reasoning competencies and to improve their communication and presentation skills
- To impart knowledge on both Aptitude and Soft skills to the students
- To actively do mathematics—such as analyzing data, constructing hypotheses, solving problems, reflecting on their work, and making connections.
- To critically evaluate and demonstrate various principles involved in solving mathematical problems and to adopt new and faster methods of calculations.
- To reinforce competencies in soft skills which are crucial in a social setting

Course Outcomes (COs)

On successful completion of the course the students will be able to:

1. Understand the basic concepts of QUANTITATIVE ABILITY
2. Understand the basic concepts of LOGICAL REASONING Skills
3. Acquire satisfactory competency in use of VERBAL REASONING
4. Actively do mathematics—such as analyzing data, constructing hypotheses, solving problems, reflecting on their work, and making connections.
5. Solve campus placements aptitude papers covering Quantitative Ability, Logical Reasoning and Verbal Ability
6. Compete in various competitive exams like CAT, CMAT, GATE, GRE, GATE, UPSC, GPSC etc.

UNIT - I

Introduction to Quantitative Aptitude, Speed Maths, Problems on Numbers, Averages, Ratios and Proportions, Problems on Ages

UNIT - II

Number Series, Blood Relation, Image Analysis, Direction Sense, Syllogism, Coding and Decoding

UNIT – III

Percentages, Data Interpretation, Profit and Loss, Simple Interest and Compound Interest

UNIT – IV

Parts of Speech, Tense, Subject Verb Agreement, Active and Passive Voice, Articles, Prepositions

UNIT - V

Conditional Clause, Degrees of Comparison, Goal Setting, Interpersonal Skills

பகுதி - I தமிழ்ப் பாடத்திட்டம் (2015 - 2016)
இரண்டாம் பருவம்
(இளநிலை அறிவியல் பட்ட வகுப்புகளுக்குரியது)
(For I-UG Science Degree Classes) 15LSU201

பாடத்திட்டப் பொதுநோக்கம்

- கற்றல் வழி சிந்தனைத் திறனையும், கருத்து வெளிப்பாட்டுத் திறனையும், மேம்படுத்துதல்.
- ஆய்வுநோக்கை மேம்படுத்துதல்.
- இலக்கியங்கள் உணர்த்தும் வாழ்வின் நுட்பமான பகுதிகளை உணர்த்துதல்.
- மனித மனத்தினைப் பக்குவப்படுத்துதலில் இலக்கியம் தரும் பங்கினை உணர்த்துதல்.
- வளர்ந்து வரும் சமூகத்தில் அறஉணர்வு, பண்பாடு போன்றவை குறித்து அறிவூட்டல்.
- அரசுத் தேர்வுகளுக்கு மாணவர்களை ஆயத்தமாக்குதல்.

பாடத்திட்டப் பயன் விளைவு

- இந்திய குடியுரிமைப் பணி முதலான போட்டித் தேர்வுகளில், விருப்பப் பாடமாக இடம்பெறுகின்ற, 'தமிழ் இலக்கிய வரலாறு' குறித்த முழுமையான அறிமுகம் பெற்றிருத்தல்.
- கல்வெட்டியல், ஓலைச்சுவடியியல் மற்றும் தொல்லியல் சார்ந்த ஆவணத் தேடலுக்குரிய ஆய்வுமனப்பான்மையுடன், இலக்கியங்களை அணுகுதல்.
- தமிழின் வளர்ச்சித் துறையாகிய, 'அறிவியல் தமிழ்' ; 'இணைய தமிழ்' குறித்த பன்னோக்கு அணுகுமுறையிலான ஆய்வுச் சிந்தனை மேம்பாடு.
- வேலைவாய்ப்புக்குரிய சுயதிறன் மேம்பாட்டுடன், படைப்பாக்கத்திறன் மேம்பாடும் பெற்றிருத்தல் .
- சமுதாய மற்றும் வாழ்வியல் மதிப்புகளைப் பேணுவதற்குக் கருவியாக இலக்கியங்களை நாடுகின்ற மனப்பான்மை வளர்ச்சி.
- மொழிபெயப்புத் துறைசார்ந்த வேலைவாய்ப்புத் திறன் பெற்றிருத்தல்

அலகு - I : பக்தி இலக்கியம்

1. சைவம் - மூவர் தேவாரத்திலிருந்து தேர்ந்தெடுக்கப்பெற்ற 15 பாடல்கள்
2. வைணவம் - ஆண்டாள் நாச்சியாரின் திருப்பாவையிலிருந்து 11 பாடல்கள்

அலகு - II : சங்கஇலக்கியம்

அ). எட்டுத்தொகை

நற்றிணை. 1. இலை இல பிடவம், திணை - முல்லை,

ஆசிரியர் - விழிக்கட் பேதைப் பெருங்கண்ணனார்.

2. மடல் மா ஊர்ந்து, திணை - குறிஞ்சி, ஆசிரியர் - மடல் பாடிய மாதங்கீரனார்.

குறுந்தொகை : 1. உள்ளார் கொல்லோ, திணை - பாலை, ஆசிரியர் - பெருங்கடுங்கோ.

2. யாரினும் இனியன், திணை - மருதம், ஆசிரியர் - வடமவண்ணக்கன் தாமோதரனார்.

ஐங்குறுநூறு : 1. நுண்ணோர் புருவத்த, திணை - குறிஞ்சி, ஆசிரியர் - கபிலர்.

2. அவறொறுந் தேரை, திணை - முல்லை, ஆசிரியர் - பேயனார்.

பதிற்றுப்பத்து - ததைந்த காஞ்சி, ஆசிரியர் - பாலைக் கௌதமனார்.

பரிபாடல் - வையை - திரை இரும் பணிப் பெளவம், ஆசிரியர் - மையோடக் கோவனார்.

கலித்தொகை - கடும் புனல் கால் பட்டு, திணை - பாலை, ஆசிரியர் - பெருங்கடுங்கோ.

புறநானூறு - 1. சிறப்பில் சிதடு முறுப்பில், திணை - பொதுவியல்,

ஆசிரியர் - உறையூர் முதுகண்ணன் சாத்தனார்.

2. இளையரு முதியரும் வேறுபுலம் படா - ஆசிரியர் - கயமனார்.

ஆ). பத்துப்பாட்டு - சிறுபாண் ஆற்றுப்படை - கடையெழு வள்ளல்களின் சிறப்பு,

நல்லியக்கோடனின் சிறப்பு, ஈகைத் திறம்.

அலகு - III : காப்பியங்கள்

1. மணிமேகலை - பாத்திரம் பெற்ற காதை - தீவதிலகை, மணிமேகலைக்குச் சொல்லியது,
சிறைக்கோட்டம் அறக்கோட்டமாக்கிய காதை - மணிமேகலை வேண்ட,
மாவண்கிள்ளி, சிறைக்கோட்டத்தை அறக்கோட்டமாக்கியது.

2. கம்பராமாயணம் - இலக்கியநயம் மிக்க, தேர்ந்தெடுக்கப்பெற்ற 41 பாடல்கள்.

அலகு - IV : கட்டுரைகள்

1. திருக்குறளில் மனிதவள மேலாண்மைக் கருத்துக்கள் - திருமிகு ஹரி விஜயலட்சுமி.

2. தமிழர் வளர்த்த நுண்கலைகள்: சிற்பமும் ஓவியமும் - தொ.மு. பாஸ்கரத் தொண்டைமான்.

3. சமயமும் தமிழும் - பேராசிரியர் அ.ச. ஞானசம்பந்தன்.

4. தமிழில் அறிவியல் - ஒரு பார்வை - பேராசிரியர் சிவகுமார்.

5. இன்றைய நெருக்கடிப் பிரச்சனைகள் - நீர்வளம் - முனைவர் ச. முத்துக்குமரன்.

அலகு - V : இலக்கணமும் மொழிப்பயிற்சியும்

1. எழுத்து, சொல், பொருள் இலக்கண எழுத்துப்பயிற்சிகள்

2. பொதுக் கட்டுரைகள்

பாட நூல்: கற்பகச்சோலை - தமிழ் ஏடு. கற்பகம் பல்கலைக்கழகத் தமிழ்த் துறை வெளியீடு.

Part I TAMIL 2015. Karpagam University, Coimbatore - 21, India

Course Objectives (CO)

- To enable the learners to acquire English language skills through literature.
- To familiarize them with English literature.
- To acquire Grammar knowledge.
- To help learners imbibe cultural values.
- To acquire skill of making correct sentences.
- To reflect originality on the application of soft skills and express in writing their views.

Course Outcome (COs)

After the completion of this course, a successful student will be able to:

1. Learn to enjoy the ecstasy of literature.
2. The select literary pieces will develop the confidence level of the learners.
3. To get the social values.
4. To know the importance of communication
5. Get sound knowledge in English
6. Trained to communicate well for business purpose.

UNIT I:

Prose: The Unexpected- Robert Lynd

Poetry: The Village Schoolmaster – Oliver Goldsmith

Short Story: The Lion's Share – Arnold Bennett

Vocabulary: Homonyms

Grammar: Irregular Verbs

UNIT II:

Prose: Travel by Train – J. B. Priestly

Poetry: The Gift of India – Sarojini Naidu

Grammar: Sentence patterns

Composition: Reading Comprehension

UNIT III:

Prose: Women's Education is Almost More Important than the Education of Boys and Men – Indira Gandhi

Short Story: The Necklace – Guy De Maupassant

One-Act Play: The Referee – W.H. Andrews and Geoffrey Dearmer

Vocabulary: Similes

Grammar: Discourse Markers

Composition: Report Writing

UNIT IV:

Poetry: Ozymandias – P.B. Shelley

One-Act Play: The Pot of Broth- W.B. Yeats

Vocabulary: Collective Nouns

Grammar: Correction of Sentences

Composition: Picture Reading

UNIT V:

Short Story: The Silver Butterfly– Pearl S. Buck

One-Act Play: The Bear – Anton Chekov

Vocabulary: Acronyms

Grammar: Question Tags

Composition: Drafting Advertisement

Syamala, V., 2006, English for Communication, Emerald Publishers: Chennai.

15ITU201	Object Oriented Programming with C++	Semester – II			
		L T P C			
		5 0 0 5			

Course Objectives (CO)

- The objective of this course is to provide the student with the fundamental knowledge and skills to become a proficient C++ programmer.
- The student will learn to transpose the physical problem domain into a hierarchy of objects.
- Industry standard software engineering techniques will be presented and used to architect the system design.
- Objects, their behaviors, and their relationships, will be modeled and these models will be programmed into a functional application that the student will compile, modify, enhance and run.
- The student will program in a structured style whereby reinforcing the concepts of software quality, reliability and maintainability.
- To learn file handling in C++.

Course Outcomes (COs)

Upon completion of this course the students will be able to:

1. Understand the difference between top-down and bottom-up approach.
2. Apply the concepts of object-oriented programming in constructor and destructor.
3. Understand how to apply the major object-oriented concepts to implement inheritance and polymorphism.
4. Apply pointer concepts in C++
5. Understand how to manage console I/O operations.
6. Use the concepts of preprocessor directives and macros.

UNIT I

Introduction: Principles of object-oriented programming: Basic concepts of object-oriented programming – Benefits of OOP – Applications of OOPs – Structure of C++ Program C++ Tokens – Control Statement – Decision Making Statements- Loop Statements - Inline Functions – Function Overloading.

UNIT II

Control Structure, Functions and Constructors: Classes and Objects: Specifying a class – Creating Objects – Accessing Class Members – Defining Member Functions – Static Data Members – Static Member Functions - Array of Objects – Friend Functions. Constructors and Destructors: - Constructors – Parameterized Constructors - Multiple Constructors in a Class – Constructors with Default Arguments - Copy Constructor - Dynamic Constructor – Destructors.

UNIT III

Operator Overloading and Inheritance: Operator overloading: Defining operator overloading – overloading unary operators – overloading binary operators – overloading binary operators using friends – type conversions. Inheritance: - Inheritance – defining derived classes – single, multilevel, multiple, hierarchical inheritance- hybrid inheritance – virtual base classes – abstract classes.

UNIT IV

Pointers and I/O Operations: Pointers: Pointers to objects – this pointer – pointers to derived classes – virtual functions- Pure Virtual Functions. Managing console I/O operations :- C++ streams – C++ stream classes – unformatted I/O operations – formatted console I/O operations – Managing output with manipulators.

UNIT V

File Management: Files: Classes for file stream operations – Opening and Closing a file – sequential input and output operations – updating a file random access – Command Line Arguments. Templates and Exceptions:- Templates – class templates – function templates – member function templates – exception handling.

www.allexperts.com

Course Objectives

- To understand how C++ improves C with object-oriented feature.
- To learn the syntax and semantics of classes in C++ programming language.
- To learn how to write a function and constructors.
- To learn how to perform operator overloading and inheritance.
- To learn how to design C++ using pointers.
- To learn file handling in C++.

Course Outcomes (COs)

Upon completion of this course the students will be able to :

1. Understand the difference between top-down and bottom-up approach.
2. Apply the concepts of object-oriented programming in constructor and destructor.
3. Understand how to apply the major object-oriented concepts to implement inheritance and polymorphism.
4. Apply pointer concepts in C++
5. Understand how to manage console I/O operations.
6. Use the concepts of preprocessor directives and macros.

Write a C++ Program for the Following Concepts

Object and classes:

1. Create a class to implement the data structure STACK . Write a constructor to initialize the top of the stack to zero .Write a member function PUSH() to insert an element and a member function POP() to delete an element.
2. Create a class ARITH which consists of a FLOAT and an INTEGER variable. Write member functions ADD(),SUB(),MUL(),DIV(),MOD() to perform addition, subtraction, multiplication, division and modulus respectively. Write member functions to get and display MAT() object values.

Operator overloading:

3. Create a class MAT as a 2D matrix and R, C represents rows and columns of the matrix. Overload the operators +,-,* to add, subtract, multiply two matrices. Write member functions to get and display MAT() object values.
4. Create a class STRING. Write member functions to initialize to get and display strings. Overload the operator + to concatenate two strings, == to compare two strings and a member function to find the length of the strings.

Inheritance:

5. Create a class which consists of EMPLOYEE detail like eno, ename, dept, basic salary, grade. Write member functions to get and display them. Derive a class PAY from the above class and Write member functions to calculate da , hra, pf depending on the grade and display the pay slip in a neat format using console I/O.
6. Create a class SHAPE which consist of two virtual functions cal_Area() and cal_Peri() to calculate area & perimeter of various figures. Derive three classes SQUARE,RECTANGLE and TRIANGLE from the class SHAPE and calculate area and perimeter of each class separately and display the result.

7. Create two classes which consist of two private variables, one integer and one float variable in each class. Write member functions to get and display them. Write a FRIEND function common to both classes which takes the object of the above two classes as arguments and the integer and float values of both the objects separately and display the result.

Console I/O:

8. Write a user-defined function USERFUN() which has the formatting commands like setw(), showpos(), precision(). Write a program which prints a multiplication table and uses userfun() for formatting.

Files:

9. Write a program to perform insertion, deletion and updation of records using files.

10. Write a program which takes a file as argument and copies into another file with line numbers using command line arguments.

Templates:

11. Write a Program to swap the numbers using the concept of function template.

Course Objectives (CO)

- To have knowledge about the basic working of a microcontroller system and its programming in assembly language.
- To provide experience to integrate hardware and software for microcontroller applications systems.
- To learn the various Concepts of Embedded System
- To acquire knowledge about microcontrollers embedded processors and their applications.
- To develop the Programming Skills in 8051 Microcontroller.
- To provide a strong knowledge in the field of Real Time Operating System.

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Ability to understand the internal architecture and interfacing of different peripheral devices with Microcontrollers.
2. Ability to write the programs for microcontroller.
3. Understand the concepts of embedded systems
4. Understand the role of embedded systems in industry.
5. Understand the design concept of embedded systems
6. Integrate hardware and software for microcontroller applications systems.

UNIT I – 8051 Microcontroller

Introduction to Microcontroller and Embedded Processors – Microcontroller for Embedded Systems – Overview of 8051 Family – 8051 Architecture – 8051 flag bits and PSW Register - Register Bank and Stack.

UNIT II –8051 Programming

8051 Assembly and C Programming – Instruction Set –Address Modes - Loop and Jump Instructions - Arithmetic Instruction - Logic Instructions - Single Bit Instructions. Data Types and Directives - I/O Port Programming.

UNIT III – Internal Peripherals of 8051

Basic Registers of Timer - Programming 8051 Timer-Counter Programming – Basics of Serial Communication – 8051 Connection to RS232 - 8051 Serial Communication Programming – 8051 Interrupts - Programming External Hardware Interrupts.

UNIT IV – Applications

Interfacing LCD to the 8051 – Interfacing ADC – Sensors to 8051- Interfacing Stepper Motor - 8051 Interfacing to the Keyboard - Interfacing DAC to the 8051.

UNIT V – Real-Time Operating System

Survey of Software Architecture: Round Robin-Round Robin with Interrupts-Function – Queue Scheduling Architecture - Introduction of RTOS - RTOS Architecture -Task and Task States - Task and Data - Semaphores and Shared Data - Message Queues, Mailboxes and Pipes - Timer Function – Events - Memory Management.

Text Books

Mohammed Ali Mazidi and Janice Gillispie Mazidi, 2008, The 8051 Microcontroller and Embedded Systems, Third Edition , Pearson Education, Singapore.

Ayala, 2010, The 8051 Architecture and its Applications, Sixth Edition, Prentice Hall of India, New Delhi.

Course Objectives (CO)

- To learn the fundamentals of PC Hardware.
- To develop base knowledge in the installation of peripheral devices.
- To get a detailed knowledge of all the hardware components that make up a computer
- To understand the different interfaces required for connecting the hardware devices.
- To understand the components on the motherboard
- To provide a strong knowledge in Trouble shooting of PC

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Understand the modern computer organization, processor and memory concept, Peripherals and recent system architecture
2. Identify the existing configuration of the computers and peripherals for upgrading the same as and when required.
3. Develop base knowledge in the installation of peripheral devices.
4. Learn the hardware components that make up a computer
5. Understand the different interfaces required for connecting the hardware devices.
6. Trouble shoots PC when required.

UNIT I – Micro Computer System

Introduction to Micro Computer System – Computer Organization – Number Systems and Codes Memory – Arithmetic and Logic Unit – Control Unit.

UNIT II – Peripheral Devices

Introduction to Peripheral Devices – Keyboard – CRT Display monitor – Printer – Magnetic Storage Devices – Floppy Disk Drive – Hard Disk Drive – Peripherals Interfaces and Controller – Keyboard Interface

UNIT III – Display Adapter

CRT Display — CRT Controller –Auxiliary Subsystems – Data Communication fundamentals – Serial Port in PC – Real time clock (RTC) – Magnetic Tape Subsystems – LAN – Memory Expansion Options

UNIT IV – Installation and Preventive Maintenance

Pre Installation Planning – Installation Practice – Routine Checks – Special Configurations – Memory Up Gradation

UNIT V – Trouble shooting

Troubleshooting – Computer faults – Nature of faults – Types of Faults Diagnostic Programs and Tools — Faults in Elimination Process – Systematic Troubleshooting – POST (Power on Self Test)

Text Books

Course Objectives (CO)

- To apply the fundamentals of assembly level programming of microprocessors.
- To build a program on a microprocessor using arithmetic & logical instruction set of 8086.
- To develop the assembly level programming using 8086 loop instruction set.
- To write programs based on string and procedure for 8086 microprocessor.
- To analyze abstract problems and apply a combination of hardware and software to address the problem
- To make use of standard test and measurement equipment to evaluate digital interfaces

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Apply the fundamentals of assembly level programming of microprocessors.
2. Build a program on a microprocessor using arithmetic & logical instruction set of 8086.
3. Develop the assembly level programming using 8086 loop instruction set.
4. Write programs based on string and procedure for 8086 microprocessor.
5. Analyze abstract problems and apply a combination of hardware and software to address the problem
6. Make use of standard test and measurement equipment to evaluate digital interfaces

UNIT I – Introduction to 8-bit Microprocessor

Introduction to 8085 – Pin Diagram –Architecture – Demultiplexing the Bus –Generation of Control Signals – Fetching, Decoding and Execution of Instruction – Instruction Timing and Status Flag.

UNIT II – Addressing Modes

Instruction Set – Addressing Modes – Instruction Format – Simple Program – Memory Read Machine Cycle – Memory Unit s Machine Cycle.

UNIT III- Interfacing Concepts

Peripheral I/O Instructions – Device Selection And Data transfer – Types of Data Transfer - Input Interfacing – Input Interfacing Using Decoders – Output Interfacing: LED and 7 Segment Display – Interfacing Memory.

UNIT IV Peripheral Devices

Introduction to Programmable Peripheral Interface 8255 – Pin Diagram –Architecture – Modes of Operation: I/O and BSR – Architecture and Operation of 8251(USART). Architecture and Operation of Programmable Interrupt Controller (8259) – Architecture of 8254(8253) Programmable Interval Timer/Counter –DMA Controller(8279).

UNIT V- Applications

Time Delay Program – Traffic Light Control System – Water Level Controller – Stepper Motor Control – Interfacing DAC –Interfacing ADC – Temperature Measurement.

------------------	---	--

Course Objectives (CO)

- To have knowledge about the basic working of a microcontroller system and its programming in assembly language.
- To provide experience to integrate hardware and software for microcontroller applications systems.
- To learn the various Concepts of Embedded System
- To acquire knowledge about microcontrollers embedded processors and their applications.
- To develop the Programming Skills in 8051 Microcontroller.
- To provide a strong knowledge in the field of Real Time Operating System.

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Understand the internal architecture and interfacing of different peripheral devices with Microcontrollers.
2. Write the programs for microcontroller.
3. Understand the concepts of embedded systems
4. Understand the role of embedded systems in industry.
5. Understand the design concept of embedded systems
6. Integrate hardware and software for microcontroller applications systems.

1. Addition of 8/16 Bit Array of Data
2. Subtract of 8/16 Bit Array of Data
3. Multiplication & Division
4. Ones and Two's Compliment
5. Data Transfer using Parallel Port
6. Sorting of Numbers
7. Stepper Motor Interface
8. Wave Form Generation
9. Biggest and Smallest Number in an Array
10. D/A Converter

15ITU212B Allied Elective Lab - PC hardware and Troubleshooting Lab	Semester II				
	L	T	P	C	
	0	0	3	2	

Course Objectives (CO)

- To learn the fundamentals of PC Hardware.
- To develop base knowledge in the installation of peripheral devices.
- To get a detailed knowledge of all the hardware components that make up a computer
- To understand the different interfaces required for connecting the hardware devices.
- To understand the components on the motherboard
- To provide a strong knowledge in Trouble shooting of PC

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Understand the modern computer organization, processor and memory concept, Peripherals and recent system architecture
2. Identify the existing configuration of the computers and peripherals for upgrading the same as and when required.
3. Develop base knowledge in the installation of peripheral devices.
4. Learn the hardware components that make up a computer
5. Understand the different interfaces required for connecting the hardware devices.
6. Trouble shoots PC when required.

(Any 8 Experiments)

1. Identifying External Ports and Interfacing
2. Identifying PC cards and Interfacing.
3. Assembling of PC
4. Preventive Maintenance of a PC
5. Trouble Shooting of SMPS
6. Keyboard Servicing
7. Study of CRT
8. Communication and Bus Interfacing
9. Partitioning and Formatting Hard disks.
10. Installing System And Application Software

Allied Elective Lab - Microprocessor and Interfacing Lab

Course Objectives (CO)

- To apply the fundamentals of assembly level programming of microprocessors.
- To build a program on a microprocessor using arithmetic & logical instruction set of 8086.
- To develop the assembly level programming using 8086 loop instruction set.
- To write programs based on string and procedure for 8086 microprocessor.
- To analyze abstract problems and apply a combination of hardware and software to address the problem
- To make use of standard test and measurement equipment to evaluate digital interfaces

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Apply the fundamentals of assembly level programming of microprocessors.
2. Build a program on a microprocessor using arithmetic & logical instruction set of 8086.
3. Develop the assembly level programming using 8086 loop instruction set.
4. Write programs based on string and procedure for 8086 microprocessor.
5. Analyze abstract problems and apply a combination of hardware and software to address the problem
6. Make use of standard test and measurement equipment to evaluate digital interfaces

(Any 8 Experiments)

1. Addition of 8/16-bit and Array of Data
2. Subtraction of 8/16-Bit Number
3. Multiplication of 8-Bit Number
4. Division of 8-bit Number
5. Fill and Transfer an Array of Data.
6. Ascending and Descending of an Array.
7. Data Transfer using Parallel Ports.
8. Stepper Motor Interface
9. Traffic Light Controller
10. A/D Convertor and D/A Convertor

Course Objectives (CO)

- To create the awareness about environmental problems among people.
- To develop an attitude of concern for the environment.
- To motivate public to participate in environment protection and improvement.
- To understand the transnational character of environmental problems and ways of addressing them, including interactions across local to global scales.
- To apply systems concepts and methodologies to analyze and understand interactions between social and environmental processes.
- To reflect critically about their roles and identities as citizens, consumers and environmental actors in a complex, interconnected world.

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Master core concepts and methods from ecological and physical sciences and their application in environmental problem solving.
2. Master core concepts and methods from economic, political, and social analysis as they pertain to the design and evaluation of environmental policies and institutions.
3. Appreciate the ethical, cross-cultural, and historical context of environmental issues and the links between human and natural systems.
4. Understand the transnational character of environmental problems and ways of addressing them, including interactions across local to global scales.
5. Apply systems concepts and methodologies to analyze and understand interactions between social and environmental processes.
6. Reflect critically about their roles and identities as citizens, consumers and environmental actors in a complex, interconnected world.

UNIT - I: Eco system and natural resources: Environment – Definition – components - Ecosystem -Definition, Concept, Scope, importance, structure and functions of ecosystem. Energy flow, Ecological succession. Food chains and food webs. Classification of ecosystem. Natural resources: Forest resources; water resources

UNIT - II: Environmental pollution: Cause, effects and control measures of Air pollution, water pollution, soil pollution, marine pollution, noise pollution, thermal pollution and nuclear hazards pollution. Solid waste management.

UNIT - III: Biodiversity and its conservation: Introduction- Definition, genetic, species and ecosystem diversity, biogeographical classification of India- Value of biodiversity: Consumptive, productive uses; social, ethical, aesthetic and option values. Threats to biodiversity: habitat loss, poaching of wildlife, man-wildlife conflicts.

UNIT - IV: Social issues and the environment: Urban problems related to energy- water conservation and management -Rain water harvesting- water shed management. Resettlement and Rehabiltilisaion. Natural resources and associated problems and sustainable utilization. Environmental Education.

UNIT - V: Environment ethics: Environmental Ethics - Gender equity, ethical basis of environment education and awareness, conservation ethic and traditional value systems of India. Valuing nature, cultures, social justice, Human heritage, equitable use of resources, preserving resources for future generation, common property resources, Ecology and its uses and its degradation, Introduction to Environmental Protection Act (EPA).

		Semester-II
		L T P C
15SSD101	Soft Skill Development - I	2 0 0 1

Instruction Hours / week: L: 2 T: 0 P: 0 Marks: Internal: 100 External: Nil Total: 100

Course Objectives (CO)

- Students will be able to apply quantitative reasoning and mathematical analysis methodologies to understand and solve problems.
- To achieve the analytical and reasoning competencies and to improve their communication and presentation skills
- To impart knowledge on both Aptitude and Soft skills to the students
- To actively do mathematics—such as analyzing data, constructing hypotheses, solving problems, reflecting on their work, and making connections.
- To critically evaluate and demonstrate various principles involved in solving mathematical problems and to adopt new and faster methods of calculations.
- To reinforce competencies in soft skills which are crucial in a social setting

Course Outcomes (COs)

On successful completion of the course the students will be able to:

1. Understand the basic concepts of QUANTITATIVE ABILITY
2. Understand the basic concepts of LOGICAL REASONING Skills
3. Acquire satisfactory competency in use of VERBAL REASONING
4. Actively do mathematics—such as analyzing data, constructing hypotheses, solving problems, reflecting on their work, and making connections.
5. Solve campus placements aptitude papers covering Quantitative Ability, Logical Reasoning and Verbal Ability
6. Compete in various competitive exams like CAT, CMAT, GATE, GRE, GATE, UPSC, GPSC etc.

UNIT - I

Introduction to Quantitative Aptitude, Speed Maths, Problems on Numbers, Averages, Ratios and Proportions, Problems on Ages

UNIT - II

Number Series, Blood Relation, Image Analysis, Direction Sense, Syllogism, Coding and Decoding

UNIT – III

Percentages, Data Interpretation, Profit and Loss, Simple Interest and Compound Interest

UNIT – IV

Parts of Speech, Tense, Subject Verb Agreement, Active and Passive Voice, Articles, Prepositions

UNIT - V

Conditional Clause, Degrees of Comparison, Goal Setting, Interpersonal Skills

Course Objectives (CO)

- To develop confidence to respond in English during situations where the use of English is imperative.
- To develop fluency in actual conversation in the English language.
- To develop speech skills necessary for confident and intelligent participations in Group Discussions and develop skills related to teamwork in work places.
- To develop confidence to respond in English during situations where the use of English is imperative.
- To develop fluency in actual conversation in the English language.
- To develop knowledge about business communication.

Course Outcome (COs)

After the completion of this course, a successful student will be able to:

- Learn the basics and purposes of listening skill.
- Understand importance of speaking.
- Develop the speaking skills on telephone, business and also in travel
- Learnt some effective vocabulary learning strategies.
- Communicate clearly and effectively and handle their day to day affairs well with their knowledge of language skills.

UNIT I

Listening: Listening comprehension – Listening for Specific Information –Note Taking – Interpreting Charts and Diagrams.

UNIT II

Speaking: Essentials of effective communication – Greeting and Introducing – Making requests – Asking for permission – Giving and Denying Permission – Offering and Accepting Help – Asking for and Declining Help – Giving Instructions and Orders - Talking about likes and dislikes.

Telephone Skills – Understanding telephone conversation – handling calls – leaving messages –making requests - giving instructions and orders

Discussion Skills – Giving your opinion – agreeing and disagreeing – Making suggestions – Interrupting – questioning – reporting – Dealing with questions.
(Completing dialogues)

UNIT III

Reading: Reading – Reading with a purpose –Skimming and Scanning – locating main points – reading critically – Sequencing of sentences – Reading comprehension.

UNIT IV

Writing: Paragraph Writing – Descriptive and Narrative. Safety Instructions/ Suggestions. Expansion of Abbreviations – Spellings- Report writing.

Translation- Translating short sentences and passages from English to Tamil and from Tamil to English.

UNIT V

Vocabulary: Improve English vocabulary: Synonyms – Antonyms – Prefixes – Suffixes – Idioms – Collocations – Different types of English – British and American (Choose the best answer type from a database of 50 words each for each topic)

Functional Grammar: Forming questions, getting answers – Articles – Parts of Speech – Punctuation – Common mistakes in English (Homophones)(Exercise based)

Course Objectives (CO)

- To assess how the choice of data structures and algorithm design methods impacts the performance of programs
- To choose the appropriate data structure and algorithm design method for a specified application.
- To study the systematic way of solving problems, various methods of organizing large amounts of data.
- To employ the different data structures to find the solutions for specific problems.
- To solve problems using data structures such as linear lists, stacks, queues.
- To understand the usage of Tree and Binary tree and search operations.

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Choose appropriate data structure as applied to specified problem definition.
2. Handle operations like searching, insertion, deletion, traversing mechanism etc. on various data structures.
3. To design and apply appropriate data structures for solving computing problems
4. To analyze algorithms and to determine algorithm correctness and time efficiency class.
5. Use linear and non-linear data structures like stacks, queues, linked list etc.
6. Illustrate various technique to for searching and Sorting

UNIT I

Overview of Data Structures: Introduction to Data Structures: Introduction to the Theory of Data Structures Data Representation-Abstract Data Types-Data Types-Primitive Data Types-Difference between Abstract Data Types, Data Types, Data Structures. Programming and Analysis of Algorithms: Program Design-Algorithms-Different Approaches to Designing an Algorithm-Complexity-Big 'O' Notation-Algorithm Analysis-Structured Approach to Programming-Recursion-Tips and Techniques for Writing Programs in C.

UNIT II

Arrays and Linked Lists: Arrays: Introduction to Linear and Non-linear Data Structures-Arrays in C- one Dimensional Arrays-Array Operations-Two Dimensional Arrays-Multi Dimensional Arrays-Pointers and Arrays. Linked List: Introduction to Lists and Linked Lists-Dynamic Memory Allocation-Basic Operations-Double Linked Lists-Circular Linked Lists-Linked List in arrays-Linked Lists versus Arrays.
Polynomials and Sparse Matrix: Introduction-Representation of Polynomials.

UNIT III

Stack and Queues: Stack: Introduction- Representation of Stack using Arrays and Linked List-Applications of Stack-Stack and Recursion. Queues: Introduction- Representation of Queue-Circular Queue-Double Ended Queue-Priority Queue-Application of Queue.

UNIT IV

Trees and Searching: Trees: Introduction-Types-Basic Definition-Properties-Representation-Operation on Binary Tree-Binary Tree Traversal-Applications of Binary Tree-Height

Balanced (AVL) Tree-Representation-Operations-Threaded Binary Tree-B Tree. Searching: Introduction-Sequential Search-Binary Search -Indexed Sequential Search

UNIT V

Graphs and Sorting: Graphs: Introduction-Sequential Representation-Linked Representation-Traversal of Graphs-Spanning Trees-Shortest Path. Sorting: Introduction – Selection Sort – Insertion sort – Bubble- Quick- Merge- Radix-Shell- Heap-Comparison of Time Complexity.

Web Sites

www.gatesit.org/gitdownloads/C&DS.pdf

Course Outcomes (COs)

- To describe a sound introduction to the discipline of database management systems.
- To give a good formal foundation on the relational model of data and usage of Relational Algebra.
- To introduce the concepts of basic SQL as a universal Database language.
- Ability to use PL/SQL
- To demonstrate the principles behind systematic database design approaches by covering conceptual design, logical design through normalization.
- To provide an overview of physical design of a database system, by discussing Database indexing techniques and storage techniques.

Course Outcomes (COs)

Upon completion of the course, students will be able to

1. Explain the features of database management systems and Relational database.
2. Design conceptual models of a database using ER modeling for real life applications and also construct queries in Relational Algebra.
3. Create and populate a RDBMS for a real life application, with constraints and keys, using SQL.
4. Retrieve any type of information from a data base by formulating complex queries in SQL.
5. Analyze the existing design of a database schema and apply concepts of normalization to design an optimal database.
6. Build indexing mechanisms for efficient retrieval of information from a database

UNIT I

Understanding Database Fundamentals: Origin of Database – Database elements – Design concepts – components of DBMS – Advantages and Disadvantages of DBMS. Database Models: Flat-file-hierarchical model – network model – relational model – object oriented model – Features of Object oriented Database Management system – Features of distributed DBMS – Comparison of DBMS & DDBMS - Object relational model. ER-model: entities – relationships – ERD symbols – cardinalities – sample ERD.

UNIT II

Entities and Entity Relationships: Relational Model: Introduction – Relational database: attributes and domains – Tuples – Relation and their schemes – Relation representation – keys – relationships – relational operations – Integrity rules. Relational Algebra: Basic operations – Additional relational algebraic operations – some Relational algebra queries. Functional dependency: Reasoning about FD's – closure of set of FD's – Attribute closure.

UNIT III

Objects: Relational database manipulation: Introduction – SQL: Data definition – Data manipulation: Basic data retrieval – condition specification – Arithmetic and aggregate operations. SQL joins – Set manipulation – categorization – updates – views – index. Data Control language: grant – revoke – simple privileges. Simple flashback queries.

UNIT IV

Overview of PL/SQL: Declaration section – executable command section: conditional logic, loops, CASE statements – exception handling section: predefined and user defined exceptions. Triggers: definition – types: row level, statement level, before and after, instead of – syntax – enabling and disabling triggers - replacing and dropping triggers. Cursors – definition – open – fetch – close – cursor attributes- select for update – types : implicit, explicit. Procedures, Functions: Local and global – procedures vs. functions – stored procedures, functions – create procedure syntax - create function syntax – calling procedures, functions. Replacing and dropping procedures, functions.

UNIT V

Packages: Package header – package body – calling package members - Replacing and dropping package. Overview of Normalization: advantages - disadvantages. Normal forms: first normal form – second normal form – third normal form – demoralization. Parallel Databases: Introduction – Design of Parallel Databases – Advantages and Disadvantages of Parallel Database.

Case Study

Project: University System

Project : Course Registration System

Project : Airline Reservation System

Web Sites

www.databasedir.com

www.rdbms.org

Course Outcomes (COs)

- To describe a sound introduction to the discipline of database management systems.
- To give a good formal foundation on the relational model of data and usage of Relational Algebra.
- To introduce the concepts of basic SQL as a universal Database language.
- Ability to use PL/SQL
- To demonstrate the principles behind systematic database design approaches by covering conceptual design, logical design through normalization.
- To provide an overview of physical design of a database system, by discussing Database indexing techniques and storage techniques.

Course Outcomes (COs)

Upon completion of the course, students will be able to

1. Explain the features of database management systems and Relational database.
2. Design conceptual models of a database using ER modeling for real life applications and also construct queries in Relational Algebra.
3. Create and populate a RDBMS for a real life application, with constraints and keys, using SQL.
4. Retrieve any type of information from a data base by formulating complex queries in SQL.
5. Analyze the existing design of a database schema and apply concepts of normalization to design an optimal database.
6. Build indexing mechanisms for efficient retrieval of information from a database

List of Programs

1. Create a table with following fields:

Employee table:

Field name	Constraint	Type	Size
Employee_no	Primary key	Character	6
Employee_name		Character	30
Address		Character	25
Designation		Character	15
Dob		Date	
Gender	Check	Character	1
Doj		Date	
Salary		Number	10,2

Queries:

- a) Display name of the employees whose salary is greater than “10,000”.
- b) Display the details of employees in ascending order according to Employee Code
- c) Display the details of the employee earning the highest salary.
- d) Display the names of the employees who earn more than “Ravi”

2. Create a table named **Student** with the following fields and insert the values:

Field name	field type	field size
Student Name	character	15
Gender	character	6
Roll No.	character	10
Department Name	character	15
Address	character	25
Percentage of Marks	number	4 , 2

Queries:

- Calculate the average mark percentage of the students.
- Display the names of the students whose percentage marks are greater than 80%
- Display the details of the student who got the highest percentage of marks.
- Display the details of the students whose mark percentage is between 50 and 70.
- Display the details of the students whose mark percentage is greater than the mark percentage of Roll No = 12CA01

3. Create a table with following fields:

Staff table:

Field name	Constraint	Type	Size
Staff_no	Primary key	Character	6
Staff_name		Character	30
Dob		Date	
Dept_code	Foreign key	Character	4
Designation		Character	15
Basic Salary		Number	7,2

Department table:

Field name	constraint	Type	Size
Dept_code	Primary key	Character	4
Dept_name		Character	30

Execute the following queries:

- To list the staff who joined 2 years back.
- To list the staff in computer science dept.
- To list the staff_name and the dept_name in which he/she works.
- To list the maximum and minimum salary in each dept.
- To list the dept along with the total amount spent on salary
- To list the name of the employees who draw the salary more than the average salary.

4. Create a table with the following fields:

Book table:

Field name	Constraint	Type	Size
Access_no	Primary key	Character	6
Title		Character	30
Author		Character	30
Publisher		Character	30
Subject		Character	10
Price		Number	6,2

Execute the following queries:

- The title of C and C++ books.
- The books written by a particular author.
- The books which cost between Rs.300/- and Rs.500/-
- The number of books available in each subject.

5. The books in the decreasing order of the cost.

5. Create a table with the following fields:

Account table:

Field name	Constraint	Type	Size
Acc_no	Primary key	Number	4
Cust_name		Varchar2	30
Branch_name		Varchar2	30
Cust_city		Varchar2	30

Borrower table:

Field name	Constraint	Type	Size
Acc_no	Foreign key	Number	30
Branch_name		Varchar2	30
Amount		Number	8,2

Write a Query to perform different types of Join.

6. Create two tables course & batch with following fields:

COURSE: coursecodeno number(5),course name varchar(20), syllabus varchar(20)

BATCH: bcode number(5), coursecode number(5),starting_date date, duration number(3),coursefee number(10,2)

Perform the following queries:

- ☐ ☐ Insert the details for course and batch tables with 10 records
- ☐ ☐ Show the description of the two tables
- ☐ ☐ Select all the fields from course & batch tables
- ☐ ☐ Select all the fields from course & batch tables where coursecode=10
- ☐ ☐ Select all the fields from batch table where starting date=march 10th
- ☐ ☐ Select batch code from batch table where net income>50000
- ☐ ☐ Select course name, batch code & starting date from batch & course tables where course code in batch table and course code in course table are equal
- ☐ ☐ Select a syllabus from course where coursecode=5

7. Create table with following fields:

Product table:

Field name	Constraint	Type	Size
Product_code	Primary key	Varchar2	7
Product_name		Varchar2	30
Price		Number	6,2
Quantity		Number	4

Vendor table:

Field name	Constraint	Type	Size
Vendor_name		Varchar2	30
Vendor address		Varchar2	30
Product_code	Foreign Key	Varchar2	7

Create a trigger to fire when the Record is deleted and inserted.

8. Write a PL/SQL trigger to update the records while deleting the one record in another table.

voters_master:

Field name	Constraint	Type	Size
voterid	Primary key	Number	5
name		Varchar2	30
Ward_no	Primary key	Number	4
dob		Date	
address		Varchar2	150

new_list

Field name	Constraint	Type	Size
voterid		Number	5
ward_no		Number	4
name		Varchar2	30
Description		Character	50

9. Create a table to store the salary details of the employees in a company. Declare the cursor id to contain empno, employee name and net salary. Use cursor to update the employee details.

Salary:

Field name	Constraint	Type	Size
emp_no	Primary key	Number	4
emp_name		Varchar2	30
designation		Varchar2	25
dept		Varchar2	30
basic		Number	5

10. Write the PL/SQL program to find the factorial and Fibonacci series of given number.

11. (i) Write the PL/SQL program to check whether the string is Palindrome.
(ii) Write the PL/SQL program to reverse a number.
(iii) Write the PL/SQL program to check whether the number is Armstrong.

12. Write a PL/SQL block to create and handle user defined exception.

clientmaster

Field name	Constraint	Type	Size
client_id		Number	6
client_name		Varchar2	30
address		Varchar2	50
phone		Number	10
balance		Number	10,2

13. Create a table to store the salary details of the employees in a company. Declare the cursor_id to contain employee number, employee name, and net salary. Use cursor to update the employee details.

salary

Field name	Constraint	Type	Size
emp_no	Primary key	Number	4
emp_name		Varchar2	30
designation		Varchar2	25
dept		Varchar2	30
basic		Number	5
da_percent		Number	3
ma		Number	6,2
other_allowance		Number	6,2
deduction		Number	6,2

14. Create a table **stock** contains the itemcode varchar2(10), itemname varchar2(50), current_stock number(5), data_of_last_purchase date. Write a stored procedure to seek for an item using itemcode and delete it, if the date of last purchase is before 1 year from the current date. If not, update the current stock.

15. Create a table to contain phone_number, user_name, address. Write a function to search for address using phone_number.

Vendor table:

Field name	Constraint	Type	Size
Vendor_name		Character	30
Vendor address		Character	30
Product_code	Foreign Key	Character	7

Create a trigger to fire when the Record is deleted.

15ITU303	Numerical Methods	Semester-III				
		L	T	P	C	
		4	2	0	4	

Course Objectives (CO)

- To understand the basic concepts of numerical methods
- To develop the mathematical skills in the areas of numerical methods.
- To understand numerical techniques as powerful tool in scientific computing.
- To provide suitable and effective methods called Numerical Methods, for obtaining approximate representative numerical results of the problems.
- To solve problems in the field of Applied Mathematics, Theoretical Physics and Engineering which requires computing of numerical results using certain raw data.
- To solve complex mathematical problems using only simple arithmetic operations. The approach involves formulation of mathematical models of physical situations that can be solved with arithmetic operations.

Course Outcomes (COs)

On completion of the course students will be able to

1. Apply Numerical analysis which has enormous application in the field of Science
2. Familiar with numerical integration and differentiation, numerical solution of ordinary differential equations.
3. Familiar with calculation and interpretation of errors in numerical method.
4. Develop and apply the appropriate numerical techniques for the problem, interpret the results, and assess accuracy.
5. Understand the basics of Numerical Differentiation & Integration and numerical solutions of ordinary differential equations.
6. Understand the concepts of difference operators and the use of Interpolation.

UNIT I

Solution of algebraic and transcendental equations: Bisection method –Regula Falsi method – Newton Raphson method. Polynomial Equations – Graeffe’s root squaring method.

UNIT II

Solution of simultaneous linear algebraic equations: Gauss elimination method – Gauss Jordan method – Method of triangularization – Gauss-Jacobi method – Gauss-seidel method.

UNIT III

Interpolation: Gregory Newton Forward and Newton Backward interpolation formula – Interpolation with unequal intervals — Lagrange’s interpolation formula – Inverse interpolation formula.

UNIT IV

Numerical Differentiation and Integration: Newton’s Forward and backward differences to compute derivatives – Trapezoidal rule, Simpson’s 1/3 & 3/8 rule.

UNIT-V

Numerical methods for solving ordinary differential equations – Taylor series(I order) – Euler and Modified Euler method – Runge kutta methods (II order , III order and IV order).

		Semester III
		L T P C
15ITU304A	Core Elective - I Wireless and Mobile Computing	4 0 0 4

Course Objectives (CO)

- To know the evolution of Mobile communication and cell concept to improve capacity of the system.
- To know the types of channel coding techniques, data transmission modes and services of GSM.
- To know the types of channel coding techniques, data transmission modes and services of GPRS
- To Know about wireless application protocol in 3G spectrum technology
- To know about various security mechanism used in Mobile computing
- To learn various Security Issues in Mobile Computing

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Understand the basic architecture of mobile computing
2. Evaluate the performance and need of wireless technology and GSM
3. Understand the basic concept of short message service and GPRS
4. Understand the architecture of wireless application protocol and 3G spectrum network
5. Understand Security Framework for Mobile Environment
6. Analyze various security mechanism and issues in security over mobile computing

UNIT I

Introduction: Introduction – Mobile Computing architecture – History – Three Tier architecture – Design consideration for Mobile Computing – Mobile Computing through Telephony – Evaluation – Multiple access procedure – Satellite Communication systems – Mobile Computing through Telephone – Developing an IVR Application – Voice XML – TAPI.

UNIT II

Emerging Technology and GSM: Introduction- Blue tooth – Radio Frequency Identification - Wireless Broad Band – Mobile IP – Internet Protocol Version 6 – Java Card – GIS- Global system for Mobile Communication – GSM architecture – GSM entities – Call routing in GSM – PLMN Interface – GSM address and Identifiers – Network aspects in GSM – Mobility Management – GSM Frequency allocation – Authentication and Security.

UNIT III

Short Message Service and GPRS: Mobile Computing over SMS – Short Message Service – Value added Service through SMS – Accessing the SMS bearer – GPRS – introduction – GPRS and Packet Data Network – GPRS Network architecture – GPRS Operations – Data Services – Applications – Limitation – EDGE.

UNIT IV

Wireless Application Protocol: Introduction – WAP – MMS – GPRS Applications – CDMA and 3G – Spread Spectrum Technology – IS-95 – CDMA Versus GSM – Wireless Data - 3G Networks – Application on 3G. – Wireless LAN – Wireless LAN Technologies – IEEE 802.11 Standards – Wireless LAN architecture – Mobility – Wireless LAN Security.

UNIT V

Mobile Computing Security: Security Issues in Mobile Computing – Introduction – Information Security – Security Techniques and algorithms – Security Protocols – Public Key Infra structure – Trust – Security – Security Models – Security Framework for Mobile Environments. Next Generation Networks .

Text Book

Asoke K. Talukder, Hasan Ahmed and Roopa R. Yavagal, 2010, Mobile Computing Technology, Application and Service Creation, 2nd Edition, Tata McGraw Hill.

References

Jochen Burkhardt Dr .Horst Henn, Klaus Rintdoff, Thomas Schack, 2009, Pervasive Computing, Pearson Education.

Fei Hu , Xiaojun Cao, 2010, Wireless Sensor Networks Principles and Practice, CRC Press.

Course Objectives (CO)

- To know the basic concepts involved in mobile development environment
- Describe the limitations and challenges of working in a mobile and wireless environment
- To facilitate students to understand android SDK
- To help students to gain a basic understanding of Android application development.
- To inculcate working knowledge of Android Studio development tool
- To integrate multimedia, camera and Location based services in Android Application.

Course Outcomes (COs)

After completion of this course, the students will be able to:

1. Identify various concepts of mobile programming that make it unique from programming for other platforms,
2. Critique mobile applications on their design pros and cons
3. Utilize rapid prototyping techniques to design and develop sophisticated mobile interfaces
4. Describe and work within the capabilities and limitations of a range of mobile computing devices.
5. Program mobile applications for the Android operating system that use basic and advanced phone features
6. Understand various Mobile security issues.

UNIT I

Introduction to Mobile Development : What is mobile computing?, History of mobile environments – early mobile phones to smartphones and tablets, Development for mobile environments, Differences from traditional application development, Trends in mobile development.

UNIT II

Mobile Development : Introduction, Advantages, Limitations, Features useful for mobiles – Geolocation, offline web applications, offline web storage, animations, 2D/3D graphics, Audio/Video etc. , Frameworks -- HTML5 , Phone Gap (Apache Cordova) framework and jQuery Mobile framework.

UNIT III

Introduction to Android: Android Overview -- Features, Architecture, Applications, Application frameworks, Libraries, Runtime, Kernel, Android Ecosystem – Application stores, publishing, Android Development Tools – Android SDK, Android emulator, Development on hardware devices

UNIT IV

Basic Android Development: Writing Android Applications, Activity Lifecycle, Multi device support, Fragments, Data storage, Intents, Data sharing, Audio playback, Photo capture

UNIT V

Advanced Android Development : Animations. OpenGL ES, Wireless connections, Data syncing, Location aware applications, Best practices for development, Security, Distribution and Monetizing Lab: Exercises using PhoneGap and the Android SDK using various features of Android.

Text Book

Jeff Mc Wherter , Scott Gowell, 2012, Professional Mobile Application Development, 1st Edition.

Course Objectives (CO)

- To learn basics of Cloud computing.
- To learn different Cloud Computing services
- To know the concepts of event management and its applications
- To learn the basic Green computing strategies and its applications
- To learn the challenges and economics involved in shifting computing hardware to the cloud
- To learn about the environmental impact of Green Computing

Course Outcomes (COs)

After completion of this course, the students will be able to:

1. Analyze the Cloud computing setup with its vulnerabilities and applications using different architectures.
2. Use and Examine different cloud computing services
3. Understand and explore event management application and explore web-based databases.
4. Understand the role of Green computing and its top ten strategies which impacts environment
5. Relate green IT to sustainable development,
6. Discuss how the choice of hardware and software can facilitate a more sustainable operation

UNIT I

Understanding cloud computing: An introduction to cloud computing- what it is & what it is not- History - The network is the computer: How cloud computing works. Companies in the cloud: cloud computing today. The pros and cons of cloud computing- benefits- developing cloud services.

UNIT II

Cloud computing for the community- Cloud computing for the corporation- Using Cloud services: collaborating on calendars, schedules, and Task management. Exploring online calendar applications- Exploring online schedule applications- Exploring online planning and task management.

UNIT III

Collaborating on Event Management: Event Management applications - Exploring Event Management Applications – Collaborating on project Management : Exploring project Management Applications – Collaborating on databases :how it works-Exploring Web-Based Databases.

UNIT IV

Green Computing Strategies That Companies Should Be Aware Of - The Climate Savers Computing Initiative Top Ten Strategies - CSCI: Computer Science or Computer Software Configuration Item? - Expectations from the CSCI Degree - CSCI Major Requirements Disclosed - The 12 Green Computer Companies.

UNIT V

Green Computing for Environmental Impact Management - Green Initiative Business: Good For IT Business? - Organization Planning for Green Computing - Tips for Green Computing Strategic Initiative - Green Computing: Tips for Strategic Planning Organization - Implementing Green Computing in a Business Organization Beneficial to All

Text Books

15SSD301	Soft Skill Development - II	Semester-III L T P C 2 0 0 0
----------	-----------------------------	---

Instruction Hours / week: L: 2 T: 0 P: 0 Marks: Internal: 100 External: Nil Total: 100

Course Objectives

- Students will be able to apply quantitative reasoning and mathematical analysis methodologies to understand and solve problems.
- To achieve the analytical and reasoning competencies and to improve their communication and presentation skills
- To impart knowledge on both Aptitude and Soft skills to the students
- To actively do mathematics—such as analyzing data, constructing hypotheses, solving problems, reflecting on their work, and making connections.
- To critically evaluate and demonstrate various principles involved in solving mathematical problems and to adopt new and faster methods of calculations.
- To reinforce competencies in soft skills which are crucial in a social setting

Course Outcomes (COs)

On successful completion of the course the students will be able to:

1. Understand the basic concepts of QUANTITATIVE ABILITY
2. Understand the basic concepts of LOGICAL REASONING Skills
3. Acquire satisfactory competency in use of VERBAL REASONING
4. Actively do mathematics—such as analyzing data, constructing hypotheses, solving problems, reflecting on their work, and making connections.
5. Solve campus placements aptitude papers covering Quantitative Ability, Logical Reasoning and Verbal Ability
6. Compete in various competitive exams like CAT, CMAT, GATE, GRE, GATE, UPSC, GPSC etc.

UNIT - I

Time, Speed and Distance, Time and Work, Pipes and Cisterns, Geometry, Data Arrangement

UNIT – II

Analogy, Logic based Venn diagram, Probability, Permutation and Combination, Logarithms

UNIT – III

Data Sufficiency, Clocks, Calendar, Reading Comprehension, Sentence Correction, Sentence Completion, Spotting the Errors, Jumbled Sentences

UNIT – IV

Synonyms, Antonyms, Verbal Analogy, Statements and Assumptions, Group Discussion

UNIT - V

Resume Writing, Introduction to HR rounds, Time Management, Attitude and Behaviour

Course Objectives (CO)

- To train the students in understanding the concepts of communication.
- To be familiar with the four basic skills of English.
- To train students in developing their written communication.
- To train students in developing their presentation skills.
- To acquire the skill of making grammatically correct sentences.
- To reflect originality on the application of soft skill views and express in writing their views.

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Acquire proficiency in communication.
2. Students have become adept in written communication and presentation skills.
3. Developed the skill of writing in English and that of public speaking.
4. Establish and maintain social relationships.
5. Develop communication skills in business environment.
6. Enhanced communication competency through LSRW skills

UNIT I – Concept of Communication – Barrier to Communication –Body language – Personality Development – Etiquette and Manners- Soft Skills – Emotional Intelligence

UNIT II – Listening Comprehension – Reading Comprehension – Paragraph writing – Precise Writing – Writing Resume and Covering Letter -Speaking – Welcome Address, Vote of Thanks, Compering, Debates, Role Play, Dialogues – Vocal Communication Techniques. Voice, Quality, Volume, Pitch

UNIT III – Dicto Composition – Letter Writing (Informal, Letters to the Editor etc) – Term paper – Book reviews

UNIT IV – Business Correspondence – Layout of Business Letter – Formal Styles of Business Letters – Letters of Acceptance, Appointment, Resignation, Complaint, Sending E-mails.

UNIT V – Effective Presentation – Planning – Audience Analysis –Logical Sequencing – Timing of the Presentation – Conclusion – Answering Queries – Group Discussion – Interview.

Selley, John. Oxford Guide to Effective Writing and Speaking. 2005, OUP: New Delhi.

Course Objectives (CO)

- To learn client and server-side scripting languages
- Understand the technologies used in Web designing.
- Know the importance of object-oriented aspects of Scripting.
- To understand and practice embedded dynamic scripting on client-side Internet Programming
- To master the theory behind scripting and its relationship to classic programming
- To gain some fluency programming in HTML, ASP, JavaScript and related languages, to design and implement one's own scripting language.

Course Outcomes (COs)

After completion of this course, the students will be able to:

1. Choose, understand, and analyze any suitable real time web application
2. Design simple web pages using markup languages like HTML and XHTML
3. Create dynamic web pages using ASP and java script that is easy to navigate and use.
4. Program server-side web pages that have to process request from client-side web pages.
5. Develop web pages using ASP, JSP and VBScript.
6. Develop embedded dynamic scripting on client-side Internet Programming

UNIT I

Introduction to HTML: Introduction-HTML Browsers-History of HTML and SGML-HTML Command Tags-Quotation Marks-Spacing-Special Symbols-Tags with Automatic Line Breaks-URLs-Understanding Domain Names-Links-Defining Web Page-Main Body of Text- Headers-Adding Paragraph-Formatting Text-Font Type, Size, Predefined Fonts, Bold, Italic-Setting Colors-Text Color, Superscripts and Subscripts-Underlining Text-Preformatted Text-Blinking Text-Block Quotes-Margins-Line Breaks-Ordered and Unordered List-Links-Scaling an Image-Images Alignment. More on HTML: Creating Table-Dividing Table into Columns-Dividing Table into Rows- Creating Headers- Adding Border –Putting a Background Image- Heading across two or More Columns-Changing Color of a Cell-Aligning the Contents of a Cell-Display of Tables.

UNIT II

HTML, Forms, Frames and Style Sheets: HTML : Working with Forms-Creating Forms-Working with Menus-Working with Radio Buttons-Check Boxes-Text Boxes -Text Areas-Password Boxes-Submit Button-Resetting the Form-Working with Frames-Creating Frameset-Creating Columns-Creating Rows and Columns-Combining Framesets-Giving Colors to the Borders-Space between Frames-Nesting Framesets-Showing or Hiding Scrollbars-Alternatives to Frames. Cascading Style Sheets: Introduction to CSS-Creating Style Sheets-Common Tasks with CSS-Colors-The Font Family-Assigning Classes-The Layer Tag-CSS Tags

UNIT III

eXtensive Markup Language: Introduction-Features of XML-XML Support and Usage-Compatibility of XML with Others-Structure of XML Document-Common Errors-Structures in XML-Creating Document Type Declarations-Flow Objects-Length-Colour and Background Properties

UNIT IV

ASP: How Active Server Pages Really Work?-Variables-Procedures-ASP Forms-Date Types-Operators. More on ASP: Introduction to Object Hierarchies-Getting Information from the Visitor-Sending Information to Visitors-ASP Applications-Getting in at the Top (Server Object)-Response Object Methods.

UNIT V

Java Script and VB Script : Java Script: Introduction-Operators-Assignments-Comparisons-Reserved Words-Browsers to Use-Software Requirement-Starting with Java Script-Using Quotes, Alert-Functions-Eval Function-Using Statements in Java Script-Working with Objects-Properties-Browser objects-Date object-Math Object-String Object-Defining Objects-Handling Events in Java Script-Event Handling Attributes-Window Events-Working with Forms-Form Elements-User Actions-windows and Frames-Window Object-Frame Object-Document Object-Navigator Object-Screen Object-Using Images and Math-Images and Animation-Area Object-Math Object-Java Script Objects.

VB Script: Introduction-Adding VB Script code to HTML- Adding VB Script code to Documents-Data Types-Getting the Message Across.

Course Objectives

- To understand the fundamentals of programming such as variables, conditional and iterative execution, methods, etc.
- To understand fundamentals of object-oriented programming in Java, including defining classes, invoking methods, using class libraries, etc.
- To use the Java SDK environment to create, debug and run simple Java programs.
- To use Java in various technologies in different platforms.
- To understand the fundamental of Packages and access modifiers and interface in java.
- To understand the fundamental of Exception Handling and AWT component and AWT classes.

Course Outcomes (COs)

After completion of this course, the students will be able to:

1. Obtain knowledge of the structure and model of the Java programming language.
2. Use the Java programming language for various programming technologies (understanding)
3. Develop software in the Java programming language (application)
4. Evaluate user requirements for software functionality required to decide whether the Java programming language can meet user requirements (analysis)
5. Use the certain technologies by implementing them in the Java programming language to solve the given problem (synthesis)
6. Choose an engineering approach to solving problems, starting from the acquired knowledge of programming and knowledge of operating systems. (evaluation)

UNIT I

Introduction to Java: Object Oriented Paradigm and Concepts-Structured versus Object Oriented Approach. Java Language: Features of Java -Environment-Java Architecture-Java Development Kit-Types of Java Program. Variable Declaration and Arrays: Data Types-Java Tokens –Variable Declaration – Type Casting and Conversion – Arrays, Operators, And Control Statements: Selection Constructs – Iteration Constructs –Jump Statements.

UNIT II***Classes and Objects***

Introduction to classes: Instance variables, Class variables, Instance Methods, Constructors, Class methods, Declaring Objects, Garbage Collection, Method Overloading - Constructor Overloading - This Reference. Inheritance: Super class variables- Method Overriding - final Keyword, Abstract Classes and Interfaces.

UNIT III

Exception Handling: Fundamentals – Hierarchy of Classes – Types of Exceptions-Exception Class – Uncaught Exceptions – Handling Exceptions – User Defined Exceptions. Multithreaded Programming: The Java Thread Model – Runnable Interface - Thread Class – Thread Creation – Thread's Life Cycle – Thread Scheduling -Synchronization and Deadlock.

Packages and Access Modifiers: Package Declaration – The CLASSPATH variable - import statement – The Java Language Packages - Access Protection.

UNIT IV

Strings: Creation – Operation on strings - Character Extraction Methods – Comparison – Searching and Modifying –Data Conversion and valueOf() Methods – Changing case of characters - String Buffer Class and its methods. Collection and Utilities: Collection of Objects – Core Interfaces and Classes – Iterators – List, Set, Map Implementations.

UNIT V

Input Output Classes: I/O Operations –Hierarchy of Classes – File class – Input Stream, Output Stream, FileInputStream, FileOutputStream, Reader and Writer classes – Random Access File class –Stream Tokenizer. Applets: Basics – Life Cycle –Methods –Graphics Class- Color, Font, and Font Metrics Class – Using the Status window – Passing parameters to Applets – getDocumentBase() and getCodeBase(). AWT Components: AWT Classes – Basic Component and Container Classes – Frame Window in an Applet.

Course Objectives (CO)

- To understand the fundamentals of programming such as variables, conditional and iterative execution, methods, etc.
- To understand fundamentals of object-oriented programming in Java, including defining classes, invoking methods, using class libraries, etc.
- To use the Java SDK environment to create, debug and run simple Java programs.
- To use Java in various technologies in different platforms.
- To understand the fundamental of Packages and access modifiers and interface in java.
- To understand the fundamental of Exception Handling and AWT component and AWT classes.

Course Outcomes (COs)

After completion of this course, the students will be able to:

1. Obtain knowledge of the structure and model of the Java programming language.
 2. Use the Java programming language for various programming technologies (understanding)
 3. Develop software in the Java programming language (application)
 4. Evaluate user requirements for software functionality required to decide whether the Java programming language can meet user requirements (analysis)
 5. Use the certain technologies by implementing them in the Java programming language to solve the given problem (synthesis)
 6. Choose an engineering approach to solving problems, starting from the acquired knowledge of programming and knowledge of operating systems. (evaluation)
-
1. Write a program to find the sum of series $1+x+x^2+x^3+\dots$
 2. Write a program to find maximum and sum of an array
 3. Write a Program to generate Fibonacci Series and Factorial for a number
 4. Define a class for Employee with name and date of appointment. Create employee objects and sort them as per their date of appointment.
 5. Create a method to calculate the area & perimeter of a circle. Extend the semicircle class child of circle class and override the method to calculate the area and perimeter of a semicircle (if possible use this & super keywords)
 6. Create an interface called arithmetic, which defines methods for sum, multiplication, division, subtraction, percentage and implement of them.
 7. Write a program to an exception out of bounds, if mark is greater than 100 throw an exception
 8. Write a program to generate multiplication table by multithreading

9. Create a package, which holds the class and an interface defined in the question 5 & 6 and use them in your main method/class.
10. Write a program to perform string operations
11. Create a StringBuffer object and illustrate the operation of the append() and reverse() methods.
12. Write a program to create an applet and draw any shapes using color
13. Write an Applet Program to create Menus
14. Write an Applet Program to perform operations in listbox
15. Write an application that converts between meters and feet. its first command-line argument is a number. Its second command-line argument if either “feet” or “meters”. If this argument equal “feet”, display a string reporting the equivalent number of meters. If this argument equal “meters”, display a string reporting the equivalent number of feet. Otherwise, report that the unit system is not recognized

Course Objectives (CO)

This course enables the students to

- To learn the basic concepts and applications of linear programming.
- To impart knowledge in concepts and tools of Operations Research.
- To know the constructive techniques to make effective business decisions
- Define and formulate linear programming problems and appreciate their limitations
- To Identify and develop operational research models from the verbal description of the real system
- To Solve network models like the shortest path, minimum spanning tree, and maximum flow problems

Course Outcomes (COs)

On successful completion of the course, students will be able to

1. Understand the basic concepts and application of operation research in various fields.
2. Understand and analyze managerial problems in industry so that they are able to use resources (capitals, materials, staffing, and machines) more effectively
3. Define and formulate linear programming problems and appreciate their limitations
4. Recognize the importance and value of Operations Research and mathematical modeling in solving practical problems in industry
5. Identify and develop operational research models from the verbal description of the real system
6. Solve network models like the shortest path, minimum spanning tree, and maximum flow problems

UNIT I

Linear Programming: Formulation of LPP – Graphical solution to LPP –Simplex method – Big M method and Duality in LPP.

UNIT II

Transportation model: Introduction – Mathematical Formulation –Finding initial Basic Feasible solutions – Optimum solution for non degeneracy and degeneracy model - Unbalanced Transportation problems and Maximization case in Transportation problem

UNIT III

The Assignment problem - Mathematical formulation of the problem – Hungarian method – Unbalanced Assignment problem- Maximization case in Assignment problem.

Queuing theory : Introduction – Characteristics of queuing system. Problems in (M/M/1):(∞/FIFO) and (M/M/1):(N/FIFO) models .

UNIT IV

Inventory Control: Introduction – Costs involved in inventory – Deterministic EOQ models – Purchasing Model without and with shortage, Manufacturing Model without and with shortage -Price break.

UNIT V

PERT and CPM: Network representation – Calculation of Earliest expected time, latest allowable occurrence time. CPM - various floats for activities – critical path.

PERT –Time estimates in PERT- Probability of meeting scheduled date of completion of projects .

Text Book

Kanthi Swarup, Gupta P.K., Man Mohan., 2006, Operations Research, Sultan Chand & Sons, New Delhi. (For Unit I – V)

References

Shanthi Sophia Bharathi D.,1999 (II edition),Operations Research/Resource management techniques, Charulatha Publications.

Course Objectives (CO)

- To recognize the error in the number generated by the solution.
- To compute solution of algebraic and transcendental equation by numerical methods like Bisection method and Newton Rapshon method.
- To apply method of interpolation and extrapolation for prediction.
- To recognize elements and variable in statistics and summarize qualitative and quantitative data.
- To calculate mean, median and mode for individual series.
- To outline properties of correlation and compute Karl-Pearson's coefficient of correlation.

Course Outcomes (COs)

Upon completion of the course students shall be able to:

1. Recognize the error in the number generated by the solution.
2. Compute solution of algebraic and transcendental equation by numerical methods like Bisection method and Newton Rapshon method.
3. Apply method of interpolation and extrapolation for prediction.
4. Recognize elements and variable in statistics and summarize qualitative and quantitative data.
5. Calculate mean, median and mode for individual series.
6. Outline properties of correlation and compute Karl-Pearson's coefficient of correlation.

UNIT-I

Meaning and definition of statistics – Classification of data - Frequency distribution - Diagrammatic Presentation – Bar diagram and Pie diagram – Graphic Presentation – Histogram, Frequency Polygon, Frequency curve and Ogives.

UNIT – II

Measures of central tendency – Arithmetic mean, median and mode. Measures of dispersion- Range, standard deviation, Coefficient of variation.

UNIT – III

Correlation – Meaning and definition - Scatter diagram –Karl pearson's correlation coefficient. Rank correlation.

Regression: Regression in two variables – Regression coefficient problems – uses of regression.

UNIT – IV

Probability theory : Axioms of Probability–Addition theorem – Multiplication theorem– conditional Probability.

Theoretical Distribution: Basic Concepts - Binomial distribution, Poisson Distribution & Normal distribution (No derivations) and simple problems.

UNIT – V

Test of significance: Tests based on Means only-Both Large sample and Small sample tests - Chi square test - goodness of fit.

15ITU403C	Allied Elective-II Discrete Mathematics	Semester IV L T P C 4 2 0 4
-----------	---	-----------------------------------

Course Objectives (CO)

- To learn the basic concepts of sets, types of sets, functions and relations
- To understand about Pigeonhole principle, Permutation and Combination, Mathematical Induction
- To solve the problems using Recurrence relations and generating functions.
- To know the basic concepts of Logical Connectives, Graphs and Trees.
- To express ideas using mathematical notation
- To solve problems with the help of tools of mathematical analysis.

Course Outcomes

On successful completion of the course, students will be able to

1. Familiar with elementary algebraic set theory.
2. Acquire a fundamental understanding of the core concepts in growth of functions.
3. Describe the method of recurrence relations.
4. Get wide knowledge about graphs and trees
5. Initiate to knowledge from inference theory
6. Solve problems with the help of tools of mathematical analysis.

UNIT-I

Mathematical logic: Connections well formed formulas, Tautology, Equivalence of formulas, Tautological implications, Duality law, Normal forms, Predicates, Variables, Quantifiers, Free and bound Variables.

UNIT-II

Relations: Properties of Binary relations – Equivalence relations - composition of relations, Closure of relations – Order relations – Partial order relations.

Functions: one-to-one, onto, one-to-one-onto functions – composition of functions, Inverse functions.

UNIT-III

Formal languages and Automata: Grammars: Phrase–structure grammar, context-sensitive grammar, context-free grammar, regular grammar. Finite state automata- Deterministic finite automata and Non deterministic finite automata-conversion of non deterministic finite automata to deterministic finite automata.

UNIT-IV

Lattices and Boolean algebra: Partial ordering, Poset, Lattices, Boolean algebra, Boolean functions, Theorems, Minimization of Boolean functions.

UNIT-V

Graph Theory: Directed and undirected graphs, Paths, Reachability, Connectedness, Matrix representation, Euler paths, Hamiltonian paths, Trees, Binary trees simple theorems, and applications.

		Semester IV			
		L T P C			
15SSD301	Soft Skill Development – II	2	0	0	1
Instruction Hours / week: L: 2 T: 0 P: 0		Marks: Internal: 100 External: Nil Total: 100			

Course Objectives (CO)

- Students will be able to apply quantitative reasoning and mathematical analysis methodologies to understand and solve problems.
- To achieve the analytical and reasoning competencies and to improve their communication and presentation skills
- To impact knowledge on both Aptitude and Soft skills to the students
- To actively do mathematics—such as analyzing data, constructing hypotheses, solving problems, reflecting on their work, and making connections.
- To critically evaluate and demonstrate various principles involved in solving mathematical problems and to adopt new and faster methods of calculations.
- To reinforce competencies in soft skills which are crucial in a social setting

Course Outcomes (COs)

On successful completion of the course the students will be able to:

1. Understand the basic concepts of QUANTITATIVE ABILITY
2. Understand the basic concepts of LOGICAL REASONING Skills
3. Acquire satisfactory competency in use of VERBAL REASONING
4. Actively do mathematics—such as analyzing data, constructing hypotheses, solving problems, reflecting on their work, and making connections.
5. Solve campus placements aptitude papers covering Quantitative Ability, Logical Reasoning and Verbal Ability
6. Compete in various competitive exams like CAT, CMAT, GATE, GRE, GATE, UPSC, GPSC etc.

UNIT - I

Time, Speed and Distance, Time and Work, Pipes and Cisterns, Geometry, Data Arrangement

UNIT – II

Analogy, Logic based Venn diagram, Probability, Permutation and Combination, Logarithms

UNIT – III

Data Sufficiency, Clocks, Calendar, Reading Comprehension, Sentence Correction, Sentence Completion, Spotting the Errors, Jumbled Sentences

UNIT – IV

Synonyms, Antonyms, Verbal Analogy, Statements and Assumptions, Group Discussion

UNIT - V

Resume Writing, Introduction to HR rounds, Time Management, Attitude and Behaviour

		Semester V
		L T P C
15ITU501	.NET Programming	5 0 0 5

Course Objectives (CO)

- To design, formulate, and construct applications with VB.NET
- To integrate variables and constants into calculations applying VB.NET
- To determine logical alternatives with VB.NET decision structures
- To implement lists and loops with VB.NET controls and iteration
- To separate operations into appropriate VB.NET procedures and functions
- To assemble multiple forms, modules, and menus into working VB.NET solutions

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Grasp the fundamentals of a programming language and know the basic differences between programming languages
2. Choose the architecture based on the problem to be solved.
3. Differentiate between the types of applications supported by .Net
4. Build, compile and execute a VB .Net program
5. Apply techniques to develop error-free software
6. To build integrated VB.NET solutions using files and structures with printing capabilities.
Translate general requirements into data-related solutions using database concepts

UNIT I

Introduction to .NET: .NET Framework features & architecture, CLR, Common Type System, MSIL, Assemblies and class libraries. Introduction to visual studio, Project basics, types of project in .Net, IDE of VB.NET- Menu bar, Toolbar, Solution Explorer, Toolbox, Properties Window, Form Designer, Output Window, Object Browser. The environment: Editor tab, format tab, general tab, docking tab. visual development & event driven Programming -Methods and events.

UNIT II

The VB.NET Language: The VB.NET Language- Variables -Declaring variables, Data Type of variables, Forcing variables declarations, Scope & lifetime of a variable, Constants, Arrays, types of array, control array, Structure Programming – Modularity – Information Hiding – Abstraction – Events – subroutines and functions– Message box – Input box. Control flow statements: conditional statement, loop statement.

UNIT III

Working with WPF: Introduction : Understanding Windows Graphics - WPF: A Higher-Level API - The Architecture of WPF. XAML: Basics, Properties and Events in XAML – Loading and compiling -Layout-.Classic Controls: The Control Class - Content Controls - Text Controls - List Controls - Range-Based Controls.

UNIT IV

Objects and collections: Understanding objects, Properties, Methods. Understanding collections. Files : Introduction – Classification of files – Processing files – handling files and folder using class – Directory class – file class.

UNIT V

Database programming with ADO.NET: Overview of ADO, from ADO to ADO.NET, Accessing Data using Server Explorer. Creating Connection, Command, Data Adapter and Data Set with OLEDB and SQLDB. Display Data on data bound controls, display data on data grid. Generate Reports Using CrystalReportViewer.

Course Objectives (CO)

- To learn the fundamental concepts of networking standards, protocols and technologies.
- Introduce the concept of communication protocols and give an overview of Data Communication Standards.
- To learn different techniques for framing, error control, flow control and routing.
- To learn OSI and TCP/IP Layers and protocols Design
- To learn the layering concepts in computer networks.
- To understand the functions of each layer

Course Outcomes (COs)

After completion of this course the student will be able to:

1. Analyze the requirements for a given organizational structure to select the most appropriate networking architecture, topologies, transmission mediums, and technologies.
2. Conceptualize and explain the functionality of the different layers within a network architecture
3. Understand design issues, flow control and error control
4. Analyze data flow between TCP/IP model using Application, Transport and Network Layer Protocols.
5. Illustrate applications of Computer Network capabilities, selection and usage for various sectors of user community.
6. Understand and analysis structure of Authentication Service and Electronic Mail Security, web security and IP security

•

UNIT I

Introduction: The uses of Computer Networks, Networks Hardware, Network Software, OSI Reference Model, TCP/IP Reference Model.

UNIT II

Physical Layer: Theoretical Basis for Data Communication- Transmission Media- Wireless Transmission- Communication Satellites- The Public Switched Telephone Network- The Mobile Telephone System- Cable Television.

UNIT III

Data Link Layer Design Issues- Error Detection and Correction – Elementary data Link Protocols, Medium Access Control Sub layer: The Channel Allocation Problem – ALOHA – Collision- Free Protocols – Wireless LAN Protocols – Ethernet: Ethernet Cabling.

UNIT IV

The Network Layer: Network layer design issues- Routing Algorithms- Congestion control Algorithms- The Transport Layer: The Transport Services – Elements of Transport Protocols – Remote Procedure Call.

UNIT V

Presentation Layer: Presentation Layer design issues- Data Compression Techniques- Cryptography. The Application Layer: Application Layer Design issues- Files Transfer, Access and Management- Electronic Mail- Virtual Terminals- Other Applications.

Course Objectives (CO)

- To understand the nature of software development and software life cycle process models, agile software development, SCRUM and other agile practices.
- To explain methods of capturing, specifying, visualizing and analyzing software requirements.
- To understand concepts and principles of software design and user-centric approach and principles of effective user interfaces.
- To know basics of testing and understanding concept of software quality assurance and software configuration management process.
- To understand the need of project management and project management life cycle.
- To understand project scheduling concept and risk management associated to various type of projects.
- Implement a given software design using sound development practices.

Course Outcomes (COs)

1. Apply their knowledge of mathematics, sciences, and computer science to the modeling, analysis, and measurement of software artifacts.
2. Work effectively as leader/member of a development team to deliver quality software artifacts.
3. Analyze, specify and document software requirements for a software system.
4. Verify, validate, assess and assure the quality of software artifacts.
5. Design, select and apply the most appropriate software engineering process for a given project, plan for a software project, identify its objectives and risks, and estimate its cost and time.
6. Express and understand the importance of negotiation, effective work habits, leadership, and good communication with stakeholders, in written and oral forms, in a typical software development environment.

UNIT I

Introduction to Software Engineering: The Evolving Role of Software-Software-Software Myths- A Generic View of process: Software Engineering –A Layered Technology- Process Models: Prescriptive Models- Waterfall Model- Incremental process Models. Evolutionary Process Models: Prototyping, The Spiral Model- Specialized process Models. Capability Maturity Model.

UNIT II

Requirement Engineering: Requirement Engineering tasks – Initiating requirement engineering process – Eliciting requirements. Building the Analysis Model: Requirements Analysis-Analysis Modeling Approaches-Data Modeling Concepts: Data Objects-Data attributes-Relationships Cardinality and Modality-Flow Oriented Modeling: Creating Data Flow Model-Creating a Control Flow Model-The Control Specification-The Process Specification- Creating a Behavioral Model.

UNIT III

Design Engineering: Design with the Context of Software Engineering-Design Process and Design Quality-Design Concepts-Creating An Architectural Design: Software Architecture-

Data Design-Architectural Design- Assessing Alternative Architectural Designs-Mapping Data Flow into Software Architecture. Modeling Component level Design: Designing Class based components- Designing conventional components

UNIT IV

Performing User Interface Design: The Golden Rules: Place the User in Control-Reduce the User's Memory Load-Make the Interface Consistent- User Interface Analysis and Design: Interface Analysis and Design Models- The Process- Interface Analysis: User Analysis - Task analysis and Modeling. Interface Design Concepts-Appling Interface Design Steps- User Interface Design Patterns-Design Issues –Design Evaluation.

UNIT V

Testing Tactics: Testing Strategies-Testing strategies for conventional software-Unit Testing- Integration Testing- Validation Testing- System Testing. Software Testing Fundamentals- Black -Box and White-Box Testing- White Box Testing-Basis Path Testing- Control Structure Testing: Condition Testing- Data Flow Testing-Loop Testing- Black Box Testing- Quality Concepts: Quality- Quality Control –Quality Assurance –Cost Of Quality – Software Quality Assurance – ISO 9000 Quality standards.

Course Objectives (CO)

- To understand the main components of an OS & their functions.
- To study the process management and scheduling.
- To understand various issues in Inter Process Communication (IPC) and the role of OS in IPC. To understand the concepts and implementation Memory management policies and virtual memory.
- To understand the working of an OS as a resource manager, file system manager, process manager, memory manager and I/O manager and methods used to implement the different parts of OS
- To understand the structure and organization of the file system
- To learn case studies based on different operating system.

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Describe the important computer system resources and the
2. Perform the role of operating system in their management policies and algorithms.
3. Understand the process management policies and scheduling of processes by CPU
4. Evaluate the requirement for process synchronization and coordination handled by operating system
5. Describe and analyze the memory management and its allocation policies.
6. Identify use and evaluate the storage management policies with respect to different storage management technologies, identify the need to create the special purpose operating system.

UNIT I

Introduction: What is an OS? – Mainframe systems Desktop Systems – Multiprocessor systems – distributed systems – real time systems. Process: - Process concepts – Operation on process – cooperation process - Inter process Communication - Mutual Exclusion - Critical sections- primitives – Semaphores

UNIT II

Processor Scheduling: Deadlock: Deadlock prevention, avoidance, detection, recovery from deadlock-preemptive scheduling: - Scheduling Criteria – Scheduling Algorithms – FCFS- SJF- Priority – Round Robin –Multilevel Queue – Multilevel Feedback Queue.

UNIT III

Storage management: Memory Management - swapping- Contiguous memory allocation – paging, segmentation – segmentation with paging – Virtual memory: Virtual storage organization – Demand Paging, Process Creation – Page replacement – Thrashing.

UNIT IV

File systems: Introduction – File System Concepts – Access Methods – Directory structure – File Sharing – Allocation Methods –Efficiency and performance – Recovery Disk Performance Optimization: Introduction – Disk structure – Disk scheduling – Disk management.

UNIT V

Case studies: LINUX, Windows 2000, Windows XP: History- Design principles- File system

Course Objectives (CO)

- To design, formulate, and construct applications with VB.NET
- To integrate variables and constants into calculations applying VB.NET
- To determine logical alternatives with VB.NET decision structures
- To implement lists and loops with VB.NET controls and iteration
- To separate operations into appropriate VB.NET procedures and functions
- To assemble multiple forms, modules, and menus into working VB.NET solutions

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Grasp the fundamentals of a programming language and know the basic differences between programming languages
2. Choose the architecture based on the problem to be solved.
3. Differentiate between the types of applications supported by .Net
4. Build, compile and execute a VB .Net program
5. Apply techniques to develop error-free software
6. To build integrated VB.NET solutions using files and structures with printing capabilities. Translate general requirements into data-related solutions using database concepts

List of Programs

1. Write a VB.NET program to calculate Simple interest and compound Interest
2. Write a VB.NET program to implement Calculator.
3. Write a VB.NET program to implement Notepad
4. Write a VB.NET program to draw several shapes and fill with color.
5. Write a VB.NET program to perform the following in list box
 - a) Add an item
 - b) Delete an item
 - c) List count
 - d) Clear the List
6. Write a program to calculate the total marks of the student and print the grades
7. Write a VB.NET Program to implement Employee Payroll System.
8. Write a VB.NET program to create and manipulate a File.
9. Write a Program to implement a Web Browser
10. Write a program to maintain the details of doctors in a hospital with their specialization.
11. Write a program to animate the picture using Timer Control.
12. Write a program to move the object from one location to another. Change the color and size of object at different time interval.

13. Write a program to place ten pictures in the list box. Using timer control take the picture from List box and change the form background after specific time interval.
14. Write a program to implement speaking program. Get the text input from the user and convert into voice.
15. Write a program to implement chatting.

15ITU505A	Core Elective – II	Oracle 10g Administration	Semester V			
			L	T	P	C
			5	0	0	5

Course Objectives (CO)

- To learn Install the Database and Back up and recover data.
- To administer users and manage data.
- To transport data between databases and configure the network.
- To optimize schemas, tables, indexes and views
- To manage database services and clients
- To take backup and perform recovery.

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Create, maintain and manipulate an Oracle Database.
2. Understand various schema and transaction methods
3. Understand and implement connectivity and user management
4. Create and understand the application of user roles, privileges, and the security of the database.
5. Understand various concept involved in database security
6. Understand and perform backup and recovery process

UNIT I

Oracle DBA's: The Oracle DBA's Role- Different DBA Job Classifications- Types of Databases, Oracle Database 10g Architecture: Oracle Database Structures- Oracle Processes- Oracle Memory Structures-Oracle Database Transaction.

Creating an Oracle Database: Create the Database- Creating the parameter file- Creating a New Database- Using a server parameter File(SPFIL)- Starting Up and Shutting Down the Database from SQL * Plus.

UNIT II

Schema Management: Type Of SQL Statements- Oracle Schemes- Table spaces- Tables- Indexes- Integrity Constraints- Views- Synonyms-Sequences- Triggers- Object information. Transaction Management: Transactions- Properties- Concurrency Control- Isolation Levels and the ISO Standard- Implementing Concurrency Control- Read Consistency.

UNIT III

Connectivity and user Management: Using SQL * Plus and iSQL*Plus-Loading and Transforming Data - Using Data Pump Export and Import- Managing the operational Oracle Database: Managing and Monitoring the operational Database- Oracle Enterprise Manager:

UNIT IV

User Management and Database Security: Managing Users- Resource Manager- Controlling Access - Auditing - Authenticating Users- Enterprise User Security .

UNIT V

Backing up Databases: Examining the Flash Recovery Area –The RMAN- Control File- Backup Tool-User Managed Backups- Database Corruption Detection- Enhanced Data Protection For Disaster Recovery-Database Recovery

			Semester V
			L T P C
15ITU505B	Core Elective – II Data Mining and Ware housing	5	0 0 5

Course Objectives (CO)

- Understand various data mining functionalities
- Inculcate knowledge on data mining query languages.
- Know in detail about data mining algorithms
- Characterize the kinds of patterns that can be discovered by association rule mining, classification and clustering.
- Learn Multidimensional schemas suitable for data warehousing
- Understand and implement classical models and algorithms in data warehouses and data mining

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Preprocess the data for mining applications
2. Apply the association rules for mining the data
3. Design and deploy appropriate classification techniques
4. Cluster the high dimensional data for better organization of the data
5. Discover the knowledge imbibed in the high dimensional system
6. Evaluate various mining and data warehousing techniques

UNIT I

Basic data mining tasks – data mining versus knowledge discovery in databases – data mining issues – data mining metrics – social implications of data mining – data mining from a database perspective. Data mining techniques: Introduction – a statistical perspective on data mining – similarity measures – decision trees – neural networks – genetic algorithms.

UNIT II

Classification: Introduction – Statistical – based algorithms - distance – based algorithms – decision tree - based algorithms - neural network – based algorithms –rule - based algorithms – combining techniques.

UNIT III

Clustering: Introduction – Similarity and Distance Measures – Outliers – Hierarchical Algorithms - Partitional Algorithms. Association rules: Introduction - large item sets - basic algorithms – parallel & distributed algorithms – comparing approaches- incremental rules – advanced association rules techniques – measuring the quality of rules.

UNIT IV

Data warehousing: an introduction - characteristics of a data warehouse – data marts – other aspects of data mart. Online analytical processing: introduction - OLTP & OLAP systems – data modelling –star schema for multidimensional view –data modelling – multifact star schema or snow flake schema – OLAP TOOLS – State of the market – OLAP TOOLS and the Internet

UNIT V

Developing a data WAREHOUSE: why and how to build a data warehouse –data warehouse architectural strategies and organization issues - design consideration – data content – metadata distribution of data – tools for data warehousing – performance considerations – crucial decisions in designing a data warehouse. Applications of data warehousing and data

mining in government: Introduction - national data warehouses – other areas for data warehousing and data mining.

Text Books

Margaret H. Dunham, 2003, Data mining introductory and advanced topics, Pearson education.

C.S.R. Prabhu, Data warehousing concepts, techniques, products and a applications, 2nd Edition, Prentice Hall India.

Sam Anahory and Dennis Murray, 2009, Data Warehousing in the Real World, Pearson Education, New Delhi.

Jiawei Han, Micheline Kamber, Jian Pei, 2012, Data Mining: Concepts and Techniques: Concepts and Techniques, Morgan Kaufmann Publishers

References

Course Objectives (CO)

- To provide an overview of an exciting growing field of big data analytics.
- To impart to students the skills required to design scalable systems that can accept, store, and analyze large volumes of unstructured data.
- The objective of this course is to ascertain that the students know the fundamental techniques and tools used to design and analyze large volumes of data.
- To teach the fundamental techniques and principles in achieving big data analytics with scalability and streaming capability.
- To enable students to have skills that will help them to solve complex real-world problems in for decision support.
- To understand, and practice big data analytics and machine learning approaches

Course Outcomes (COs)

After completion of this course, the students will be able to:

1. Explain the motivation for big data systems and identify the main sources of Big Data in the real world.
2. Demonstrate an ability to use frameworks Hadoop to efficiently store retrieve and process Big Data for Analytics.
3. Implement several Data Intensive tasks using the Map Reduce Paradigm
4. Understand the key issues in big data management and its associated applications in intelligent business and scientific computing.
5. Interpret business models and scientific computing paradigms, and apply software tools for big data analytics.
6. Achieve adequate perspectives of big data analytics in various applications like recommender systems, social media applications etc.

UNIT I

Introduction to Big Data : Introduction to BigData Platform – Challenges of Conventional Systems - Intelligent data analysis – Nature of Data - Analytic Processes and Tools - Analysis vs. Reporting - Modern Data Analytic Tools - Statistical Concepts: Sampling Distributions - Re-Sampling - Statistical Inference - Prediction Error.

UNIT II

Mining Data Streams: Introduction To Streams Concepts – Stream Data Model and Architecture - Stream Computing - Sampling Data in a Stream – Filtering Streams – Counting Distinct Elements in a Stream – Estimating Moments – Counting Oneness in a Window – Decaying Window - Real time Analytics Platform(RTAP) Applications - Case Studies - Real Time Sentiment Analysis, Stock Market Predictions.

UNIT III

Hadoop: History of Hadoop- The Hadoop Distributed File System – Components of Hadoop- Analyzing the Data with Hadoop- Scaling Out- Hadoop Streaming- Design of HDFS-Java interfaces to HDFS- Basics-Developing a Map Reduce Application-How Map Reduce Works-Anatomy of a Map Reduce Job run-Failures-Job Scheduling-Shuffle and Sort – Task execution - Map Reduce Types and Formats- Map Reduce Features

UNIT IV

Hadoop Environment: Setting up a Hadoop Cluster - Cluster specification - Cluster Setup and Installation – Hadoop Configuration-Security in Hadoop - Administering Hadoop – HDFS - Monitoring-Maintenance-Hadoop benchmarks- Hadoop in the cloud

UNIT V

Frameworks: Applications on Big Data Using Pig and Hive – Data processing operators in Pig – Hive services – HiveQL – Querying Data in Hive - fundamentals of HBase and ZooKeeper - IBM InfoSphere BigInsights and Streams. Visualizations - Visual data analysis techniques, interaction techniques; Systems and applications

Text Books

15OEU501	Intranet Technology	Semester V L T P C 0 0 0 3
-----------------	----------------------------	---

Course Objectives (CO)

- Able to share and view information within the organization
- To have access to the intranet all the time.
- Promote fundamental concepts within the company over intranet
- Cost effective, saves money - this is one of the greatest benefits of the intranet.
- Messages, event and information can be placed on the intranet as they are quick. This saves time.
- To learn to maintain database and its applications

Course Outcomes (COs)

After completion of this course, the students will be able to:

1. Understand the advantage of intranet over groupware technologies
2. Understand the concept of sharing of files over Intranet
3. Work on Intranet chat tools and Intranet phones
4. Gain knowledge over the Intranet usage of Group scheduling, Message boards, News Feeds and other applications
5. Understand how to integrate intranet with existing applications
6. Understand impact to f security issues and its mechanisms

UNIT I

Introduction: Intranets: Internet Definition – The Internet in Action – Intranets Versus traditional Groupware – Client server basics and Theory. Building Intranet – Server Software – Starting with the Server – Connectivity – wide area networks – Selecting an Intranet Service Provider – Client Issues – Security.

UNIT II

Applications: Business applications – Viewing corporate Information with HTML – Authoring Tool – Creating a Dynamic & Functional site – Presentations: PDF – SGML-Audio – Video.

UNIT III

Intranet: Intranet Corporate data – Sharing files – using databases – Direct access. Communication – E-Mail – Intranet chat tools – Intranet phones.

UNIT IV

Intranet applications: Developing Intranet applications – Intranet tools – Creating real word applications – Group scheduling – Message boards – Contact Databases – Alert messaging and real time chat – News Feeds – Group Document creation and Editing – Private Messaging areas – Document submission – Search functions – Help Desk – Reference Desk.

UNIT V

Administering Intranet: Integrating existing applications – Maintaining a user Databases – Designing a successful file structure – Maintaining Security – Hardware and software upgrades – the Future of Intranets.

Text Book

David Garrett, 1998, Intranet Unleashed, 2nd Edition, Techmedia publication, New Delhi.[Unit-I(3-220), Unit-II(299-390), Unit-III(393-499), Unit-IV(513-698), Unit-V(701-802)]

References

Dasgupta, Subhasish. 2001. Managing Internet and Intranet Technologies in Organizations: Challenges and opportunities, 1st Edition, Idea Group Publishing.

Rolf Oppliger, 2002, Internet and Intranet Security, 2nd edition, Artech House Inc.

Course Objectives (CO)

- To understand the various characteristics of Intelligent agents
- To learn about the different search strategies in AI
- To learn to represent knowledge in solving AI problems
- To understand the different ways of designing software agents
- To know about the various applications of AI.
- Understand the various searching techniques, constraint satisfaction problem and example problems- game playing techniques.

Course Outcomes (COs)

At the end of the course, the student should be able to:

1. Identify problems that are amenable to solution by AI methods.
2. Identify appropriate AI methods to solve a given problem.
3. Formalize a given problem in the language/framework of different AI methods.
4. Implement basic AI algorithms.
5. Design and carry out an empirical evaluation of different algorithms on a problem formalization, and state the conclusions that the evaluation supports.
6. Ability to apply knowledge representation, reasoning, and machine learning techniques to real-world problems

UNIT I

What is Artificial Intelligence?: The AI Problems - The Underlying Assumption - What is an AI Technique? - The Level of the Model - Criteria for Success.

Problems, Problem Spaces , and Search: Defining the Problem as a State Space Search - Production Systems - Problem Characteristics - Production System Characteristics - Issues in the Design Of Search Programs.

UNIT II

Heuristic Search Techniques: Generate-and-Test - Hill Climbing - Best-First Search - Problem Reduction - Constraint Satisfaction - Means-Ends Analysis

UNIT III

Knowledge Representation Issues: Representations and Mappings - Approaches to Knowledge Representation - Issues in Knowledge Representation - The Frame Problem. *Using Predicate Logic*: Representing Simple Facts in Logic - Representing Instance and Isa Relationships - Computable Functions and Predicates – Resolution - Natural Deduction. *Weak Slot-and-Filler Structures*: Semantic Nets - Frames. *Strong Slot-and- Filler Structures*: Conceptual Dependency - Scripts – CYC.

UNIT IV

Lisp: Why Lisp? – Lisps - Typing at Lisp - Defining Programs - Basic Flow of Control in Lisp - Lisp Style - Atoms and Lists - Building Up List Structure - More on Predicates – Properties - The for function – Recursion - Scope of Variables

UNIT V

Expert Systems: A Little History - Features Of an Expert System – Players in the Expert System Use of Expert Systems - Real Experts Vs Expert Systems. Organizing Knowledge - Representing Knowledge. Expert Systems Vs Conventional Programs: Basic Characteristics of an Expert System, Expert Systems Make Mistakes.

Expert System Applications: Basic Activities Of Expert Systems - The Types Of Problems that Expert Systems Solve. *Application-Oriented AI Research: Medicine – Overview - Medical Systems: MYCIN*

Course Objectives (CO)

- To understand the multimedia communications systems, application and basic principles,
- To analyze of the multimedia streaming,
- To perform and establish multimedia communication terminals,
- To present multimedia communications
- Explore a brief history of multimedia in education
- Analyze instructional and informational media (print materials, audio/visual materials and/or web-based materials, games/simulations, etc.)

Course Outcomes (COs)

Upon successful completion the student will be able to:

1. Define multimedia to potential clients.
2. Identify and describe the function of the general skill sets in the multimedia industry.
3. Identify the basic components of a multimedia project.
4. Identify the basic hardware and software requirements for multimedia development and playback.
5. Describe the process of digitizing (quantization) of different analog signals (text, graphics, sound and video).
6. Use appropriate tools for the design, development and creation of digital media artefacts.

UNIT I

Multimedia – An overview: Introduction – Multimedia presentation and production – Characteristics of Multimedia presentation – Hardware and Software Requirements – Uses of Multimedia. Text: Types of text - Font - Text File formats. Image: Image data representation – Image file formats – Image processing software. Graphics: Advantages of graphics – Uses – Components of a graphics system.

UNIT II

Audio: Sound waves – Types and properties of sound – Components of audio system – Digital audio - Musical Instrument Digital Interface (MIDI) – Audio file formats – Audio processing software. Video: Motion video – Television systems – Video file formats – Video processing software. Animation: Uses of animation – Computer based animation – Animation file formats – Animation software.

UNIT III

Introducing Photoshop elements: About elements – Welcome screen – Create mode – Menu bar – Toolbox – Options bar – Panels. Organizing images: Obtaining images – Tagging images - Searching for images - Opening and saving images. Selecting Areas – Layers – Text and Drawing Tools.

UNIT IV

Understanding Flash: Understanding Flash basic elements – Creating a simple animation. Learning Flash Toolbox: Learning the toolbox – Using tools. Learning Flash Panels: Understanding the panels. Using timeline and layers: Understanding how timeline works – Understanding layers. Drawing objects: Drawing lines and fills – Using colors – Rotating, skewing and scaling – Grouping objects. Creating animation – How animation works – Creating motion tweens – Creating shape tweens. Understanding masks – Creating masks.

UNIT V

Creating symbols and using the library: Learning about symbols – Creating symbols – Using libraries. Learning Basic ActionScript concepts: ActionScript basics – Data type basics. Learning basic ActionScript Programming: Applying ActionScript – Using ActionScript to Control actions – Using Actionsript to control properties – Understanding Actions and Event Handlers.

Text Books

Ranjan Parekh, 2013, Principles of Multimedia, 2nd Edition, Tata McGraw hill . (Unit I, Unit II)

Nick Vandome, 2011, Photoshop Elements 9, Tata McGraw hill. (Unit III)

Brian Underdahl, 2002, Macromedia Flash MX – A Beginners Guide, Dreamtech Press. (Unit IV, Unit V)

References

Tay Vaughan, 2002, Fundamentals of Multimedia, 5th Edition, Tata McGraw-Hill.

Bill Sanders. 2001. Flash5 Action Script, 1st Edition, DreamTech Press, New Delhi.

Course Objectives (CO)

- To understand the multimedia communications systems, application and basic principles,
- To analyze of the multimedia streaming,
- To perform and establish multimedia communication terminals,
- To present multimedia communications
- Explore a brief history of multimedia in education
- Analyze instructional and informational media (print materials, audio/visual materials and/or web-based materials, games/simulations, etc.)

Course Outcomes (COs)

Upon successful completion the student will be able to:

1. Define multimedia to potential clients.
2. Identify and describe the function of the general skill sets in the multimedia industry.
3. Identify the basic components of a multimedia project.
4. Identify the basic hardware and software requirements for multimedia development and playback.
5. Describe the process of digitizing (quantization) of different analog signals (text, graphics, sound and video).
6. Use appropriate tools for the design, development and creation of digital media artefacts.

Flash

1. Change a Shape to Another Shape. (Shape Animation)
2. Create a Man to walk with the help of Key Frame Animation.
3. Change the Colors of an object with the help of Animation.
4. Draw a Bird with Flash tools and make it fly with key Frame Animation.
5. Create a Shining Stores with the help of Movie Clip.
6. Create an animation to represent a growing moon using frame by frame animation
7. Create an animation to bounce a ball on steps.
8. Simulate movement of a cloud.
9. Create Morphing between two images in Flash.
10. Create an Action script to execute for a event in a Flash application.

Photoshop

1. Create Water Drops using Photoshop.
2. Animate Plane Flying with the Clouds using Photoshop.
3. Create Plastic Surgery for Nose using Photoshop.
4. Create a Web Page using Photoshop
5. Given a picture of a flower with a background, Extract the flower and organize on a different background.
6. Display the given picture through your name using mask.

Course Objectives (CO)

- To describe different parallel architectures, inter-connect networks, programming models and algorithms for common operations such as matrix-vector multiplication.
- To define problem, develop an efficient parallel algorithm to solve it.
- To analyze processors time complexity as a function of the problem size and number of processors.
- Given a parallel algorithm, an input to it, and the number of processors, show the steps performed by that algorithm on that input.
- To learn various Parallel programming languages:
- To learn parallel processing algorithms and analyze their performance

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Understand basic construction and use of parallel computers
2. Understand different type of processor organizations like mesh, binary tree, hyper tree and pyramid networks
3. Understand parallel algorithms and key technologies.
4. Analyze the performance issues in parallel computing and trade-offs.
5. Understand, appreciate and apply parallel algorithms in problem Solving.
6. make of the terminology to measure the performance of parallel algorithms and parallel computers

UNIT I

Computational Demands of modern science-advent of practical parallel processing-parallel processing terminology. PRAM algorithms: A model of serial computation-PRAM model of parallel computation-PRAM algorithms: parallel reduction-list ranking-preorder tree traversal merging two sorted lists.

UNIT II

Processor organizations: mesh networks-binary tree networks-hyper tree networks-pyramid networks. Processor arrays-connection machine Multiprocessors: uniform memory access multiprocessors-non-uniform memory access multiprocessors

UNIT III

Parallel programming languages: programming parallel processes-an illustrative example-a sample application-FORTRAN 90-Fortran 90 programmer's model-Fortran 90 language features. nCUBE C: the run-time model-extensions to the c language-sample program-OCCAM programmer's model-language constructs-sample program-CLINDA-programmer's model – language constructs-sample programs

UNIT IV

Elementary parallel algorithms-classifying MIMD algorithms-reduction: hypercube SIMD model shuffle-exchange SIMD model-2-D mesh SIMD model-UMA multiprocessor model Matrix multiplication-sequential matrix multiplication-algorithms for multiprocessors

UNIT V

Sorting: Enumeration sort-lower bounds on parallel sorting-odd even transposition sort-quick sort based algorithms-parallel quick sort-hyper quick sort. Combinatorial search-divide and conquer-branch and bound-traveling salesperson problem parallel branch and bound algorithms.

Text Book

Lin and Snyder,.2008, Principles of Parallel Programming, 2nd Edition, Addison-Wesley Publication.

References

Yun Calvin Lin, Lawrence Snyder, 2008, Principles of parallel programming, 2nd Edition, Pearson/Addison Wesley Publication, India.

Lin, 2011, Principles of Parallel Programming, 3rd Edition, Addison-Wesley Publication.

Course Objectives (CO)

- To provide students with basic concepts in information system and the benefits with these systems in modern society
- To differentiate between data, information, and knowledge
- To understand systems definition, systems requirements, and information needed for decision maker
- To understand several requirement and operations that the analyst needed to analyze, design, and implement the systems in what is called system development life cycle (SDLC)
- Appraise the interrelationships among elements that comprise a modern security system, including hardware, software, policies, and people
- Assess the role of strategy and policy in determining the success of information security

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Understand the basic of computer network threat and vulnerability and overview of digital crime.
2. Understand the various types of cyber attacks and criminals planning activities for cracking the system.
3. Understand the cryptography and its application and some of the important terms used in information security
4. Understand various Information Security Policies
5. Identify, Assess and control risk that occur while handling information transmission
6. Understand various security technologies available to handle different types of threats

UNIT I

Introduction : History, What is Information Security?, Critical Characteristics of Information, NISTSSC Security Model, Components of an Information System, Securing the Components, Balancing Security and Access, The SDLC, The Security SDLC

UNIT II

SECURITY INVESTIGATION : Need for Security, Business Needs, Threats, Attacks, Legal, Ethical and obstacles to security, Ten steps to building a secure organization.

UNIT III

Security analysis : Risk Management: Identifying and Assessing Risk, Assessing and Controlling Risk

UNIT IV

Logical Design: Blueprint for Security, Information Security Policy, Standards and Practices, ISO 17799/BS 7799, NIST Models, VISA International Security Model, Design of Security Architecture, Planning for Continuity

UNIT V

Physical Design: Security Technology, IDS, Scanning and Analysis Tools, Cryptography, Access Control Devices, Physical Security, Security and Personnel

Text books

Michael E Whitman and Herbert J Mattord, 2003, Principles of Information Security, 1st Edition, Vikas Publishing House, New Delhi,

John R. Vacca, 2013, Computer and Information Security Handbook, Elsevier.

References

Micki Krause, Harold F. Tipton, 2004, Handbook of Information Security Management, CRC Press LLC.

Stuart Mc Clure, Joel Scrambray, George Kurtz, Hacking Exposed, 2nd Edition, Tata McGraw-Hill.

Course Objectives (CO)

- To learn the fundamental principles and practices associated with each of the agile development methods:
- To learn how agile methods scale to large and distributed projects, including the role of systems engineering. And, to learn the essentials of collaboration as they apply to agile methods.
- To perform in-depth explorations into aspects of agile development that are particularly relevant to each student through detailed discussion sessions.
- To understand the benefits and pitfalls of working in an Agile team.
- To provide a good understanding of software design and a set of software technologies and APIs.
- To understand Agile development and testing through various case studies

Course Outcomes (COs)

After completion of this course the students will be able to:

1. Realize the importance of interacting with business stakeholders in determining the requirements for a software system
2. Perform iterative software development processes: how to plan them, how to execute them.
3. Point out the impact of social aspects on software development success.
4. Develop techniques and tools for improving team collaboration and software quality.
5. Perform Software process improvement as an ongoing task for development teams.
6. Show how agile approaches can be scaled up to the enterprise level.

UNIT I

Introduction :Software is new product development – Iterative development – Risk-Driven and Client-Driven iterative planning – Time boxed iterative development – During the iteration, No changes from external stakeholders – Evolutionary and adaptive development - Evolutionary requirements analysis – Early “Top Ten” high-level requirements and skilful analysis – Evolutionary and adaptive planning – Incremental delivery – Evolutionary delivery – The most common mistake – Specific iterative and Evolutionary methods.

UNIT II

Agile And Its Significance: Agile development – Classification of methods – The agile manifesto and principles – Agile project management – Embrace communication and feedback – Simple practices and project tools – Empirical Vs defined and prescriptive process – Principle-based versus Rule-Based – Sustainable discipline: The human touch – Team as a complex adaptive system – Agile hype – Specific agile methods. The facts of change on software projects – Key motivations for iterative development – Meeting the requirements challenge iteratively – Problems with the waterfall. Research evidence

UNIT III

Agile Methodology : Method overview – Lifecycle – Work products, Roles and Practices values – Common mistakes and misunderstandings – Sample projects – Process mixtures – Adoption strategies – Fact versus fantasy – Strengths versus “Other” history.

UNIT IV

Case Study: Agile – Motivation – Evidence – Scrum – Extreme Programming – Unified Process – Evo – Practice Tips.

UNIT V

Agile Practicing and Testing: Project management – Environment – Requirements – Test – The agile alliances – The manifesto – Supporting the values – Agile testing – Nine principles and six concrete practices for testing on agile teams.

Text Books

15ITU506	TCP/IP Protocol Suite	Semester V L T P C 0 0 0 4
-----------------	------------------------------	---

Course Objectives (CO)

- To understand fundamental concepts of computer networking.
- To familiarize with the basic taxonomy and terminology of the computer networking area.
- To understand the function of each layer of the TCP/IP protocol suite
- To understand why a protocol is essential for communication between computers
- To familiarize the functions of IP protocol
- To learn the requirements of IP routing and choose appropriate routing methods

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Independently understand basic computer network technology.
2. Understand and explain Data Communications System and its components.
3. Identify the different types of network topologies and protocols.
4. Identify the different types of network devices and their functions within a network.
5. Understand and building the skills of subnetting and routing mechanisms.
6. Able to analyze IP addressing requirements and design an addressing scheme

UNIT I

Introduction: History of internet – Interconnecting devices - Protocols and Standards - TCP/IP protocol suite - Internetworking Devices – Routing Concept - Classful IP Addressing – Subnetting – Supernetting – Classless Addressing

UNIT II

ARP & RARP – Proxy ARP – ARP over ATM – ARP and RARP Protocol Format. IP Datagram – Fragmentation – Options – IP Datagram Format – Routing IP Datagrams – Checksum. ICMP – Types of Messages - Message Format – Error Reporting – Query – Checksum .

UNIT III

Group Management – IGMP Message – IGMP Operation – Process to Process Communication – UDP Operation – TCP Services - Flow Control.

UNIT IV

BOOTP - DHCP – Address Discovery and Binding. DNS – Name Space – DNS in Internet – Resolution – Resource Records.

UNIT V

Remote Login - FTP – SMTP – SNMP. IP over ATM Wan – Cells – Routing the Cells – ATMARP – Logical IP Subnets-VPN.

Course Objectives (CO)

- To Architect J2EE applications using industry-recognized best practices
- To understand the importance of extension JDBC package in Enterprise Java applications.
- To Integrate J2EE applications with external systems
- To Identify and resolve J2EE security issues
- To Design and develop Web applications using JSP
- To implement and access Web Service components using EJB

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Understand J2EE technology and its applications
2. Understand JDBC components and its functionality
3. Invoke the remote methods in an application using Remote Method Invocation (RMI)
4. Develop a session using servlets and understand inter servlet communications
5. Make a reusable software component, using Java Bean
6. Develop a EJB application

UNIT I

Introducing J2EE basics: Need for enterprise programming– J2EE advantages – Enterprise architecture types – J2EE Multi-Tier Architecture – Architecture of J2EE – Introducing J2EE components – J2EE containers – Types of J2EE technologies .

UNIT II

Databases: JDBC objects –concept of JDBC – JDBC driver types – JDBC packages – overview of JDBC process-Database connection-statement objects - Resultset. Remote Method Invocation: RMI concept –Sever side – Client side.

UNIT III

Java servlets: simple java servlet – anatomy of a java servlet – deployment descriptor – session tracking with servlets – cookies. Inter servlet communication: chaining – tunneling.

UNIT IV

Java server pages: Introduction- JSP tags – variables and objects – methods – control statements – loops – tomcat -cookies – session objects.

UNIT V

Enterprise Java Beans: EJB container ,classes, Interfaces – Deployment descriptors – Session java Bean – Entity Java Bean- Message driven Bean.

		Semester V			
		L T P C			
15ITU507	Knowledge Management and Information Technology	0	0	0	5

Course Objectives (CO)

- To know the fundamentals of Knowledge Managements and its applications.
- To understand the basics of Information Security
- To know the legal, ethical and professional issues in Information Security
- To know the aspects of risk management
- To learn the Evolution of Knowledge management.
- To learn and assess various types of security threats in information security

Course Outcomes (COs)

After the completion of this course, a successful student will be able to

1. Identify and analyze the applications of knowledge management (KM)
2. Understand knowledge management models and technologies to business situations.
3. Create a KM system to capture and evaluate knowledge of Expert
4. Understand the basic concepts in information system and the benefits with these systems in modern society
5. Analyze information security needs of an organization.
6. Understand the need of security mechanism and risk management.

UNIT I

Knowledge Management Km Myths – KM Life Cycle – Understanding Knowledge – Knowledge, intelligence – Experience – Common Sense – Cognition and KM – Types of Knowledge – Expert Knowledge – Human Thinking and Learning.

UNIT II

Knowledge Management System Life Cycle Challenges in Building KM Systems – Conventional vs. KM System Life Cycle (KMSLS) – Knowledge Creation and Knowledge Architecture – Nonaka's Model of Knowledge Creation and Transformation. Knowledge Architecture.

UNIT III

Capturing Knowledge Evaluating the Expert – Developing a Relationship with Experts – Fuzzy Reasoning and the Quality of Knowledge – Knowledge Capturing Techniques, Brain Storming – Protocol Analysis – Consensus Decision Making – Repertory Grid- Concept Mapping – Blackboarding

UNIT IV

Information Security History, What is Information Security ?, Critical Characteristics of Information, NSTISSC Security Model, Components of an Information System, Securing the Components, Balancing Security and Access, The SDLC, The Security SDLC.

UNIT V

Security Investigation Need for Security, Business Needs, Threats, Attacks, Legal, Ethical and Professional Issues – Risk Management: Identifying and Assessing Risk, Assessing and Controlling Risk

Text Books

Elias.M. Award & Hassan M. Ghaziri, 2008, Knowledge Management, 2nd Edition Pearson Education , India.

Guus Schreiber, 2001, Knowledge Engineering and Management, 3rd Edition Universities Press.

Course Objectives (CO)

This subject provides students with

- To learn basic system concept and definitions of system simulation and modeling
- To learn various methods to generate and test random variable
- Techniques to model and to simulate various systems
- The ability to analyze a system and to make use of the information to improve the performance.
- To learn Discrete, Poisson, Geometric, Gamma distribution methods to design a simulation model
- To learn simulation language and generate model

Course Outcomes (COs)

After the completion of this course, a successful student will be able to:

1. Understand the principles within computer modelling and simulation
2. Generate and test random number by applying various techniques
3. Understand and evaluate various distribution models
4. Create a manual simulation even scheduling
5. Design and evaluate simulation experiments
6. Implement simulation case studies and analyze the result

UNIT I

Principle of computer modeling and simulation, Monte Carlo simulation. Nature of computer modelling and simulation. Limitations of simulation, areas of application. System and environment – components of a system – Discrete and continuous systems. Models of a system – A variety of modelling approaches.

UNIT II

Random number generation, technique for generating random numbers – Midsquare method – The midproduct method – Constant multiplier technique – Additive congruential method – Linear congruencies method – Tests for random number – The Kolmogorov Smirnov test – The chi-square test. Random variable generation – Inverse transform technique – Exponential distribution – Uniform distribution – Weibull distribution, empirical continuous distribution – Generating approximate normal variates.

UNIT III

Empirical discrete distribution – Discrete uniform distribution – Poisson distribution – Geometric distribution – Acceptance – Rejection technique for Poisson distribution – Gamma distribution.

UNIT IV

Design and evaluation of simulation experiments – Input – Output analysis – Variance reduction technique – Verification and validation of simulation models. Discrete event simulation – Concepts in discrete – event simulation – Manual simulation using event scheduling, single channel queue, two server queue, simulation of inventory problems.

UNIT V

Simulation languages – GPSS – SIMSCRIPT – SIMULA – Programming for discrete

event systems in GPSS and C. Case Study : Simulation of LAN – Manufacturing system – Hospital management system.

15LAU101

தமிழ்த்துறை

5H-5C

பகுதி - I தமிழ்ப் பாடத்திட்டம் (2013 - 2015)

முதல்பருவம்

(இளநிலை கலையியல் பட்ட வகுப்புகளுக்குரியது)

(For I-UG Arts Degree Classes)

15LAU101

பாடத்திட்டப் பொதுநோக்கம்

- கற்றல் வழி சிந்தனைத் திறனையும், கருத்து வெளிப்பாட்டுத் திறனையும், மேம்படுத்துதல்.
- ஆய்வுநோக்கை மேம்படுத்துதல்.
- இலக்கியங்கள் உணர்த்தும் வாழ்வின் நுட்பமான பகுதிகளை உணர்த்துதல்.
- மனித மனத்தினைப் பக்குவப்படுத்துதலில் இலக்கியம் தரும் பங்கினை உணர்த்துதல்.
- வளர்ந்து வரும் சமூகத்தில் அறஉணர்வு, பண்பாடு போன்றவை குறித்து அறிவூட்டல்.
- அரசுத் தேர்வுகளுக்கு மாணவர்களை ஆயத்தமாக்குதல்.

பாடத்திட்டப் பயன் விளைவு

1. இந்திய குடியுரிமைப் பணி முதலான போட்டித் தேர்வுகளில், விருப்பப் பாடமாக இடம்பெறுகின்ற, 'தமிழ் இலக்கிய வரலாறு' குறித்த முழுமையான அறிமுகம் பெற்றிருத்தல்.
2. கல்வெட்டியல், ஓலைச்சுவடியியல் மற்றும் தொல்லியல் சார்ந்த ஆவணத் தேடலுக்குரிய ஆய்வுமனப்பான்மையுடன், இலக்கியங்களை அணுகுதல்.
3. தமிழின் வளர்ச்சித் துறையாகிய, 'அறிவியல் தமிழ்' ; 'இணைய தமிழ்' குறித்த பன்னோக்கு அணுகுமுறையிலான ஆய்வுச் சிந்தனை மேம்பாடு.
4. வேலைவாய்ப்புக்குரிய சுயதிறன் மேம்பாட்டுடன், படைப்பாக்கத்திறன் மேம்பாடும் பெற்றிருத்தல் .
5. சமுதாய மற்றும் வாழ்வியல் மதிப்புகளைப் பேணுவதற்குக் கருவியாக இலக்கியங்களை நாடுகின்ற மனப்பான்மை வளர்ச்சி.
6. மொழிபெயப்புத் துறைசார்ந்த வேலைவாய்ப்புத் திறன் பெற்றிருத்தல்

தாள்கள் வரிசையும் தேர்வுச் செயல்திட்டமும் பகுதி-I

பருவம்	தாள்	கற்பிக்கும் நேரம்/வாரம்	தேர்வு மணிகள்	மதிப்பெண் அக/எழுத்து	மொத்தம்	மதிப்பீடு
ஒன்று	I	5	3	40 / 60	100	4

அலகு I தற்கால இலக்கியம்

- | | | |
|-------------------|---|--|
| 1.மனோன்மனீயம் | - | சுந்தரம்பிள்ளை |
| 2.பாரதியார் | - | பாரதியார் கவிதைகள் |
| 3.பாரதிதாசன் | - | குன்றம் (அழகின் சிரிப்பு) |
| 4.நாமக்கல் கவிஞர் | - | தமிழன் இதயம் |
| 5.அப்துல் ரகுமான் | - | கூடுதூறக்கும் பறவைகள் |
| 6.சிற்பி | - | ஒடு ஒடு சங்கிலி (ஒரு கிராமத்து நதி) |
| 7.வைரமுத்து | - | மரங்களைப்பாடுவேன் |
| 8.தாமரை | - | அவசரம் ஒரு அகர ஊசி |
| 9.புதியமாதவி | - | (ஒருகதவும் கொஞ்சம் கள்ளிப்பாலும்)
மகளே வந்துவிடு (ஹேராம்) |

அலகு II பக்தி இலக்கியம்

1. சைவம் - பன்னிரு திருமுறைகளில் 12 பாடல்கள்
2. வைணவம் - ஆழ்வார் பாடல்கள் 12)

அலகு III உரைநடை

- | | | |
|----------------------------------|---|-----------------------|
| 1. பழந்தமிழ்நாடு | - | டாக்டர். கு. கதிரேசன் |
| 2. நொய்யல் நாகரிகம் | - | புலவர் செ. இராக |
| 3. அறிவியல் தமிழாக்கம் இற்றைநிலை | - | வா.செ. குழந்தைசாமி |
| 4. கணிப்பொறி | - | சுஜாதா |
| 5. சுற்றுச்சூழல் மேலாண்மை | - | தமிழ்நாடு அரசு |

அலகு IV பயிற்சி

இலக்கணம், கடிதங்கள் - அலுவலகநிலை, மொழிபெயர்ப்பு
நிகழ்ச்சித் தொகுப்புகள்
(பயிற்சி ஏடு - கல்லூரி வெளியீடு)

அலகு V இலக்கிய வரலாறு

- 1.தற்காலத் தமிழ்க் கவிதைகளின் வரலாறும், வளர்ச்சியும்
- 2.புதுக்கவிதைப் பிதாமகன்கள் குறித்த அறிமுகம்
- 3.பாரதியார், பாரதிதாசனின் தமிழ்த்தொண்டு
- 4.உரைநடையின் தோற்றமும் வளர்ச்சியும்

(For all undergraduates students admitted from 2015 onwards)

Course Objectives:

- To enable the learners to acquire English language skills at a faster pace.
- To introduce different kinds of literary works
- To familiarize different genres of Literature
- To instruct moral values through literature.
- To improvise their productive and receptive skills
- To strengthen the basic knowledge about grammar.

Course Outcomes:

1. Learn to reflect on the literary works and communicate flexibly.
2. Reading and comprehending literary works
3. Genres of literature to provide moral education
4. Develop communication skills in business environment
5. Interpersonal skills will be developed.
6. Betterment of language competence

UNIT I:

Prose: Google Guys (Extract) – Richard L Brandt

Poetry: The Blind Pedlar – Osbert Sitwell

Short Story: A Garden So Rich – Christie Craig

Vocabulary: Prefixes, Antonyms, Sentence Completion

Grammar: Articles, Adverbs, Pronouns

Composition: Proverb Expansion

UNIT II:

Prose: Happiness 101 – Geeta Padmanabhan

Poetry: An Old Woman – Arun Kolatkar

Vocabulary: Suffixes, Analogies

Grammar: Nouns, Adjectives

Composition: Dialogue Writing

UNIT III:

Prose: Structured Procrastination – John Perry

Short Story: The Umbrella Man – Roald Dahl

One-Act Play: The Boy Who Stopped Smiling – Ramu Ramanathan

Vocabulary: Synonyms, Euphemisms, Word Definitions

Grammar: Verbs, Conjunctions and Interjection, Indirect/Reported Speech

UNIT IV:

Poetry: No Sentence – Anjum Hassan

One-Act Play: While the Auto Waits- O' Henry

Vocabulary: Words Often Confused, Anagrams

Grammar: Prepositions, Voice- Active and Passive

Composition: Letter Writing- Informal

UNIT V:

Short Story: The Bird – Amar Jalil

One-Act Play: The Cellphone Epidemic – Claudia I. Haas

Vocabulary: Portmanteau Words, One Word Substitute

Grammar: Questions, Pronunciation

Composition: Letter Writing- Formal

15BAU101

PRINCIPLES OF MANAGEMENT**Semester - I**
5H – 5C

Instruction Hours / week L: 5 T: 0 P : 0

Marks: Internal: 40 External: 60 Total: 100
End Semester Exam: 3 Hours**COURSE OBJECTIVES****To make the students**

- To define the concepts of management.
- To assess the functions of management and help the students to develop cognizance of the importance of management principles.
- To understand the concept of staff line function in decision making
- To help the students gain understanding of the functions and responsibilities of managers
- To provide them tools and techniques to be used in the performance of the managerial job.
- To enable them to analyze and understand the environment of the organization.

COURSE OUTCOMES**Learners should be able to**

1. Apply the basic concepts in understanding the business organizations
2. Discuss the managerial functions of planning, organizing, staffing, directing and controlling (including decision making).
3. To study the functions and principles of management.
4. To learn the application of the principles in an organization.
5. To enable the effective and barriers communication in the organization
6. To study the system and process of effective controlling in the organization.

UNIT I Nature and Scope of Management:

Meaning – Definition - Management is a Science or Art – Development of Management – Scientific Management – Functions - Social responsibilities and Ethics

UNIT II Planning:

Meaning and Characteristics of Planning – Steps in Planning – Objectives - Types of Planning - Policies, Procedures and Methods.

UNIT III Organizing:

Meaning – Definition - Functions of Organization – Types of Organizational Structure - Process of Decision making – Type of Decisions – Problems. – Span of control –Delegation - Decentralization and Centralization.

UNIT IV Staffing:

Line and Staff relationship – Co-ordination – Features. Motivation – Maslow's theory – Leadership – Qualities - Techniques.

UNIT V Controlling:

Meaning and Importance of Control – Control process – Controlling Techniques – Preventive control – Budgetary and Non-budgetary control - Business Ethics – Ethics and Morals – Nature of Ethics – Need for Business Ethics.

TEXT BOOKS

1. Dinkar Pagare, (2015), Principles of Management, S.Chand & Co Ltd., New Delhi.

REFERENCES

1. T.Ramasamy, (2014), Principles of Management, Himalaya Publishing house, Mumbai.
2. Koontz and Harold, (2014), Management Essentials, Tata Mc Graw Hill Publishers Pvt. Ltd. New Delhi.
3. S.P.Arora. (2009). Office Organization and Management,. Vikas Publishing House Pvt. Ltd. New Delhi.
4. Dr.Saxen,(2009), Business Administration and Management, Sahitya Bhavan Publications, New Delhi.

COURSE OBJECTIVES**To make the students**

- To state the concepts and conventions of accounting and basic accounting framework
- To demonstrate the fundamentals of accounting procedure
- To illustrate calculating non-trading concerns accounts
- To define concepts and formats of different types of accounts
- To interpret business data to prepare appropriate accounting statements
- To demonstrate and apply various accounting practices applicable to business

COURSE OUTCOMES**Learners should be able to**

1. Understand the basic concepts underlying the accounting practices and its techniques with special reference to Sole-Proprietorship.
2. Identify the various aspects of accounting related to Non-trading Concerns.
3. Apply principles of financial accounting and their applications in business organizations.
4. Describe the role of accounting information and its limitations
5. Equip with the knowledge of accounting process and preparation of final accounts of sole trader
6. Identify and analyze the reasons for the difference between cash book and pass book balances

UNIT I Accounting:

Meaning – Distinction Between Book-keeping and Accountancy – Objectives – Limitations – Rules of Double Entry system - Accounting Principles - Accounting Conventions – Journal – Ledger - Trial Balance.

UNIT II Subsidiary Book:

Purchase Book – Sales Book – Purchase Return book - Sales Return Book Errors - Meaning - Importance - Merits of Errors – Demerits of Errors - Types of Errors - Rectification of Errors - Bank Reconciliation Statement -Meaning – Importance - Merits of BRS – Demerits of BRS - Preparation of Bank Reconciliation Statements.

UNIT III Final Accounts:

Double Entry System – Single Entry System – Difference between Double Entry and Single Entry System. Final Accounts - Trading Account – Profit and Loss Account - Balance Sheet. Accounting for Non-Trading Institutions.

UNIT IV Depreciation:

Depreciation - Meaning- Importance – Causes of Depreciation - Methods of Depreciation - Straight Line Method – Written Down Value Method – Annuity Method

UNIT V Account Current:

Meaning – Importance – Objectives - Methods of Calculation of Interest – By Interest Tables – By product method – Red Ink Method – Epoque Method – Periodic Balance Sheet - Average Due Date – Meaning – Importance – Objectives - Methods of Ascertaining the Average Due Date.

Note : Distribution of marks between problems and theory shall be 80% and 20%.

15BAU103

BASIC MATHEMATICS FOR MANAGERS

Semester - I
6H – 4C

Instruction Hours / week L: 4 T: 2 P : 0

Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVES**To make the students**

- To Understand the recent techniques of Operations Research and their applications
- To demonstrate the ability to model real-life scenarios using functions
- To solve nonlinear equations using analytic methods.
- To use mathematics concepts in real life situations.
- To explain the concepts and use equations, formulae, and mathematical expressions and relationships in a variety of contexts
- To apply the knowledge in mathematics (algebra, matrices, calculus) in solving business problems

COURSE OUTCOMES**Learners should be able to**

1. Calculate Simple and compound interests, Annuities, optimal assignments and Network scheduling with various applications of Mathematics in business management.
2. Distinguish between the concepts of sequence and series, and determine limits of sequences and convergence and approximate sums of series.
3. Analyze first-order difference equations and first-order differential equations and small systems of such equations using analytic, graphical, and numeric techniques, as appropriate,
4. Be able to modify a CPM and PERT use the Fundamental Insight of Linear Programming to identify the new solution, or use the Dual Simplex Method to restore feasibility,
5. Interpret the dual variables and perform sensitivity analysis in the context of economics problems as shadow prices, imputed values, marginal values, or replacement values,
6. Produce and interpret graphs of basic functions of these types, Solve equations and inequalities, both algebraically and graphically, and Solving and model applied problems.

UNIT I

Basic concept – Simple and compound interest – Effective rate of interest – Depreciation. Annuities – Present value of an immediate annuity, Present value of an annuity due, Amount of an immediate annuity, Amount of an annuity due.

UNIT II

Linear Programming Problem Formulation – Solution by Graphical Method -Solution by Simplex Method (problems using slack variables only)

UNIT III

Transportation model: Introduction – Mathematical formulation of the problem-Initial Basic Feasible solution – Optimum solution for non degeneracy Transportation problem – Unbalanced Transportation problem and Maximization case in Transportation problem.

UNIT IV

The Assignment problem - Mathematical formulation of the problem – Hungarian method – Unbalanced Assignment problem- Maximization case in Assignment problem.

UNIT V

CPM – Principles – Construction of Network for projects – Critical Path –Various floats for activities.PERT – Time Estimates – Critical Path – Probability of Completion of Project – Advantages and Limitations.

15FCA101

**FOUNDATION COURSE – A
VALUE EDUCATION****Semester - I
2H – 5C**

Instruction Hours / week L: 2 T: 0 P : 0

Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVES**To make the students**

- Analyze the integral development of human begins
- Demonstrate the students towards sustainable lifestyle
- To discover awareness about the values and their significance and role
- Employ the concept of discipline and freedom
- To teach and inculcate the importance of value based living by giving the students a deeper understanding about the purpose of life.
- To teach and inculcate the essential qualities to become a good leader.

COURSE OUTCOMES**Learners should be able to**

1. Apply a sense of competitive spirit, co-operation, leadership, diligence, punctuality, and team-spirit
2. Develop a backdrop for the development of their creative talents
3. To gain deeper understanding about the purpose of their life.
4. To understand and start applying the essential steps to become good leaders.
5. To understand and start applying the essential steps to become good leaders by becoming value based professionals.
6. To emerge as responsible citizens with clear conviction to practice values and ethics in life

UNIT – I

Concept of Self, self-esteem and self-confidence. Concept of personality, determinants and disorganisations of it. Personality development – meaning.

UNIT – II

Goal setting – meaning and importance; steps in goal setting Manners and Etiquette – meaning need and importance; means to improve. Positive thinking.

UNIT – III

Discipline – meaning. Concept of Roles and Responsibility Time Management – Meaning and steps for effective time management.

UNIT – IV

Interpersonal relationship – meaning and importance; means to improve it. Healthy friendship.

UNIT – V

Family Relationship importance of it; Means to improve. Spirituality – meaning. Its relationship with Altruism, sacrifice, self control, tolerance and truthfulness.

TEXT BOOKS

1. Karpagam Academy of Higher Education, Study Material, 2015.

15SSD101

SOFT SKILL DEVELOPMENT - I

Semester I
2H – 0C

Instruction Hours / week L: 2 T: 0 P : 0

Marks: Internal: 40 External: 60 Total: 100
End Semester Exam: 3 Hours**COURSE OBJECTIVES****To make the students**

- Identify knowledge on both Aptitude and Soft skills to the students
- Identify various principles involved in solving mathematical problems and to adopt new and faster methods of calculations.
- Apply the competencies in soft skills which are crucial in a social setting
- To make the engineering students aware of the importance, the role and the content of soft skills through instruction, knowledge acquisition, demonstration and practice.
- To develop and nurture the soft skills of the students through individual and group activities.
- To expose students to right attitudinal and behavioral aspects and to build the same through activities

COURSE OUTCOMES**Learners should be able to**

1. Apply the analytical and reasoning competencies
2. Appraise communication and presentation skills
3. Communicate effectively through verbal/oral communication and improve the listening skills
4. To write precise briefs or reports and technical documents
5. Actively participate in group discussion / meetings / interviews and prepare & deliver presentations
6. Become more effective individual through goal/target setting, self motivation and practicing creative thinking

UNIT - I

Introduction to Quantitative Aptitude, Speed Maths, Problems on Numbers, Averages, Ratios and Proportions, Problems on Ages

UNIT - II

Number Series, Blood Relation, Image Analysis, Direction Sense, Syllogism, Coding and Decoding

UNIT – III

Percentages, Data Interpretation, Profit and Loss, Simple Interest and Compound Interest

UNIT – IV

Parts of Speech, Tense, Subject Verb Agreement, Active and Passive Voice, Articles, Prepositions

UNIT - V

Conditional Clause, Degrees of Comparison, Goal Setting, Interpersonal Skills

கற்பகம் உயர்கல்வி கலைக்கழகம்
தமிழ்த்துறை
பகுதி - I தமிழ்ப் பாடத்திட்டம் (2015 - 2016)
இரண்டாம் பருவம்
(இளநிலை அறிவியல் பட்ட வகுப்புகளுக்குரியது)
(For I-UG Arts Degree Classes) 15LAU201

பாடத்திட்டப் பொதுநோக்கம்

- கற்றல் வழி சிந்தனைத் திறனையும், கருத்து வெளிப்பாட்டுத் திறனையும், மேம்படுத்துதல்.
- ஆய்வுநோக்கை மேம்படுத்துதல்.
- இலக்கியங்கள் உணர்த்தும் வாழ்வின் நுட்பமான பகுதிகளை உணர்த்துதல்.
- மனித மனத்தினைப் பக்குவப்படுத்துதலில் இலக்கியம் தரும் பங்கினை உணர்த்துதல்.
- வளர்ந்து வரும் சமூகத்தில் அறஉணர்வு, பண்பாடு போன்றவை குறித்து அறிவூட்டல்.
- அரசுத் தேர்வுகளுக்கு மாணவர்களை ஆயத்தமாக்குதல்.

பாடத்திட்டப் பயன் விளைவு

1. இந்திய குடியுரிமைப் பணி முதலான போட்டித் தேர்வுகளில், விருப்பப் பாடமாக இடம்பெறுகின்ற, 'தமிழ் இலக்கிய வரலாறு' குறித்த முழுமையான அறிமுகம் பெற்றிருத்தல்.
2. கல்வெட்டியல், ஓலைச்சுவடியியல் மற்றும் தொல்லியல் சார்ந்த ஆவணத் தேடலுக்குரிய ஆய்வுமனப்பான்மையுடன், இலக்கியங்களை அணுகுதல்.
3. தமிழின் வளர்ச்சித் துறையாகிய, 'அறிவியல் தமிழ்' ; 'இணைய தமிழ்' குறித்த பன்னோக்கு அணுகுமுறையிலான ஆய்வுச் சிந்தனை மேம்பாடு.
4. வேலைவாய்ப்புக்குரிய சுயதிறன் மேம்பாட்டுடன், படைப்பாக்கத்திறன் மேம்பாடும் பெற்றிருத்தல் .
5. சமுதாய மற்றும் வாழ்வியல் மதிப்புகளைப் பேணுவதற்குக் கருவியாக இலக்கியங்களை நாடுகின்ற மனப்பான்மை வளர்ச்சி.
6. மொழிபெயப்புத் துறைசார்ந்த வேலைவாய்ப்புத் திறன் பெற்றிருத்தல்

தாள்கள் வரிசையும் தேர்வுச் செயல்திட்டமும் பகுதி-I தமிழ்

அலகு V இலக்கிய வரலாறு

- 1.எட்டுத்தொகை, பத்துப்பாட்டு நூல்கள் அறிமுகம்
2. பன்னிரு திருமுறை, நாலாயிரதிவ்யபிரபந்தம்
3. சைவ, வைணவ இலக்கியங்கள் தமிழுக்குச் செய்த தொண்டு
4. சிறுகதையின் தோற்றமும் வளர்ச்சியும்

(For all undergraduates students admitted from 2015 onwards)

Course Objectives:

- To enable the learners to acquire English language skills.
- To familiarize them with English literature.
- To acquire Grammar knowledge.
- To help learners imbibe cultural values.
- To acquire skill of making correct sentences.
- To reflect originality on the application of soft skills and express in writing their views.

Course Outcomes:

1. Learn to enjoy the ecstasy of literature.
2. The select literary pieces will develop the confidence level of the learners.
3. To get the social values.
4. To know the importance of communication
5. Get sound knowledge in English
6. Trained to communicate well for business purpose.

UNIT I:

Prose: The Unexpected- Robert Lynd

Poetry: The Village Schoolmaster – Oliver Goldsmith

Short Story: The Lion's Share – Arnold Bennett

Vocabulary: Homonyms

Grammar: Irregular Verbs

UNIT II:

Prose: Travel by Train – J. B. Priestly

Poetry: The Gift of India – Sarojini Naidu

Grammar: Sentence patterns

Composition: Reading Comprehension

UNIT III:

Prose: Women's Education is Almost More Important than the Education of Boys and Men – Indira Gandhi

Short Story: The Necklace – Guy De Maupassant

One-Act Play: The Referee – W.H. Andrews and Geoffrey Dearmer

Vocabulary: Similes

Grammar: Discourse Markers

Composition: Report Writing

UNIT IV:

Poetry: Ozymandias – P.B. Shelley

One-Act Play: The Pot of Broth- W.B. Yeats

Vocabulary: Collective Nouns

Grammar: Correction of Sentences

Composition: Picture Reading

UNIT V:

Short Story: The Silver Butterfly– Pearl S. Buck

One-Act Play: The Bear – Anton Chekov

Vocabulary: Acronyms

Grammar: Question Tags

Composition: Drafting Advertisement

15BAU201

PRINCIPLES OF MARKETING**Semester - II
6H – 5C****Instruction Hours / week L: 5 T: 1 P : 0****Marks: Internal: 40 External: 60 Total: 100****End Semester Exam: 3 Hours****COURSE OBJECTIVES****To make the students**

- To define the concepts and functions of marketing
- To develop the strategies of marketing and to relate the impact of marketing and its integration.
- Apply the knowledge on promotional steps in marketing
- To understand marketing is carried out by an organization to meet the requirements of domestic and international buyers, both households and businesses, within the bounds of ethics and the legal environment.
- To apply key frameworks and methods, and develop analytical skills to solve marketing problems.
- To provide a firm foundation in marketing theory and marketing lexicon.

COURSE OUTCOMES**Learners should be able to**

1. Analyzing the marketing environment, consumer behavior, marketing mix and product life cycle.
2. Developing best products in terms of goods and services that bring consumer satisfaction.
3. Evaluate the knowledge of the individual components of marketing mix and . marketing functions.
4. Demonstrate an understanding of how marketing fits with the other business disciplines within an organization.
5. Relate the impact of marketing and its integration with your own major or field of interest.
6. Identify wants and environmental factors that shape marketing activities for certain target markets ,

UNIT I

Marketing: Meaning – Definition - Concept – Marketing Management – Meaning - Importance – Functions of Marketing – Marketing Environment - Factors affecting the Marketing Functions.

UNIT II

Consumer Behaviour and CRM: Buyer Behaviour – Buying Motives – Market Segmentation – Meaning – Definition – Bases – Marketing Strategy – Market Structure – Customer Relationship Management – Meaning – Importance – Consumer Protection Act 1986

UNIT III

Product: Product – Marketing Characteristics – Consumer Goods – Industrial Goods – Production Policy – Product Life Cycle (PLC) – Product Mix – Modification and Elimination –Developing New Products – Strategies.

UNIT IV

Pricing: Pricing Policies – Objectives - Factor Influencing Pricing Decision –Pricing Strategy - Physical Distribution – Management of Physical Distribution – Marketing Risk – Storage and Warehousing

UNIT V

Promotion: Advertisement – Personal Selling and Sales Promotion – Importance – Channels of Distribution – Meaning – Types - Functions of Middlemen – Elimination of Middlemen.

COURSE OBJECTIVES**To make the students**

- To Apply practical knowledge about the computer package
- To develop knowledge in MS Office and recognize when to use each of the Microsoft Office programs to create professional and academic documents
- To dramatize knowledge on presentation
- Use Microsoft Office programs to create personal, academic and business documents following current professional and/or industry standards.
- Demonstrate the ability to effectively prioritize, plan, and organize resources for task completion
- Recognize the social and ethical issues which face users of computer information technology.

COURSE OUTCOMES**Learners should be able to**

1. Employ insight into the basic knowledge on MS Office
2. Manipulate the students to know about the preparation of word documents, excel sheet and power point presentation
3. Create personal, academic and business documents following current professional and/or industry standards
4. Recognize when to use each of the Microsoft Office programs to create professional and academic documents.
5. Provide education for office careers by focusing on developing human relations skills, communication skills, as well as skills in modern office technology systems and procedures
6. Compete in today's world of technology and achieve success in computer-related occupations in whatever field they choose to pursue

MS WORD

1. Type Chairman's speech/ Auditor's report / Minutes/ Agenda and perform the following operations:
Bold, Underline, Font Size, style, Background color, Text color, Line spacing, Spell Check, Alignment, Header & Footer, Inserting pages and page numbers, Find and Replace.
2. Prepare an invitation for the college function using Text boxes and Clip Art.
3. Design an invoice and Account sales by using Drawing tool bar, Clip Art, Word Art, Symbols, Borders and Shading.
4. Prepare a Class Time Table and perform the following operations: Inserting the table, Data Entry, Alignment of Rows and Columns, Inserting and Deleting the Rows and Columns and Change of Table Format.
5. Prepare a Shareholders meeting letter for 10 members using mail merge operation.
6. Prepare Bio-Data by using Wizard/ Templates.

MS EXCEL

1. Prepare a mark list of your class (minimum of 5 subjects) and perform the following operations:
Data Entry, Total, Average, Result and Ranking by using arithmetic and logical functions and sorting.
2. Prepare Final Accounts (Trading, Profit & Loss Account and Balance Sheet) by using formula.
3. Draw the different type of charts (Line, Pie, Bar) to illustrate year-wise performance of sales, purchase, profit of a company by using chart wizard.
4. Prepare a statement of Bank customer's account showing simple and compound interest calculations for 10 different customers using mathematical and logical functions.
5. Prepare a Product Life Cycle which should contain the following stages:
Introduction, Growth, Maturity, Saturation, Decline.

MS POWERPOINT

1. Design presentation slides for a product of your choice. The slides must include name, brand name, type of product, characteristics, special features, price, special offer etc. Add voice if possible to explain the features of the product. The presentation should work in manual mode.
2. Design presentation slides for organization details for 5 levels of hierarchy of a company by using organization chart.
3. Design slides for the headlines News of a popular TV Channel. The Presentation Should contain the following transactions: Top down, Bottom up, Zoom in and Zoom out. - The presentation should work in custom mode.
4. Design presentation slides about an organization and perform frame movement by interesting clip arts to illustrate running of an image automatically.

5. Design presentation slides for the Seminar/Lecture Presentation using animation effects and perform the following operations: Creation of different slides, changing background color, font color using word art.

MS ACCESS

1. Prepare a payroll for employee database of an organization with the following Details: Employee id, Employee name, Date of Birth, Department and Designation, Date of appointment, Basic pay, Dearness Allowance, House Rent Allowance and other deductions if any. Perform queries for different categories.
2. Create mailing labels for student database which should include at least three Table must have at least two fields with the following details: Roll Number, Name, Course, Year, College Name, University, Address, Phone Number.
3. Gather price, quantity and other descriptions for five products and enter in the Access table and create an invoice in form design view.
4. Create forms for the simple table ASSETS.
5. Create report for the PRODUCT database.

TEXT BOOKS

15BAU202

ALLIED - BUSINESS STATISTICS

Semester- II
6H – 5C

Instruction Hours / week L: 4 T: 2 P : 0

Marks: Internal: 40 External: 60 Total: 100
End Semester Exam: 3 Hours**COURSE OBJECTIVES**

- To apply the students to understand the meaning, definition and functions of statistics through collection, representation, finding various measures such as mean, median, mode, correlation etc.
- Apply the procedures to analyze, and make recommendations on, a range of practical business problems
- Offer a critical knowledge of statistical practices in the various functional areas of business (accounting, finance, management and marketing)
- Describe and explain basic statistical concepts (including their empirical applications in a business context)
- Understand how to organize and summarize data by using descriptive statistics and appropriate statistical graphic
- Analyze and contrast techniques and biases of quantitative methods within the context they are to be applied in business decision making.

COURSE OUTCOME

1. Analyze statistical data graphically using frequency distributions and cumulative frequency distributions.
2. Analyze statistical data using measures of central tendency, dispersion and location.
3. Use the basic probability rules, including additive and multiplicative laws, using the terms, independent and mutually exclusive events.
4. Analyze and contrast techniques and biases of quantitative methods within the
 - i. context that are to be applied and evaluate sampling methodologies and them
 - ii. associated analysis.
5. Translate real-world problems into probability models and derive the probability density function of transformation of random variables.
6. Calculate probabilities, and derive the marginal and conditional distributions of bivariate random variables and Type of correlation.

UNIT I

Statistical description of data - Tabular Representation – Diagrammatic Representation – Frequency distribution- Graphical Representation – Ogives.

UNIT II

Measures of Central Tendency: Introduction to Mean - Median - Harmonic Mean – Standard deviation – Quartile Deviation – Mode – Mean Deviation – Range.

UNIT III

Probability – definitions – addition and multiplication rules (only statements) – simple business problems.

Probability distribution - Binomial, Poisson and Normal – simple problems applied to business.

UNIT IV

Correlation : Definition , Type of correlation , Method of correlation - scatter diagram – Karl Pearson's coefficient of correlation – Spearman's Rank correlation.

Regression: Definition, Regression equations – Methods of forming the regression equations - Problems.

UNIT V

Index numbers – meaning and definition – uses – methods of construction – Unweighted and weighted index number – Laspeyre's, Paasche's and Fischer's method – Tests for an ideal index number – Wholesale and Cost of living index .

**FOUNDATION COURSE - B
ENVIRONMENTAL STUDIES****Semester - II
2H – 1C****Instruction Hours / week L: 2 T: 0 P : 0****Marks: Internal: 40 External: 60 Total: 100****End Semester Exam: 3 Hours****COURSE OBJECTIVES****To make the students**

- To demonstrate awareness about environmental problems among people.
- To develop an attitude of concern for the environment and think holistically about sustainability using perspective across multiple disciplines.
- To prepare public to participate in environment protection and improvement.
- To learn ways in which natural resources are used to produce what they consume, such as the food they eat, the water they drink, and the energy they use.
- To understand ways in which their lifestyle and well-being are interconnected with those of diverse producers and consumers around the world, including impoverished communities. Sustainability knowledge and skills
- To learn core concepts of ecology and develop skills relevant to their chosen field to provide a basis for environmental sustainability.

COURSE OUTCOMES**Learners should be able to**

1. Demonstrate various renewable and nonrenewable resources of the region, enables environmentally literate citizens (by knowing the environmental acts, rights, rules, legislation, etc.)
2. Design an appropriate judgments and decisions for the protection and improvement of the earth.
3. Will be able to articulate basic understanding of various social science theories/frameworks and how they apply to environmental issues.
4. Understand key concepts in the life and physical sciences and will apply them to environmental issues.
5. Analyze and evaluate ideological and philosophical approaches used to understand environmental relationships.
6. Articulate a coherent philosophy of the environment, & consider ethical bases for responding to environmental questions

Unit - I

Eco system and natural resources: Environment – Definition – components - Ecosystem - Definition, Concept, Scope, importance, structure and functions of ecosystem. Energy flow, Ecological succession. Food chains and food webs. Classification of ecosystem. Natural resources: Forest resources; water resources

Unit - II

Environmental pollution: Cause, effects and control measures of Air pollution, water pollution, soil pollution, marine pollution, noise pollution, thermal pollution and nuclear hazards pollution. Solid waste management.

Unit – III

Biodiversity and its conservation: Introduction- Definition, genetic, species and ecosystem diversity, biogeographical classification of India- Value of biodiversity: Consumptive, productive uses; social, ethical, aesthetic and option values. Threats to biodiversity: habitat loss, poaching of wildlife, man-wildlife conflicts.

Unit – IV

Social issues and the environment: Urban problems related to energy- water conservation and management -Rain water harvesting- water shed management. Resettlement and Rehabilitation. Natural resources and associated problems and sustainable utilization. Environmental Education

Unit – V

Environment ethics: Environmental Ethics - Gender equity, ethical basis of environment education and awareness, conservation ethic and traditional value systems of India. Valuing nature, cultures, social justice, Human heritage, equitable use of resources, preserving resources for future generation, common property resources, Ecology and its uses and its degradation, Introduction to Environmental Protection Act (EPA).

15SSD201

SOFT SKILL DEVELOPMENT - I

Semester - II
2H – 1C

Instruction Hours / week L: 2 T: 0 P : 0

Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVES**To make the students**

- Construct knowledge on both Aptitude and Soft skills to the students
- To evaluate and demonstrate various principles involved in solving mathematical problems and to adopt new and faster methods of calculations.
- Interpret reinforcing competencies in soft skills which are crucial in a social setting
- To encourage the all round development of students by focusing on soft skills. To make the engineering students aware of the importance, the role and the content of soft skills through instruction, knowledge acquisition, demonstration and practice.
- To develop and nurture the soft skills of the students through individual and group activities.
- To expose students to right attitudinal and behavioral aspects and to build the same through activities

COURSE OUTCOMES**Learners should be able to**

1. Employ the Analytical and reasoning competencies
2. Express their communication and presentation skills
3. Effectively communicate through verbal/oral communication and improve the listening skills
4. Become more effective individual through goal/target setting, self motivation and practicing creative thinking
5. Actively participate in group discussion / meetings / interviews and prepare & deliver presentations
6. Develop problem-solving skills and apply those skills through the high-impact practice of experiential learning

UNIT - I

Introduction to Quantitative Aptitude, Speed Maths, Problems on Numbers, Averages, Ratios and Proportions, Problems on Ages

UNIT - II

Number Series, Blood Relation, Image Analysis, Direction Sense, Syllogism, Coding and Decoding

UNIT – III

Percentages, Data Interpretation, Profit and Loss, Simple Interest and Compound Interest

UNIT – IV

Parts of Speech, Tense, Subject Verb Agreement, Active and Passive Voice, Articles, Prepositions

UNIT - V

Conditional Clause, Degrees of Comparison, Goal Setting, Interpersonal Skills

15ENU301

ENGLISH III

Semester - III

Instruction Hours / week L: 4 T: 0 P : 0

Marks: Internal: 40 External: 60 Total: 100
End Semester Exam: 3 Hours**Communicative English****Course Objectives:**

- To develop confidence to respond in English during situations where the use of English is imperative.
- To develop fluency in actual conversation in the English language.
- To develop speech skills necessary for confident and intelligent participations in Group Discussions and develop skills related to teamwork in work places.
- To develop confidence to respond in English during situations where the use of English is imperative.
- To develop fluency in actual conversation in the English language.
- To develop knowledge about business communication.

Course Outcomes:

1. Students learnt the basics and purposes of listening skill.
2. Students understand importance of speaking.
3. Students developed the speaking skills on telephone, business and also in travel
4. Learnt some effective vocabulary learning strategies.
5. Students will able to communicate clearly and effectively and handle their day to day affairs well with their knowledge of language skills.
6. Betterment of language competence

UNIT I

Listening: Listening comprehension – Listening for Specific Information –Note Taking – Interpreting Charts and Diagrams.

UNIT II

Speaking: Essentials of effective communication – Greeting and Introducing – Making requests – Asking for permission – Giving and Denying Permission – Offering and Accepting Help – Asking for and Declining Help – Giving Instructions and Orders - Talking about likes and dislikes.

Telephone Skills – Understanding telephone conversation – handling calls – leaving messages –making requests - giving instructions and orders

Discussion Skills – Giving your opinion – agreeing and disagreeing – Making suggestions – Interrupting – questioning – reporting – Dealing with questions.
(Completing dialogues)

UNIT III

Reading: Reading – Reading with a purpose – Skimming and Scanning – locating main points – reading critically – Sequencing of sentences – Reading comprehension.

UNIT IV

Writing: Paragraph Writing – Descriptive and Narrative. Safety Instructions/ Suggestions. Expansion of Abbreviations – Spellings- Report writing.

Translation- Translating short sentences and passages from English to Tamil and from Tamil to English.

UNIT V

Vocabulary: Improve English vocabulary: Synonyms – Antonyms – Prefixes – Suffixes – Idioms – Collocations – Different types of English – British and American (Choose the best answer type from a database of 50 words each for each topic)

Functional Grammar: Forming questions, getting answers – Articles – Parts of Speech – Punctuation – Common mistakes in English (Homophones)(Exercise based)

Reference Books:

Language in Use: Kenneth Anderson, Cambridge University Press.

Study Speaking: A course in Spoken English for Academic Purpose: Kenneth Anderson, Joan MacLean and Tony Lynch, Cambridge University Press, 2008.

15BAU301

PRODUCTION AND MATERIALS MANAGEMENT**Semester III
5H – 5C****Instruction Hours / week L: 4 T: 1 P : 0****Marks: Internal: 40 External: 60 Total: 100
End Semester Exam: 3 Hours****COURSE OBJECTIVES****To make the students**

- To practice the concepts and functions of production
- To apply the knowledge in the concept of inventory
- To assess knowledge in purchase procedure and quality control
- To understand how the knowledge of materials management can be an advantage to logistics and supply chain operations.
- To sensitize the students on the materials management functions – Planning, Purchase, Controlling, Storing, Handling, Packaging, Shipping and Distributing, and Standardizing.
- To realize the importance of materials both in product and service.

COURSE OUTCOMES**Learners should be able to**

1. Employ the whole process of manufacturing a product or a service
2. Interpret the concept of optimum utilization of resources and minimization of cost
3. Understand the concept of materials management, concept of inventory and quality control.
4. Develop the knowledge and skills needed to plan and control manufacturing of goods and services in an industrial setting, TQM and ISO
5. Identifying the scope for integrating materials management function over the logistics and supply chain operations. Integrate the organization wide materials requirement to develop an overall plan (MRP).
6. Identify, study, compare, and evaluate alternatives, select and relate with a good supplier

UNIT I

Production Management – Functions – Scope – Plant location – Factors – Site location – Plant layouts – Principles - Process – Product Layout for Production Planning and Control – Principles - Information Flow – Routing – Scheduling – Dispatching – Control.

UNIT II

Materials Handling – Importance – Principles – Criteria for selection of material handling equipment's. Maintenance – Types – Breakdown – Preventive – Routine – Methods study – Time Study – Motion Study – Principles – Work Measurement.

UNIT III

Organization of Materials Management – Fundamental Principles – Structure – Integrated Materials Management – Purchasing – Procedure – Principles – Import Substitution and Import Purchase Procedure – Vendor Rating – Vendor Development.

UNIT IV

Functions of Inventory – Importance – Tools – ABC Analysis – EOQ – Levels of stock- Reorder Point – Safety Stock – Lead Time – JIT - Store Keeping – Objectives – Functions – Store Keeper – Duties – Responsibilities – Location of Store – Stores Ledger – Bin card.

UNIT V

Quality Control – Factors Determining Quality – Quality circle - TPM - 5 s - Types of Inspection – Centralized and Decentralized - TQM - Meaning – Objectives – Elements – Benefits – Bench Marking - Meaning – Objectives – Advantages – ISO - Features – Advantages – Procedure for obtaining ISO - Balanced Score Card.

TEXT BOOKS

1. Khanna O.P, (2010), Industrial Engineering and Management, Dhanpat Rai Publications Pvt. Ltd. New Delhi.

REFERENCES

1. Banga.T.R, (2007) Industrial Engineering and Management Science, Khanna Publishers. New Delhi.
2. Varma. M.M., (2010), Materials Management, Sultan Chand & Sons. New Delhi.
3. Gopalakrishnan, (2004) Materials Management, Prentice Hall of India Pvt. Ltd. New Delhi.

COURSE OBJECTIVES**To make the students**

- To employ the student's knowledge on direct tax
- To Practice the students with the Income tax law
- To prepare students to understand the concepts of tax authorities
- To acquaint the students with the legal regime governing the direct taxes.
- To gain knowledge and understanding of the provisions of the direct tax laws.
- To acquire the ability to apply the knowledge of the provisions of the direct tax laws to the various situation in actual practice.

COURSE OUTCOMES**Learners should be able to**

1. Computation of gross total income
2. Illustrate basis of charge the residential status of an individual, HUF and all other persons
3. Construct Assessment procedure of individuals and computation of tax liability.
4. Define the procedure of direct tax assessment.
5. File IT return on individual basis.
6. Able to compute total income and define tax complications and structure.

UNIT I

Income Tax Act – Definition – Income – Agricultural Income – Assessee – Previous year – Assessment year – Residential status – Scope of Total Income – Exempted Incomes – Heads of income.

UNIT II

Computation of Income from Salaries – Allowances – Perquisites – Deductions out of gross salary - Income from House Property – Annual value – Net annual value.

UNIT III

Computation of Profits and Gains of Business or Profession – Capital Gain- Long term Capital Gain – Short term Capital Gain – Exempted Capital Gain.

UNIT IV

Computation of Income from other sources – Set-Off and Carry Forward of Losses - Deduction from Gross Total Income – Assessment of Individuals

UNIT V

Income Tax Authorities – Procedures for assessment – Collection of Tax

Note: Theory and problems shall be distributed at 40% & 60% respectively.

TEXT BOOKS

4. T.N.Manoharan, (2014), Students Handbook on Income Tax Law, Snow White Publications Pvt. Ltd. Mumbai.

COURSE OBJECTIVES**To make the students**

- To design the concept of human behavior and provide the students to analyze specific strategic human resources demands for future action.
- To employ the students knowledge with various factors involved in human behaviour
- To apply students to understand about the organizational climate
- To gain an appreciation of the relevance of the study of organizational behaviour to the practice of human resource management
- To enable students to describe how people behave under different conditions and understand why people behave as they do.
- 4. To enable students to synthesize related information and evaluate options for the most logical and optimal solution such that they would be able to predict and control human behavior and improve results.

COURSE OUTCOMES**Learners should be able to**

1. Understanding the human behavior aspects in achieving the organization goal
2. Construct individual and group behavior in organization.
3. Demonstrate the applicability of the concept of organizational behavior to understand the behavior of people in the organization.
4. Demonstrate the applicability of analyzing the complexities associated with management of individual behavior in the organization.
5. Analyze the complexities associated with management of the group behavior in the organization.
6. Develop cognizance of the importance of human behavior.

UNIT I

Organizational Behaviour - History - Evaluation - Importance and Scope of Organizational Psychology – Individual Differences – Intelligence Tests – Measurement of Intelligence – Personality - Determinants of Personality - Personality Tests – Nature, Types and uses.

UNIT II

Perception – Perceptual process, Applications in Perception, Factors Affecting Perception – Motivation – Theories - Maslow's Theory – Herzberg – McGregor - X and Y Theory – Financial and Non-financial Motivation – Techniques of Motivation.

UNIT III

Job Satisfaction – Meaning – Factors – Management of Job Satisfaction – Morale – Importance – Employee Attitude and Behaviour - Significance to Employee Productivity - Values and behavior - Factors - Job Enrichment – Job Enlargement.

UNIT IV

Hawthorne Experiment – Importance – Groups Dynamics – Cohesiveness – Co-operation – Competition – Conflict – Types of Conflict – Resolution of Conflict – Sociometry – Groups Norms – Role – Status – Supervision Style – Training for Supervision.

UNIT V

Leadership – Types – Theories – Traits, Managerial Grid - Fiedler's Contingency - Organizational Climate – Organizational Effectiveness – Organizational Development – Counseling and guidance – Importance of counselor – Types of counseling – Merits of counseling.

15BAU311

PRACTICAL - TALLY**Semester- III**
4H – 2C

Instruction Hours / week L: 0 T: 0 P : 4

Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVES**To make the students**

- To apply practical knowledge about the accounting package
- To employ in computerization of accounts in various vouchers
- To express in system computation accounting procedures
- To learn Basics of Accountancy, its principles, concepts, conventions, recording procedures, Bank reconciliation, final accounts etc
- To learn and practice Computerized Accounting Systems using Tally.ERP.9
- To, learn how to record accounting transactions with the help of tally ERP software

COURSE OUTCOMES**Learners should be able to**

1. Demonstrate the basic knowledge on accounting package
2. Assess voucher and various accounting statements
3. Construct in computing procedures and develop various types of Financial Statements.
4. Create a company, enter accounting voucher entries including advance voucher entries, do reconcile bank statement, do accrual adjustments
5. Understanding of basic Accounting concepts and principles and generate Accounting and Inventory Masters, Vouchers and Basic Reports in Tally
6. Gain practical knowledge of accounting and competent in preparation of Accounts for the Business Entities.

Practical List

1. Create a new company in integrate accounts mode and account with inventory mode
2. Create a primary and sub groups using single or multiple ledger mode
3. Create minimum 10 ledgers using single or multiple ledger, and alter and delete any 2 ledger
4. Enter the following voucher
 - Payment vouchers
 - Receipt
 - Purchase
 - Sales
 - Credit note
 - Debit note
 - Journals
 - Memo
 - Optional

5. Create stock, stock groups and enter the vouchers
6. Prepare inventory statements using (calculate inventory using all methods)
 - FIFO
 - LIFO
 - Simple Average Method
 - Weighted Average Method
7. Prepare the following ratio analysis
 - Financial ratio
 - Operating ratio
 - Investment ratio
8. Prepare the following
 - Cash flow statement
 - Fund flow statement
9. Preparation of reports for the following
 - Trial Balance
 - Profit & loss a/c
 - Balance sheet
 - Bank reconciliation statement
 - Back up and restore the company information

15BAU304A

BUSINESS ECONOMICS

Semester - III
6H – 5C

Instruction Hours / week L: 6 T: 0 P : 0

Marks: Internal: 40 External: 60 Total: 100
End Semester Exam: 3 Hours**COURSE OBJECTIVES****To make the students**

- To employ students with the knowledge of pricing under different market conditions
- To develop the students skills in managing capital and profit
- To Practice students knowledge in national income analysis
- To integrate the concept of price and output decisions of firms under various market structure
- To impart the knowledge of economics as a subject and its importance
- To take business decisions scientifically on the basis of all available information.

COURSE OUTCOMES**Learners should be able to**

1. Understand the concept of demand, supply, market equilibrium, production functions and market structure
2. Apply the economic theory and integrate the concept of price and output decisions of firms under various market structure.
3. Develop the knowledge on economic concepts help for management decisions
4. To understand the concepts of cost, nature of production and its relationship to Business operations.
5. To apply marginal analysis to the “firm” under different market conditions
6. To analyze the causes and consequences of different market conditions.

UNIT I

Business Economics and Economic Theory: Scope of Business Economics –Profit Maximization- Economic Cost of using Resources - Social Responsibilities of Business - Maximizing the Value of a Firm – Basic Techniques of a Firm.

UNIT II

Demand, Supply and Market Equilibrium: Demand - Law of Demand – Determinants – Elasticity - Demand Function – Forecasting - Theories of Demand - Supply – Law of Supply – Elasticity of Supply - Supply Functions - Market Equilibrium - Changes in Market Equilibrium.

UNIT III

Production and Cost Analysis: Production Function- Iso-quant curves - Production in the short run and long run - Law of Diminishing Marginal Product - Short run and long run cost of production – Short run Total Costs - Cost Curves - Cost Analysis - Concept of Cost - Types - Cost Output Relationship in Short and Long Period.

UNIT IV

Market Structure And Pricing Decisions: Classification of Markets – Pricing Under Perfect Competition – Pricing Under Monopoly – Price Discrimination – Dumping – Pricing Under Monopolistic Competition – Monopsony - Pricing Under Oligopoly Kinked Demand Curve Model – Cournot’s Model Of Duopoly.

UNIT V

National Income Analysis: National Income Analysis – Theories of Income, Output and Employment – Classical - Keynesian theory - Theory of Trade Cycles-Concept and Causes of Trade Cycles -Measures to Control Trade Cycles - Macro Economic Policy - Monetary and Fiscal - Theories of Inflation- Causes and Control of Inflation.

15BAU304B

MANAGEMENT INFORMATION SYSTEM

Semester - III
6H – 5C

Instruction Hours / week L: 6 T:0 P : 0

Marks: Internal: 40 External: 60 Total: 100
End Semester Exam: 3 Hours**COURSE OBJECTIVES****To make the students**

- Formulate the management information system and their applications in Management
- To develop the awareness among students in telecommunication revolution
- To introduce the fundamental principles of computer-based information systems analysis and design and develop an understanding of the principles and techniques used.
- To enable students understand the various knowledge representation methods and different expert system structures as strategic weapons to counter the threats to business and make business more competitive.
- To enable the students to use information to assess the impact of the Internet and Internet technology on electronic commerce and electronic business and understand the specific threats and vulnerabilities of computer systems.
- To provide the theoretical models used in database management systems to answer business questions.

COURSE OUTCOMES**Learners should be able to**

1. Comply knowledge to get an exposure to the experts' theories and practices in the field of MIS
2. Analyze how technology can be used to synthesize complex data to make sound business decisions information support systems and management operations needs
3. Compare the processes of developing and implementing information systems.
4. Outline the role of the ethical, social, and security issues of information systems.
5. Translate the role of information systems in organizations, the strategic management processes, with the implications for the management.
6. Apply the understanding of how various information systems like DBMS work together to accomplish the information objectives of an organization.

UNIT I

Introduction to Information Systems - Definition - Features - Steps in Implementation of MIS - Need for Information - Information System for Decision making- MIS as Competitive Advantages – MIS Structures.

UNIT II

MIS - Strategic Information System - MIS Support for Planning - Organising - controlling - MIS for Specific Functions – Personnel – Finance - Marketing Inventory Production Data Base Management System Models - Hierarchical - Network - Relational - Modular.

UNIT III

Computer Hardware - Description of Electronic Computers – CPU Operations - Classification of Computers - Main - Mini – Workstations - Micro Computers - Super Computers - Personal Computers. Computer Software - Types of Software - Data Representation in Computers - Introduction to Client-Server.

UNIT IV

Input Devices - Mouse - Touch Screens - MICR - OCR - Keyboard - Pen Based Input - Digital Scanners - Voice Input Devices - Sensors. Output Devices - Impact Printers - Non-Impact Printers - Video Display Terminals - Plotters - Voice Output Devices. Secondary Storage Devices - Magnetic Disk, Floppy, Magnetic Tape, Optical Disk Storage - DROM

UNIT V

Telecommunication Revolution - Introduction to Email- Internet - Intranet – Teleconferencing - www Architecture - Introduction to E-Commerce - Models B_B, B_C, and EDI, EDI Applications in Business - Electronic Payment Cash - Smart Cards - Credit Cards - Fundamentals of ERP- Information Technology Act, 2000.

TEXT BOOKS

1. James O Brien, (2014), Management Information System, Tata Mc Grew Hill, New Delhi.

REFERENCES

1. Kenneth Laudon and Jane Laudon , (2011), Management Information System- A contemporary perspective, Pearson Prentice Hall of India, New Delhi.
2. Gordon B Davis, (2012), Management Information System, Tata Mc Grew Hill, New Delhi.
3. Sudalaimuthu S, (2014), Computer applications in business, Himalaya Publishing House Pvt.Ltd, Mumbai.

COURSE OBJECTIVES**To make the students**

- To employ the students to understand the concepts of Information technology
- To understand the components of computer system
- To Practice the Knowledge in operating system
- Demonstrate knowledge of information technologies and digital cultures, both historic and contemporary, and be aware of the social, ethical and philosophical issues related to technological development.
- Demonstrate that they can evaluate and explain the on-going changes in digital technology and their impacts on society.
- Demonstrate that they can apply a variety of information technologies to their own work, demonstrating their competence in researching, creating, and presenting projects using a variety of digital information tools.

COURSE OUTCOMES**Learners should be able to**

1. Categorize the fundamentals of computers and Understand basic concepts and terminology of information technology
2. Apply in computer language and electronic data processing
3. Have a basic understanding of personal computers and their operations
4. Demonstrate that they can use a personal computer or mobile device for accessing the internet and use basic computer applications
5. Demonstrate that they can use digital technology in research, analysis, and critical inquiry.
6. Demonstrate an understanding of the concepts of online security and privacy.

UNIT I

Computer system : Introduction - Types of computer systems - micro, mini, mainframe and super computers - analog, digital and hybrid computers - business and scientific computer systems - first, second, third and fourth generation computers.

UNIT II

Components of computer system: input, output and storage devices. software: system software and application software - programming language – machine language – assembly language – high level languages – flow chart and programmed flow charts – steps in developing a computer programmer.

UNIT III

Hardware and software: computer systems - importance of computers in business - data and information - data processing - data processing systems batch-online and real time systems - time sharing-multi programming and multi processing systems.

UNIT IV

Operating systems: DOS –windows – UNIX - window NT –window'98 – E-Commerce – internet – intranet – email its uses and importance – world wide web sites and computers.

UNIT V

System analysis and design - computer based information systems – transaction processing – office automation – management information systems – decision support systems – expert system.

COURSE OBJECTIVES**To make the students**

- To understand the concept of research methodology.
- To estimate knowledge in sampling techniques
- To discover knowledge in writing a good research report.
- To identify the overall process of designing a research study from its inception to its report.
- Be familiar with ethical issues in educational research, including those issues that arise in using quantitative and qualitative research
- To familiarize participants with basic of research and the research process and conduct research work and formulating research synopsis and report

COURSE OUTCOMES**Learners should be able to**

1. Identify the conceptual framework of the research process
2. Apply parametric and non parametric test
3. Demonstrate research tools and techniques in research work
4. Demonstrate the ability to choose methods appropriate to research aims and objective and understand the limitations of particular research methods
5. Develop skills in qualitative and quantitative data analysis and presentation and Develop advanced critical thinking skills
6. Familiar with how to write a good introduction to an educational research study and the components that comprise such an introduction

UNIT I

Research: Meaning - Scope and Significance - Characteristics of Good Research Types of Research – Research Process - - Problems in Research - Identifying Research Problem – Research Design - Features of Good Design – Types

UNIT II

Sampling Design: Meaning - Concepts - Steps in Sampling - Criteria for Good Sample Design - Types of Sample Designs - Probability and Non-Probability Samples. Data Collection - Sources of Data - Methods of Data Collection – Observation – Questionnaire – Interview - Schedule – Secondary Data - Data Processing – Editing - Coding - Classification - Tabulation.

UNIT III

Hypothesis: Meaning - Sources - Types - Formulation - Scaling Techniques - Meaning - Types of scales - Scale Construction Techniques.

UNIT IV

Test of Significance: Parametric Test - T test, F Test and Z test - Non Parametric Test –Chi square test. U Test, Kruskal Wallis, Sign test. Multivariate Analysis -Factor - Cluster.

UNIT V

Interpretation: Meaning - Techniques of Interpretation - Report writing:-Significance - Report Writing:- Steps in Report Writing - Layout of report – Types of Reports - Oral Presentation - Executive Summary - Mechanics of Writing Research Report - Precautions for Writing Report - Norms for using Tables, Charts - and Diagrams - Appendix:- Norms for using Index and Bibliography.

Note : Distribution of marks for theory and problems shall be 80% and 20% respectively.

* A panel of external and internal members shall evaluate the **Comprehensive Viva Voce** for 100 marks respectively. The aggregate of the marks shall be averaged for final ESE marks.

#The internal evaluation for **Foundation Course, Management Practice and Communication Practice** shall be as follows:

- Attendance = 5 marks
- Activity/Seminar = 45 marks (15 marks for Unit I, 15 Marks for Unit II and 15 Marks for Unit III. Activity/seminar will be conducted at end of each Unit)
- **Open Elective** (Self Study): Students can opt for an open elective course provided by any other PG department of the University. The Course offered is **Human Resource Management** (Code:15OEP201L), Credit: 4

The internal evaluation of **Major Project & Viva voce** shall be as follows:

- Review 1 (PPT Presentation) = 15 marks
- Review 2 (PPT Presentation) = 15 marks
- Model Viva-voce = 20 marks
- Project Record = 10 marks
- Viva voce Examination (internal examiner) = 20 marks

KARPAGAM ACADEMY OF HIGHER EDUCATION
(Deemed to be University)
(Established under section 3 of UGC Act, 1956)

Programme Outcomes (POs)

Graduates of the MBA programme will be able to:

- Understanding the management and domain concepts and apply them to achieve business environmental solutions.

- b. Demonstrate the ability to apply multiple theoretical perspectives to address complex managerial issues required for effective problem solving and decision making in contemporary organizational environment.
- c. Possess the skills required to work individually and lead effectively in a team-based environment.
- d. Recognize the values and ways to identify and resolve ethical issues and apply them in organizational settings
- e. Evaluate the implications of changing environmental factors on organizational choices within a global environment
- f. Ability to effectively communicate, persuade and strategically engage diverse stakeholders within a business environment.

PROGRAMME SPECIFIC OUTCOMES (PSO)

- g. Postgraduates will develop critical thinking and conceptualization of functional knowledge of management
- h. Able to accept various responsibilities and exhibit high level of commitment to complete on time.
- i. Ability to organize events individually / team and can show creativity and unique ideas in every business solutions

Programme Educational Objectives (PEOs)

- I. To develop professional skills for life-long learning in areas of management and related fields.
- II. To enable students to acquire proficiency, a sense of professionalism, integrity and team spirit to work in diverse environments.
- III. To develop capabilities in students to independently conduct theoretical as well as applied research.
- IV. To develop sound knowledge and skill to become an intrapreneur/entrepreneur and to inculcate creativity and innovation among students
- V. To adapt to a rapidly changing environment with learned and applied new skills and become socially responsible and value driven citizens committed to sustainable development.

5. Human Resource Management Review
6. Training and Development Journal
7. Personnel today
8. Academy of Management Journal
9. Academy of Management Review
10. The IUP journal of Organization Behavior

Course Objectives:

To make students

- To illustrate the application of economic theory and methodology as an alternative in managerial decisions.
- To understand the demand behavior and estimate demand
- To gain knowledge on the production functions, economies of scale and cost functions
- To gain a rigorous understanding of competitive markets as well as alternative market structures.
- To understand the forces determining macroeconomic variables such as inflation, unemployment, interest rates, and the exchange rate.
- To obtain familiarity on the macro level business components like money, banking, monetary policy, fiscal policy, trade, business cycles and balance of payments.

Course Outcomes (Cos):

Learners should be able to

1. Apply the economic way of thinking to individual decisions and business decisions
2. Measure the responsiveness of consumers' demand to changes in the price of a goods or service, and understand how prices get determined in markets,
3. Evaluate the different costs of production and how they affect short and long run decisions and derive the equilibrium conditions for cost minimization and profit maximization
4. Design competition strategies, including cost, pricing, and market environment according to the structure of the markets.
5. Critically evaluate the consequences of basic macroeconomic policy options under differing economic conditions within a business cycle.
6. Demonstrate an understanding of monetary and fiscal policy options as they relate to economic stabilization in the short run and in the long run.

Unit I

Managerial Economics - meaning, nature and scope - Managerial Economics and business decision making – Role and responsibilities of Managerial Economist - Fundamental concepts in

Managerial Economics. Objectives of Business Firms - Determinants and types of demand - Elasticity of demand - Demand Forecasting - Applications.

Unit II

Production and Costs - Meaning of Production Function –Law of Diminishing returns- Law of variable proportions - Isoquants, Cobb-Douglas function - Law of Supply and Elasticity of Supply, Economies and diseconomies of scale – Cost – types – Determinants- Short and Long run cost curves.

Unit III

Product markets - Market Structure - Pricing under different markets- perfect competition, monopoly, monopolistic competition, oligopoly - Pricing Methods - Pricing in Public Sector Undertakings.

Unit IV

Theories of profit, wages, rent - Keynes Liquidity Preference Theory of interest - Cost Benefit Analysis- Steps - Break Even Analysis- Profit - Meaning and nature - Profit policies.

Unit V

Government and Business - Need for Government intervention in the market – Monetary and Fiscal policy- Prevention and control of monopoly - National Income - methods- Trade Cycles- Economic Liberalization and Business Trends

Note: Emphasis will be given to case discussion and article reviews

Journals:

1. The IUP Journal of Managerial Economics
2. Economic Challenger
3. Economic and political weekly
4. Business policy and Economics (International Journal)
5. International Journal of Economic Research

Course Objectives:

To make the students

- To make the students understand the basics of legal concept and environment in which the present day business is carried.
- To provide an overview of important laws that have a bearing on the conduct of business in India
- To acquaint students with the functioning of negotiable instruments
- Understand the legal and fiscal structure of different forms of business organizations and their responsibilities as an employer.
- To acquire knowledge of income tax act and sales tax act and its applications in business
- To understand the existing law and practice relating to consumer protection and cyber crimes

Course Outcomes (Cos):

Learners should be able to

1. Analyze the nature of contract law, Company law and cyber laws and its application in business.
2. Appreciate the overall legal framework within which business activities are carried out.
3. Assess the legal forms of business organization and its modus operandi.
4. Recognize the application of factories act and wages act in business scenario.
5. Understand and apply the concept and laws pertaining to income tax and sales tax, intellectual property rights and cyber laws and evaluate its impact on business and social environment.
6. To illustrate the consumer legislations towards consumer protection and cyber crimes

Unit I

Mercantile Law - Contracts: Nature and Classification of Contracts. The Agreement of Offer and Acceptance. Consideration and capacity – Free consent – Contingent and Quasi contracts – Discharge of contracts – Breach of contract- Essentials of Contract of Agency – Creation of Agency – kinds of Agents – Rights and duties of Principal and Agent-Termination of Agency-

Sales contract, Transfer of title and risk of Loss, Warranties in sales Contract. Performance of Sales contract, conditional sales.

Unit II

Negotiable Instruments-Nature and requisites of Negotiable Instruments, Transfer of Negotiable Instruments and liability of parties, Enforcement's of secondary Liability, Holders in due course, special rules for cheques and banks Discharge of Negotiable instruments.

Unit III

Company Law - Major principles – types of companies, memorandum and articles of association, Promotion and Formation of a Company - prospects, powers, duties and liabilities of directors – Corporate Governance.

Unit IV

Income Tax Department & Sales Tax Act - Corporate tax planning, overview of sales tax act, including value added tax.

Unit V

The Consumer Protection Act 1986: Object of the Consumer Protection Act – Rights of Consumers – Definitions of Important Terms. – Cyber law in India – Information Technology Act – 2000.

Note: Emphasis will be given for legal case discussion and review of legal articles related to business.

Text Books:

3. M.C. Shukla, "Mercantile Law", S. Chand and Company, New Delhi, 2007.
4. S.S. Gulshan, "Business Law", Excel Books New Delhi, 2007.

Journals & additional readings:

1. Legal news & views
2. Labour law reporter
3. The practical lawyer-supreme court cases
4. Chennai law times

Course Objectives:

To make the students

- To understand the financial accounting standards, conventions and principles in preparation of financial reports
- To understand the tools and techniques used for analyzing the financial statements.
- To recognize the cost concepts and prepare cost sheets.
- Calculate and analyse the cash flow operations with available inputs.
- To know various tools from accounting this would facilitate the decision making
- To develop analytical abilities to face the business situations

Course Outcomes (Cos):

Learners should be able to

1. Illustrate the financial statements for the organization.
2. Ability to prepare and analyse financial statements to assess the financial performance and position of a company;
3. Evaluate the cost concepts to analyse business management decisions related to pricing and outsourcing
4. Demonstrate capabilities of problem-solving and critical thinking
5. Develop an awareness on ethical, social issues in addition to financial information, in the management decision making process
6. Develop group work and communication skills

Unit I

Financial Accounting – Definition – Accounting Principles – Concepts and conventions – Journal – Ledger - Trial Balance

Unit II

Final Accounts – Financial accounting Vs Management accounting - Objectives and functions of management accounting - Financial Statement Analysis – Objectives – Comparative Statements, Common-Size statement, Trend Percentages

Unit III

Costing – Basic concepts – Element costing – Preparation of Cost Sheet. Ratio Analysis, Meaning, Nature, Uses, Limitations, Classification of Ratios, Interpretation of Ratios.

Unit IV

Funds Flow Statement, Meaning and Concept of Funds, Flow of Funds, Uses and Significance of Funds Flow Statement, Limitations of Funds Flow Statement, Statement of Schedule of Changes in Working Capital, Funds From Operation.

Unit V

Cash Flow Statement, Classification of Cash Flows, Comparison between Funds Flow Statement and Cash Flow Statement, Uses and significance of Cash Flow Statement, Computation of Cash Flow Statement and Cash from Operations.

Note: Problems 60 Marks and Theory 40 Marks.

Text Books:

1. R.K. Sharma & Shashi K Gupta, “Management Accounting”, Kalyani Publishers, Ludhiana, 2014.
2. Jelsy J. Kuppapally, 1st Edition, “Accounting for Managers”, PHI, New Delhi, 2009.

3. Stice & Stice, Financial Accounting Reporting and Analysis, 8th edition, Cengage Learning, 2010.
4. Singhvi Bodhanwala, Management Accounting -Text and cases, PHI Learning, 2009.
5. Ashish K. Battacharya, Introduction to Financial Statement Analysis, Elsevier, 2009

Journals & Magazines:

1. Finance India
2. Journal of Accounting and Finance

3. Indian Journal of Finance
4. Accounting Research and Audit Practice
5. Indian Journal of Accounting
6. The Management Accountant
7. The Chartered Accountant

Course Objectives:

To make the students

- To understand the classification and analysis of the data with statistical tools and techniques.
- To know the descriptive and inferential statistics, and apply them to examine business and economic data.
- To know the use of tools and techniques of correlation and regression
- To understand the concept of measurement of central tendency
- To realize the applications of probability and distributions in the analytical decision making.
- To understand the index number concepts and its applications.

Course Outcomes (Cos):

Learners should be able to

1. Identify the basic statistical tools and techniques and its application in business decision making.
2. Categorize and estimate the measures of central tendency
3. Develop an ability to analyse and interpret the collected data to provide meaningful information in making management decisions
4. Demonstrate capabilities of problem-solving, critical thinking, and communication skills related to the discipline of statistics.
5. Classify and evaluate the hypothesis to obtain reliable results.
6. Develop skills to design business model and Analytics projects

Unit I

Role of mathematics and statistics in business decisions - Statistics – meaning – Scope - Functions, limitations, uses and Misuses of statistics. Collection of data - Classification and Tabulation of data, Diagrammatic and graphic representation of data

Unit II

Measures of Central tendency - Mean, Median and Mode. Combined mean and corrected mean
Measures of Dispersion-Range, Quartile deviation, standard deviation and Coefficient of Variation.

Unit III

Correlation: Types of Correlation-methods of correlation-scatter diagram-Karl Pearson's co-efficient of correlation-Spearman's Rank correlation-Regression two regression lines-regression co-efficient-methods of forming the Regression equations.

Unit IV

Probability: Basic definitions-addition and multiplication rules (only statements)-simple business problems. Probability distributions: binomial distribution-Poisson distribution and normal distribution- simple business problems.

Unit V

Hypothesis testing – Errors in Hypothesis testing - large sample test (Z – test) single and two mean test, Small sample test (t – test)-Single mean-Two mean- Chi-square test –Goodness of fit, ANOVA – one way-f-test.

Note: Problems 60 Marks and Theory 40 Marks.

Text Books:

1. S.P. Gupta, "Statistical Methods", Sultan Chand & Sons, New Delhi, 2009
2. N.Elhance, Veena Elhance, B.M. Agarwal, "Fundamentals of Statistics", Kitab Mahal, Allahabad, 2008.

References:

2. R.S.N.Pillai, Bagavathy, "Statistics", S. Chand & Company Ltd, New Delhi, 2002.

Course Objectives:

To make the students

- Understand Global and Indian Environmental Policies and laws.
- To enhance their synthesis skills to evolve strategic corporate responses to integrate social/environmental issues into business management
- To understand the International and Indian efforts for environmental Protection
- To emphasize importance of understanding external environment in marketing decision making
- Familiarize with the concepts of green marketing strategies
- Recognize the impact of Industrial and Business activities on the Environment

Course Outcomes (Cos):

Learners should be able to

1. Categorize the various environmental issues and remedies
2. Create awareness on the issues related to environment and enforcing agencies.
3. Describe organizations as systems and their role in environmental management
4. Capacity to critically assess theoretical and conceptual issues relating to environmental management
5. To present synthesised and critically evaluated information in oral and written forms.
6. To work effectively to create environmental management analysis outputs of professional quality, both independently and within team environments.

Unit I

Environmental awareness - Sustainable Development; Global Environmental - Problems- Global Warming and Climate change, Concept of Carbon Credit; Pollution – Air, Water resources and Land

Unit II

International and Indian efforts for environmental Protection, United Nations Framework Convention on Climate Change, Earth Summit

Unit III

Business and environment- Impact of Industrial and Business activities on the Environment, business implications and opportunities arising from social and environmental issues; Eco-friendly manufacturing, Packaging, Green Marketing

4. Rajagopalan, R. (2011). Environment, Oxford University Press

Course Objectives:

- To train graduates to become as managers of varying departments through activity based learning.
- This course provides training on decision making skills
- To determine the role to be played during conflict and empowerment skills.
- To help the students to acquire some of the necessary skills to handle day-to-day managerial responsibilities
- To gain a solid understanding of human behavior in the workplace from an individual, group and organizational perspective
- To obtain frameworks and tools to effectively analyze and approach various organizational situations

Course Outcomes (cos):

1. Gain the knowledge and skills necessary to manage various components of a practice that include organization, administration, communication, and managerial aspects.
2. To focus on decision making aspects and implementation of decisions
3. Students should be able to demonstrate the Interpersonal Skills and Practice-Based Learning
4. Demonstrate the roles of the manager and become an effective planner and decision maker
5. Systematically identify relevant theory and concepts and relate to appropriate methodologies and draw conclusions
6. Evaluate, classify, imagine and plan the successful management practices.

UNIT I**Interpersonal Skills**

Decision Skills: Group decision making (strengths and weaknesses), Developing characteristics of charismatic and transformational leadership. Emotional intelligence and leadership effectiveness - self awareness, self management, self motivation, empathy and social skills

Negotiation skills- preparation and planning, definition of ground rules, clarification and justification, bargaining and problem solving, closure and implementation

UNIT II

Conflict Management skills:

Types of conflict (intrapersonal, Intra group and inter group conflicts), Basic concepts, cues, signals, symbols and secrets of body language, Significance of body language in communication and assertiveness training, Conflict stimulation and conflict resolution techniques for effective management.

UNIT III

Empowerment Skills:

Stimulating innovation and change- coping with “temporariness”, Network culture, Power tactics and power in groups (coalitions), Managerial empowerment and entrepreneurship, Prevention of moral dwarfism especially terrorism, Altruism (pro-social behaviour/helping behaviour), Spirituality - strong sense of purpose- trust and respect- humanistic practices- toleration of fellow human beings expressions.

2. Robbins, S.B. (2005). Organizational Behaviour. New Delhi: Prentice Hall of India.
3. Hurlock, E.B. (2006). Personality Development, 28th Reprint. New Delhi: Tata McGraw Hill.

Course Objectives:

- To impart students and enrich communication and non-verbal activity such that students will be good on their communication.
- To understand norms of business letters and prepare prompt business letters
- Make students to understand the value of face to face communication
- To learn the importance of postures and gestures
- The students acquire skills on conducting meetings, seminar and conferences.
- To gain practical knowledge on designing and developing clean and lucid writing skills.

Course Outcomes (Cos):

1. The student will able to get practice with Verbal communication and Non- Verbal communication.
2. Demonstrate the understanding of face to face Communication and appropriate ways to communicate to an audience
3. The students shall be familiar with conducting meetings, seminar and conferences.
4. Students attain competence in functional use of communication during both academic and non-academic life situations.
5. To draft effective business correspondence with brevity and clarity.
6. To stimulate their Critical thinking by designing and developing clean and lucid writing skills.

Unit I

Communication - Meaning and significance for management- Types of communication- media –
 Barriers to communication - Norms for Business letters - Letter for different kinds of situations.
 Report writing - formal & informal reports - writing research reports & technical reports-
 Principles of effective communication. Listening and answering the questions

Unit II

Communication: Face to face communication – telephonic conversation. Structuring the resume / report – Letter writing / E-mail communication – Samples. Conducting Meetings: Procedure – preparing Agenda, minutes and resolution

Unit III

Non-verbal communication - personal appearance - posture - body language - visual & audio visual aids for communication - face to face communication - Conducting Meetings - Procedure - preparing Agenda, minutes and resolutions - conducting seminars and conferences

References:

1. Leena Sen, “Communication Skills”, 8th edition, PHI Learning Pvt Ltd, New Delhi, 2007.
2. Raymond. V. Lesikar’s, “Basic Business Communication”, 7th Edition, Tata McGraw Hill Education Pvt Ltd, 2008.
3. Kitty. O. Locker and Stephen Kyo Kaczmarek, “Business communication Building Critical Skills”, 3rd edition, TMH, 2007.
4. Rajendra Pal and Korlahali, “Business Communication”, 7th edition, Nisha Publishers, New Delhi, 2007.

Course Objectives:

To make the students

- To provide insight on importance of technology for communication and decision making.
- To familiarize Students with basic to intermediate skills for using tally in the classroom vis-à-vis Business Applications
- To provide hands-on usage of MS-office to creating new word documents including features like tables, charts and references.
- To enable students to explore MS office
- To provide students hands on experience on tally Utilities
- To gain proficiency in creating solutions for Data Management and Reporting

Course Outcomes (Cos):

1. Develop the student to work efficiently in MS Office and Tally
2. Get familiarize with the shortcuts used in office tools.
3. Recognize effective use of charts, diagrams, and other graphics in business messages and identify potential sources for these visual aids
4. Evaluate and practice various techniques of analysis in excel tools
5. To design presentation using animation, special effects and graphics.
6. To facilitate the understanding of accounting package and its application

Unit I

Components of Computer – Introduction to MS Office- Word – Creating a new documents with templates and wizards- Using Key Board Short cuts – Symbols and Pictures – Text Management.

Unit II

Introduction to Excel – Working with work sheets – Calculation using formulas work sheet formatting – Types of Charts – Formatting and printing – Chart elements

Unit III

Introduction to Power Point – Creating New Presentations - Presentation using Graphics – Slide Transition and Adding Sounds Using action Buttons.

Unit IV

Internet and World Wide Web: Introduction to Internet – Internet access – Internet Addressing – Introduction and use of E-mail working of E-mail – E-mail names and address- Working in Blogs.

Unit V

Accounting Package Tally: Introduction to tally – create a company – creating groups & ledger accounts – Account Voucher creation – Statement of accounts – Inventory reports display

Text book:

V. Rajaraman, 2009, “Fundamentals of Computer”, 4th Edition, Prentice Hall of India Pvt Ltd, New Delhi.

Reference:

P.K. Sinha, 2008, “Fundamentals of Computer”, 6th Edition, BPB publication

Course Objectives:

To make the students

- To assess the overall knowledge of the student in the relevant field of Management
- Realize the knowledge and skills required to excel in their career
- To test their learning and understanding of various concepts of the syllabus during the course of their programme
- To acquaint the students with fundamentals of communication and help them to transform their communication abilities
- To obtain frameworks and tools to effectively analyze and approach various Organizational situations.
- To prepare the students to face interview both in the academic and the industrial sector

Course Outcomes (Cos):

Learners should be able to

1. To equip students with skills and knowledge to excel in their future careers
2. To develop an in-depth knowledge on the management concepts, theories and principles
3. Develop an ability to analyse and interpret contents and concepts to provide meaningful information in making management decisions
4. Recognize the application of various techniques to achieve the objective of the task
5. Determine opportunities and emerging challenges in the upcoming business trends
6. Demonstrate capabilities of problem-solving, critical thinking, and communication skills related to various courses.

A Comprehensive Viva Voce will be conducted at the end of the Semester. The panel shall consist of an external expert and faculty members who handled the courses. The viva is aimed to evaluate the student's knowledge in all the core and elective courses in the particular semester

Course Objectives:

- Help the Students in developing their communication skills, especially presentation before the group.
- Develop and improve discussion skills
- The students will be able to analyze any given issue and to present before an identified group.
- Identify and comprehend main ideas and supporting idea in detailed manner
- Manage timings on discussion
- Develop and present options based on selected materials

Course Outcomes (Cos):

1. Develop multiple thinking strategies to examine real-world issues and explore creative avenues of expression
2. Analyze the impact of word choice and tone that can have on presentation
3. Identify ways to make information more accessible to audience
4. Students will demonstrate the ability to construct a paper consistent with expectations of the discipline, including an appropriate style
5. Evaluate an enthusiastic and well-practiced method of presentation
6. Critically evaluate individual and peer effort and performance

Each Student is expected to present a topic approved by the Teacher. In the First Semester, the Student being fresh to the environment and coming from different academic background, the topic of the Seminar shall be on general subjects of their choice.

Course Objectives:

- The students understand proper usage of English in their profession and focus on report writing.
- To develop new ability to practice new problem solving skills in group and use these skills in personal life
- To develop employability and enterprise skills, such as teamwork and communication.
- To develop positive attitudes in the pupils towards study and work.
- To provide students with impartial advice about options that is available to them.
- To provide equal opportunity of access to careers inspiration and guidance.

Course Outcomes (Cos):

1. The ability to speak clearly, persuasively, and forcefully
2. Exhibit important life skills including Decision making, Problem solving and creative thinking.
3. Anticipate what they gain from educational experience
4. Track their progress and set bench mark
5. Identify the methods of assessment of knowledge and skills
6. Plan appropriate strategies to enrich the need based learning techniques

Verbal Ability: Parts of Speech , Tense - Subject Verb and Agreement - Active and Passive Voice - Clause - Degrees of Comparison - Reading Comprehension - Sentence Correction - Sentence Completion - Spotting the Errors - Jumbled Sentence - Articles and Prepositions - Synonyms & Antonyms - Verbal Analog

Course Objectives:

To make the students

- To understand the operations management concepts that yields a competitive advantage through operational excellence.
- Aware of various business combinations, location, layout, total quality management
- Learn about design, planning and control of an organization's processes.
- To know the Maximum utilisation of all kinds of resources needed.
- To understand Master Production Schedule, Material Requirement Planning and Total Quality Management
- To get acquainted with ISO Quality Certifications

Course Outcomes (Cos):

Learners should be able to

1. Classify and understand the core features of the operations and production management function
2. Evaluate and prepare the best plant and factory location and layout.
3. Obtain the knowledge of identifying and applying a quality management tools to improve organizational effectiveness.
4. Compare and combine various business locations, layouts, total quality management.
5. Define and list operations management concepts that yield a competitive advantage through operational excellence.
6. Discover, estimate and classify products & services to customers by improving process & supply chain performance.

Unit I

Operations Management – Meaning – Importance – historical contributions – Functions of OM – Differences between Production and Operations Management – Recent trends in Production and Operations - Types of Production Systems, Product Design and Process selection

Unit II

Facility Location – Facility Layout – Facility Layout planning and Designing, Types of layout – Cellular, Lean and Agile manufacturing systems – Computer Integrated Manufacturing Systems

-Assembly line balancing, Introduction to product layout and process layout-Comparison of Product Layout and Process Layout.

Unit III

Capacity Planning and Control — functions - Determinants of Effective Capacity planning – Forecasting Demand for Capacity Planning- Capacity Control– Aggregate planning – Master Production Schedule (MPS) – Material Requirement Planning (MRP) – BOM – Capacity Requirement Planning (CRP) –An Introduction to MRP II and ERP.

Unit IV

Materials Management – functions – material planning and budgeting – Value Analysis - purchase functions and procedure - inventory control – types of inventory – safety stock – order point –inventory control systems – perpetual – periodic – JIT – KANBAN.

Unit V

Total Quality Management Concept - Statistical Quality Control for Acceptance Sampling and Process Control –Quality movement – Quality circles — ISO Quality Certifications and types – Quality assurance – Six Sigma concept.

Note: Problems 20 Marks and Theory 80 Marks

Text Books:

1. Pannerselvam, “Production and Operations Management”, 2nd edition, PHI, 2012.
2. M. Senthil, “Production and Operations Management”, 2nd edition, 2009.

5. E.S Buffa, “Modern Production and Operations Management”, 8th edition, Wiley India, 2009.

6. Lee J. Krajewski and Larry P. Ritzman, “Operations Management: Strategy and Analysis”, 7th edition, Addison Wesley, 2007.
7. Chase, Aquilano & Jacobs, “Production and Operations Management”, 13th edition, Tata McGraw Hill, 2009.

Journals:

1. Journal of Operations Management, Published by Elsevier in collaboration with APICS, Educational & Research Foundation.
2. International Journal of Operations Management, Published by Emerald Journals.
3. POM Journal, published by POM Society.
4. International Journal of Advanced Operations Management, published by Inderscience.

Course objectives:

To make the students

- To understand the marketing environment and marketing functions
- Learn the importance of consumer buying motives and consumer behavior.
- To get familiarize in marketing mix
- To get an in-depth view on advertising and sales promotional tools
- To make aware of direct marketing and customer relation marketing
- To aware of the competitive strategy for leader, follower & nichers.

Course outcomes (Cos):

Learners should be able to

1. Apply the core concepts of marketing and the role of marketing in business and society.
2. Perform market analysis by formulating and identifying the best marketing mix.
3. Evaluate and support the latest trends in marketing and apply the ethical norms in marketing domain.
4. Effectively communicate ideas, explain procedures and interpret results and solutions in written and oral forms to the team members.
5. Evaluate and relate the techniques involved in promoting and branding products
6. Analyze the importance of consumer buying motives & consumer behavior, Designing competitive strategies for Leaders.

Unit I

Marketing-definition – market - conceptual framework - Marketing Environment: Internal and External – Marketing Functions – E-Marketing, Green Marketing.

Unit II

Buyer behavior - process, Market segmentation – levels - bases, targeting – patterns, positioning and differentiation, Tools of product differentiation.

Unit III

Marketing mix - Product mix - New product development - product line – brand - Product life cycle, Packing, Price mix - methods and strategies.

Unit IV

Place Mix - Channel System – Flows - Channel Design - Promotion Mix – Advertising – types – Media, Sales promotion – Tools, Public Relations - Tools - Direct Marketing.

Unit V

Customer relation marketing - Customer database, identifying and analyzing competitors - Designing competitive strategies for leaders, Challengers, followers and nichers:–Attracting and retaining customers.

Note: Emphasis will be given to case discussion and article reviews

Text books:

1. Kotler Philip and Keller, “Marketing Management”, PHI, New Delhi, 2014.
2. R.S.N Pillai Bagavathi, “Marketing Management”, S.Chand & Company Ltd, 2013

References:

1. Rajan Saxena, “Marketing Management”, 2nd edition, Tata Mc Graw Hill. 2008
2. Ramasamy and Namakumari, “Marketing Management”, McMillan, India Ltd., 2007
3. Sherlekar, “Marketing Management”, 14th edition, Himalaya Publication House, 2008
4. K.S Chandrasekar, “Marketing Management”, Tata Mc Graw Hill, 2010.

Journals:

1. Indian journal of marketing
2. Business & marketing
3. Advertising Express

Course objectives:

To make the students

- To understand the human resource management and human resource information system
- To increase knowledge of HR planning, Selection, Recruitment, job analysis and its interrelations.
- To gain information on feedback systems
- To know about compensation and reward management and its practice in industry.
- To understand the concept of competency mapping and components of quality work life
- To get an in-depth knowledge of employee welfare measures and global HR practices

Course outcomes (Cos):

Learners should be able to

1. Analyze and assess the job analysis for a profile and understand its linkage with HR planning
2. Identify and evaluate the training needs and prepare a training programme.
3. Examine and outline the compensation and reward system applicable to the industry based and understand its linkage with performance management
4. Apply the appropriate employee relations measures and Recruitment process, Learning organization Auditing HR functions
5. Draft the HR functions and latest developments in the field of HR and effectively communicate ideas, explain procedures and interpret results and solutions in written and oral forms to different audiences.
6. To make any manager to identify various activities related to Human Resources, Job involved in HR, Training, and Compensation and Labour welfare practices

Unit I

Human resource management - Importance of HRM; Objectives of HRM; HR Planning –factors affecting HR Planning – Human resource information system(HRIS) - Functions of HRM-

Changing environments of HRM - Using HRM to attain competitive advantage- Trends in HRM- Qualities and role of HR managers.

Unit II

Job analysis and Design – Process of job Analysis-Job description, Job specification, Job rotation, Job enrichment- Job evaluation- Recruitment and selection: Sources of recruitment, Recruitment process – Process of selection - Induction and Placement.

Unit III

Orientation & Training: Orienting the employees, Training – Training process - Performance appraisal- Traditional and modern techniques of performance appraisal- Performance appraisal process - 360° - 720° feedback.

Unit IV

Basics of compensation- factors determining pay rate- Current trends in compensation – Pay for performance and financial incentives, issues in compensation management – Competency mapping – Quality work life.

Unit V

Labor Welfare – Statutory and Voluntary Welfare measures. Knowledge management – Learning organization Auditing HR functions - Future of HRM function, International HRM – Global differences and similarities in HR Practices – Application of IT in various HRM functions

Note: Emphasis will be given to case discussion and article reviews

Text Book:

1. V.S.P.Rao, “Human Resource Management- Texts and Cases”, 2nd Edition, Excel Books, New Delhi, 2014.

References:

3. Scott, Snell ,George ,Bohlander , “Human Resource Management - A South Asian Perspective”, Cengage Learning, 2010.
4. Klerman, “Human Resource Management”, Biztantra, 2008.

Journals/ additional readings and other materials:

1. HRD Times
2. Personnel today
3. Human capital
4. Vision
5. Management and labour studies
6. IIMB management review
7. HR effective
8. Vikalpa
9. www.hrd.com

Course objectives:

To make the students

- To understand the financial management concept and its importance and its applications in business
- To gain knowledge on the sources of finance and the role and functions of chief financial officer.
- To know the concept of time value of money and the rationale for using the time value of money concept in capital budgeting techniques for evaluations of business proposals.
- To recognize the availability of different source of capital and computation of cost of capital.
- To recognize the importance of working capital its application in business.
- To comprehend on the importance of capital structure, the factors which influence the dividend policy.

Course outcomes (Cos):

Learners should be able to

1. Evaluate the various sources of capital and its impact on business
2. Demonstrate knowledge and compute value of money to evaluate the business proposal applying capital budgeting techniques
3. Compute the cost of capital to estimate the optimal capital structure.
4. Comprehend the knowledge of assessing the working of organization to assess the liquidity position of the firm.
5. Discover the knowledge on capital structure, and the determination of dividend policy
6. Develop analytical skills which facilitate the financial decision making in business situations

Unit I

Financial Management, Objectives, Functions, Role of Financial Management, Risk - Return Relationship, Sources of Long Term Finance, Capital Market in India.

Unit II

Capital Budgeting , Time Value of Money, Methods of Appraisal, Pay Back Method, Rate of Return, NPV, IRR, Profitability Index.

Unit III

Cost of Capital, Determining component cost of capital, Specific cost of Capital, Overall Cost of Capital, Cost of Equity Capital, Cost of Preference Capital, Cost of Debt, and Weighted Average Cost of Capital.

Unit IV

Working Capital Management, Current asset and liability decision, Factors affecting working capital requirements, forecasting working capital requirements.

Unit V

Capital Structure, Optimum Capital Structure, EBIT - EPS Analysis - Leverages - Dividend Policy, Factors determining Dividend Policy.

Note: Emphasis should be given to case discussions and review of articles. Mark distribution - Problems 40 marks and Theory 60 marks.

Text Books:

1. Pandey.I.M, “Financial Management”, 9th Edition, Vikas Publishing House, New Delhi, 2013.
2. Prasanna Chandra, “Financial Management”, 7th Edition, Tata McGraw Hill, New Delhi, 2012.

References:

1. Khan & Jain, “Financial Management”, Tata McGraw Hill, New Delhi.
2. James C Vanhorne, John M Wachowicz Jr, “Fundamentals of Financial Management”, Pearson Education Limited, 2001.
3. Lawrence J Gitman, “Principles of Managerial Finance” Pearson Education limited.
4. Periasamy P, “Financial Management”, Vijay Nichole Imprints, Chennai.

Journals / Additional Readings:

1. Finance India, Indian Journal of Finance
2. Journal of Financial Services and Management
3. Asia Pacific Business Review
4. Corporate India

Course objectives:

To make the students

- To understand the basic framework of operation research and its applications in business decision.
- To develop an understanding of Transportation model for Mathematical formulation of the Transportation problem.
- To identify strategies for to minimize the cost of service through Queuing theory.
- To have a thorough understanding on game theory
- Understand the mathematical tools and professionally allocate scarce resources to optimize and maximise profit.
- To inculcate the knowledge of geometric programming to solve the non linear programs

Course outcomes (Cos):

Learners should be able to

1. Assess the operation research and its applications in business decision.
2. Discover suitable transportation model and apply mathematical formulation of the transportation problem.
3. Apply suitable strategies to minimize the cost of service
4. Analyze the non-linear programming techniques to solve the problems in functional areas
5. Demonstrate separable programming function to design a suitable Programming based on the ethical norms of research.
6. Identify the mathematical software to solve the proposed models

Unit I

Introduction to Operations Research – Meaning – Scope – Models – Limitation and applications in management decision making. Linear Programming – Formulation– Graphical method – Simplex method (Problems using slack variables only)

Unit II

Transportation model- Mathematical formulation of the Transportation problem-Initial Basic Feasible solution - Optimum solution for non degeneracy and degeneracy models - Unbalanced Transportation problems and Maximization case in Transportation problem The Assignment problem - Mathematical formulation of the problem – Hungarian method –Unbalanced Assignment problem-Maximization case in Assignment problem.

Unit III

Queuing theory: Introduction – Characteristics of queuing system –Single server finite and infinite capacity models. Game Theory: Two Person-Zero-Sum Game- Saddle Point- Value of Game- Dominating Strategy- Mixed Strategy.

Unit IV

Nonlinear Programming: Introduction – Formulating lagrangian function – Formulation of NLP – General Nonlinear Programming problem – Methods of NLP – Graphical solution methods – Quadratic Programming – General mathematical model – kuhn tucker conditions – applications of quadratic programming

Unit V

Separable Programming – separable functions – reduction to separable form – piece-wise linear approximation of nonlinear functions – mixed linear approximation of separable NLP. Geometric programming – general form of geometric programming – necessary condition for optimality – primal GP with equality conditions. Stochastic programming – sequential stochastic programming – Non-sequential stochastic programming

Note: Problems 60 Marks and Theory 40 Marks

Text Books:

1. Franks S.Buknick Mcleavey, Richard Mojena, “Principles of Operations Research for Management”, AITBS publishers, 2002. (Unit I – III)
2. J.K Sharma, “Operations Research- Theory and Applications”, MacMillan Publishers India Pvt Ltd, 2013. (Unit IV – V)

References:

1. Kanthi Swarup, P.K. Gupta, Man Mohan. "Operations Research", Sultan Chand & Sons, New Delhi, 2010.
2. Anand Sharma, "Operations Research", Himalaya Publishing House, 2004.
3. Dr.S.D.Sharma, "Operations Research", Kedar Nath Ram Nath & Co, 2002.
4. V.K.Kapoor, "Operation Research Techniques for Management", Sultan Chand & Sons, 2001.

Course objectives:

To make the students

- To understand the basic framework of research and research process and its important in business decision.
- To learn the research situations from the management perspective
- To develop an understanding of various research designs and sampling techniques and its application.
- To identify appropriate sources of information and methods of data collection for solving a business issue.
- To understand the selection of appropriate tools to analyse the quantitative and qualitative data.
- Disseminate the knowledge of research report and be familiar with the content to be included in the report.

Course outcomes (Cos):

Learners should be able to

1. Assess the best suitable research type and formulate the research objective for the business problem.
2. Identify and design a research process to solve the real time issues in the organizations
3. Formulate the suitable research designs and select appropriate sampling techniques for the research.
4. Practice the appropriate data collection method for solving the business issue and decide the appropriate measurement scale for designing the instrument for data collection.
5. Evaluate the appropriate analytical tools for the data collected and formulate a suitable suggestion for the business problem.
6. Demonstrate capabilities of designing a suitable research report based on the principles of research.

Unit I

Research Scope and Significance- Types of research- research process- Characteristics of good research-criteria for good research- objectivity in research - Problems encountered by Researchers in India.

Unit II

Research Design- meaning- classification- features – importance - selection of research problem - steps in research design - Sample design - meaning- concepts - steps in sampling - criteria for good sample design – sampling types.

Unit III

Data collection:- Types of data - sources - Tools for data collection methods of data collection - constructing questionnaire - Pilot study - case study - Data processing:- coding - editing - and tabulation of data - Measurement - meaning – need- Errors in measurement - scaling Techniques - meaning - Types of scales - scale construction techniques.

Unit IV

Data Analysis: Hypothesis – Meaning – Types - Test of Significance - Assumptions about parametric and non-parametric tests. Non-Parametric Test: One Sample Test - Sign Test, Chi-Square Test, ANOVA, Run test for randomness - Factor analysis.

Unit V

Interpretation- Meaning – Techniques - Charts and Diagrams - Report Writing- Significance, STEPS- Layout- Types Of Reports - Oral Presentation- Executive Summary - Precautions For Writing Report- Norms For Using Tables, Charts And Diagrams. APPENDIX: Norms for using index and bibliography- conventions relating to preparation of research reports.

Note: Problems 20 Marks and Theory 80 Marks

Text Books:

1. R.Paneerselvam, “Research Methodology”, Prentice Hall of India Pvt Ltd, 2007.
2. C.R.Kothari, “Research Methodology: Methods and Techniques”, New Age International Pvt Ltd, 2008.

References:

1. Dr. Deepak Chawala and Dr. Neena Sondhi, “Research Methodology concepts and cases”, Vikas Publishing House Pvt Ltd, 2011
2. Bill Taylor, “Research Methodology: A Guide for Researchers in Management and Social Sciences”, Prentice Hall of India pvt ltd, 2007.
3. William Zikmund, “Business Research Methods”, South Western Publishers, 2003.

Journals:

1. IUP Management Research
2. International Journal of Economic Research.
3. International Journal of Economics Research
4. Journal of Marketing Research
5. HRM Review

Course Objectives:

- The course has been introduced in order to make them use statistical package for their research
- Make the students to prepare data sheet and manipulate the data.
- Learn an organization's information systems and technology decision making processes.
- To gain in-depth knowledge on research situations from management perspectives
- To train them to access different statistical tools and interpret the results
- To gain data analytics skills to solve the business/Research problem.

Course Outcomes (Cos):

1. Effectively to apply the statistical package to analyze the research problem under study
2. Evaluate the usage of graphical presentation of data for dissemination of information to audience
3. To analyze the real time data by use of appropriate tools at any given situation in order to come with conclusion
4. Experts in handling data files and carry out basics statistical analysis
5. Get acquainted with advanced statistical tools and bring out appropriate solutions to business problems
6. Develop data analytics skills and meaningful interpretation to the data sets so as to solve the business/Research problem.

Unit I

SPSS – Meaning – scope- Limitation- Data view- Variable view- Data entry procedures

Unit II

Data editing- Missing-Recoding Using Transform - table scores- Frequencies Distribution – Diagram –Graphs.

Unit III

Descriptive statistics – Mean, Median, Mode Squeezes – kurtosis – Standard Deviation

Unit IV

T- Test for Independent sample and X test – ANOVA

Unit V

Correlation – Rank correlation – Regression – charts

Text Book:

1. Darren George, “SPSS for Windows step by step”, 7th Edition

Course Objectives:

- To assess the overall knowledge of the student in the relevant field of Management
- Realize the knowledge and skills required to excel in their career
- To test their learning and understanding of various concepts of the syllabus during the course of their programme
- To acquaint the students with fundamentals of communication and help them to transform their communication abilities
- To understand the frameworks and tools to effectively analyze and approach various Organizational situations.
- To prepare the students to face interview both in the academic and the industrial sector

Course Outcomes (Cos):

1. Students get equipped with skills and knowledge to excel in their future careers
2. To develop an in-depth knowledge on the management concepts, theories and principles
3. Develop an ability to analyse and interpret contents and concepts to provide meaningful information in making management decisions
4. Recognize the application of various techniques to achieve the objective of the task
5. Determine opportunities and emerging challenges in the upcoming business trends
6. Demonstrate capabilities of problem-solving, critical thinking, and communication skills related to various courses.

A Comprehensive Viva Voce will be conducted at the end of the Semester. The panel shall consist of an external expert and faculty members who handled the courses. The viva is aimed to evaluate the student's knowledge in all the core and elective courses in the particular semester.

Course Objectives:

- Help the Students in developing their communication skills, especially presentation before the group.
- Develop and improve discussion skills
- The students will be able to analyze any given issue and to present before an identified group.
- Identify and comprehend main ideas and supporting idea in detailed manner
- Manage timings on discussion
- Develop and present options based on selected materials

Course Outcomes (Cos) :

1. Manipulate the functions and operations related to management
2. Demonstrate capabilities of problem-solving, critical thinking, and communication skills.
3. Organize and participate in business meetings and presentations
4. Identify ways to make information more accessible to audience
5. Students will demonstrate the ability to construct a paper consistent with expectations of the discipline, including an appropriate style
6. Evaluate an enthusiastic and well-practiced method of presentation

In second Semester the seminar shall be on the topics related to Trade, Industry, Commerce, Corporate world and Corporate Affairs.

Course Objectives:

- To train the students on analytical aptitude and reasoning
- To provide enhanced recruitment and better training activities.
- To develop employability and enterprise skills, such as teamwork and communication.
- To develop positive attitudes in the pupils towards study and work.
- To provide students with impartial advice about options that is available to them
- To provide equal opportunity of access to careers inspiration and guidance.

Course Outcomes (Cos):

1. Practice the quantitative and reasoning ability to analyze the business issues
2. Demonstrate the critical thinking and problem-solving techniques
3. Disseminate the knowledge of data arrangement and presentation
4. Develop competent management professional skills
5. Develop proactive thinking so as to perform effectively in the dynamic socio-economic and business ecosystem.
6. Ability to communicate effectively.

Quantitative & Reasoning Ability: - Number Theory - Number series - Blood Relation - Averages - Ratios and Proportions - Venn diagram, Syllogism – Percentage- - Profit and Loss - Problems on Interests - Data Interpretation - Image Analysis - Time speed and Distance - Coding and De-coding - Problems on Trains and Boats - Problems on Ages - Data Arrangement - Time and Work - Pipes and Cisterns - Directions

15 OEP201L HUMAN RESOURCE MANAGEMENT (OPEN ELECTIVE)

Course Objectives:

- To make students aware on Human Resources and their scope in organization
- To provide knowledge on Job involved in HR, Training, Compensation and Labour welfare practices.
- To train the students in recruitment and selection process
- To disseminate the knowledge of labour welfare measures practiced in organizations
- To get insight the concept of collective bargaining and worker's participation in management
- To understand the current issues, trends, practices, and processes in HRM

Course Outcomes (Cos):

1. Helps in effective management of human resources and to plan key human resource functions within organization.
2. Enhanced recruitment skills and career development
3. Utilize the knowledge to gain the competitive advantage through people
4. Acquire the skill to conduct organizational Training and performance appraisal.
5. To develop human relations and facilitate collective bargaining
6. To examine the current issues, trends, practices, and processes in HRM

UNIT I

Human Resource Management - Definition - Objectives - Functions - Scope -Importance - HRM in India - Evolution of HRM - Quality of a good Human Resource Managers- Human Resource Planning - Job Analysis, Job description and Job Specification.

UNIT II

Recruitment and Selection - Sources of Recruitment - Selection Process – Test Types - Interview Types - Career Planning - VS Man Power Planning and succession Planning - Career Planning - Process - Career Development -Placement and Induction.

UNIT III

Training - Methods of Training - Executive Development – Performance Appraisal - Methods of Performance Appraisal - Transfers – Promotion

UNIT IV

Industrial Relations - Meaning & Characteristics Industrial Relations - Parties to Industrial relations - Nature of Trade Unions - Problems of Trade Union -Measures to Strengthen Trade Union Movement in India - Causes for Industrial Disputes - Settlement of Industrial Disputes.

UNIT V

Collective - Bargaining - Features - Pre-requisite of Collective Bargaining -Agreement at different levels - Workers Participation in Management-Objectives for Successful Participation.

4. IIBM Management Review

Course Objectives:

- To provide theoretical foundations of entrepreneurship
- To acquaint students with the special challenges of starting new ventures and introducing new product and services ideas
- To train the students on entrepreneurial ethics and project management
- Knowledge on various sources of institutional finance
- Knowledge on setting up of small business and entrepreneurial performance
- To make understand the rural entrepreneurship and women entrepreneurship in all round industrialization

Course Outcomes (Cos):

1. To inculcate entrepreneurial skills
2. Categorize the promotional measures and forms of business for entrepreneurs
3. Design and development the project and undergo feasibility analysis
4. Evaluate the best sources of finance suitable for financing projects
5. Analyze the reasons of business sickness and develop self preventive techniques
6. Communicate effectively the promotion of women entrepreneurship

Unit I

Entrepreneur – Meaning - Nature – Importance – Characteristics and Types- Qualities- Entrepreneur Vs Intrapreneur - Role of Entrepreneurship in the Indian Economy – Entrepreneurial Environment – Entrepreneurship and economic development.

Unit II

Evolution of Entrepreneurs – Entrepreneurial promotion: Training and development of entrepreneurs - Entrepreneurial Motivation – mobility of Entrepreneurs – Entrepreneurial change – occupational mobility – factors in mobility – Role of consultancy organizations in promoting Entrepreneurs – Forms of business for Entrepreneurs.

Unit III

Entrepreneurial Careers, education and Training – Entrepreneurial Ethics. Project management: Sources of business idea – project classifications – identifications – formulation and design – feasibility analysis – Preparation of project report and presentation.

Unit IV

Project finance: Sources of finance – Institutional finance – Role of IFC, IDBI, ICICI, LIC, SFC, SIPCOT, and Commercial Bank – Appraisal for bank loans. Institutional aids for Entrepreneurship development – Role of DICS, SIDCO, NSICS, IRCI, SIDBI, SISI, SIPCOT, Entrepreneurial guidance bureau – Approaching institutions for assistance.

Unit V

Steps in setting SSI unit – Selection of location of enterprise- problems of Entrepreneurs – sickness in small scale industries – reasons and remedies – incentives and subsidies – Evaluating Entrepreneurial performance – Rural Entrepreneurship – Women Entrepreneurship – International Entrepreneurship - The future of Entrepreneurship.

Note: Emphasis will be given to case discussion and article reviews

Course Objectives:

- To make one to understand the global concepts used in financial management.
- To know the functions and its application in financial decision making.
- To get insights in the foreign exchange markets
- To gain knowledge on international financial decisions of various international financial institutions
- To get insights into the competencies required to become an effective financial manager
- To practice the students with the intricacies of international business in terms of investment with monetary systems.

Course Outcomes (Cos):

1. Identify the basis global trade and trade transaction mechanism
2. Analyze the foreign exchange rate and factors influencing fluctuations
3. Estimate the flow of Foreign Direct Investment and its impact on Indian economy
4. Ability to evaluate the functioning of international financial institutions
5. Assess the resources of Financing of foreign trade
6. To discover facts on foreign trade.

Unit I

International Trade – Meaning and Benefits –Basis of International Trade – Foreign Trade and Economic Growth – Balance of Trade –Balance of payment – Current Trends in India –Barriers to International Trade- World Trade Organisation, Trends in world trade, International trade finance.

Unit II

Foreign Exchange Markets- Market Participants – Types of Transactions - Spot Prices and Forward Prices – Factors influencing Exchange rates – Determination of Foreign Exchange rate and Forecasting – Foreign Exchange Exposure - Measurement and Management.

Unit III

International investment decisions – **Political risk** - Foreign Direct Investment – **Foreign Institutional Investors** – International capital budgeting – International portfolio investment.

Unit IV

International financial decisions – Multilateral Development Banks – World Bank – International Finance Corporation – International banking – International financial market instruments.

Unit V

Financing of foreign trade – Documentation- Mode of payment – Methods of trade financing – EXIM Bank, ECGC and its schemes - International taxation.

Note: Emphasis will be given to case discussion and article reviews

Course Objectives:

- To understand the concept of costing and cost reduction methods.
- To make students to learn to manage total cost and production costing.
- To provide knowledge on the process of various costing methods and management.
- To understand the concept involved costing related to business decisions.
- Provide insight in strategic cost management
- To learn the techniques of cost management that are effective and ethical

Course Outcomes (Cos) :

1. Illustrate the cost sheet and cost reduction methods to improve organizational productivity.
2. Estimate the total cost and production cost to source competitive advantage
3. Evaluate cost control systems and various costing methods and management
4. To analyze the cost function in mathematical methods.
5. Analyze productive results on cost management and reduction
6. Interpret knowledge in Market Based and Cost Based Transfer Prices and Multinational Transfer Pricing.

Unit I

Costing- Purpose- Utility, objectives-Elements of Cost- Cost Sheet –methods of costing – Problems - Cost reduction and productivity: Cost reduction value analysis- productivity- Value added concepts- Learning curves- quality circles.

Unit II

Total cost management- Managing process cost- Managing production costs- Managing delivery costs- Managing structural cost. Target costing - cost as a source of competitive advantage - Life cycle costing

Unit III

Activity based costing - Drawbacks of conventional costing- Methodology of ABC - Merits, demerits suitability of ABC - implementation of ABC. Management control systems - evaluating management control systems - responsibility centers- Evaluation of the performance of different responsibility centers- Problems.

Unit IV

Linear programming and regression analysis- Implications of Linear Programming for cost accountants - Guidelines for regression analysis- Applications of regression analysis in cost functions.

Unit V

Strategic control systems - Decentralization and Transfer pricing - Choices about responsibility centers-Market based and cost based transfer prices- Multinational transfer pricing.

Note: Emphasis will be given for case discussion and review of articles

3. Indian Journal of Finance
4. IFCAI Applied Finance

Course Objectives:

- Understand the various ways of generating funds in to an organization and ways and means of investing surplus.
- To understand the regulation of merchant banking
- To know about mutual funds and the concept of factoring
- To learn the concepts of leasing and effective management of financial resources
- To provide knowledge on hire purchase and investment
- To understand the importance of various credit rating techniques

Course Outcomes (Cos):

Learners should be able to

1. To assess the regulation of merchant banking.
2. To estimate the benefits of mutual funds and the concept of factoring.
3. Classify the different factoring that helps in investment decision making
4. Develop skill to explore new avenues in business operations
5. Developing capabilities of evaluating leasing techniques
6. To manage hire purchase and investment.

Unit I

Nature and scope of merchant banking – Regulation of merchant banking – overview of current Indian merchant banking scenario – procedural aspects of primary issue – pre-issues decision making – post issue management.

Unit II

Mutual funds – operation – performance – SEBI guidance for mutual funds securitization – concept, securitization as a funding mechanism, securitization of residential real estate – mortgages & mortgage investments.

Unit III

Concept of factoring – forms of factoring Vs Bill discounting – Factoring Vs credit financing – factoring Vs forfeiting – Evaluation of a factor – legal aspects of factoring – Factoring services in India – Bill of exchange – Definition – Features.

Unit IV

Leasing – History & Development – Concept & classification – types – Advantages – Disadvantages- legislative framework – supplier, lessor, lessee relationship – sub lease – Default & remedies – lease evaluation in lessee's and lessor's point of view.

Unit V

Hire purchase – concept & Characteristics – rate of interest – legal aspects – tax implication frame work for financial evaluation – credit rating – concept – types – advantages & disadvantages – credit rating process – credit rating agencies.

- Students understand the business system concepts and role of systems analyst
- Understand the processes of constructing the different types of information systems
- Provides knowledge on system planning and investigation
- To make the students to know the use of systems design techniques, methodologies, and tools
- Make students proficient in systems specializations.
- To make the students understand the system implementation and security aspects of system

Course Outcomes (Cos):

1. Effectively perform the role of system analyst
2. Construct a model to carry out the feasibility study and cost benefit analysis
3. Comprehend knowledge on system design and system security to improve the productivity of system management.
4. Implement code of ethics in system management
5. Provide a solid foundation of systems principles and an understanding of how business function is carried on
6. Gain expertise in system testing and quality assurance

Unit I

Overview: Introduction - business Systems concepts, The system development life cycle – life cycle models - waterfall model, prototyping model, incremental model, spiral model, RAD model - Role of systems analyst.

Unit II

System Analysis: System planning and Initial Investigation - Information gathering - Tools of structured analysis - Feasibility study, Cost benefit analysis.

Unit III

System Design: The process and stages of system design - Major development activities - Input and output forms design - File organization and database design - Sequential - Logical and Physical views of data - Normalization.

Unit IV

System Implementation: System testing and quality assurance -The nature of test data - The test plan-Quality Assurance - Role of the data processing auditor - Implementation and software maintenance hardware/software selection, Project Scheduling and Software.

Unit V

System Security: Introduction, definition and Threats to system, security, control measures.

Disaster/recovery planning: the plan, Ethics in system development, ethic codes and standards of behavior.

Note: Emphasis will be given to case discussion and article reviews.

Text book:

1. Elias M.Awad, "System analysis and design", 2nd Edition, Galgotia publication, New Delhi, 2010

References:

1. Jr Jain. V.K., "System Analysis and Design", 1st edition. Dream Tech Press, New Delhi 2009.
2. Senn, "Analysis and Design of Information System", Mc Graw Hill 2009.
3. Alli Baharami, "Object Oriented Systems Development", 1st edition. McGraw Hill 2010.

Course Objectives:

- Disseminate knowledge to students on recent trends and developments in technology which covers e-Commerce e-Security, e-Logistics and knowledge management aspects.
- Learn about the physical components needed for information system in Nanotechnology.
- To acquaint with network security systems.
- To provide a clear understanding of e-learning models on e-logistics and supply chain management.
- To give better understanding of knowledge management
- To provide clear view on GIS Standards & Standardization process of GIS development

Course Outcomes (Cos) :

1. Familiarity with e-commerce simplifies the workload in personal and organizational system.
2. Develop skills on e-security which improves the efficiency in work.
3. Helps to develop network security in relevant areas
4. Design a e-learning models that provides a clear understanding on e-logistics and supply chain management.
5. Illustrate how current technologies and decision-support tools can be utilized to the advantage of business operations
6. Communicate effectively knowledge management techniques

Unit I

Overview of an E-Commerce, Internet, Intranet, Extranet, Goals of E-Commerce – Difference between E-Commerce and E-Business- Models of E-Commerce- Limitations and Advantages of E-commerce, Banking-Transactions: Inter-Banking, Intra Banking, Electronic Payments, (Payment-Gateway Example)- Securities in E-Banking-SSL, Digital Signatures, Service Provided- ATM Smart card, ECS- Electronic Clearing System- Telephone, Electricity Bills.

Unit II

E-Security- Firewalls, Electronic Market, E-shop, Introduction to Security, Types of Securities, security tools, Network Security. CRM: Sales, Marketing and Service Management, BPO/BCP- Needs-Guidelines-Merits & Demerits, Call Center-Functioning, Ethics, Disaster Recovery Management, Case Study.

Unit III

Content Management and Disseminations: E-learning-Models WBT, CBT, Virtual Campus, LMS & LCMS, Video conferencing, Chatting, Bulletin, Building Online community, Asynchronous and Synchronous Learning, Case Study.

Unit IV

E-Logistics- Logistics and Supplier Chain Management, Warehousing management, Transportation/Distribution Management. E-Governance models- G2B, G2C, C2G, G2G- Challenges to E-Governance, Strategies and tactics for implementation of E-Governance- Case Study.

Unit V

Knowledge Management-Components- Types –models-Knowledge Management Cycle- tools- approaches. GIS/GPS-Nature of geographic data, Spatial objects & data models, Getting map on computers, GIS Standards & Standardization process of GIS development, Implementation and deployment Phases.

Note: Emphasis will be given to case discussion and article reviews.

Text Book:

1. **Gerard** H. Gaynor, “Handbook of Technology Management”, Tata Mcgraw Hill 2009.

References

1. E-Governance: Case Studies-Ashok Agarwal , Hyderabad, India Universities Press 2008.
2. Management Information System-Jawadekar, Mc Graw Hill Education Books In India.
3. The Essential Guide to Knowledge Management - Amrit Tiwana , Prentice Hall

Course Objectives:

- To make students understand the the impact of the implementation of new software, hardware, and networking technologies
- Provides knowledge on process models that can be utilized to the advantage of business operations
- To understand the process of software design and components
- To know about the life cycle process of the software testing and methods
- To know about the concept of quality in software development.
- To exhibit knowledge software configuration and management

Course Outcomes Cos) :

1. Design models to manage the data resources of organizations.
2. Expertise on software design creates career opportunities
3. Hands-on implementation of a data base in corporate environment
4. Gain knowledge in software design
5. Helps to bring new techniques in Software testing
6. Expertise in Software Configuration and Management

Unit I

Fundamentals -A Generic View of Process – Process Models – The Waterfall Model – Incremental Model –Evolutionary Model – Specialized Model – The Unified Process – Agile Process – Agile Models – Software Cost Estimation – Planning – Risk Analysis – Software Project Scheduling.

Unit II

Requirement Analysis -System Engineering Hierarchy – System Modeling – Requirements Engineering: Tasks – Initiating the Process – Eliciting Requirements – Developing Use Cases – Negotiating Requirements – Validating Requirements – Building the Analysis Models

Unit III

Software Design- Design Concepts – Design Models – Pattern Based Design – Architectural Design – Component Level Design – Component – Class Based and Conventional Components Design – User Interface – Analysis and Design.

Unit IV

Software Testing – Strategies: Conventional – Object Oriented – Validation Testing – Criteria – Alpha – Beta Testing – System Testing – Recovery – Security – Stress – Performance – Testing Tactics – Testing Fundamentals – Black Box Testing – While Box Testing – Basis Path – Control Structure.

Unit V

SCM And Quality Assurance-Software Configuration and Management – Features – SCM Process – Software Quality Concepts – Quality Assurance – Software Review – Technical Reviews – Formal Approach To Software Quality Assurance – Reliability – Quality Standards – Software Quality Assurance Plan.

Note: Emphasis will be given to case discussion and article reviews.

Text Book:

1. Roger Pressman. S, “Software Engineering: A Practitioner's Approach”, Sixth Edition, Tata Mc graw Hill 2007

References:

1. Fleegeer. P, “Software Engineering”, Prentice Hall of India, 2009
2. Carlo Ghezzi, Mehdi Jazayari, Dino Mandrioli, “Fundamentals of Software Engineering”, Prentice Hall of India, 2010.
3. Sommerville, “Software Engineering”, Seventh Edition, Addison Wesley, 2011

Course Objectives:

- To make the students understand the ways and means of finance for entrepreneurs.
- To get familiar with various sources of funds available for capital formation.
- To highlight the importance of various decision making areas of financial management
- Students get acquainted with the short term sources and cash management
- Knowledge on venture capital, hire purchase and leasing
- To train the students in project plan preparation.

Course Outcomes (Cos):

1. Estimate planning and capital expenditures related to project.
2. Developing the skills required to be a successful entrepreneur.
3. Evaluate the ways and means of raising funds to the business including forms of financing.
4. Develop competency in venture capital, hire purchase and leasing
5. To maintain ethical standards in individual and business life
6. The student will be able to apprehend different level of facilities available to run the business

Unit I

Project planning & Project Appraisal: Concepts - Capital Expenditures - Importance and difficulties - Phases of Capital budgeting - Levels of Capital budgeting - Estimation of Project Cash flows -Expenditures - Time value of money. Payback period - NPV of inflows - IRR concepts -Cost of acquiring capital - Planning of portfolio. Risk Analysis - Economic Risk - Industry Risk - Company Risk - Financial Risk.

Unit II

Sources of Finance: Various sources of Finance available: Long term sources -Equity Shares, Preference Shares and debentures- Kinds Private Placements- IPO-SEBI- FDI- Institutional Finance - Banks - IDBI, IFCI, IIBI, ICICI, SIDBI, SFC's in India - Merchant Banks in India - NBFC's in India - their way of financing in India for small and medium business.

Unit III

Short Term Sources: banks and financial Institutions that give short term finance - Bills Discounting - Factoring - Working Capital - Concepts - Importance -Cash Management - Inventory Management - Receivables Management - Sources of Working Capital.

Unit IV

Venture Capital, Hire Purchase And Leasing: Venture capital - meaning - origin - importance - Venture capital in India - Benefits. Hire Purchase - Concept - Evaluation of Hire Purchase Proposals - Leasing - Overview -Tax aspects - Lease Accounting - Evaluation of Leasing Proposals.

Unit V

Preparing the Financing Plan: General considerations - Construction Financing- Long term financing - Withholding Tax Considerations - Estimating the Borrowing capacity of a project- Loan repayment. Parameters - Borrowing Capacity, assuming full Draw down Immediately prior to project Completion & Periodic Loan Draw downs - applications to Hypothetical High Speed rail Project- Annual Coverage Tests.

Text book:

1. Indian Financial Systems - M. Y. Khan. (Tata McGraw - Hill Publishing Corporation Limited, New Delhi).

References:

1. Projects - Planning, Analysis, Selection, Implementation and Review - Prasanna Chandra. (Tata McGraw - Hill Publishing Corporation Limited, New Delhi).
2. Financial Markets - Gordon & Natarajan. (BPB Publications).
3. Investment Management - V. K. Bhalla. (S. Chand & Company Publishers Ltd.,)
4. Project Financing- Asset based Financial Engineering - John D Finnerty - John Wiley & Sons Inc, New York

Course Objectives:

- Developing the entrepreneurial skill and promoting the qualities, traits, of entrepreneur and is taught in this course.
- To make them understand the value of entrepreneurial promotions and economic development.
- To provide an overview of the competences needed to become an entrepreneur
- To make them know the available international entrepreneurship opportunities
- Provides knowledge on steps for starting a small industry
- Gain understanding on the role of government in promoting entrepreneurship

Course Outcomes (Cos):

1. Students will gain awareness of entrepreneurial skills
2. Knowledge to setup new ventures and make profitable business
3. Capital Budget planning and carry out feasibility study
4. Generating innovative ideas and find ways to apply these ideas to solve issues and problems in different industries and settings.
5. Knowledge to appraise the environment and start new ventures
6. Analyze the role of government in business

Unit I

Entrepreneur - meaning- importance-Qualities, nature, types, traits, culture, similarities and economic and differences between Entrepreneur and Intrapreneur. Entrepreneurship development-its importance- Role of Entrepreneurship -Entrepreneurial environment.

Unit II

Evolution of Entrepreneurs - Entrepreneurial promotion. Training and development - motivation: factors - mobility of Entrepreneurs - Entrepreneurial change - occupational mobility-factors in mobility - Role of consultancy organizations in promoting Entrepreneurs - Forms of business for Entrepreneurs.

Unit III

Creating and starting the venture - Steps for starting a small industry - selection of types of organization - International entrepreneurship opportunities.

Unit IV

Managing, growing and ending the new venture - Preparing for the new venture launch - early management decisions - Managing early growth of the new venture - new venture expansion strategies and issues - Going public - ending the venture.

Unit V

Entrepreneurship Development and Government: Role of Central Government and State Government in promoting Entrepreneurship - Introduction to various incentives, subsidies and grants - Export Oriented Units - Fiscal and Tax concessions available. Women Entrepreneurs - Reasons for low / no women Entrepreneurs their Role, Problems and Prospects

Text book:

1. Vasanth Desai "Dynamics of Entrepreneurial Development and Management Himalaya Publishing House

References:

1. N.P.Srinivasan & G.P.Gupta, "Entrepreneurial Development", Sultanchand & Sons.
2. P.Saravanelu "Entrepreneurship Development", Eskapee Publications.
3. Satish Taneja, "Entrepreneur Development", New Venture Creation.
4. Robert D.Hisrich, Michael P.Peters, "Entrepreneurship Development", Tata McGraw Hill edition.

Course Objectives

- To make students understand all aspects of Project Management covering project identification formulation, planning, scheduling & control.
- Enable students to acquire concepts, tools & techniques of project management.
- To sensitize the students to complexities of project management.
- To enhance the students of project financing and development banks
- To know the implementation of project and preparation of project report
- To evaluate the project performance and evaluation of costs.

Course Outcomes (Cos):

1. Inculcate in the students the expertise required for formulating project ideas and projecting cash flows as well as evaluation of project proposals.
2. To analyze project feasibility
3. To know the difficulties in project implementation and provide solutions
4. Analyze the learning and understand techniques for Project planning, scheduling and Execution Control.
5. Helps students to develop project models
6. Initiate students to carry out social and government projects

Unit I

Project management – Concept of a Project – Categories of Project - Project life cycle- Definition of project management - The project as a conversion Process - project environment - complexity of projects - the relationship between project Management and line management - current issues in project management- system approach to project management - Roles and responsibilities of project manager.

Unit II

Project planning - project planning as a value adding activity - process of project planning - managing the planning process - communicating project plans - dealing with increased complexity through net work diagrams - Analyzing the network- Critical Path Analysis - Activity on Nodes diagramming- Dealing with the uncertainty Programme Evaluation and Review Technique- Computerized Project Management - planning with standards.

Unit III

Project financing and development banks - Development banking and western world - debt Equity ratio - Equity and Preference Share Capital - Internal Generation of Funds - Leasing Financing - Public sector bonds - Debentures- Assistance from International financial - Short Term funds for Working capital- All India Development Corporation- Specialized Institution - Investment Institution - means of financing - project financing package - procuring funds.

Unit IV

Project implementation - stages - Bottlenecks in project implementation - Guidelines for effective implementation - Management techniques for project management - project monitoring - essentials - roles - tools and techniques - Project management performance indicators performance improvement - project management environment - management reporting - report designing - project evaluation - project review.

Unit V Project feasibility study - Market Feasibility - Technical Feasibility - Financial Feasibility - Economic Feasibility - Critical Success factors- Demand forecasting techniques.

15MBAPB303A FUNDAMENTALS OF COMMERCIAL BANK MANAGEMENT 4004

Course objectives:

- To understand the history and growth of banks and process of financial intermediation
- To understand the basic concepts of advances, deposits and Negotiable Instruments Act.
- To make the students understand the nuances of modern banking.
- To know the principles for lending services and other agency services of financial institutions
- To know the procedure for Opening of bank accounts, Types of deposit account: Savings account, Current account
- To provide the knowledge of e-banking and its impact of business operations

Course outcomes (Cos):

1. Analyze the banking services offered and recommendations of committees on banking process.
2. Categorize various Negotiable Instruments, Duties of paying and collecting banker
3. Create bank account and evaluate the bank rate for securities
4. Demonstrate knowledge of the liabilities of paying and collecting banks - bills of exchange and promissory notes.
5. To assess various services provided by the banks
6. Gain knowledge in e-banking ,m-banking and Cheque Transaction System

Unit I

Introduction to Banking: Role of banks, Brief History of banking in India, Structure of banking sector in India, Rationale of Banking Sector reforms, Basle Committee recommendations, Banker Customer relationship, RBI Act (Salient Features), Latest recommendations of Basel Committee.

Unit II

Negotiable Instruments – Cheques - Meaning, Characteristics, Crossing, Endorsement, Duties of paying banker, Duties of collecting banker, bouncing of cheques. Liabilities of paying and collecting banks

Unit III

Deposits - Opening of bank accounts, Types of deposit accounts: Savings account, Current account, fixed deposit, Recurring deposit, Certificate of deposit, KYC Norms. Monthly income plan.

Unit IV

Advances - Principles of Sound Lending, Methods of granting advances, Types of securities, Modes of creating charges, Bank guarantees, Interest rates: Base rate, Fixed vs. floating rates, Registration of charges with ROC. RBI norms on bank charges

Unit V

Other Services - ATM, EFT, e-banking, m-banking, Cheque Transaction System, Ancillary businesses: DD, Safe deposit lockers, Credit cards, Debit cards, Smart cards, NEFT/RTGS, Call center.

Text Book:

4. Timothy W. Koch and S. Scott Macdonald, *Bank Management*, Bangalore: Thomson South-Western, 2009.

Course objectives:

- To know the banker customer relationship and KYC norms
- To understand the basics of low cost, no cost and high cost deposits.
- To study on importance of nomination and the rules governing non-resident accounts.
- To understand the various types of term deposits
- To understand use of decision tools for effective resources mobilization and management
- To study the Nomination facilities, Deceased accounts, Inoperative accounts, Accounts of non-residents

Course outcomes (Cos) :

1. Create bank deposits and aware of banking relationship
2. Infer knowledge of saving deposits and its process
3. Demonstrate the creation of current account and its process
4. The knowledge of Payment of interest and Service charges, Issue of cheque books, closing of accounts
5. Knowledge of opening accounts and building customer relationship
6. Illustrate the different types of deposits and nomination facilities available

Unit I

Opening of deposit accounts - Relationship with customers, Opening of accounts: Individuals, Illiterate persons, Minors, Blind persons, Firms, Associations and Limited Companies. HUF

Unit II

Savings deposits - Introduction, Savings Bank account rules, Passbooks/Statement of accounts, Payment of cheques, Collection of cheques, Payment of interest and Service charges, Issue of cheque books, closing of accounts.

Unit III

Current Deposits - Introduction, Current account rules, Procedure of return of unpaid cheques, Minimum balance, Service charges, Statement of current accounts, closing of accounts.

Unit IV

Term deposits - Introduction, various types of term deposits: Fixed deposit, Monthly income plan, Recurring deposit, Payment of deposit: On due date, Pre-payment, Renewal of deposits, Advances against bank's own deposit - Base rate

Unit - V

Other Aspects - Nomination facilities, Deceased accounts, Inoperative accounts, Accounts of non-residents: NRE, NRO and FCNR accounts. DICGCI (Deposit Insurance alone). NRI

3. Reserve Bank of India, *Non – Resident Accounts*, Mumbai: Foreign Exchange Dealers' Association of India, 2000.
4. Reserve Bank of India, *Non – Residents Accounts*, Mumbai: Foreign Exchange Dealers' Association of India, 1992.

Course objectives:

- Understand the purpose of lending and the elements of income for banks.
- Understand the types of credit facilities and the procedure for granting various types of advances
- Understand the different types of securities and the methods of creating charges.
- To know the Agricultural Lending, Direct and Indirect Finance, and financing of Micro and Small enterprises
- To disseminate the knowledge of various financial bills
- To provide clear understanding of various credit available to customers and calculation of EMI

Course outcomes (Cos):

1. Create bank deposits and aware of banking relationship
2. Infer knowledge of saving deposits and its process
3. Demonstrate the creation of current account and its process
4. The knowledge of Payment of interest and Service charges, Issue of cheque books, closing of accounts
5. Knowledge of opening accounts and building customer relationship
6. Illustrate the different types of deposits and nomination facilities available

Unit I

Introduction to Advances - Lending, Profit maximization: Spread, Burden, Net Interest Income, Net Interest Margin, Net Interest expenses, Non Interest Expenses, Non-Interest income. Cost minimization

Unit II

Credit facilities and Securities - Principles of Sound lending, Methods of granting advances, Types of Securities, Modes of creating charges, Floating charge, Consortium lending, credit syndication. Pledge of shares

Unit – III

Priority Sector advances - Rationale of Priority Sector advances, Targets and sub targets under priority sector advances, Agricultural Lending: Direct and Indirect Finance, Micro and Small enterprises, weaker sections. SIDBI

Unit – IV

Bills Business - Introduction to Bills, Bills Purchased (clean bills), Bills purchased (Demand documentary bills), Bills discounting (Usance Bills). Foreign bills

Unit - V

Retail Lending - Home loans, Educational loans, Credit Cards, Consumer loans, other personal loans, Calculation of EMI: Effect of quantum of advance, repayment period and Interest rates on EMI. Impact of fixed and floating rates

Course Objectives:

- To have an exposure in retailing concept and consumer behavior in retail.
- To understand the retail marketing models and theories.
- To evaluate, plan and choose channels of retail distribution strategies.
- To get an insight in Foreign Direct Investment in retail sector
- To know the various retail models being applied in the market
- To know concepts of global retail and factors affecting the success of global retailing strategy.

Course Outcomes (Cos)

1. Apply marketing concepts in retailing and setting trends
2. Demonstrate retailing and its various concepts.
3. Construct business models in retail
4. Create strategies and tools for effective retailing
5. Evaluate marketing tools and techniques to interact with the customers.
6. To analyze the consumers decision making process and threats in global retailing.

Unit I

Retail: Meaning – Functions and special characteristics of a Retailer – Reasons for studying Retailing – Marketing-Retailer Equation – Marketing concepts applied to retailing – Retailing as a career – Trends in Retailing.

Unit II

Retail Model and Theories of Retail Development – Life cycle and phase in growth of retail markets – Business models in retail – other Retail models.

Unit III

Strategic Planning in Retailing: Situation Analysis – Objectives – Need for identifying consumer needs – Overall strategy, feedback and control – consumer decision-making process.

Unit IV

Retail in India: Evolution and Size of retail in India – Drivers of retail change in India – Foreign Direct Investment in retail – Challenges to retail developments in India.

Unit V

Global retail markets: Strategic planning process for global retailing – Challenges facing global retailers – Challenges and Threats in global retailing – Factors affecting the success of global retailing strategy.

Text Book:

1. Swapna Pradhan – Retailing Management – Text and Cases, Tata McGraw Hill – 2nd edition, 2004

References:

1. Barry Berman and Joel R Evans – Retailing Management – A Strategic Approach, Prentice Hall of India, 8th Edition, 2002.
2. James R. Ogden, Denise Ogden – Integrated, Retail Management – Biztantra 2005
3. Gibson G Vedamani – Retail Management – Functional Principles and Practice, Jaico Publishing House, Second edition, 2004.

Course Objectives:

- To understand the store layout plan and inventory management in retailing
- To have an exposure in retailing concept and consumer behavior in retail.
- To acquire knowledge on store layout and effective retail space management
- To understand the store security, insurance and credit management
- To evaluate, plan and choose channels of retail distribution strategies.
- To get an insight in Space Mix and Effective Retail Space Management

Course Outcomes (Cos):

1. Analyze the factors influencing store location and locate stores.
2. Evaluating a Retail Operation, Store Operating Parameters and its various concepts.
3. Eliminate the difficulties in operating a retail business.
4. Applying the Strategic Resource Model in Retailing
5. To understand the Floor Space Management and Retail Method of Inventory Valuation.
6. Estimate the Return on Inventory Investments and Stock Turnover

Unit I

Choosing a Store Location: Importance of location to a retailer – Trading Area Analysis
Regional Analysis – Characteristics of the trading areas

Unit II

Site selection: Actual site analysis and selection – Choice of a general location – characteristics of the available site – Retail store layout – the circulation plan – space mix and effective retail space management – Floor space management

Unit III

Operations Management: Operating a retail business – operations Blueprint – store maintenance, Energy management and renovations – Inventory management – store security – Insurance – Credit management – Computerization – Outsourcing – Crisis Management

Unit IV

Evaluating a retail operation: Store operating parameters – Using the strategic resource model in retailing – designing a performance programme

Unit V

Retail Inventory: Inventory Planning – Return on inventory investments and stock turnover – Inventory Management – Physical and perpetual inventory systems – retail method of inventory valuation

Text Book:

1. James R Ogden and Denise T Ogden – Integrated Retail Management, Biztantra, 2005

References:

1. Barry Berman and Joel R Evans – Retail Management – A strategic Approach, Prentice Hall of India, Tenth edition, 2006
2. Gibson G Vedamani – Retail Management – Functional Principles and Practice, Jaico Publishing House, Second edition. 2004
3. Swapna Pradhan – Retailing Management : Text and Cases – Tata McGraw Hill Publishing Company Ltd., 2004

Course Objectives:

- To understand the basic concepts of merchandising, strategies and forecasting.
- To have an exposure on factors affecting merchandising function and functions of Merchandise Manager.
- To understand the Merchandise Buying and Promotional measures.
- To evaluate the sources, Branding Strategies, Category Management and the Components of category management strategies.
- To know the marketing tools used to gain customers in business
- To get an insight Visual Merchandising, Display Planning and Characteristics of effective display trends.

Course Outcomes (Cos) :

1. Demonstrate knowledge in merchandising and its various concepts and how it is done in global level.
2. To evaluate the factors of merchandising and formulate appropriate strategies
3. To formulate merchandise budgets to minimize costs
4. Analyze the ways that merchandising is used in marketing tools and techniques to interact with their customers.
5. To estimate pricing and analyze merchandise performance
6. Innovate visual merchandising to increase the sales volume

Unit I

Merchandising – meaning – concept – factors affecting merchandising function – merchandise manager-functions – merchandise hierarchy – merchandise mix – components of merchandise management – merchandise strategies

Unit II

Merchandise planning - steps involved – merchandise control – the open to buy – assortment planning – steps involved – merchandising stages- merchandise budgets and forecasting

Unit III

Merchandise buying – types of buying – sources of supply-identifying and contracting - evaluating sources – branding strategies – category management – components of category management – category management and business process – role of category captain.

Unit IV

Merchandise performance – retail pricing – elements – merchandise allocation – analyzing merchandise performance – methods – integrating dollar and unit concept – gross margin return on investment – mark ups and downs – shrinkage in retail management

Unit V

Visual merchandising – types of display – display planning – characteristics of effective display – selling power of display – methods of display – window display and interior display – space management – planning layout.

Text Book:

1. Chetan Bajaj And Ranjith – Retail Management – Oxford University Press, second edition 2005

References:

1. Gillespie. Hecht and Lebowitz – Retail Business Management, McGraw Hill Book company, Third edition 2002
2. Gibson G. Vedamani – Retail Management: Functional Principles and Practices, Jaico Publishing House, Second Edition 2004
3. James R. Ogden. Denise T. Ogden – Integrated Retail Management, Wiley Pvt Ltd, 2005

Course Objectives:

- To have an exposure in international marketing management concept
- To understand the international marketing management and market segmentation.
- To know the process of promoting the product in the international market
- Acquire knowledge on pricing strategies and factors influencing pricing
- To provide better understanding on international distribution systems and strategy related to distribution channel
- To learn about marketing communication and promotion programmes

Course Outcomes (Cos):

1. Ability to analyze the scope of international marketing and International marketing management process
2. Demonstrate the International Market Segmentation and Positioning
3. Ability to determine product policies and pricing strategies and environment factors affecting international prices
4. Focuses on risk involved in multinational product planning and market communications.
5. Ability to understand structure of international distribution systems and Distribution channel strategy
6. Demonstrate capabilities in international marketing communication and promotion programme

Unit I

Introduction, Importance and Challenges – Nature, Importance and scope of International Marketing, Domestic marketing vs. International marketing, International marketing management process – an overview, influence of physical, economic, socio-cultural, political and legal environments on International marketing information, scanning and monitoring global marketing environment; international marketing information system.

Unit II

International market segmentation, positioning, Analysis of world market, market analysis, international marketing research, screening and selection of markets, International market entry Export, Licensing , Franchise, Joint Venture, Multinational operations, contract manufacturing

Unit III

International Product Policies – Major product decisions – product features and quality, product design, labeling, packaging, branding and product support services; strategies in multinational product planning, international product life cycle, New product development, International Trade

Unit IV

International Pricing Decisions – international Price determination, price escalation, international pricing process and policies, delivery terms and currency for export price quotations, international transfer pricing, methods of determining transfer pricing, Differential Pricing

Unit V

International marketing communication – communication with foreign buyers, planning and preparing, international promotion programme, Media structure, planning media strategy, corporate advertising.

Text Book:

1.Nargundkar- International Marketing (Excel Books)

References:

- 1) Czinkota - International Marketing (Thompson, 8th Ed.)
- 2) Cateora Graham - International Marketing (TMH, 10th Ed.)
- 3) Siddiqui- International Marketing (Wiley Dream tech)
- 4) Cherunilam F - International Trade and Export Management (Himalaya, 2007)
- 5) Varshney R.L, Bhattacharya B - International Marketing Management (Sultan Chand & Sons, 9th Ed.)
- 6) Jain S. – International Marketing (Thomson)

Course Objectives:

- To have an exposure to International Distribution system and Logistics
- To have an exposure in broad conceptual focus on documentation in exports and imports
- To understand the Logistics and International marketing channel decision.
- To acquire knowledge on the procedures to be followed to Export and Import License
- To get an insight on the international trade terms and legal framework involved in it.
- To understand the concept of export, EXIM strategies, custom clearance and Export incentive schemes.

Course Outcomes (Cos):

1. Demonstrate retailing and its various concepts.
2. Evaluate the value adding perspective of logistics and distribution system.
3. Analyze the linkage of logistics with operations, manufacturing and supply chain.
4. Analyze international terms of trade and trade contracts related to logistics
5. Prepare documents on the exports and imports of goods
6. Understand EDI and custom operations

Unit I

International Distribution system and Logistics – International marketing channel decision, importance and scope of channel decisions, channels between nations, international physical distribution decisions, nature of physical distribution

Unit II

Transportation – Importance of effective transportation system, service choices and their characteristics, cost characteristics and role fixation, In-company management vs. outsourcing, shipping structure – Sea borne trade, international shipping characteristics, important international sea routes, liner & tramp operations, liner freighting, CFC and ICD, Indian shipping – growth, policy and problems, major Indian ports, International Air Transport, freight rates, India's exports and imports by air – problems and prospects, Air cargo, I.A.T.A.

Unit III

Documentation - Naming the enterprise, forms of ownership, opening a bank account, Need for documentation, Process of obtaining Export and Import License:- general registrations, registrations with RBI, registration with Licensing authorities, registration with appropriate EPC/Commodity Board's. Main commercial documents: statutory documents for exporting country, statutory documents for importing country, and documents for claiming export benefits.

Unit IV

International Trade Terms – International Trade Terms – trade contract and trade terms, credit risk management and payment terms,, LC & parties involved, types of LC, UCPDC – major clauses, consignment sale, transit risk management – contract of cargo insurance parties, Insurance policy and certificate, cargo loss clauses – procedure and documentation

Unit V

Clearance – excise duty – definition, types of duties, legal framework – central excise act and rules, tariffs, customs act 1962, customs tariffs act 1975, foreign trade act 1992, physical examination of goods, EDI and custom operations

Khanna K K - Physical Distribution Management : Logistical Approach (Himalaya, 2007)

References:

Johnson J, Wood D- Contemporary Logistics.

Reji Ismail- Logistic Management (Excel Books)

Dornier- Global Operation & Logistic Management (John Wiley)

Course Objectives:

- To understand the framework of international business negotiations
- To acquaint the students with the model of the negotiation process with different strategies and planning
- To enhance students knowledge in international culture and negotiation
- To have an understanding of the negotiating conventions and expectations between foreign counterparts
- To become aware of the ethics in Negotiations, retail marketing mix and Promotional measures.
- To evaluate, plan and choose channels of retail distribution strategies.

Course Outcomes (Cos):

1. To make the students to define International Business Negotiations and its various concepts.
2. Examine Cultural the aspects of International Business Negotiation and its impact
3. To evaluate the licensing agreements in various business forms
4. Get an insight in ethics in negotiations
5. Analyze the framework and support institutions for negotiations
6. Practice ethics in negotiations and develop business etiquettes

Unit I

Nature of International Business Negotiations: Framework for international business negotiations - Background factors - Impact of national culture, organizational culture and personality on buyer-seller interaction – a model of the negotiation process with different strategies and planning – Distributive bargain and integrative negotiations.

Unit II

Cultural aspects of International Business Negotiation. Role of culture, patterns of cross-culture behavior and communication. Importance of understanding the negotiating conventions and expectations between foreign counterparts. Comparative and inter-cultural studies of negotiating behavior.

Unit III

Inter-firm negotiation studies: buyers' negotiating strategies in international sourcing, negotiating sales, export transaction and agency agreements. Negotiating licensing agreements, negotiating international joint ventures, projects. Cooperative negotiation for mergers and acquisitions.

Unit IV

Frameworks and support for international business negotiations: multinational, bilateral trade agreements, government supported trade delegations, international trade fairs, international trading houses, industry associations.

Unit V

Ethics in negotiations. Differences from an ethical perspective of the importance of relationship development, negotiating strategies, decision making methods, contracting practices, illicit behaviours such as bribery. Best practices in negotiations, business etiquette. Personality and negotiation skills.

References:

- 1.Pervez N. Gauri and Jean Claude Usunier, *International Business Negotiations*, Elsevier ltd.
- 2.Leigh L, *Negotiation Theory and Research*. Thompson.

Course Objectives:

- Emphasize challenges and opportunities for Business Process Reengineering across the process life cycle.
- To understand the importance of business process reengineering and kaizen.
- To gain expertise in ISO standardization and its benefits
- To enable the students to understand the relevance of change management in business process reengineering.
- To familiarize the process of implementation of Business Process Engineering
- To understand the Change Management in Business Process Reengineering

Course Outcomes (Cos):

1. Analyze the Business Process Reengineering and Kaizen and its various concepts.
2. Categorize the benefits of ISO standards
3. Evaluate the Implementation of Business Process Reengineering
4. Get an insight the Pitfalls in organizational environment
5. Demonstrate Application of negotiation in BPR and Implementation of changes
6. Estimate the ways of Change Management in Business Process Reengineering and techniques to interact with their customers.

Unit I

Business Process Reengineering and Kaizen - BPR: Definition, Japanese Business strategy, Kaizen and Management, Characteristic features of Kaizen relevant to BPR. New developments in BPR

Unit II

Business Process Reengineering and other Management concepts - Issues in BPR, BPR and TQM, QFD, ISO standards, ERP. Benefits of ISO standards.

Unit III

Implementation of Business Process Reengineering - Business vision and process objectives, Identification of processes to be reengineered, Measurement of processes, Design. Evaluation of process prototype.

Unit IV

Reengineering Structure and Pitfalls - BPR leader, Process owners, Reengineering teams, Pitfalls in organizational environment. Complacency management, Reengineered process, Appraisal system

Unit V

Change Management in Business Process Reengineering - Structure of change, Approaches to radical change, Management of change in BPR, Application of negotiation in BPR. Implementation of changes

Text book:

4. H. Harrington, “*Business Process Improvement: The Breakthrough Strategy for Total Quality, Productivity and Competitiveness*”, New Delhi: Tata McGraw Hill, 2005.

Course Objectives:

- To understand the advanced maintenance management that provides an insight into maintenance planning, analysis, system, cost and advanced techniques
- To aware the functions of maintenance.
- To gain insight in the concept of Reengineering Maintenance Process
- To familiarize the students with Total Productive Maintenance.
- To enable the students to understand the concept of optimum overhaul.
- To make them understand the Management Information system and Technical audit

Course Outcomes (Cos):

1. Analyze and define maintenance concepts and strategies
2. Determine the design for maintainability and preventive maintenance
3. To evaluate Design out maintenance, Total Productive Maintenance - Reduction of Maintenance Cost
4. To categorize Reengineering Maintenance Process
5. Analyze the Total Productive Maintenance and Reduction of Maintenance Cost
6. Develop knowledge on Maintenance Management Information System & Technical Audit

Unit I

Maintenance Concepts - Objectives and functions of maintenance, types, Maintenance strategies.

Organization for maintenance, Five Zero concept New Developments in Maintenance

Unit II

Failure Data Analysis - MTBF, MTTF, Useful life, Survival curves, Repair time distribution,

Break down time distributions, Poisson, Exponential and Normal distribution. Availability of

repairable Systems, Maintainability prediction, Design for maintainability. Preventive

Maintenance

Unit III

Maintenance Planning - Overhaul and repair: Meaning and difference, optimal overhaul / Repair

/ Replace maintenance policy, Re placement Decisions: Optimal Interval. Group Replacement

Unit IV

Maintenance Systems - Fixed time maintenance, Condition based maintenance, Operate to

failure, Opportunity maintenance, Design out maintenance, Total Productive Maintenance.

Reduction of Maintenance Cost

Unit V

Advanced Techniques - Reliability Centered Maintenance (RCM) – Total Productive Maintenance (TPM) - Philosophy and implementation, Signature analysis - Expert systems – Concept of Terro technology, Reengineering Maintenance Process, Concept of reliability, Reliability improvement, Concept of maintainability and maintainability improvement, Maintenance Management Information System & Technical Audit

4. U.K. Singh and J.M. Dewan, “*Maintenance Management*”, New Delhi: Common Wealth Publishers, 2007.

Course Objectives:

- To gain knowledge on lean manufacturing system
- To enable the student to understand the Designing of 5S and Kanban Signaling
- To have an exposure in the integrated perspective of Lean thinking apart from covering all the basic tools needed.
- To enable the student to acquire the knowledge of Value Stream Mapping
- To get an insight with the implementation of various lean manufacturing techniques. ,
- To aware of Lean line optimization

Course Outcomes (Cos):

1. To analyze the lean manufacturing system in manufacturing industries
2. Define Lean Manufacturing System and its various concepts.
3. Demonstrate lean implementation in service
4. Practice Kanban Strategies and inventory management
5. Analyze the ways of Lean Implementation and Milestones tools and techniques to interact with the workers
6. Evaluate the customer demand and Customer response policy

Unit I

Benefits of Lean Manufacturing System - History and modern applications, MRP and their impact, Lean manufacturing model, Kanban Methodology, Continuing evaluation, Strategic Business Analysis. Internet and e-commerce applications & Reverse Auction

Unit II

Understanding Product, Process and Demand - Value Stream Mapping - Scope, Selecting parent parts, Lean line, Demand, Documenting process flow, Talk time, Process linking and Balancing - Imbalance, Approach, Resource, Definition, Physical Layout, Designing 5S, Kanban Signaling

Unit III

Kanban Strategies - Process, Single, Multi Card system, Inventory Management, Advantages and Disadvantages. Team Establishment: Commitment, Physical facilitation, Management Structure. Transformation process & perpetual inventory

Unit IV

Lean Implementation and Milestones - Software requirement milestones, Understanding process, Product and Materials, Checking, Factory design, Line startup, Lean implementation in services

Unit V

Lean Line management - Matching customer demand, Customer response policy, Lean line optimization, Resistance to change, Flexibility and rewards.

Text book:

4. Allan, Robinson and Stewart, *Lean Manufacturing – A Plant Floor Guide*, Society of Manufacturing Engineers, 2001.

Course Objectives:

- To understand the components of Personality Development
- To enhance the personal etiquette among students
- To equip students with the basic knowledge of building relationship with superiors and staff
- To develop students critical and innovative thinking
- To inculcate the knowledge of organizing seminars, conferences and conducting meetings
- To improve managerial skills and goal setting among students

Course Outcomes (Cos):

1. Demonstrate capabilities of lateral thinking and handling criticisms
2. Practice business etiquettes and aware cross-cultural etiquette
3. Demonstrate goal-setting and problem-solving
4. Develop proactive thinking
5. Ability to communicate effectively.
6. To gain professionalism in personal and organizational life

Unit I

Personality Development / Personal Branding for Career Success – SWOT Analysis – Knowing your personality – Emotional Quotient – Lateral thinking – Handling criticisms – Body language

Unit II

Personal etiquette - Good work practices, Dress code, Code of Good conduct, Handling ethical dilemmas – Business etiquettes — Behaviour at work - Awareness of Diversity, Respecting others' space, Greeting in business setting, Meeting people in business setting, developing relationship with superiors and staff - Dining Etiquette - Cross Cultural Etiquette

Unit III

Managerial Skills – Innovative planning – Conducting professional meetings and conferences – Customer retention and satisfaction – Goal setting and problem solving.

References:

1. Hurlock, E.B. (2006). Personality Development, 28th Reprint. New Delhi: Tata McGraw Hill.

Course Objectives:

- To impart students and enrich communication and non-verbal activity such that students will be good on their communication.
- To understand the use of language in day-to-day business life
- To provide the skills in improving social communication
- Make students to understand the value of face to face communication
- To train them in group discussions and interviews
- The students shall be familiar with conducting meetings, seminar and conferences.

Course Outcomes (Cos):

1. The student will able to get practice with Verbal communication and Non- Verbal communication.
2. Demonstrate the understanding of face to face Communication.
3. The students shall be familiar with conducting meetings, seminar and conferences.
4. Students attain competence in functional use of communication during both academic and non-academic life situations.
5. To draft effective business correspondence with brevity and clarity.
6. To stimulate their Critical thinking by designing and developing clean and lucid writing skills.

UNIT I**PERSONAL COMMUNICATION:**

Day-to-day conversation with family members, neighbours, relatives, friends on various topics, context specific – agreeing/disagreeing, wishing, consoling, advising, persuading, expressing opinions and arguing.

UNIT II**SOCIAL COMMUNICATION:**

Telephone calls (official), colleagues in the work spot, discussing issues (social, political, cultural), clubs (any social gathering), answering questions, talking about films, books, news items, T.V. programmes, sharing jokes.

UNIT III**GROUP / MASS COMMUNICATION:**

Group discussion (brainstorming), debate, panel discussion, anchoring / master of ceremony, welcome address, proposing vote of thanks, introducing speakers, conducting meetings, making announcements, Just-a-minute (JAM), Block and tackle, shipwreck, spoof, conducting quiz, negotiations, oral reports.

3. Goleman, Daniel. 1998. *Working with Emotional intelligence*. Bantam Books. New York.

Course Objectives:

- Internship is aimed to feed industry - institutional- orientation among the students
- To sensitize students to the nuances of corporate culture and familiarize them with the corporate code of behavior.
- To educate the graduates to acquire skills, knowledge, attitudes, and perceptions along with the experience needed to constitute a professional identity
- To give an insight into the working of the real organizations
- To inculcate the knowledge about business organizations in their totality
- To learn the opportunities available and plan their career

Course Outcomes Cos):

1. Demonstrate theoretical knowledge in solving real time problems.
2. Gain practical exposure of the core area of functioning in industry
3. Learn actual supervised professional experiences
4. Effectively communicate ideas and evaluate its impact on business environment.
5. Understand perspective about business organizations in their totality.
6. Discover career opportunities

During second semester vacation each student shall undertake a Summer Internship for 30 Days. The summer internship may be a general study of all functional areas of a company or may be a functional focus on a specialized functional area of management in a company. The students shall bring the attendance certificate from the company. He /She shall also submit a detailed report for Viva-voce Examination.

Course Objectives:

- To assess the overall knowledge of the student in the relevant field of Management
- Help them to gain the knowledge and skills required to excel in their career
- To test their learning and understanding of various concepts of the syllabus during the course of their programme
- To acquaint the students with fundamentals of communication and help them to transform their communication abilities
- To obtain frameworks and tools to effectively analyze and approach various Organizational situations.
- To prepare the students to face interview both in the academic and the industrial sector

Course Outcomes (Cos) :

1. Students get equipped with skills and knowledge to excel in their future careers
2. To develop an in-depth knowledge on the management concepts, theories and principles
3. Develop an ability to analyse and interpret contents and concepts to provide meaningful information in making management decisions
4. Recognize the application of various techniques to achieve the objective of the task
5. Determine opportunities and emerging challenges in the upcoming business trends
6. Demonstrate capabilities of problem-solving, critical thinking, and communication skills related to various courses.

A Comprehensive Viva Voce will be conducted at the end of the Semester. The panel shall consist of an external expert and faculty members who handled the courses. The viva is aimed to evaluate the student's knowledge in all the core and elective courses in the particular semester.

Course Objectives:

- Help the Students in developing their communication skills, especially presentation before the group.
- Develop and improve discussion skills
- The students will be able to analyze any given issue and to present before an identified group.
- Identify and comprehend main ideas and supporting idea in detailed manner
- Manage timings on discussion
- Develop and present options based on selected materials

Course Outcomes:

1. The students will be able to analyze any given issue and to present before an identified group.
2. Develop multiple thinking strategies to examine real-world issues and explore creative avenues of expression
3. Analyze the impact of word choice and tone that can have on presentation
4. Identify ways to make information more accessible to audience
5. Students will demonstrate the ability to construct a paper consistent with expectations of the discipline, including an appropriate style
6. Evaluate an enthusiastic and well-practiced method of presentation

The seminar motivates students to engage in Research in the subject area. To provide students with an overview and understanding of Global issues. It shall be based on concurrent trends of their specialization.

Course objectives:

- To develop new ability to practice new problem solving skills in group and use these skills in personal life
- The students understand proper usage of English in their profession and focus on report writing
- To develop employability and enterprise skills, such as teamwork and communication.
- To develop positive attitudes in the pupils towards study and work.
- To provide students with impartial advice about options that is available to them.
- To provide equal opportunity of access to careers inspiration and guidance.

Course Outcomes (Cos):

1. The ability to speak clearly, persuasively, and forcefully
2. Exhibit important life skills including Decision making, Problem solving and creative thinking.
3. Anticipate what they gain from educational experience
4. Track their progress and set bench mark
5. Identify the methods of assessment of knowledge and skills
6. Plan appropriate strategies to enrich the need based learning techniques

Self Introduction - Presentation on their own topic – Extempore - Group Activity - Group Discussion - Do's and Don'ts of Group Discussion - Group Discussion - Body language, Grooming & Resume - Resume correction.

Course objectives:

To make the students

- Being specialized in finance present day managers to be aware of short term movement of capital and problems related to working capital management
- To study about the importance of working capital.
- To learn the factors of cash management.
- To understand credit policy of receivable management.
- To learn the various techniques of inventory management.
- To provide clear view of committee's recommendation on working capital.

Course outcomes (Cos):

Learners should be able to

1. Estimate the requirements and manage the working capital required for the business
2. Analyze the different sources of capital and computation of cost of capital.
3. Develop cash management techniques
4. Evaluate the components of financial leverage, dividend policies and capital structure theories and its application in business.
5. Develop new techniques in managing and controlling inventory in organizations
6. Analyze the Committee recommendations on working capital financing

Unit I

An Overview - Importance of Working Capital Management - Components of Working Capital – concept of working capital – levels of working capital investment- Factors Influencing the Requirements of Working Capital, Issues and Practices of working capital management in India. Computation of Working Capital requirement (Problems) Concepts of Working Capital - Determinant of Working Capital - Issues in Working Capital Management.

Unit II

Cash Management – Facets of cash management – Motive of Holding cash – Factors influencing cash balance – Determining Optimum Cash Balance – Cash Planning – Managing cash collections and disbursement – Investing the Surplus in Marketable Securities. Cash Budget (Problems), Cash Management Practices in India.

Unit III

Problems -Receivables Management- Objectives - Credit Policies – Credit Terms - Nature and Goals of Credit Policy – Optimum Credit Policy - Credit Period - Collection Efforts - Credit Evaluation - Credit granting decision - Control of Receivables – Factoring – Definition and Mechanism – Advantages Problems.

Unit IV

Inventory Management-Nature of Inventories – Objective of Inventory Management - Need to hold Inventories - Techniques for managing inventory - Inventory Control System - A.B.C. analysis - Problems

Unit V

Working capital financing: Working Capital Control and Banking policy - Committee recommendations on working capital - New system of assessment of working capital finance. Working capital financing – Trade credit – Bank Credit – Commercial Papers – Certificate of Deposits– recent trends in working capital financing

Note: Problems 60 Marks and Theory 40 Marks.

Journals:

1. Journal of Financial Services and Management
2. Asia Pacific Business Review
3. Corporate India

Course objectives:

To make the students

- Understand the securities market and factors influencing risk
- To provide the knowledge of the structure and functioning of capital market
- To expose the concepts of investment Risks and Securities.
- To facilitate them to understand and exploit the tools available for analysis.
- To hassle the need of portfolio management and its application
- To understand the security analysis & portfolio management concept and its importance and its applications in business

Course outcomes (Cos):

Learners should be able to

1. Analyze the role of a financial manager, and their role in taking decisions professionally.
2. To clarify the structure and functioning of capital market.
3. Demonstrate knowledge and compute value of security analysis & portfolio management and apply the concept to Evaluate the business proposal applying capital budgeting techniques
4. Compute the security analysis & portfolio management
5. Demonstrate capabilities of teamwork, problem-solving, critical thinking, and communication skills related to finance decisions
6. Gain insight in risk management techniques

Unit I

Investments – Concepts and features- Objectives – Constraints - Investment vs Speculation - Investment Process Investment Planning - Investment Avenues – Securities Market – Participants – Securities – Indices - Risk and return – Types - Factors Influencing Risk.

Unit II

Over view of capital market - Structure in Indian capital market- Major players - Role of stock exchanges - Trading and settlement procedures at NSE and BSE. Securities Contract Regulation Act - Securities and Exchange Board of India - Indian debt market.

Unit III

Fundamental Analysis: Economic analysis – Economic Forecasting - Industrial Analysis - Industry life cycle – Analytical tools – SOWT – Porter’s Five Force Model – Company Analysis – Mode of analysis – financial analysis.

Unit IV

Forecasting individual stock performance: Technical analysis – Charting methods – Market indicators, Trends –Trend reversals- Moving average –Oscillators - CAPM –APT theory
Valuation of securities.

Unit V

Portfolio theory – Portfolio construction – Markowitz diversification model – Performance evaluation – Portfolio revision- Portfolio management and performance evaluation: Sharpe Index, Treynor Index, Jensen's Model.

Note: Emphasis will be given to case discussion and article reviews

Course objectives:

- To make the students
- To clarify the structure and functioning of concepts of Bonds, Derivatives, Futures
- To expose the concepts of futures and options
- To impart the structure and functioning of commodities market.
- To equip young managers with the knowledge of emerging commodities derivatives trading practices in India.
- To explain the regulatory framework of these markets and domestic and international historical developments in commodities market.
- To understand the settlement and risk management in commodity trading

Course outcomes (Cos) :

- Learners should be able to
1. Understand the role of a financial manager, and their role in taking decisions professionally
 2. Apply derivatives as risk management tools for hedging market risk exposure
 3. Demonstrate knowledge and compute value of security analysis & portfolio management
 4. Estimate the eligibility of stock for futures and options trading.
 5. Compute the commodity trading: commodity derivatives – commodity exchanges in India
 6. Demonstrate capabilities of teamwork, problem-solving, critical thinking, and communication skills related to finance decisions

Unit I

Bonds attributes – bond returns & prices – risk structure of bonds – forecasting interest rate bonds – the term structure of interest rates. Bond management strategies; - passive – semi active – active – passive and active strategies – new innovations in bonds.- Bond portfolio management.

Unit II

Introduction to Derivatives: Definition – types – market index: types of index; introduction to futures and options; forward contract – limitations – features, futures Vs forward contract. Introduction to options – distinction between futures and options, pay of for derivative contracts.

Unit III

Futures and options , trading systems – basis of trading – eligibility of stock for futures and options trading – clearing and settlement; clearing entities – members – banks – mechanism – settlement mechanism – regularity framework-case studies in relevant topics.

Unit IV

Introduction to commodity trading: commodity derivatives – commodity exchanges in India – types of instruments available for trading – pricing – commodity derivatives, hedging, speculation, arbitrage in commodity derivative markets. Case studies in relevant topics.

Unit V

Clearing, settlement and risk management in commodity trading, Calendar and settlement schedule – position determination – settlement mechanism - settlement price – margining – final statement – exception handling – regularity framework. Case studies in relevant topics.

Course Objectives:

- To equip the students with the various dimensions of product management such as Brand Positioning and its Preference.
- To get familiarize with the portfolio management and competitor's analysis
- To develop familiarity and competence with the strategies
- To understand the tactics involved in building, leveraging and defending strong brands in different sectors.
- To equip the students with the various dimensions of product management such as Brand Positioning and its Preference.
- To possess knowledge on building brand equity

Course Outcomes (Cos):

1. Analyze the product concepts and new product development
2. Developing strategies for new product development using various models
3. Construct branding strategy considering social and political aspects of brands
4. Evaluate the failure of branding using new media
5. Create models for brand positioning
6. Evaluate brand equity and brand valuation for successful implementation of branding strategy.

Unit I

Products - Concepts - New Product Development – Strategies - Launching Strategies, Product Life Cycle - Portfolio Management - BCG, GE, Porter's Model, Competitor's Analysis, Customer Analysis, Market potential, Product Demand pattern and Trend Analysis.

Unit II

The Concept of Brands - The Economic Importance of Brands - The Social and Political Aspects of Brands - Difference between Marketing and Branding - Changing Rules of Marketing and Branding in India - Digital Dimension, Consumer Activism, Leveraging Technology - Why Some Companies Fail in Using New Media.

Unit III

Introduction to Brand Positioning: The 4Ps – An Inherently Futuristic Model - 4Ps in the IT Age
 - Brand Positioning - Fundamentals of Brand Positioning - First Movers - Mistakes in Brand
 Positioning – Introspection - Gaining Brand Preference.

Unit IV

The Brand Relevance Model: The First Mover Advantage - Managing a New Category - The
 Different Levels of Innovation - Understanding Brand Relevance – Categorization - Creating
 New Categories or Subcategories — Four Tasks - How Categorization Affects Information
 Processing and Attitudes

Unit V

Packaging – Labeling - Brand Rejuvenation - Brand Success strategies - Brand Resilience -
 Brand Equity - Brand valuation - Building global brands - Branding failures.

3. www.campaignindia.in

Course Objectives:

- To have an exposure in retailing concept and consumer behavior in retail.
- To know the theories of retail management and classification of models
- To give a perspective of the Indian retailing scenario
- To understand the retail marketing mix and Promotional measures.
- To evaluate, plan and choose channels of retail distribution strategies.
- To get an insight in IT application and international retailing trends

Course Outcomes (Cos):

1. Adopt strategies to the challenges in retailing and gain competitive advantage
2. Construct models for direct marketing
3. Demonstrate knowledge of the various forms of Retail outlets and current trends in Retail
4. Analyze the retail marketing mix and draw plan for effective combination
5. Adopt information tools and techniques to interact with their customers.
6. Inculcate ethical values, enabling to set value standards and belief to have positive outcomes

Unit I

Retailing – Introduction – Importance – Challenges in retailing — Consumer behavior in retail context –demographic and socio-economic factors – strategic Retail Planning process – opportunities and Competitive advantage

Unit II

Theories of retail development-The Evolution of retail format –Theories in retail development-environmental, Cyclical and conflict theory – The concept of life cycle in retail - Retail Models – Classification – Store Based – Non store based – Direct Marketing – Franchising – Forms - Mall Management – Mall Designs.

Unit III

Retail Marketing Mix – Product decision – Nature, selection & delivery decision - Pricing decision- concepts - leader pricing - odd pricing - Promotion decision – advertising, sales promotion & publicity - channel & channel management

Unit IV

Application in retail - IT applications in retail – Database marketing, data mining and business intelligence – Electronic retailing – Developing decision support systems – Visual Merchandising – Store location and Site location.

Unit V

Global retailing trends - Indian and International retailing trends – Indian Retailers in Jewellery - Textiles – Food - Music and Electronics – Ethics in retailing – Social responsibility & Consumerism, E-CRM.

Note: Emphasis will be given on Case discussion and Article reviews.

5. IAMS journal of business spectrum, Bangalore

Course objectives:

- To understand the need and importance of maintaining a good relationship with customers
- To expose to the various approaches of Customer Relationship Management
- To have an in-depth knowledge in CRM structures, planning and implementation
- To acquire acquaintance in Concepts and Context of relationship Management
- To gain familiarity by understanding Customers Behaviour and role of relation manager
- To identify Customer perception with the concepts and practical implications of customer relationship management

Course outcomes (Cos) :

1. Formulate tools for effective customer relation towards organization
2. Analyze the customer database and profile and serve to their expectations
3. Build CRM models based on customer psychology behind customer relationship
4. Estimate the Customer behavior in relationship perspectives
5. Recognize Data Ware housing and use the Data mining for CRM
6. Develop the CRM software packages

Unit I

Introduction - Definitions - Concepts and Context of relationship Management – Evolution - Transactional Vs Relationship Approach – CRM as a strategic marketing tool – CRM significance to the stakeholders.

Unit II

Understanding Customers - Customer information Database – Customer Profile Analysis - Customer perception, Expectations analysis – Customer behavior in relationship perspectives; individual and group customer's - Customer life time value – Selection of Profitable customer segments.

Unit III

CRM structures - Elements of CRM – CRM Process – Strategies for Customer acquisition – Retention and Prevention of defection – Models of CRM – CRM road map for business applications.

Unit IV

CRM planning and implementation - Strategic CRM planning process – Implementation issues – CRM Tools - Analytical CRM – Operational CRM – Call center management – Role of CRM Managers.

Unit V

Trends in CRM – E-CRM Solutions – Data Warehousing – Data mining for CRM – an introduction to CRM software packages

Text Books:

6. Zikmund . Customer Relationship Management, Wiley 2012.
7. Mohammed Hp/ Sagadevan.A Customer Relationship Management- A step by step approach

Course objectives:

- To learn about industrial relations concepts and objectives.
- To gain familiarity in the industrial relation trends of India
- To know about the industrial conflict and handling the disputes.
- To understand collective bargaining and formation of trade unions
- To focus on industrial safety and psychological problems
- Thorough understanding on labor welfare measures

Course outcomes (Cos):

1. Evaluate the significance of industrial relations
2. Analyze the grievance techniques and adopt suitable grievance method to settle disputes
3. Ability to manage industrial conflicts and disputes
4. Evaluate the role the collective bargaining and manage the settlements
5. Create awareness on occupational hazards with HR and Industrial safety
6. Effective implementation of welfare measures in order to have a peaceful industrial relation

Unit I

Industrial Relations – Concepts and Approaches – causes of poor Industrial Relations-Effects of poor Industrial Relations-Suggestions to improve Industrial Relations- Trends in India. Trade unionism –objectives - functions – structure.

Unit II

Industrial Conflicts – industrial disputes –Types - causes –handling and settling disputes – employee grievances – steps in grievance handling – Employee discipline-causes-types-kinds of punishment-procedure for taking disciplinary action.

Unit III

Collective Bargaining:-Concept – function and importance – Principles and forms of collective bargaining – Procedure – conditions for effective collective bargaining – worker's participation in management:- Role and methods of worker's participation – Management participation in Trade Unions.

Unit IV

Industrial Safety – Causes of accidents – Prevention – Safety Provisions – Industrial Health and Hygiene – Importance and Problems – Occupational hazards – Diseases – Psychological problems – counseling.

Unit V

Labour Welfare – Concept – Objectives – Scope – Need – Voluntary Welfare Measures – Statutory welfare measures – Welfare Funds – Education and training schemes – Child labour – Female labour – Contract labour – Construction labour – agricultural labour.

Note: Emphasis will be given on Case discussion and Article reviews.

Text Book:

N.G Nair, Latha Nair, “Personnel Management and Industrial Relations”, Sultan Chand & Sons, New Delhi, 2007

4. P.Subba Rao, “Essentials of human Resource Management and Industrial Relations”, Himalaya Publishing House, Mumbai, 2008.

Journals:

1. Techno First
2. A practical journal for HRM
3. Indian Management
4. Global pensions
5. Asian management Review

Course objectives:

- To know the role and functions of training and development in organization,
- To understand the theories, principles and their implications for the effectiveness of training programs.
- To elucidate on Implementation of Training – Physical arrangements – Classroom management – Trainer's skills and styles
- To understand Career Planning and Factors affecting Career Choices, Career Stages, Career anchors, Succession planning
- To realize the need of controlling in improving the performance of the organization.
- To enable students to synthesize related information and evaluate options for the most logical and optimal solution such that they would be able to predict and control human behaviour and improve results

Course outcomes (Cos):

1. Ability to train and develop employees to improve organizational efficiency.
2. Assess various key factors in designing training programme
3. Designing the training methods for employees as per the requirement of organization
4. Analyze the efficiency of employees and develop career planning
5. Gain knowledge in management development programmes
6. Evaluate the training programmes and prepare a report

Unit I

Training concepts - Features of Training and Development – Objectives – Benefits of Training and Development – Principles of Training, Scope of Training and Development, Historical development of Training and Development, applying to organizational effectiveness

Unit II

Concepts of Learning, Components of Learning – Principles of Learning – Learning Theories – E –Learning - Training Process – Key factors in designing training programme - Assessing Training needs – Methods of TNA – Training Design – Constraints in Training Design

Unit III

Implementation of Training – Physical arrangements – classroom management – Trainer's skills and styles – Transfer of Training - Evaluation of Training – need – types of instruments – Evaluation design – Models of Training evaluation.

Unit IV

Training Methods – On and Off the Job training Techniques - Lecture Methods, Programmed Learning – Discussion methods, case Methods, Role Play, Business games, in-basket exercises, Field Training, Audio-Visual Aids, Static and Dynamic media – Computer based training, Training methods adopted by Successful Indian Organizations.

Unit V

Career Planning – need - Factors affecting Career Choices, Career Stages, Career anchors, Succession planning - steps. Management Development – Need & Importance – Management characteristics – skill acquisition – training for Executive level management - Emerging Trends and Future Prospects in Training and Development.

Note: Emphasis will be given on Case discussion and Article reviews.

5. Training and Development Journal
6. Personnel today
7. Academy of Management Journal
8. Management and labour studies
9. The IUP journal of Organization Behavior
10. IIMB Management Review

Course objectives:

- To make the students to be familiar with Wages, Salary, incentives, Compensation and pay scale systems
- To understand the Concept of Equity and Components of Compensation
- To understand the compensation designing and factors deciding compensation designing
- To know the basics of compensation, various incentives and fringe benefits applicable
- To understand the fundamentals of wages, salary, incentives, compensation and pay scale systems and apply lifelong
- To have relevant knowledge of social security laws for employees of the organization

Course outcomes (Cos):

1. Design the compensation plan suitable to their organization
2. Formulate incentives and retirement plans
3. Evaluate the existing fringe benefits and design new programmes for organization
4. Analyze the Internal and External Equity in Compensation Systems
5. Classify the Laws Relating to Workmen's Compensation, Employee's State Insurance, and Provident Fund
6. Evaluate the Compensation plans provided by Public sectors & Private Sectors

Unit I

Concept and Nature of Compensation – Concept of Equity & Compensation, Nature and Form of Compensation, Compensation Plans- Types of Compensation plans, Designing Wage, salary and Compensation Policies, Factors Influencing Wage and Salary Administration. Wage – Theories of Wages, Types of Wages – Time rate, piece rate, debt method, Wage differentials, Competitive Imperatives influencing Compensation.

Unit II

Compensation Designing – Job analysis, Identifying job contents, Process of Job Analysis, Job Analysis Questionnaire, Designing Compensation, Factors affecting Compensation Designing Pay for Performance, Pay by Seniority, Group Piece rate, Production sharing plan, Employee Profit sharing Employee stock ownership, Gain Sharing. Incentives and Retirement plans: Basic

Pay, Provisions for Dearness allowance – Calculation of total compensation package, various methods of compensating cost of living Neutralization factors.

Unit III

Incentives and Fringe Benefits – Incentives – Definition, Types of Incentives, Individual incentives: Measured day Work, Piece work, standard hour, Gain sharing, its advantages and disadvantages, Organization Wide incentives – Scanlon Plan, Kaiser Plan, Profit sharing, on-financial incentives, Fringe Benefits – Definition, Objectives, Types of Fringe Benefits.

Unit IV

Planning for Improved Competitiveness: Diagnosis and Bench Marking, Obtaining Commitment; Determination of Inter and Intra-industry Compensation Differentials, Internal and External Equity in Compensation Systems. Compensation provided by Public sectors & Private Sectors.

Unit V

Social Security Laws – Laws Relating to Workmen’s Compensation, Employee’s State Insurance, Provident Fund, Gratuity and Maternity Relief. Wages and Bonus Laws – The Law of Minimum Wages, Payment of Wages, Payment of Bonus. Objectives and scope of these Laws. Equal Remuneration Act Working of Different Institutions related to Reward system like Wage Boards, Pay Commissions. The Impact of fifth pay scale on Central and State Government.

Note: Emphasis will be given on Case discussion and Article reviews.

6. Academy of Management Journal
7. Academy of Management Review
8. Business Week
9. HRD times
10. Management and labour studies
11. The IUP journal of Organization Behavior

Course Objectives:

- To understand the practices and technology to start an online business
- To analyse the technology requirements for Ecommerce
- To know the different business models available for running a e-business
- To study the different ways of payment and payment services available.
- To acquire knowledge on the E-supply chain management relating to e- business.
- To know about E-business models and Virtual Merchants

Course outcomes (Cos)

1. Ability to manage an e-business
2. Analyse the various market forces influencing the I-way
3. Assess the different technology for managing business online
4. Apprehend different level of applications available to run the business
5. Analyze the different marketing strategies
6. Apply the different E-supply chain management relating to e- business

Unit I

E-Commerce: What is E-Com – Need- Types of E-Com-E-Com framework - E-Com and media convergence - E-Com consumer applications – E-Com organization application. Business models for E-commerce: E-business models based on relationship of transaction parties.

Unit II

Market forces influence the I-way - components of the I-way - public policy issues shaping the I-way enabling technologies of the WWW- Case studies on I – way.

Unit III

E-business models - E-payment systems – Digital payment requirements, digital E-Token systems, properties of electronic cash, and cheque payment systems on the Internet, risk and E-Payment system, designing E-Payment system, digital signature.

Unit IV

E-marketing: Traditional Marketing, identifying Web presence goals, browsing behavior model, on-line marketing, E-Advertising, internet marketing trends, E-Branding, marketing Strategies.

E-customer relationship management: Customer relationship management, typical business touch points.

Unit V

E-supply chain management: E-Supply chain -E-strategy: Information and strategy, the virtual value chain, seven dimensions of E-Commerce strategy, value chain and E-Strategy, planning the E-Commerce Project, Strategies for Web site development - Case study: mobile commerce

Note: Emphasis will be given on Case discussion and Article reviews.

Journals:

1. E-commerce time.com, Magazine on Internet – Online
2. International Journal of E-Commerce
3. International Journal on media management

Course Objectives

- To understand project management cycle in software development
- To study resources planning in software development
- To know about acquisition Process of Hardware, Software and Network
- To know the different ways of testing and quality models for software projects
- To apprehend different acquisition process and performance evaluation used
- To understand the risk management associated with implementation of software management

Course outcomes (Cos):

1. Able to identify the software models and software development process
2. Analyze the risk management in project finance
3. Design Resources Planning suitable for organization
4. Ability the undertake testing and develop quality models for software projects
5. Evaluate the acquisition process and its performance
6. Able to identify and managing risk in software

Unit I

Introduction-Software Project Management - An overview of Project planning- Stepwise planning- -Overview of COCOMO Model, PERT/CPM, Reileigh Curve -Project Organization - Risk Management -Project Finance -Procurement Management -Project Scheduling

Unit II

Software Project Management -Resources Planning and Estimation, Different Methods in brief- Function Point Analysis in some details-Use of CASE Tools-Introduction to MS Projects- Design and Development –Schedule -Resource Allocation-Progress Review

Unit III

Testing -Overview of Test Plan-Generation of Test Cases, Test Data -Types of Testing -Quality Concepts - ISO, CMM -Production / Implementation -User Acceptance Tests -Parallel Runs- Maintenance -Types - Adaptive, Corrective, Preventive Version Control and Configuration Management-Documentation Methods for all these topics.

Unit IV

Acquisition Process - Hardware, Software, Network, Infrastructure -Requirement Planning-
 Sizing-Selection Methodology including Benchmarking -Documents involved
 IT HRM –Selection –Retention –Training -Career Path Planning -IT Operations –Scheduling -
 Performance Evaluation

Unit V

Risk management- Nature of risk- Managing risk- evaluating risk - A software management
 process frame works- Life cycle phases- software maintenance and configuration management.
 Maintenance characteristics- Maintenance task- Maintenance side effects

Text books:

1. Roger S. Pressman & Martin L.Shooman David Gilbert, “Software Engineering”
2. Edwin Bennetan, “Software Project Management”.

Journals:

1. IEEE journals of data compression
2. IEEE data engineering-bulletin (Vol 15-20), 2002

Course objectives

- This course aims to enhance the understanding of the students with respect to the conceptual framework and the technological infrastructure of Enterprise Resource Planning.
- It also aims to expose the students to the implementation issues and future trends associated with ERP.
- To know the future trends in ERP systems to have good relation with customers.
- To understand the concept of Enterprise Resource Planning, its implementation, future trends in ERP and apply the learning's lifelong.
- To evaluate the need of ERP for an organization, select the best vendor and implement the module that is appropriate for the organization need
- To apprehend different Sales and Distribution tools used

Course outcomes (Cos):

1. Determine the right choice of ERP systems curtailing the needs of organization
2. Gain insight in storage management database administrator
3. Evaluate the factors determining the success and failures of ERP
4. Illustrate how current technologies and decision-support tools can be utilized to the advantage of business operations
5. To analyze the future trends in ERP systems to have good relation with customers.
6. To apprehend the application of different Sales and Distribution tools for business.

Unit I

Introduction- purpose of database system –View of data-data models-database languages-transaction management-storage management database administrator-database users-system structure.

Unit II

Entity relational model: basic concept –key entity relationship diagram, weak entity sets, E-R features, specialization, generalization, relational model-structure of relational databases-relational algebra-views.

Unit III

SQL –background- basic structures-set operations-aggregate functions-null values-nested –sub queries-derived relations-views –modification of the database-joined relations-data definition language-embedded SQL features – Data warehousing-concepts-architecture-data transformation-user interface-distributed database.

Unit IV

ERP concepts: introduction to ERP system-review of DBMS & Transaction processing concepts – Information models – Financial model – Financial Accounting, controlling - Issues in Customizing - ERP system for organization. Introduction to Business Information flows – Work flows.

Unit V

Sales and distribution – basic functions – billing – Electronic data interchange – transportation .Case studies – SAP R/3, people soft – oracle financials – development tools – administration tools – reporting and analysis tools and integration tools – BPR – implementation project management – meaning – business benefits of ES

Note: Emphasis will be given on Case discussion and Article reviews.

TECHNOLOGY INNOVATION AND SUSTAINABLE ENTERPRISE FOR MANAGEMENT

Course Objectives

- The course focuses on different matters of importance related to Technology and Innovation Management.
- Provides clear understanding on the Technology Transfer and Joint Ventures
- Enable students to know web marketing and its strategies in marketing research.
- To know about Web Marketing strategies
- To understand E-Mail Marketing and Instant Market Research
- To study Enterprise Resource Planning from an entrepreneurial perspective

Course Outcomes (Cos):

1. Appreciate the role of technology in the modern business economy
2. Analyze the key aspects of Technology Transfer and Joint Ventures and implement in business
3. Assess and develop the necessary critical factors in the Web Marketing
4. Identify and evaluate opportunities for new technologies
5. Compare and contrast the different forms of intellectual property protection in terms of their key differences and similarities.
6. Students will be able to analyze the Enterprise Resource Planning and e-Business Blueprint Planning

Unit I

Innovation: - Need - Objectives of innovation - Technology innovation - its importance - Knowledge Management- need - Business strategies related to knowledge management - Knowledge Management Approaches-Transformation of an enterprise through Knowledge Management - Creating Knowledge Management System in Organization Establishing Knowledge Management through IT- Organizational culture for Knowledge Management - Future of Knowledge Management

Unit II

Technology Transfer and Joint Ventures -Policy, Procedure & Practices-India's Technology base and Capabilities-Preference of Indian Technology-major Constraints and problems- Operational constraints-Problems in Indian Business Environment Problems in Finalization of Agreement-

Major Problems in Technology transfer Collaboration Agreements, R& D, Import Substitution, Scaling, Diagrams- Patterns and Intellectual Property rights.

Unit III

Web Marketing- Meaning- Benefits of Web Marketing-Myths and Facts in Web Marketing- Web Psychology: Understanding the Internet mind- The Internet and the Law: Copyright, Censorship, Privacy, Jurisdiction- Do's and Don'ts on Web.

Unit IV

Web marketing Strategies- Choosing the strategy- Online store fronts -Target Marketing Attracting Customers- Web Advertising - E-Mail Marketing-Instant market research -Securities Issues

Unit V

Enterprise Resource Planning: The E- Business backbone -Meaning- ERP decision Enterprise Architecture Planning- ERP Implementation- The Future of ERP Applications- Procurement- e-Business Blueprint Planning.

Text book:

1. Technology Transfer and Joint Ventures Abroad-R.R.Azad, Deep& deep Publications, New Delhi

Reference Books:

1. Knowledge Management for Competitive advantage - Harish Chandra Chaudharaty, Excel Books Publications, New Delhi
2. Web Advertising and marketing Thomas J Kuegler,Jr. Jrd Edition-Prentice- Hall of India, New Delhi
3. E-Business Roadmap for Success- Dr.Ravi Kalakota- Perason Education
4. "Frontiers of Electronic Commerce", Ravi Kalakota, Andrew B. Whinston, Addition -Wesley, 2000.

Course Objectives:

- To know the fundamental parameters used to generate an idea for business plan
- To understand the business plan sources through trade and industries associations
- To study the industry analysis for applying skills and tools to manage and analyze the gap.
- Helps to understand the marketing plan and sales strategy
- To acquire knowledge on emerging ethical issues in business
- To develop the ethical decision making process

Course Outcomes (Cos):

1. Prepare a business plan considering the basic parameters of capital management and change
2. Critically analyse the sources of information for business plan
3. Identify the gap for applying expertise skills and tools.
4. Evaluate the emerging ethical issues in business.
5. Formulate the ethical decision making process
6. Analyze the Business Ethics in a Global Economy and emerging ethical issues in business

Unit I

Business Plan - Meaning- The why of business plan - Basic parameters - Timing of decision undertaken Project parameters - the common considerations - Factors of successful business - capital management- financial control - anticipating change and adaptability.

Unit II

Business plan process - sources of information - Internet, government sources and statistics - offline research resources - library - SBDC'S - Trade and industries associations - sources of market research - evaluating data- benefits of market study - coverage of market study - information sources.

Unit III

Business plan components - The Executive summary - company description - Industry analysis and trends - Target market - Competition - strategic position and risk assessment - Marketing plan and sales strategy - operations - Technology plan - management and organization

Unit IV

Business ethics - Definition and importance - Benefits of business ethics - emerging ethical issues in business - Ethics as a dimension of social responsibility.

Unit V

The ethical decision making process - understanding ethical decision making and corporate governance - Individual factors - organizational factors - Implementing and auditing ethics programs - Business ethics in a global economy

Text book:

1. Business ethics - Ethical decision making and cases. O.C. Ferrell John Paul 23.

Reference books:

1. Fraedrich, Linda Ferrell. 6th edition, published by Biztantra.
2. Business ethics - William H. Shaw 4th edition Published by Thomson Wadsworth
3. Rhonda Abrams " The Successful business Plan Secret \$ Strategies " prentice
4. Rhonda Abrams "The business plan in a day" Prentice.
5. Business plan preparation - Entrepreneurship Development Institute of India

Course Objectives:

- To understand entry of multinationals and innovation of new products
- To study cultural impacts and changes on business
- To study the international trade theories and strategies for managing global entry
- To get familiarize with the Import and Export Acts
- To gain knowledge on the strategic responses to changing environment
- To know the legal acts in India relating to Industry.

Course Outcomes (Cos):

1. Evaluate the modes of entry of multinationals and innovation of new products
2. Demonstrate the Social Responsibility of Business.
3. Critically analyse the cultural changes and its impact on business
4. Formulation of strategies to get profit from global business
5. Estimate the export and import acts for managing global entry.
6. The student will able to evaluate the legal acts in India relating to Industry and the role of cultural diversity in Business Environment.

Unit I

Business - Concepts and Significance - Entry of Multinationals - New Changes in Business - Innovation of new products - Technological changes – Competition in Business - Social Responsibility of Business.

Unit II

Cultural concept - Cultural change - Culture and Workplace - Cross culture - Culture and Competition - Differences in culture - Cultural theories - Impact of Culture on Business - Managing Cultural impacts and changes.

Unit III

Nature of Competition - Heckscher Ohlin Theory - The new Trade Theory - National Competitive Advantage - Porter's Diamond - Impact of Competition - Managing Competition - Updating of new technology. Era of Globalization - Significance - Strategy and the firm - Profiting from Global Expansion - Pressures for cost reductions and Local responsiveness - Strategic Choice - Entry mode - Liberalization of Indian economy - Export and Import acts - Managing global entry

Unit IV

Strategic Responses to changing environment - Portfolio Related, Process Related and Structure Related - Aligning HR Strategy - strategic Changes - Planned Changes - drawbacks- Unplanned Change - Steps in Planned Change - Changes and Amendments in Labors Laws - International Trade Unions and Business Associations

Unit V

Legal acts in India - Industrial Developmental Regulation Act (IDRA) - New Industrial Policy - New Economic Policy - Abolition of MRTP Act and introduction of Competitive Act - Consumer Protection Act - Imposing of MODVAT in India - Political Environment -Political uncertainty - Impact of Politics on Business- GATT - WTO- TRIPS –TRIMS - Consumer movements, Right to information

Text book:

1. Business Environment - Francis Cherunilam. (Himalaya Publishers)

Reference Books:

1. Business Environment - Aswathappa. (Himalaya Publishers)
2. International Business - Francis Cherunilarn. (Prentice Hall of India).
3. International Business: Competing in the Global Market Place - Hill. C. W. (Tata McGraw - Hill Publishing Corporation Limited, New Delhi).
4. Indian Economy - A. N. Agarwal. (Wishwa Prakashan).

Course Objectives:

- To understand documentary credits and letters of credit
- To apprehend to export finance and Pre-shipment finance
- To study the different types of post-shipment finance
- To understand the strategic rules governing import credit
- To know the Export and Import policy of India
- To provide knowledge on the various incentives given by the Government of India for exports

Course Outcomes (Cos):

1. Ability to file documentary credits and letters of credit
2. Critically analyse export finance related to Pre-shipment finance and documentation
3. Critically analyse the rules governing the post-shipment finance
4. Examine the strategic rules governing import credit
5. Evaluate the Export and Import policy of India and role of RBI in export finance
6. Evaluate the incentives given by the Government of India for exports

Unit I

Introduction to Documentary credits - Documentary Credits, Letters of Credit, Parties to letters of credit, Types of letters of credit, Documents in documentary credit. FOB, CIF, C&F

Unit II

Export Finance – Pre-Shipment Advance - Pre-shipment finance, Types of Pre-shipment finance, Disbursements of packing credit advance, Overdue Packing Credit Advances and their follow up, Packing Credit in Foreign Currency (PCFC). Transshipment

Unit III

Export Finance – Post-Shipment Advance - Post – shipment finance, Rules governing post-shipment finance, Types of post-shipment finance, Crystallization of overdue export bills and their follow up. Forward cover procedure

Unit IV

Imports - Import letter of credit, Rules governing Import credit, Forward exchange contracts for imports, Payment for import of goods. Technology imports procedure

Unit V

ECGC and EXIM Bank - Export and Import policy of India, Incentives given by the Government of India for exports, Role of RBI in promoting export credit, ECGC – Types of policies, EXIM bank – its role and their promotional activities. Foreign Trade shows

Text Book:

1. Reserve Bank of India, *Documentary Credits*, Mumbai: Foreign Exchange Dealers' Association of India, 2000.

Reference Books:

1. Reserve Bank of India, *Exports Finance*, Mumbai: Foreign Exchange Dealers' Association of India, 2000.
2. Reserve Bank of India, *Trade and Exchange Control Regulations Relating to Imports*, Mumbai: Foreign Exchange Dealers' Association of India, 2000.
3. Dun and Bradstreet, *Foreign Exchange Markets*, New Delhi: Tata McGraw-Hill, 2007.
4. Thummuluri Siddaiah, *International Financial Management*, New Delhi: Pearson, 2010.

Course Objectives:

- To make the student to aware of accumulation of NPA, rule regarding rehabilitation of sick units and recovery of dues
- To know the procedure for classification of non-performing assets
- To study the concessions under Income Tax Act for mergers and unwillingness to pay and inability to pay
- To understand the process of recovery of advances and the role of Credit Guarantee Corporation.
- To know about provisioning to various Non- Performing assets and write – off of advances
- To understand Securitization and Reconstruction of Financial Assets and Securities Interest Act

Course Outcomes (Cos):

1. Analyze the impact of sickness on industries and ways & means of preventing sickness
2. Classify the non-performing assets accumulated in their organization
3. Evaluate the concessions under Income Tax Act for mergers and unwillingness to pay and inability to pay
4. Student will discover the process of recovery of advances
5. Understand the importance of Credit Guarantee Corporation
6. Develop the procedure for Accounting Practices.

Unit I

Sickness and its Prevention - Causes and detection of sickness, Follow up of advances, Post – sanction inspection, ABC norms, Sick Industrial companies Act – BIFR. Risk averseness

Unit II

Non-Performing Assets - Introduction to NPAs, Income Recognition, Asset classification: Standard, Sub-standard, Doubtful and loss assets, Provisioning to various Non- Performing assets and write – off of advances. Gross NPA and Net NPA

Unit III

Rehabilitation of sick units - Classification of units as viable and non-viable, Guidelines for drawing rehabilitation scheme, revival by Mergers and Amalgamations, Concessions under Income Tax Act for mergers. Unwillingness to pay and inability to pay

Unit IV

Recovery of dues - Corporate Debt Restructuring, Civil suits, Debt Recovery Tribunal, Securitization and Reconstruction of Financial Assets and Securities Interest Act SARFASI, Asset Reconstruction Company, Compromise agreements CIBIL

Unit V

Credit Guarantee Corporation - Objectives of Credit Guarantee Corporation, the small loans Guarantee scheme, the small loans (SSI) Guarantee Scheme, Accounting practices. Crop insurance

Text book:

1. I. M. Pandey and Ramesh Bhat, *Cases in Financial Management*, New Delhi: Tata McGraw-Hill, 2000.

References:

1. Master Circular on NPA – Norms for Classification of Advances, www.rbi.org.in

3. Master Circular on A Guide to Deposit Insurance, www.dicgc.org.in
4. Ciaran Walsh, *Key Management Ratios: How to Analyze, Compare and Control the Figures that Drive Company Value*, New Delhi: Macmillan India Ltd., 2006.

Course Objectives:

- To make the student to aware of regulations of RBI to banks
- To know the market risks- interest rate risks for asset and liability management
- To study the credit quality problem and credit scoring models for measurement of credit risk
- To study the basics of reducing off-balance sheet risks and comprehend Commercial letters of credit
- To understand the regulations of RBI to mitigate the risks
- To understand foreign exchange risk and the role to follow capital adequacy norms

Course Outcomes (Cos):

1. Classify the various risks faced by the banks
2. Student can able to analyze the regulations of RBI to banks on various risks.
3. Formulate the procedures for reducing market risks- interest rate risks for asset and liability management
4. Ability to develop the methods for measurement of credit risk,
5. Analyze off-balance sheet risks and commercial letters of credit and provide solutions
6. Estimate the solvency nature of a company and foreign exchange risk.

Unit I

Introduction to Risks - Risk, An introduction to various risks faced by banks, the impact of risks on banks profitability and the regulations of RBI to mitigate these risks. Zero risk assets

Unit II

Market Risks - Interest rate risks, Rate sensitive assets, Rate sensitive liabilities, Re-pricing risks, Liquidity risk, Asset liability management Committee: role and purpose. Maturity buckets

Unit III

Credit Risk - Credit quality problems, Meaning of willful default and inability by borrower to pay the dues, Measurement of credit risk, Credit scoring models, Loan portfolio and concentration risk. Discriminant analysis

Unit IV

Off-Balance Sheet Risks - Commercial letters of credit, Standby letters of credit, Guarantees,

Derivative contracts: basics of reducing off-balance sheet risks. Notes on accounts

Unit V

Other Risks - Operational risk, Foreign exchange risk, Country or sovereign risk, Technology

risk, Insolvency risk and Capital adequacy norms. Sovereign rating by credit rating agencies

Course Objectives:

- To have an exposure in international retailing segmentation
- To understand the trends in retail marketing and changing nature of boundaries.
- Students have basic understanding of Multi country Competition and Global Competition
- Acquire knowledge for entering and competing in foreign markets.
- To have clear insight of the Stages in development of International Operations
- Students learn about public relation and sales promotional strategies

Course Outcomes (Cos):

1. Analyze the international retailing and markets.
2. Discover the strategies and options for entering and competing in foreign markets.
3. Construct marketing tools and techniques to meet Multi country Competition and Global Competition
4. Access the retail operation through formulation of retail structure.
5. Gain knowledge on international retailing and markets.
6. Mapping Market Research and Sales Promotion Strategies

Unit I

International Trade – Barriers and Facilitators - Regional Economic/Political Integration - Cultural Influences on International Marketing - International Marketing Segmentation – Positioning - The Marketing Plan and Entry Mode Selection

Unit II

International Retailing - definitions, interpretations - Trends in the internationalization of retailing and evolution of international retailing - Motives for international retailing - the changing nature of boundaries – International - Where retailers internationalize - Assessing the potential of retail markets - Methods of international retailing - accessing retail markets.

Unit III

Competing in Foreign Markets - Why Companies Expand into Foreign Markets - Cross Country Differences in Cultural, Demographic and Market Conditions - Concept of Multi country Competition and Global Competition - Strategy Options for Entering and Competing in Foreign Markets - Quest for competitive Advantage in Foreign Markets

Unit IV:

Retail Structure - Enterprise Density - market Concentration - Developing markets - Stages in development of International Operations – Export - Management Contracts - Franchising – Acquisition and Mergers – Organic Growth - Choice of Market Entry - Domestic Market - Retail Operations - Non Domestic market.

Unit V:

Market Research – Segmentation – Targeting - Positioning – The Market Mix - Image Product range – Format – Price – Location – Distribution – Promotion - Promotional Mix and Advertising – Publicity – Public Relations and Sales Promotion Strategies - Personal Selling and Sales Management.

4. Allan M Findlay, Ronan Paddison and John A Dawson Retailing Environments in Developing Countries- Rutledge

Course Objectives:

- To understand the role of retailing and strategic business management in service sector
- To study the operations and financial aspects in retail planning
- To comprehend the human resources management in retailing
- To study the legal & compliances for a retail Store
- To know the procedures applicable for a Retail Store
- To emphasize on Mall management and its various forms.

Course Objectives (Cos):

1. Analyze the role of retailing and strategic business management in service sector
2. Know the retailing in banking and other financial services
3. Design the operations and financial aspects in retail planning
4. Comprehend the human resources management in retailing
5. Ability to resolve the legal and compliances for a retail Store
6. Discover strategies for mall management and its various forms.

Unit I

Marketing & Strategic Management: Retailing - Role, Relevance & Trends - Retail Customer - Retail market segmentation & franchising - Retailing in banking and other financial services - mutual funds and Insurance - Services marketing and management

Unit II

Operations & Finance in Retailing: Retail location strategy - Product and Merchandise management – Total Quality Management - Security measures - Footfalls / computerized methods & non computerized methods - Visual / display methods - Management of Obsolete goods

Unit III

Human Resources Management in Retailing: Retail organization - Laws involved in Human Resources - Motivation - Customer psychology - Training needs for employee - Top grading - Obstacles to Top grading - Coaching to fix weakness - Interviews guide

Unit IV

Legal & compliances for a Retail Store: License - Contracts & Recovery - Legal Process -PF/ESI & Exemptions - Food & Restaurants – PPF - IR – Law - Shops & establishments - IPR Patents, Copyright & Trademarks - Inclusion of Service Mark - Procedure and Duration of Registration Collective Mark - Procedures applicable for a Retail Store .

Unit V

Mall Management: Types of Various retail formats - Concepts in mall design - Factors influencing Malls establishments - Aspects in Finance - Aspects in security / accounting - Aspects in HR - Aspects in Quality management

Text Book:

4. Retail Management A Strategic Approach – Barry Berman & Joel R.Evans- The Prentice Hall of India, New Delhi
5. Legal Aspects of Business –Akhileshwar Pathak- The McGraw Hill Companies

Course Objectives:

- To understand the basic concepts of personal and impersonal communication in retail
- Knowledge on communication programmes to develop brand images and building customer loyalty
- Students learn about planning, implementing and evaluating communication programs for retailing
- To know the ways of planning and allocating of communication budget
- Acquire knowledge on integrated marketing communications
- To learn the suitable technology for Integrated Marketing Communications

Course Outcomes (Cos):

1. Demonstrate capabilities concepts of personal and impersonal communication in retail
2. Organize communication programmes to develop brand images and building customer loyalty
3. Analyse the planning, implementing and evaluating communication programs for retailing
4. Apply the suitable technology for Integrated Marketing Communications
5. Apply the understanding of Retailing, Retail market segmentation, Retail location, merchandising, Retail operations and Retail Pricing in lifelong practice.
6. Demonstrate capabilities of analysing problems, team work and communication skills.

Unit I

Retail Communication – methods of communicating with customers – Paid and Unpaid Communication – Personal and Impersonal Communications.

Unit II

Communication programmes to develop Brand Images and Building customer Loyalty – Extending the brand name.

Unit III

Retail communication planning – setting objectives – communication budget – allocation of the promotional budget – planning and implementing and evaluating communication programs

Unit IV

Retail Communication Mix – Advertising – Sales promotion – Public Relations and Publicity
Personal selling – Point of Purchase displays.

Unit V

Integrated Marketing Communications – E tailing – E-commerce – Applications of Technology
– EDI, DBMS – Data Warehousing – Data mining - RFID

15MBAPI401A MULTILATERAL TRADE AGREEMENTS AND REGULATIONS 4004

Course Objectives:

- Attempt to appreciate the conceptual and practical aspects of trade agreements.
- Acquaint the students with environmental, procedural, institutional and decisional aspects of trade.
- To develop capabilities to understand the International Business Laws
- To understand the dispute settlement and issues related to intellectual property regime.
- To understand Implications for International business and progress made by WTO in the last one decade
- Students get familiarize on the formation of regional blocks and its impact on trade.

Course outcomes (Cos):

1. Students can able to link theoretical concepts of trade in business situations
2. Analyze the prevailing international business laws to outsource their business
3. Evaluate the value of trade of their economies and other economies
4. Understand various International Commercial Dispute Settlement
5. Compare and estimate the various trade agreements among nations
6. Ability to manage resources, identify and carry out specific goal oriented tasks

Unit – I

Historical background of International Trade, Direction and Composition of International Trade. Terms of Trade, Trade as an engine of growth. Concept of Law - Types of law, Domestic and International and their jurisdiction. Regional Trade Agreements: Concept, origin, types. European Union, NAFTA, ASEAN, MERCOSUR –their structure, decision making, funding, implications on world trade.

Unit – II

Law of WTO: Introduction, Objectives, Functions, Structure, Principles, Agreements – implications for International business, Progress made by WTO in the last one decade. Tariff and Non-tariff barriers - implications for WTO members.

Unit – III

International Business Law – International Sale of Goods, Laws governing International Sale of goods – Domestic laws, International Treaties, International Mercantile Customs and Usages –

Inco terms, Rules on International Sale of Goods, International Commercial Dispute Settlement – Reconciliation, Arbitration etc.

Unit – IV

Intellectual Property: Historical Background, IPR Administration – WIPO, WTO, Indian Patent Office, Patents, Copyrights, Trademarks, Geographical Indications, Industrial Designs, Layout Designs, Trade secrets.

Unit V

Selected Regional Blocks- NAFTA, EU, ASEAN, SAARC, SAPTA, Indo-Lanka Free trade, Indo -Singapore CECA Globalization vs. Regionalization

Text book:

1. Vinod V Sople, “Managing Intellectual Property” PHI Learning Private Limited

Reference:

1. Palle Krishna Rao, “WTO text and cases” Excel Books

Course Objectives:

- To make students understand international trade and formation of economic integration
- To enhance knowledge on gains from trade and terms of trade
- To acquire knowledge on the determination of exchange rate, tariffs and quotas
- Students learn about the balance of payments and its consequences.
- To understand the concept and limitations of Foreign Trade Multiplier
- Familiarize the students with the knowledge of export promotion measures and growth of foreign trade

Course Outcomes (Cos):

1. Analyze the significance of Inter-regional and international trade for an economy
2. Gain insight on the regional integration of economies and multilateral arrangements
3. Analyze the impact of exchange rate fluctuation on home currencies
4. Students evaluate the policies pursued by various economic bodies in international trade
5. Analyze the balance of payments and its impact on business
6. Evaluate the benefits and schemes of government and other bodies for promotion of exports

Unit I

Introduction: International Economics- meaning, Scope & Importance Inter-regional and international trade. Importance of International Trade. Theoretical Aspects of Economic Integration: Free trade area, customs union and common market; Theory of customs union; Trade creation and Diversion effects.

Unit II

Theories of International Trade. Theory of Absolute Cost Advantage, Theory of Comparative Cost Advantage. Intra-Industry Trade. Gains from Trade, Measurement of gains, static and dynamic gains. Terms of trade – Importance & Types, Determinant's of Terms of trade, Causes of unfavorable terms of trade to less developed countries.

Unit III

Trade policy & Exchange Rate, Free trade policy - case for and against, Protections – case for and against, Types of Tariffs and Quotas, Determination of Exchange rate, Fixed & Flexible Exchange Rate- Merits & Demerits.

Unit IV

Balance of Payments, Balance of trade and Balance of payments: Concepts and Components - Equilibrium and Disequilibrium in Balance of Payments; Causes and Consequences, Measures to correct deficit in the Balance of Payments. International Monetary System, Devaluation; - Merits, Demerits and Limitations, Foreign Trade Multiplier; - Concept and Limitations, IMF, World Bank – Objectives, Functions & Performance.

Unit V

Foreign Trade in India, Recent changes in the composition and direction of foreign trade; Causes and Effects of persistent deficit in the Balance of Payments; Measures adopted by the Government to correct the deficit after 1991; WTO & India Export Promotion measures, Partial and Full convertibility of Indian Rupees, Export Promotion – Contribution of SEZ Foreign Trade policy 2009, Role of Multinational Corporations in India.

3. Soderste, *International Economics*, Macmillan Press Ltd.

Course Objectives:

- To have an exposure to International Distribution system and Logistics
- To understand the code of conduct in Logistics and International marketing channel decisions.
- To acquire knowledge on the procedures and role of intermediaries in ocean transportation
- Detailed overview of the important sea routes and shipping ports and cost involved in consignments
- To provide knowledge with the consignment of goods through air transport
- To get an insight on the inventory control and warehousing facilities

Course Outcomes (Cos):

1. Evaluate the significance of the value adding perspective of logistics and distribution system.
2. Analyze the freight structure and practices of shipping
3. Make Strategic and Operational logistics decisions in the context of different modes of shipping
4. Practice of planning for inventory control and warehousing facilities
5. Gain knowledge to analyze the significance of Logistics in Global scenario.
6. Analyze the liners and freight structures to plan for business outsourcing

Unit I

Marketing Logistics: Concept, objectives and scope; System elements; Relevance of logistics in international marketing; International supply chain management and logistics; Transportation activity – internal transportation, inter-state goods movement; Concept of customer service.

Unit II

General Structure of Shipping: Characteristics, liner and tramp operations; Code of conduct for liner conferences; Freight structure and practices; Chartering principles and practices; UN convention on shipping.

Unit III

Developments in Ocean Transportation: Containerization; CFS and inland container depots; Dry ports; Multi-modal transportation and CONCOR; Role of intermediaries including freight booking, shipping agents, C&F agents, Ship owner and shipper consultation arrangements.

Unit IV

Air Transport: Air transportation –total cost concept, advantages, freight structure and operations; Carrier consignee liabilities.

Unit V

Inventory Control and Warehousing: Inventory management – concepts and application to international marketing; Significance and types of warehousing facilities; Total cost approach to logistics.

Course Objectives:

- To understand the purchase functions and materials management.
- To study the vendor development and maintenance for purchasing of capital goods.
- To familiarize with materials planning and codification.
- To recognize the legal aspects of buying and assess the industry ethical practices in materials
- To familiarize the knowledge of warehousing management.
- To provide knowledge on the Materials Management Information system

Course Outcomes (Cos)

1. Demonstrate the concept vendor development and maintenance for purchasing of capital goods.
2. Able to manage and plan material flows and related information flows as part of the company's logistics process.
3. Examine the vendor's development and maintenance for purchasing of capital goods.
4. Creating practical engineering solutions for materials planning and codification
5. Classify the functions of Materials Management Information System
6. Develop a model for warehousing management and import-export logistics management.

Unit I

Purchasing Functions - Relationship of purchasing Department with other departments, Procurement, Supply management activities, Purchasing objectives and policies, Operating procedures, Purchasing cycles, Objectives of materials management, Organization of material function.

Unit II

Supply Sources - Importance of source selection, Vendor development & maintenance, Vendor rating, Competitive bidding, selecting the source, Negotiation: Objectives, Process, Techniques, Price negotiation, Purchasing of capital goods, Seasonal commodities, Insurance spares. Contract management

Unit III

Materials Planning - Materials Codification: Evolution of codes, Classification, Methodology, Advantages, Standardization: Definition, Specification, Advantages, Techniques, Pricing Principles: Price analysis, Discounts, Economic consideration in determining the right price

Unit IV

Materials Management - Materials management, Legal aspects of buying, Buyer-Seller relationship and ethics Industry ethical practices in Materials

Unit V

Warehousing Management - Stores management, Incoming material Control, Stores documentation & accounting, Materials Management Information System (MMIS). New developments in MMIS

Course Objectives

- To understand the concept of supply chain and logistics.
- To get familiarize with the key drivers of supply chain performance.
- To acquire knowledge of supply chain inventory
- To have clear understanding of supply chain network optimization models
- To provide basic concepts of freight management and ocean carrier management
- To enable the students to understand the international logistics and analytical tools necessary to solve supply chain problems.

Course Outcomes (Cos):

1. The students able to demonstrate the connection between company's internal materials management and the network in supply chain.
2. The students able to evaluate the material flow and related information flow as part of the company's logistics process.
3. Illustrate the engineering solutions to solve existing conflicts between good customer satisfaction and working capital.
4. The students will understand the importance of accurate planning and product data management as a part of Logistics Management.
5. Familiarize the key drivers of Logistics outsourcing.
6. Get an in-depth knowledge in Transactional Logistics

Unit I

Supply Chain - Fundamentals, Importance, Decision Phases, Process view, "Supplier-Manufacturer-Customer chain", Supply chain performance: Drivers, Structuring supply chain. Overview of supply chain models

Unit II

Overview of Demand forecasting in the supply chain - Aggregate planning, Managing predictable variability. Managing supply chain cycle inventory, Uncertainty, safety inventory, Determination of optimal level of product availability, Coordination in the Supply Chain

Unit III

Distribution Network Design - Role, factors influencing network, options, Value Addition. Models for facility location and capacity planning. Network design: Impact of uncertainty,

decisions using decision trees. Distribution center location models. Supply chain network optimization models. New developments in network designs

Unit IV

Logistic System - Evolution, Infrastructure and Networks. Freight Management, Route Planning, Containerization. Modal Characteristics, Inter-modal operators and transport economies. Ocean carrier management, import-export logistics management. Logistics outsourcing, 3PL / 4PL, Importance of Insurance, Reverse logistics

Unit V

Transactional Logistics - Framework and role of supply chain in e- business and b2b practices. Supply Chain IT Framework. International supply chain, GPS, tracking system, Software Packages in Supply Chain

Course Objectives:

- To make the students understand the basic concepts of total quality management and appreciate its importance in today's business environment.
- To understand the quality management practice and TQM tools and its application in improving the organizational performance.
- To provide an insight on the process approach to TQM
- To get exposure on tools and techniques of various quality tools.
- To know the ways of winning quality awards
- To familiarize the students about the Quality Management System.

Course Outcomes (Cos):

1. Demonstrate the knowledge of quality management to improve organizational effectiveness.
2. Student will able to practice various aspects on total quality management
3. Acquire required diagnostic skills on use of various quality tools.
4. Student will get exposure on tools and techniques of quality management
5. Student will familiarize about the Quality Management System.
6. Apply the Quality tools and techniques in improving the performance.

Unit I

Introduction - Introduction and basic concepts, Definition of quality, Dimensions of quality, Evolution of TQM, TQM frame work, Cost of Quality.

Unit II

TQM Implementation - Leadership for TQM, Deming's quality principle, TQM implementation, PDCA cycle, Quality Circles, Quality Council, Supplier Partnership.

Unit III

Process approach to TQM - Process approach, Juran's Trilogy, Taguchi's loss function, Kaizen, Quality by design, 5S, ESI (Early Supplier Involvement), 5M.

Unit IV

Tools and Techniques - 7 Old quality control tools, Total productive maintenance, Failure mode and effect Analysis, POKAYOKE, Six Sigma, Toyota and Six Sigma.

Unit V

Quality Management Systems - Management systems for TQM, ISO 9000 & 14000 Quality management systems, Auditing and certification Process, Quality Awards

Text book:

1. Subburaj Ramasamy, “Total Quality Management”, New Delhi: Tata McGraw Hill Publishing Co. Ltd, 2008.

References:

1. Dale H. Besterfield et al, “Total Quality Management”, New Delhi: Pearson Education, 2011.

4. Greg Brue, “Six Sigma for Managers”, New Delhi: Tata McGraw Hill Publishing Co. Ltd, 2002.

Course Objectives:

- To assess the overall knowledge of the student in the relevant field of Management
- Realize the knowledge and skills required to excel in their career
- To test their learning and understanding of various concepts of the syllabus during the course of their programme
- To acquaint the students with fundamentals of communication and help them to transform their communication abilities
- To obtain frameworks and tools to effectively analyze and approach various Organizational situations.
- To prepare the students to face interview both in the academic and the industrial sector

Course Outcomes (Cos):

1. Students get equipped with skills and knowledge to excel in their future careers
2. To develop an in-depth knowledge on the management concepts, theories and principles
3. Develop an ability to analyse and interpret contents and concepts to provide meaningful information in making management decisions
4. Recognize the application of various techniques to achieve the objective of the task
5. Determine opportunities and emerging challenges in the upcoming business trends
6. Demonstrate capabilities of problem-solving, critical thinking, and communication skills related to various courses.

A Comprehensive Viva Voce will be conducted at the end of the Semester. The panel shall consist of an external expert and faculty members who handled the courses. The viva is aimed to evaluate the student's knowledge in all the core and elective courses in the particular semester.

Course Objectives:

- To understand the problems in the functional areas of business enterprises
- To instill a spirit of work behavior among the student participants.
- Internship is aimed to feed industry - institutional- orientation among the students
- To sensitize students to the nuances of corporate culture and familiarize them with the corporate code of behavior.
- Learn actual supervised professional experiences.
- To understand the working environment and functions of departments

Course Outcomes (Cos):

The students will be able

1. Develop the skills, knowledge, attitudes, and perceptions along with the experience needed to constitute a professional identity.
2. Gain actual supervised professional experiences.
3. Get insight in working of the real organizations
4. Analyze the work behavior of the specific functional areas.
5. Match linkages among different functions and departments.
6. Discover career opportunities to students in exploring in their areas of interest.

Every student has to undergo major project in a company for a period of 25 working days during the fourth semester. He / She has to submit a project report containing details of company, company profile, different functional area problems and prospects. The project should be done during the fourth semester. A research project may be based on primary / secondary data.

The report should be well documented and supported by –

- Cover & Title Page
- Certificate, Company Certificate & Declaration
- Acknowledgement
- List of Contents, List of Tables & List of Charts
- Introduction of the Study
- Review of Literature
- Research Methodology
- Data Analysis & Interpretation
- Findings, Suggestions & Conclusion

- Bibliography
- Appendix

Course Objectives:

- To understand the human resource management
- To increase knowledge of HR planning, Selection, Recruitment, job analysis and its interrelations.
- To gain information on HR questions
- To know about Do's and Don'ts in HR Interview
- To understand the concept of role play
- To get an in-depth knowledge of global HR practices

Course Outcomes (Cos):

1. The ability to speak clearly, persuasively, and forcefully
2. Exhibit important life skills including Decision making, Problem solving and creative thinking.
3. Anticipate what they gain from educational experience
4. Track their progress and set bench mark
5. Identify the methods of assessment of knowledge and skills
6. Plan appropriate strategies to enrich the need based learning techniques

Introduction to HR - HR questions and Do's and Don'ts in HR - HR Interview - Mock HR – Role Play.

பாடத்திட்டப்பொதுநோக்கம்

- கற்றல் வழி சிந்தனைத் திறனையும், கருத்து வெளிப்பாட்டுத் திறனையும், மேம்படுத்துதல்.
- ஆய்வுநோக்கைமேம்படுத்துதல்.
- இலக்கியங்கள் உணர்த்தும் வாழ்வின் நுட்பமான பகுதிகளை உணர்த்துதல்.
- மனித மனத்தினைப் பக்குவப்படுத்துதலில் இலக்கியம் தரும் பங்கினை உணர்த்துதல்.
- வளர்ந்து வரும் சமூகத்தில் அறஉணர்வு, பண்பாடு போன்றவை குறித்து அறிவூட்டல்.
- அரசுத் தேர்வுகளுக்கு மாணவர்களை ஆயத்தமாக்குதல்.

பாடத்திட்டப்பயன்விளைவு

1. இந்தியகுடியுரிமைப்பணிமுதலானபோட்டித்தேர்வுகளில், விருப்பப்பாடமாகஇடம்பெறுகின்ற, 'தமிழ்இலக்கியவரலாறு' குறித்தமுழுமையானஅறிமுகம்பெற்றிருத்தல்.
2. கல்வெட்டியல், ஓலைச்சுவடியியல்மற்றும்தொல்லியல்சார்ந்தஆவணத்தேடலுக்குரியஆய்வுமனப்பான்மையுடன், இலக்கியங்களைஅணுகுதல்.
3. தமிழின்வளர்ச்சித்துறையாகிய, 'அறிவியல்தமிழ்' ; 'இணையதமிழ்' குறித்தபன்னோக்குஅணுகுமுறையிலானஆய்வுச்சிந்தனைமேம்பாடு.
4. வேலைவாய்ப்புக்குரியசுயதிறன்மேம்பாட்டுடன், படைப்பாக்கத்திறன்மேம்பாடும்பெற்றிருத்தல் .
5. சமுதாயமற்றும்வாழ்வியல்மதிப்புகளைப்பேணுவதற்குக்கருவியாகஇலக்கியங்களைநாடுகின்றமனப்பான்மைவளர்ச்சி.
6. மொழிபெயப்புத்துறைசார்ந்தவேலைவாய்புத்திறன்பெற்றிருத்தல்

அலகு – I :இக்காலஇலக்கியம்

தத்துவம் : மகாகவிபாரதியார்- பகைவனுக்குஅருள்வாய்.

கவிஞர்ந.பிச்சுமூர்த்தி- கிளிக்கூண்டு

இயற்கை : பாவேந்தர்பாரதிதாசன்- அழகின்சிரிப்பு – ஞாயிறு.

சமுதாயம் :கவிக்கோஅப்துல்ரகுமான்- இன்றையநிலை

அறிவியல் : கவிஞர்சிற்பிபாலசுப்பிரமணியன்- காலம்.

பெண்ணியம் :கவிஞர்சிவரமணி- வையகத்தைவெற்றிகொள்ள

சூழலியல் :அன்பாதவன் - மரணம்

காதல்:வைரமுத்து -காதல்உயில்

தன்னம்பிக்கைபா.விஜய் - தன்னம்பிக்கை

அலகு – II :அறஇலக்கியம்

1. திருக்குறள் - தேர்ந்தெடுக்கப்பட்டகுறள்கள் 20

2. நான்மணிக்கடிகை - தேர்ந்தெடுக்கப்பட்டஐந்துபாடல்கள்

3. திரிகடுகம் - தேர்ந்தெடுக்கப்பட்டஐந்துபாடல்கள்

அலகு - III :சிற்றிலக்கியம்

1. நரிவிருத்தம் - அறன்வலியுறுத்தல்

2. தமிழ்விடுதூது - தமிழின்சிறப்புரைத்தல்

3. மதுரைமீனாட்சியம்மைப்பிள்ளைத்தமிழ்- தொடுக்கும்கடவுள்பழம்பாடல்

அலகு - IV :சிறுகதை

1. புதுமைப்பித்தன்-நிகும்பலை

2. தனுஷ்கோடிராமசாமி- கந்தகக்கிடங்கிலே

3. கந்தர்வன் - துண்டு

4. வாஸந்தி- வடிகால்

5. சி.ஆர். ரவீந்திரன் - வழக்குமரம்

அலகு- V :மொழிப்பயிற்சி

1. விண்ணப்பங்கள்எழுதுதல்மற்றும்கடிதப்பயிற்சி

2. மொழிபெயர்ப்புப்பயிற்சி

பாடநூல்:கற்பகச்சோலை – தமிழ்எடு.கற்பகம்பல்கலைக்கழகத்தமிழ்த்துறைவெளியீடு.

Course Objectives

This course enables the students to learn

- To enable the learners to acquire English language skills at a faster pace.
- To introduce different kinds of literary works
- To familiarize different genres of Literature
- To instruct moral values through literature.
- To improvise their productive and receptive skills
- To strengthen the basic knowledge about grammar.

Course Outcomes(Cos)

On successful completion of this course, the students will be able to

1. Learn to reflect on the literary works and communicate flexibly.
2. Reading and comprehending literary works
3. Genres of literature to provide moral education
4. Develop communication skills in business environment
5. Interpersonal skills will be developed.
6. Betterment of language competence

UNIT I:

Prose: Google Guys (Extract) – Richard L Brandt

Poetry: The Blind Pedlar – Osbert Sitwell

Short Story: A Garden So Rich – Christie Craig

Vocabulary: Prefixes, Antonyms, Sentence Completion

Grammar: Articles, Adverbs, Pronouns

Composition: Proverb Expansion

UNIT II:

Prose: Happiness 101 – Geeta Padmanabhan

Poetry: An Old Woman – Arun

Kolatkars **Vocabulary:** Suffixes, Analogies

Grammar: Nouns, Adjectives

Composition: Dialogue Writing

UNIT III:

Prose: Structured Procrastination – John Perry

Short Story: The Umbrella Man – Roald Dahl

One-Act Play: The Boy Who Stopped Smiling – Ramu Ramanathan

Vocabulary: Synonyms, Euphemisms, Word Definitions

Grammar: Verbs, Conjunctions and Interjection, Indirect/Reported Speech

UNIT IV:

Poetry: No Sentence – Anjum Hassan

One-Act Play: While the Auto Waits- O' Henry

Vocabulary: Words Often Confused, Anagrams

Grammar: Prepositions, Voice- Active and Passive

Composition: Letter Writing- Informal

UNIT V:

Short Story: The Bird – Amar Jalil

One-Act Play: The Cellphone Epidemic – Claudia I. Haas

Vocabulary: Portmanteau Words, One Word Substitute

Grammar: Questions, Pronunciation

Composition: Letter Writing- Formal

Prescribed Texts:

Rao, G. Chandralekha and et al. *Spring* 2013. Emerald Publishers: Chennai.

Reference

Course Objectives

This course enables the students to learn

- The concepts of essentials of matrices and its geometrical applications.
- The convergence and divergence of the series
- To find the roots for the different types of the equation and its applications.
- Binomial, Exponential and Logarithmic series theorems
- Rolle's theorem and its application
- To find the Multiple roots and integral roots of the equation

Course Outcomes (COs)

On successful completion of this course, the students will be able to

1. Acquire the knowledge on Hamilton theorem.
2. Explore the concept of convergence and divergence of series.
3. Explain the concept of Binomial, Exponential and Logarithmic series theorems.
4. Evaluate the roots any equation.
5. Understand the relation between the roots and coefficients of an equation.
6. Use Roll's theorem to produce results on Integral and multiple roots.

UNIT I

Basic concept – Eigen values and eigen vectors- Properties of eigen values and eigen vectors – Diagonalisation of a matrix – Orthogonal Matrices – Cayley-Hamilton theorem (Statement only) – Verification.

UNIT II

Convergence and Divergence of series – Series of positive terms – Comparison tests – Cauchy's condensation test - D'Alemberts Ratio test –Uniform convergence.

UNIT III

Binomial theorem – Statement only – Expansion of rational fraction- Exponential theorem – Statement – Summation of series-Logarithmic series theorem – Statement – Some important result – Summation of series.

UNIT IV

Theory of equations: Remainder theorem – Roots of an equation – Relations between the roots and coefficients of equation – Symmetric function of roots

UNIT V

Descarte's rule of signs – Rolle's theorem – Multiple roots –Integral roots.

TEXT BOOKS

1. Manicavachagam pillai., Natarajan.T., and Ganapathy.K.S, 2000. Algebra , Volume I ,S.Viswanathan printers and publishers Pvt Ltd, Madras. (For Unit- II,III,IV & V)
2. Veerarajan.T., 2007. Engineering Mathematics, Fourth edition ,Tata McGraw hill publishing company ltd, New Delhi.(For Unit-I)

REFERENCES

1. Goyal S.K, 2008.Algebra, Arihantprakasan,Meerut.
2. Sundaram V., Balasubramanian R., and K.A. Lakshminarayanan., 2000. Engineering Mathematics Vol. I , Vikas publishing house PVT., LTD, NewDelhi.
3. Manicavachagampillai., Natarajan.T., and Ganapathy., 1994. Algebra, Volume II , S.Viswanathan printers and publishers Pvt Ltd,Madras.

Course Objectives

This course enables the students to learn

- The concepts of essentials of concavity, inflection points and its geometrical applications.
- The basic concepts in derivatives of Algebraic, Exponential and Logarithmic functions.
- Curvature and radius of Curvature in Cartesian and Parametric co-ordinates.
- The concepts of Evolutes and Envelopes.
- The basics of Definite Integrals and Methods of Integration.
- The Higher order derivatives and its applications in business, economics and life sciences.

Course Outcomes (COs)

On successful completion of this course, the students will be able to

1. Evaluate the derivatives of Algebraic, Exponential, Logarithmic and Trigonometric functions.
2. Estimate the maxima and minima of any functions.
3. Apply the concept of radius of curvature and center of curvature in physical problems.
4. Calculate the definite integral by using the various methods of integration.
5. Evaluate the double and triple integrals of functions and change the order of integration in multiple variables
6. Describe the Beta and Gamma functions and evaluate multiple integral using Beta and Gamma functions.

UNIT I

Differential Calculus: Meaning of derivatives- Simple Differentiation of Algebraic, Exponential, Logarithmic and Trigonometric functions – Evaluation of First and Second order derivatives – Maxima and Minima of functions.

UNIT II

Curvature and Radius of curvature – Radius of curvature in Cartesian co-ordinates– Radius of curvature in parametric co-ordinates – Centre and circle of curvature– Evolutes and Envelopes

UNIT III

Integration: Introduction – Definite Integral – Methods of Integration – Integrals of functions containing linear functions of X – Integrals of functions involving $a^2 \pm x^2$ – Integrals of functions of the form $f(x) \cdot x^{n-1}$, $[f(x)]^n f'(x)$, $F[f(x)] \cdot f'(x)$ – properties of Definite Integral – Integration by parts.

UNIT IV

Multiple Integral: Introduction – Evaluation of Double and Triple integrals – Change of order of integration from Cartesian coordinates to polar coordinates.

UNITY

Beta and Gamma integrals-their properties, relation between them- evaluation of multiple integrals using Beta and Gamma functions.

TEXT BOOKS

- 1.Narayanan.S and T.K.M. Pillai,2000.Calculus vol 1 , Viswanathan Publishers,Chennai.(For Unit-I,II)
- 2.Narayanan.S and T.K.M. Pillai,2000.Calculus vol 2”, Viswanathan Publishers,Chennai.
(For Unit- III,IV&V)

REFERENCES

1. David V.Widder,2008.Advanced Calculus,Prentice Hall of India pvtLtd,NewDelhi.
2. Shanthi Narayanan & P.K.Mittal,2008. Integral calculus, S.Chand&Co,NewDelhi.

Course Objectives

This course enables the students to learn

- To understand basic theories and experiments in Physics.
- To understand the fundamentals of physics.
- To educate and motivate the students in the field of science
- To learn about the electronic component like Diode, transistor etc.
- To learn the logic gates and its applications
- To understand the Polarization and coherence of the optical science.

Course Outcomes (COs)

On successful completion of this course, the students will be able to

1. Describe Debroglie's concept of matter waves, Debroglie's wavelength and Thomson's experiment.
2. Design and construct Zener diode, Photo diode, Light emitting diode (LED).
3. Explain the concept of amplifiers, and perform amplifier as an adder, subtractor, differentiator and integrator.
4. Analyze binary, Octa, Hexa, decimal number systems and also relate ASCII and EBCDIC coding.
5. Develop Nand and Nor Gates as Universal Building Block and theorize De Morgan's theorem.
6. Explain Snell's Law, Planarization and coherence of optics.

UNIT – I**MODERN PHYSICS**

Debroglie's concept of matter waves- Debroglie's wavelength –Characteristics of Debroglie's matter waves- calculation of Debroglie's wavelength of material particles like electrons
–experimental study of matter waves-Thomson's experiment

UNIT – II**ANALOG ELECTRONICS**

Construction, characteristics and applications of Zener diode, Photo diode, Light emitting diode (LED); working, efficiency, ripple factor and advantages of a full wave rectifier-Qualitative analysis of a common emitter amplifier; Phase reversal of the output voltage; advantage of common emitter amplification circuit.

UNIT - III**AMPLIFIERS**

Circuit symbol polarity conventions and virtual ground or summing point of an operational amplifier; characteristics of an ideal operational amplifier; amplifier as an adder, subtractor, differentiator and integrator.

UNIT – IV**DIGITAL ELECTRONICS**

Number systems-Binary Octal-Hexa decimal-ASCII and EBCDIC-Redundant coding for error detection and correction. Basic logic design using digital integrated circuits. Truth tables, Boolean algebra, Simple arithmetic circuits-exclusive half adder-full adder-half subtractor, full subtractor. NAND AND NOR As Universal Building Block-De Morgan's theorem and its proof.

UNIT –V

OPTICS

Reflection–Refraction–Snell’s law–Total internal reflection–Interference–Diffraction– Polarisation – Coherence

TEXT BOOKS

1. Murugesan. R., Modern Physics, S.Chand & CO, New Delhi
2. Aruldas G. and P.Rajagopal, „Modern Physics“, Printice Hall of India, New Delhi, 2009

REFERENCES:

1. Rajam. J.B., Atomic Physics, S.Chand & Co, New Delhi.
2. Gupta and Kumar, 2000, Solid State Physics - Pragati Prakashan, Meerut.
3. Kittel. C., 1996, Introduction to Solid State Physics, 7TH Edition, John Willey & sons, New Delhi.
4. Dekkar. A.J. , 1900, Solid State Physics - Macmillan India Ltd., New Delhi.

Course Objective

This course enables the students to learn

- To acquire basic understanding of laboratory technique and to educate and motivate the students in the field of Physics
- To allow the students to have a deep knowledge of fundamentals of optics.
- To gain practical knowledge by applying the experimental methods to correlate with the Physics theory.
- To learn the usage of electrical and optical systems for various measurements.
- To develop intellectual communication skills and discuss the basic principles of scientific concepts in a group.
- To apply the mathematical concepts/equations to obtain quantitative results

Course Outcomes (COs)

On successful completion of this course, the students will be able to

1. Test the Young's Modulus non uniform bending and static cantilever.
2. Measure the Refractive Index of liquid prism and solid prism
3. Categorize the characteristics of junction diodes.
4. Calculate μ of a lens and Thickness of a thin wire
5. Apply the various procedures and techniques for the experiments.
6. Use the different measuring devices and meters to record the data with precision.

Any 8 Experiments

1. Young's Modulus-Non Uniform bending-Opticlever
2. Young's Modulus-Staticcantilever
3. Rigidity modulus- Dynamicmethod
4. Acceleration due to gravity-Compound pendulum
5. Refractive Index of a liquidprism-Spectrometer
6. Refractive Index of a solid prism (I-d) curve-Spectrometer
7. Co-efficient of thermal conductivity-Lee's discmethod
8. Wavelength of spectral lines -Grating-minimum deviationmethod-Spectrometer.
9. Characteristics of a Junctiondiode
10. μ of a lens-Newton's ringmethod
11. Thickness of a thin wire-Air wedgemethod
12. Frequency of tuning fork and density of solid and liquid – Melde'sString

Course Objectives

This course enables the students to learn

- Teach and inculcate the importance of value based living.
- Give students a deeper understanding about the purpose of life.
- Teach and inculcate the essential qualities to become a good leader.
- The significance of being responsible citizens of the society.
- To inculcate the importance of harmonious living.
- To realize their role in the nation building.

Course Outcomes (COs)

On successful completion of this course, the students will be able to

1. Create self-confidence, self-esteem and personality development.
2. Execute the goals of life and improve positive thinking.
3. Perform the roles and responsibility of citizens and practice effective time management techniques.
4. Know the value of healthy friendship and the know the importance of relationships.
5. Relate the spirituality with altruism and sacrifice.
6. Understand the importance of family relationship, self-control, sacrifice and truthfulness.

UNIT – I

Concept of Self, self-esteem and self-confidence. Concept of personality, determinants and disorganisations of it. Personality development – meaning.

UNIT – II

Goal setting – meaning and importance; steps in goal setting Manners and Etiquette – meaning need and importance; means to improve. Positive thinking.

UNIT – III

Discipline – meaning. Concept of Roles and Responsibility Time Management – Meaning and steps for effective time management.

UNIT – IV

Interpersonal relationship – meaning and importance; means to improve it. Healthy friendship.

UNIT – V

Family Relationship importance of it; Means to improve. Spirituality – meaning. Its relationship with Altruism, sacrifice, self control, tolerance and truthfulness.

TEXT BOOKS

1. Karpagam Academy of Higher Education, Study Material, 2015.

Course Objectives

This course enables the students to learn

- Encourage the all-round development of students by focusing on soft skills.
- Make the engineering students aware of the importance, the role and the content of soft skills through instruction, knowledge acquisition, demonstration and practice.
- Develop and nurture the soft skills of the students through individual and group activities.
- Expose students to right attitudinal and behavioral aspects and to build the same through activities
- To help formulate problem solving skills
- To create a desire to fulfill individual goals, and to educate students about unproductive thinking

Course Outcomes (COs)

On successful completion of this course, the students will be able to

1. Solve Quantitative Aptitude questions and also solve problems on numbers, averages and ratios.
2. Understand the concept of verbal reasoning problem skills.
3. Understand the concept of blood relation, Image analysis and coding, decoding problems
4. Measure simple and compound interest of amounts and calculate profit and loss.
5. Describe active and passive voices and tense, subject and verb agreement.
6. Create the knowledge for goal setting and interpersonal skills.

UNIT - I

Introduction to Quantitative Aptitude, Speed Maths, Problems on Numbers, Averages, Ratios and Proportions, Problems on Ages

UNIT – II

Number Series, Blood Relation, Image Analysis, Direction Sense, Syllogism, Coding and Decoding

UNIT – III

Percentages, Data Interpretation, Profit and Loss, Simple Interest and Compound Interest

UNIT – IV

Parts of Speech, Tense, Subject Verb Agreement, Active and Passive Voice, Articles, Prepositions

UNIT – V

Conditional Clause, Degrees of Comparison, Goal Setting, Interpersonal Skills

பாடத்திட்டப்பொதுநோக்கம்

- கற்றல் வழி சிந்தனைத் திறனையும், கருத்து வெளிப்பாட்டுத் திறனையும், மேம்படுத்துதல்.
- ஆய்வுநோக்கைமேம்படுத்துதல்.
- இலக்கியங்கள் உணர்த்தும் வாழ்வின் நுட்பமான பகுதிகளை உணர்த்துதல்.
- மனித மனத்தினைப் பக்குவப்படுத்துதலில் இலக்கியம் தரும் பங்கினை உணர்த்துதல்.
- வளர்ந்து வரும் சமூகத்தில் அறஉணர்வு, பண்பாடு போன்றவை குறித்து அறிவூட்டல்.
- அரசுத் தேர்வுகளுக்கு மாணவர்களை ஆயத்தமாக்குதல்.

பாடத்திட்டப்பயன்விளைவு

1. இந்தியகுடியுரிமைப்பணிமுதலானபோட்டித்தேர்வுகளில், விருப்பப்பாடமாகஇடம்பெறுகின்ற, 'தமிழ்இலக்கியவரலாறு' குறித்தமுழுமையானஅறிமுகம்பெற்றிருத்தல்.
2. கல்வெட்டியல், ஓலைச்சுவடியியல்மற்றும்தொல்லியல்சார்ந்தஆவணத்தேடலுக்குரியஆய்வுமனப்பான்மையுடன், இலக்கியங்களைஅணுகுதல்.
3. தமிழின்வளர்ச்சித்துறையாகிய, 'அறிவியல்தமிழ்' ; 'இணையதமிழ்' குறித்தபன்னோக்குஅணுகுமுறையிலானஆய்வுச்சிந்தனைமேம்பாடு.
4. வேலைவாய்ப்புக்குரியசுயதிறன்மேம்பாட்டுடன், படைப்பாக்கத்திறன்மேம்பாடும்பெற்றிருத்தல் .
5. சமுதாயமற்றும்வாழ்வியல்மதிப்புகளைப்பேணுவதற்குக்கருவியாகஇலக்கியங்களைநாடுகின்றமனப்பான்மைவளர்ச்சி.
6. மொழிபெயப்புத்துறைசார்ந்தவேலைவாய்புத்திறன்பெற்றிருத்தல்

அலகு - I : பக்திஇலக்கியம்

- 1.சைவம் -மூவர்தேவாரத்திலிருந்துதேர்ந்தெடுக்கப்பெற்ற15 பாடல்கள்
- 2.வைணவம் – ஆண்டாள்நாச்சியாரின்திருப்பாவையிலிருந்து 11 பாடல்கள்

அலகு- II:சங்கஇலக்கியம்**அ). எட்டுத்தொகை**

நற்றிணை:1.இலைஇலபிடவம், திணை – முல்லை,

ஆசிரியர் – விழிக்கட்பேதைப்பெருங்கண்ணனார்.

2. மடல்மாஊர்ந்து, திணை –குறிஞ்சி, ஆசிரியர் – மடல்பாடியமாதங்கீரனார்.

குறுந்தொகை : 1.உள்ளார்கொல்லோ,திணை –பாலை, ஆசிரியர் – பெருங்கடுங்கோ.

2.யாரினும்இனியன்,திணை – மருதம்,

ஆசிரியர் – வடமவண்ணக்கன்தாமோதரனார்.

ஐங்குறுநூறு : 1.நுண்ணோர்புருவத்த,திணை – குறிஞ்சி, ஆசிரியர் – கபிலர்.

2. அவறொறுந்தேரை,திணை – முல்லை, ஆசிரியர் –பேயனார்.

பதிற்றுப்பத்து- ததைந்தகாஞ்சி, ஆசிரியர் -பாலைக்கௌதமனார்.

பரிபாடல் - வையை- திரைஇரும்பனிப்பௌவம்,ஆசிரியர் -மையோடக்கோவனார்.

கலித்தொகை – கடும்புனல்கால்பட்டு,திணை – பாலை, ஆசிரியர் – பெருங்கடுங்கோ.

அகநானூறு - 1. ஆடுஅமைக்குயின்ற, திணை – குறிஞ்சி, ஆசிரியர் – கபிலர்.

2.யான்எவன்செய்கோதோழி,திணை – பாலை,ஆசிரியர் –நோய்பாடியார்.

புறநானூறு- 1. சிறப்பில்சிதடுமுறுப்பில்,திணை –பொதுவியல்,

ஆசிரியர் –உறையூர்முதுகண்ணன்சாத்தனார்.

2.இளையருமுதியரும்வேறுபுலம்படா – ஆசிரியர் –கயமனார்.

ஆ).பத்துப்பாட்டு- சிறுபாண்ஆற்றுப்படை – கடையெழுவள்ளல்களின்சிறப்பு,

நல்லியக்கோடனின்சிறப்பு, ஈகைத்திறம்.

அலகு - III : காப்பியங்கள்

1.மணிமேகலை –பாத்திரம்பெற்றகாதை- தீவதிலகை, மணிமேகலைக்குச்சொல்லியது,

சிறைக்கோட்டம்அறக்கோட்டமாக்கியகாதை – மணிமேகலை

வேண்ட, மாவண்கிள்ளி, சிறைக்கோட்டத்தைஅறக்கோட்டமாக்கியது.

2.கம்பராமாயணம் - இலக்கியநயம்மிக்க, தேர்ந்தெடுக்கப்பெற்ற 41 பாடல்கள்.

அலகு - IV : கட்டுரைகள்

1.திருக்குறளில்மனிதவளமேலாண்மைக்கருத்துக்கள் - திருமிகுஹரிவிஜயலட்சுமி.

2.தமிழர்வளர்த்தநுண்கலைகள்: சிற்பமும்ஓவியமும் – தொ.மு. பாஸ்கரத்தொண்டைமான்.

3. சமயமும் தமிழும் – பேராசிரியர் அ.ச. ஞானசம்பந்தன்.

4. தமிழில் அறிவியல் – ஒருபார்வை - பேராசிரியர் சிவகுமார்.

5. இன்றைய நெருக்கடிப்பிரச்சனைகள் - நீர்வளம் - முனைவர் ச. முத்துக்குமரன்.

அலகு - V : இலக்கணமும் மொழிப்பயிற்சியும்

1. எழுத்து, சொல், பொருள் இலக்கண எழுத்துப்பயிற்சிகள்

2. பொதுக்கட்டுரைகள்

பாடநூல்: கற்பகச்சோலை – தமிழ் ஏடு. கற்பகம்பல்கலைக்கழகத்தமிழ்த்துறை வெளியீடு.

Course Objectives

This course enables the students to learn

- To enable the learners to acquire English language skills through literature.
- To familiarize them with English literature.
- To acquire Grammar knowledge.
- To help learners imbibe cultural values.
- To acquire skill of making correct sentences.
- To reflect originality on the application of soft skills and express in writing their views.

Course Outcomes(Cos)

On successful completion of this course, the students will be able to

1. Learn to enjoy the ecstasy of literature.
2. The select literary pieces will develop the confidence level of the learners.
3. To get the social values.
4. To know the importance of communication
5. Get sound knowledge in English
6. Trained to communicate well for business purpose.

UNIT I

Prose: The Unexpected- Robert Lynd

Poetry: The Village Schoolmaster – Oliver Goldsmith

Short Story: The Lion's Share – Arnold Bennett

Vocabulary: Homonyms

Grammar: Irregular Verbs

UNIT II

Prose: Travel by Train – J. B. Priestly

Poetry: The Gift of India – Sarojini Naidu

Grammar: Sentence patterns

Composition: Reading Comprehension

UNIT III

Prose: Women's Education is Almost More Important than the Education of Boys and Men – Indira Gandhi

Short Story: The Necklace – Guy De Maupassant

One-Act Play: The Referee – W.H. Andrews and Geoffrey Dearmer

Vocabulary: Similes

Grammar: Discourse Markers

Composition: Report Writing

UNIT IV

Poetry: Ozymandias – P.B. Shelley

One-Act Play: The Pot of Broth- W.B. Yeats

Vocabulary: Collective Nouns

Grammar: Correction of Sentences

Composition: Picture Reading

UNIT V

Short Story: The Silver Butterfly– Pearl S. Buck

One-Act Play: The Bear – Anton Chekov

Vocabulary: Acronyms

Grammar: Question Tags

Composition: Drafting Advertisement

Prescribed Texts

Wings of Communication 2014. Board of Directors. Emerald Publishers: Chennai

Reference

Syamala, V. *English for Communication. 2006.* Emerald Publishers: Chennai

Course Objectives

This course enables the students to learn

- First order exact differential equations, linear homogeneous and non-homogeneous equations of higher order with constant coefficients.
- The complete solution of a non-homogeneous differential equation with constant coefficients by the method of undetermined coefficients.
- The basic concepts of Partial Differential Equations.
- How to solve Partial Differential Equations using Charpit's method.
- The transform of a periodic function.
- The applications of the inverse Laplace transform.

Course Outcomes (COs)

On successful completion of this course, the student will be able to

1. Solve any first order homogenous and non homogenous differential equations.
2. Evaluate Exact differential equations, Clairaut's form of equations and linear equations with constant coefficients.
3. Solve any partial differential equations and describe different integrals of partial differential equations.
4. Estimate the standard types of partial differential equations and solve Lagrange's equations using Charpit's method.
5. Evaluate Laplace transforms of periodic functions and estimate integral using Laplace transforms.
6. Describe inverse Laplace transforms of periodic functions and solve Ode by using Laplace transforms.

UNIT I

Ordinary Differential equations : Definition – Formation of differential equations – Equations of first order and first degree – Variable separable – Homogeneous equations – Non homogeneous equations of first degree in X and Y – Linear equation – Bernoulli's Equation.

UNIT II

Exact differential equations – First order higher degree equations – Clairaut's form – Equations do not contain X explicitly – Equations do not contain Y explicitly – Equations Homogeneous in X and Y – Linear differential equations with constant coefficients.

UNIT III

Partial Differential Equations : Derivation of partial differential equations – Different integrals of partial differential equations - Standard types of first order equations – Equations reducible to the standard form – Lagrange's equation – Charpit's method.

UNIT IV

Laplace transforms: Definition-Sufficient conditions for the existence of the Laplace Transform- Laplace Transform of periodic functions- Some general theorems-Evaluation of integrals using Laplace Transform.

UNIT V

Inverse Laplace Transforms: Solving ordinary differential equations with constant coefficients using Laplace Transforms-Solving a system of differential equations using Laplace Transforms .

TEXT BOOK

1.Narayanan S.andT.K.M.Pillai, S.Viswanathan, 1996. Calculus, Printers and Publishers Pvt. Ltd, New Delhi.

REFERENCES

1. SankaraRao.K, 2005.Introduction to Partial Differential Equations, Prentice Hall of India Private limited, NewDelhi.
2. Veerarajan.T, 2004.Partial Differential Equations and Integral Transforms,TataMc Graw - Hill Publishing Company limited, NewDelhi.
3. Earl A. Coddington, 2002. An introduction to Ordinary differential Equations, Prentice Hall of India Private limited, NewDelhi.
4. Somasundaram.D, 2002.Ordinary differential Equations - A first course, Narosa Publishing House, New Delhi.

Course Objectives

This course enables the students to learn

- The concepts of exponential, logarithmic, trigonometric functions and their applications.
- The ability to use inverse functions to solve equations, specifically to solve exponential and trigonometric equations.
- Summation of Trigonometric series
- Gregory series, Euler series, Maclarines series and Rutherford series
- To evaluate the six trigonometric functions for a given angle
- To apply the definitions of angle of elevation and angle of depression in real life applications

Course Outcomes (COs)

On successful completion of this course, the students will be able to

1. Describe the expansions of $\sin n\theta$, $\cos n\theta$ and $\tan n\theta$ in terms of $\tan\theta$.
2. Evaluate the powers of sin and cosine function in terms of θ and also describe the expansion of powers of sine and cosine functions.
3. Explain about Hyperbolic functions and inverse hyperbolic function.
4. Discuss the logarithms of complex quantities and real , imaginary part of exponential functions.
5. Estimate the sum of any series of trigonometric functions.
6. Explain Gregory series, Euler series and Maclarine series, etc.

UNIT-I

Expansions of $\cos n\theta$, $\sin n\theta$ - Expansion of $\tan n\theta$ in terms of $\tan \theta$ - Expansion of $\tan(A+B+C+ \dots)$ - Formation of Equations.

UNIT-II

Powers of sines and cosines of θ in terms of functions of multiples of θ - expansions of $\sin \theta$ and $\cos \theta$ in a series of ascending powers of θ - Expansion of $\cos^n\theta$, $\sin^n\theta$ and $\sin^m\theta\cos^n\theta$

UNIT-III

Hyperbolic functions: Definition - Relation between Hyperbolic Functions -Periods of hyperbolic functions – Separation into real and imaginary parts – Inverse hyperbolic function.

UNIT-IV

Logarithms of complex quantities: Express $\log(x+iy)$ in the form $(A+iB)$ – The general exponential function – Real and imaginary part of Exponential functions.

UNIT-V

Summation of Trigonometric Series: Method of Differences - Gregory Series - Euler Series- Maclarine series and Rutherford series.

TEXT BOOK

1.Dr.Nigam.H.N., 1996. Trigonometry, Krishna Prakashan Media Pvt.Ltd, Meerut.

REFERENCES

1. Vittal.P.R. 2004. Trigonometry, Margham Publications,Chennai.
2. Veerarajan.T., Fourth edition 2007. Engineering Mathematics, Tata McGraw hill publishing company ltd, NewDelhi.
3. Sudha.S., 1998. Algebra Analytical Geometry(2D) and Trigonometry, Emerald Printing House Pvt. Ltd,Chennai.
4. Kandasamy P., Thilagavathy K., and K.Gunavathy., 2009. Engineering Mathematics, S.Chand& company Ltd, Ram Nagar, New Delhi-110055.

Course Objectives

This course enables the students to learn

- Basic knowledge on material properties.
- Magnetism and digital electronics.
- To educate and motivate the students in the field of science.
- Given the unit cell for some crystal structure, be able to draw the atomic packing arrangement for a specific crystallographic plane.
- Explain the use of X-ray diffraction measurements in determining crystalline structures.
- The Photo electric effect and its applications.

Course Outcomes (COs)

On successful completion of this course, the students will be able to

1. Explain about Bending of beams, Uniform and non-uniform bendings.
2. Estimate Torsion and Rigidity by static and dynamic methods.
3. Measure the surface tension surface energy and Vapour pressure over a surface.
4. Demonstrate Photo electric effect and Einstein's photo electric equation and apply photo electric in Nuclear physics.
5. Identify Raman effect, Raman shift and describe laser Raman spectrometer.
6. Understand the all concepts of solar physics such as: solar constant – measurement of solar radiations by Pyroheliometer and Pyranometer

UNIT-I**ELASTICITY OF SOLIDS**

Elastic constants of an isotropic solid - Relations connecting them - Poisson's ratio - Bending of beams - Uniform and non-uniform bending - Bending moment of a bent beam - cantilever - Static and dynamic methods - Torsion in a wire - Rigidity modulus determination by Static and dynamic methods.

UNIT-II**SURFACE TENSION**

Surface tension and Surface energy- Pressure difference across a spherical surface- Pressure difference across a curved surface - Angle of contact - Angle of contact for water in a glass - Vapour pressure over a flat and curved surface - Variation of Surface tension with temperature - Jaeger's method - Quinke's method.

UNIT-III

MODERN PHYSICS: Photo electric effect – Einstein's photo electric equation – verification of Einstein's photo electric equation by Millican's experiment – photo electric cells – applications Nuclear physics :characteristicsof nuclear forces – nuclear structure by liquid drop model– Binding energy – mass defect – particle accelerators – cyclotron and betatron nuclear Fission and nuclear Fusion.

UNIT-IV

LASER PHYSICS: Purity of spectral lines – Coherence length and time – spontaneous and induced emissions – population inversion – meta stable state – conditions for laser actions – Ruby laser – Helium – neon laser – applications of lasers – Raman effect – Raman shift – stokes and anti stokes lines – Laser Raman Spectrometer.

UNIT-V

SOLAR PHYSICS: solar constant – measurement of solar radiations by Pyroheliometer and Pyranometer – general applications of solar energy – flat-plate collector - box type cooker - solar water heaters – solar photo – voltaic cells – general applications of solar cells.

TEXT BOOKS

1. Murugesan. R., Modern Physics, S.Chand& CO, NewDelhi
2. Aruldas and P.Rajagopal, Modern Physics, Prentice Hall of India, NewDelhi.

REFERENCES:

1. Mathur. D.S., 2003, Elements of properties of matter - Shyamlal Charitable Trust, NewDelhi.
2. Brijlal and N. Subramanyam, 2004, Properties of matter, S. Chand & Company, NewDelhi.
3. Rai. G.D, Solar energy and its utilization, S.Chand& Co., NewDelhi.
4. Rajam. J.B., Atomic Physics, S.Chand& Co, NewDelhi

Course Objective

This course enables the students to learn

- To enhance the students to understand the concepts in integrated chips.
- To understand the optical and electronic properties of solids through experimentations.
- To learn the usage of electrical and optical systems for various measurements.
- To develop intellectual communication skills and discuss the basic principles of scientific concepts in a group.
- To enable the students to gain knowledge on the basic principles of applied electronics
- To identify the strength, the given objects

Course Outcomes (COs)

On successful completion of this course, the students will be able to

1. Perform basic experiments in mechanics, heat and electricity and analyze the data.
2. Acquire engineering skills and practical knowledge, which help the student in their everyday life.
3. Know the physical principles and applications of Electronics.
4. Apply the various procedures and techniques for the experiments.
5. Apply the mathematical concepts/equations to obtain quantitative results.
6. Develop basic communication skills through working in groups in performing the laboratory experiments and by interpreting the results.

ANY TEN EXPERIMENTS

1. Field Intensity-Circular coil- Vibration magnetometer
2. Co-efficient of thermal conductivity-Lee's disc method
3. Refractive Index of a prism (I-I'') curve-Spectrometer
4. Moment of a magnet-Circular coil-Deflection Magnetometer
5. Temperature coefficient of resistance of a thermistor-Post office box
6. Comparison of viscosities of two liquids
7. Study of logic gates using IC's
8. Study of NOR gate as Universal building block.
9. Study of NAND gate as Universal building block.
10. Verification of Basic logic gates using discrete components.

11. Determination of Cauchy's constant – Spectrometer

12. AC frequency -Sonometer

Course Objectives

This course enables the students to learn

1. The study creates awareness among the people to know about various renewable and non renewable resources of the region, enables environmentally literate citizens (by knowing the environmental acts, rights, rules, legislation, etc.) to make appropriate judgments and decisions for the protection and improvement of the earth.
2. Creating the awareness about environmental problems among people.
3. Developing an attitude of concern for the environment.
4. Motivating public to participate in environment protection and improvement.
5. About the interaction of human society (urban sprawl, energy use/generation, resource consumption and economics) with the Earth's systems.
6. To give students an understanding of how science and the scientific method work to address environmental problems

Course Outcomes (COs)

On successful completion of this course, the students will be able to

1. Establish the Natural resources, Forest resources and water resources, etc.
2. Identify the cause and effects of pollution and measure the pollution in air, water, noise and soil.
3. Inspect the biodiversity and its conservation and threats to biodiversity.
4. Evaluate the social issues, urban problems and manage sustainable utilization of natural resources.
5. Analyze the ethics of environmental, environmental education, social justice and human heritage.
6. Sketch the preserving resources for future generation, common property resources, Ecology and its uses.

UNIT - I: Eco system and natural resources: Environment – Definition – components - Ecosystem - Definition, Concept, Scope, importance, structure and functions of ecosystem. Energy flow, Ecological succession. Food chains and food webs. Classification of ecosystem. Natural resources: Forest resources; water resources

UNIT - II: Environmental pollution: Cause, effects and control measures of Air pollution, water pollution, soil pollution, marine pollution, noise pollution, thermal pollution and nuclear hazards pollution. Solid waste management.

UNIT - III: Biodiversity and its conservation: Introduction- Definition, genetic, species and ecosystem diversity, biogeographical classification of India- Value of biodiversity: Consumptive, productive uses; social, ethical, aesthetic and option values. Threats to biodiversity: habitat loss, poaching of wildlife, man-wildlife conflicts.

UNIT - IV: Social issues and the environment: Urban problems related to energy- water conservation and management -Rain water harvesting- water shed management. Resettlement and Rehabilitation. Natural resources and associated problems and sustainable utilization. Environmental Education.

UNIT - V: Environment ethics: Environmental Ethics - Gender equity, ethical basis of environment education and awareness, conservation ethic and traditional value systems of India. Valuing nature, cultures, social justice, Human heritage, equitable use of resources, preserving resources for future generation, common property resources, Ecology and its uses and its degradation, Introduction to Environmental Protection Act (EPA).

TEXT BOOKS

1. Agarwal, K.M., P.K. Sikdar and S.C. Deb, 2002. A Text Book of Environment, Mac Millan India Ltd, Kolkatta, India.
2. Kotwal, P.C. and S. Banerjee, 2002. Biodiversity Conservation – In Managed forest and protected areas, Agrobios, India.

5. Patrick L. Abbott, 2008. Natural Disasters, Mc Graw Hill, New York. Page: 1-7.

Course Objectives

This course enables the students to learn

1. To impart knowledge on both Aptitude and Soft skills to the students
2. To critically evaluate and demonstrate various principles involved in solving mathematical problems and
3. To adopt new and faster methods of calculations.
4. Reinforcing competencies in soft skills which are crucial in a social setting
5. To help increase a person's self-esteem, to develop cognitive skills.
6. To making appropriate and responsible decisions, to create a desire to fulfill individual goals

Course Outcomes (COs)

On successful completion of this course, the students will be able to

1. Solve Quantitative Aptitude questions and also solve problems on numbers, averages and ratios.
2. Understand the concept of verbal reasoning problem skills.
3. Understand the concept of blood relation, Image analysis and coding, decoding problems
4. Measure simple and compound interest of amounts and calculate profit and loss.
5. Describe active and passive voices and tense, subject and verb agreement.
6. Create the knowledge for goal setting and interpersonal skills.

UNIT - I

Introduction to Quantitative Aptitude, Speed Maths, Problems on Numbers, Averages, Ratios and Proportions, Problems on Ages

UNIT - II

Number Series, Blood Relation, Image Analysis, Direction Sense, Syllogism, Coding and Decoding

UNIT – III

Percentages, Data Interpretation, Profit and Loss, Simple Interest and Compound Interest

UNIT – IV

Parts of Speech, Tense, Subject Verb Agreement, Active and Passive Voice, Articles, Prepositions

UNIT - V

Conditional Clause, Degrees of Comparison, Goal Setting, Interpersonal Skills

Course Objectives:

- To develop confidence to respond in English during situations where the use of English is imperative.
- To develop fluency in actual conversation in the English language.
- To develop speech skills necessary for confident and intelligent participations in Group Discussions and develop skills related to teamwork in work places.
- To develop confidence to respond in English during situations where the use of English is imperative.
- To develop fluency in actual conversation in the English language.
- To develop self confidence in Group discussion, meeting and special addresses.

Course Outcomes:

1. Students learnt the basics and purposes of listening skill.
2. Students understand importance of speaking.
3. Students developed the speaking skills on telephone, business and also in travel
4. Learnt some effective vocabulary learning strategies.
5. Students will able to communicate clearly and effectively and handle their day to day affairs well with their knowledge of language skills.
6. Able to understand the knowledge about business communication

UNIT I

Listening: Listening comprehension – Listening for Specific Information –Note Taking – Interpreting Charts and Diagrams.

UNIT II

Speaking: Essentials of effective communication – Greeting and Introducing – Making requests – Asking for permission – Giving and Denying Permission – Offering and Accepting Help – Asking for and Declining Help – Giving Instructions and Orders - Talking about likes and dislikes.

Telephone Skills – Understanding telephone conversation – handling calls – leaving messages – making requests - giving instructions and orders

Discussion Skills – Giving your opinion – agreeing and disagreeing – Making suggestions – Interrupting – questioning – reporting – Dealing with questions.
(Completing dialogues)

UNIT III

Reading: Reading – Reading with a purpose –Skimming and Scanning – locating main points – reading critically – Sequencing of sentences – Reading comprehension.

UNIT IV

Writing: Paragraph Writing – Descriptive and Narrative. Safety Instructions/ Suggestions. Expansion of Abbreviations – Spellings- Report writing.

Translation- Translating short sentences and passages from English to Tamil and from Tamil to English.

UNIT V

Vocabulary: Improve English vocabulary: Synonyms – Antonyms – Prefixes – Suffixes – Idioms – Collocations – Different types of English – British and American (Choose the best answer type from a database of 50 words each for each topic) Functional Grammar: Forming questions, getting answers – Articles – Parts of Speech – Punctuation – Common mistakes in English (Homophones)(Exercise based)

Reference Books

Language in Use: Kenneth Anderson, Cambridge University Press.

Study Speaking: A course in Spoken English for Academic Purpose: Kenneth Anderson, Joan MacLean and Tony Lynch, Cambridge University Press, 2008.

Spoken English Part I & II (for Tamil speakers), Orient Longman Pvt. Ltd.

Dr. J. John Love Joy, Dr.FrancisM.Peter S.J. “Lets Communicate – Basic English for Everyone”, Vaigarai Publications, 1st edition, Dindigul 2007.

Course Objectives

This course enables the students to learn

- The strong foundation in the concepts of mechanics to know how the friction is regulating the motion of objects.
- About the motion of particles under the influence of various forces like gravitational force, central force, impulsive force etc., which plays an essential role in Applied Mathematics.
- The application of geometric and trigonometric properties in equilibrium and motion of particles.
- The basic concepts of Moments, Friction and Motions.
- To develop the capacity to predict the effects of force and motion while carrying out the creative design functions of engineering.
- To help the student develop this ability to visualize, which is so vital to problem formulation

Course Outcomes (COs)

On successful completion of this course, the students will be able to

1. Describe the Parallelogram, analytical expression, perpendicular triangle and polygon of forces.
2. Evaluate the resultant of parallel forces of two equal and unequal forces.
3. Measure the angle, coefficient and cone of friction and calculate moments of force.
4. Explain the concept of equation of motions and moment momentum, angular momentum in any physical situation.
5. Inspect the harmonic motions in straight line and two parallel lines and also express the simple and compound problem.
6. Apply the impact of an elastic sphere with a smooth fixed plane.
7. Evaluate the impacts of elastic sphere with a smooth fixed plane.

UNIT I

Force acting at a Point: Parallelogram of Force – Analytical Expression for the Resultant of two forces acting at a point – Perpendicular Triangle of Forces – Converse of Triangle of Force – Polygon of Forces Parallel Forces- To find the Resultant of two like parallel forces acting on a Rigid body – To find Resultant of two unlike and unequal Forces acting on a Rigid body – Resultant of number of parallel forces acting on a rigid body – Condition of Equilibrium of three Coplanar parallel forces – Center of two parallel forces.

UNIT II

Moments and Friction: Moment of a force – physical significance of moment of force – Geometrical representation of moment – sign and unit of moment – Varignons Theorem of moment- principle of moment. Friction – Laws of Friction – Angle, coefficient of Friction, cone of friction.

UNIT III

Coplanar motion : Equations of motion in polar coordinates- moment of momentum – angular momentum . Central orbits: Differential equation of a central orbit in polar coordinates- Apse -circular and elliptic orbits- Kepler's laws of planetary motion.

UNIT IV

Simple harmonic motion : Amplitude, periodic time, phase – composition of two simple harmonic motions of the same period in a straight line and in two perpendicular lines – Simple harmonic motion as the projection of uniform circular motion – The simple pendulum – The seconds pendulum-Compound Pendulum.

UNIT V

Impact : Impulsive force – Equations of motion for impulsive forces – motion of a shot and gun – Impact of water on a surface – Oblique impact of two elastic spheres – Impact of an elastic sphere with a smooth fixed plane.

TEXT BOOKS

- 1.Venkataraman.M.K., 1998 . Statics, Agasthiar Publications, Trichy.(For Unit – I, II & III)
- 2.Venkataraman.M.K.,2000 . Dynamics, Agasthiar Publications, Trichy. (For Unit – IV & V)

REFERENCES

1. DharmapadamA .V., 1993. Dynamics, S.Viswanathan printers and publishersPvt Ltd,Chennai-2..
2. Duraipandian, 2000. Text book of Dynamics, Emerald publishers,Chennai-2
3. Duaripandian.P.,LakshmiDuraipandian.,Muthamizh Jaya Pragasam, 2011.Mechanics,S.Chand& Company Ltd,NewDelhi.

Course Objective:

This course enables the students to learn

- The basic concepts of primary data and secondary data.
- Basic concepts in central tendency and statistical measures
- Commonly used probability distributions (both discrete and continuous)
- Central Limit theorem and their applications in various disciplines.
- To analyze forces and moments in two and three dimensions due to concentrated and distributed forces in various systems such as beams, frames and trusses.
- To understand the procedure for analysis of static objects; concepts of force, moment, and mechanical equilibrium.

Course Outcomes (COs)

On successful completion of this course, the student will be able to

1. Perform in primary and secondary data and illustrate in Bar and Pie diagrams.
2. Evaluate the mean, median and mode of any given data also evaluate quartiles and deviations.
3. Describe the Correlation, Rank Correlation and Regression of two variables.
4. Understand the basic concept of test of significance of z-test, t-test and chi-square test.
5. Compute probabilities and conditional probabilities in appropriate ways.
6. Derive the Binomial and Poisson distribution.

UNIT I

Meaning and definition of statistics – sources of data – collection of data – primary and secondary data - methods of primary data collection –sources of secondary data – Classification of data. Diagrammatic representation– Bar diagram and Pie diagram – Graphic representation – Histogram, Frequency distribution, Ogives.

UNIT II

Measures of central tendency - Arithmetic Mean, Median, Mode. Measures of dispersion – Range, Quartile deviation, Standard deviation and Coefficient of variation.

UNIT III

Correlation – meaning and definition – scatter diagram – Pearson's correlation coefficient Computation and interpretation – Rank correlation.

Regression: Regression in two variables – Regression coefficient problems.

UNIT IV

Test of Significance: Basic concepts – Z-test for two means – Small sample tests- t- test for single mean, two means – Chi Square Test.

UNIT V

Probability (Concept only) – Binomial distribution – Poisson Distribution – Normal distribution– Exponential Distribution (No derivations) and simple problems.

TEXT BOOK

1. Pillai R.S.N., and Bagavathi V., 2002., Statistics , S. Chand & Company Ltd, New Delhi.

REFERENCES

1. Navnitham P.A , 2004. Business Mathematics And Statistics, Jai Publications, Trichy,
2. Gupta S.P., 2001. Statistical methods, Sultan Chand & Sons, New Delhi.
3. Gupta S.C., and Kapoor V.K., 1999. Fundamentals of Mathematical statistics, Sultan Chand & Sons, Educational Publishers, New Delhi.
4. Dr.P.N.Arora, 1997, A foundation course statistics, S.chand& Company Ltd, New Delhi.

Course Objectives

This course enables the students to learn

- It is well recognized nowadays the importance of Statistics as an indispensable tool for obtaining and spreading information.
- Importance has been enhanced by the use of computational resources and particularly the software SPSS, that showed, during the last decades, to be an effective tool for treating and analyzing statistical data.
- Ability to use SPSS procedures in handling data files and performing statistical analysis, and to interpret the outputs provided by the program.
- Acquiring sensitivity and critical thinking towards arguments and conclusions based on statistical studies.
- Understanding the fundamental principles underlying descriptive and inferential statistical reasoning; ability to perform current statistical analysis, selecting the most appropriate techniques and methods for collecting and processing statistical data.
- To Recognise some of the pitfalls associated with statistical analysis.

Course Outcomes (COs)

On successful completion of this course, the student will be able to

1. Describe and classify data using statistical terminology.
2. Apply SPSS Package, to find mean, mode, median for any data.
3. Test the significance of hypothesis using Z and Chi-square test.
4. Calculate the rank correlation in unpaired and tied ranks.
5. Design a program for analyzing data in SPSS package.
6. Know when to use basic statistical hypothesis tests (t-tests, chi-squared tests, correlation) and how to carry out these tests using SPSS.

1. Using SPSS Package, draw bar diagram and pie diagram for discrete series.
2. Using SPSS Package, calculate the Mean for individual, discrete and continuous series.
3. Using SPSS Package, calculate the Median for individual and discrete series.
4. Using SPSS Package, calculate the Mode for individual and discrete series.
5. Using SPSS Package, calculate the Standard deviation.
6. Using SPSS Package, calculate the Karl Pearson's Correlation.
7. Using SPSS Package, calculate the Rank Correlation Coefficient for Unpaired Rank.
8. Using SPSS Package, calculate the Rank Correlation Coefficient for Tied Rank.
9. Using SPSS Package, test the significance of hypothesis using Z-test.
10. Using SPSS Package, test the significance of hypothesis using Chi Square Test.

Course Objectives

This course enables the students to

- Understand fundamental accounting concepts and principles.
- Develop the capability to perform the basic accounting functions: the recognition, valuation, measurement and recording of the most common business transactions and the preparation of accounting statements.
- Deals with the “Fundamental Issues in Accounting” and comprises.
- Enable students to describe how people analyze the corporate financial under different conditions and understand why people describe the financial statements in different manner.
- Demonstrate an understanding of accounting principles
- Balance ledger accounts, prepare a trial balance, prepare a work sheet.

Course Outcomes (COs)

On successful completion of this course, the student will be able to:

1. Use the fundamental accounting equation and book keeping to analyze the effect of business transactions on an organization's accounting records and financial statements.
2. Enrich the ability to create subsidiary books, sales book and etc.
3. Develop the ability to use accounting concepts, principles, and frameworks to analyze and effectively communicate information to a variety of audiences.
4. Promote the ability to use accounting information to solve a variety of business problems.
5. Demonstrate the applicability of the concept of Accounting to understand the managerial Decisions and financial statements.
6. Apply the Financial Statement Analysis associate with Financial Data in the organization.

UNIT I

Accounting – Definition- Fundamentals of Book Keeping – Branches of Accounting – Nature of Accounts - Accounting Concepts and Conventions – Journal –Ledger.

UNIT II

Subsidiary books – Introduction – Types of subsidiary books - purchases book - sales book- returns book - cash book - single column cash book – Two column cash book - Three column Cash book - petty cash book

UNIT III

Trial balance - Errors and their rectification - Final accounts of a sole trader with adjustments - Trading and Profit and Loss Account - Balance Sheet – Difference between Profit and Loss Account and Balance Sheet.

UNIT IV

Depreciation- Definition- Methods of depreciation- straight line method- written down value method- annuity value method- sinking fund method- provisions and reserves

UNIT V

Accounts for Non Profit organization- Receipts and Payments and income and expenditure account and Balance sheet – Difference between Receipts and Payments and income and expenditure account and Balancesheet

Note: Distribution of Marks between problems and theory shall be 75% and 25%.

Course Objectives

This course enables the students to

- Principles and Practices of banking represents the origin or banks, classification functions, Types of bank accounts, service banking and Indian money market.
- This paper provides the functioning and process of various banks.
- Fundamental knowledge of banking as service and bank as an institution which would form the basis for courses related to more areas of banking and insurance
- To have knowledge of banking, insurance and capital market law besides fundamental legal knowledge
- To introduce the students to the basic concept of banking as a financial intermediation service and bank as a financial institution.
- Know basics of International Banking and Finance

Course Outcomes (COs)

On successful completion of this course, the student will be able to:

1. Know the Banking system and modern commercial Banks
2. Describe the services of Banking
3. Measure the qualitative and quantitative of credits
4. Analyze the feature and deficiencies of money market.
5. Understand the banking system in rural and commercial banks.
6. To express their opinions about banking and insurance in written and oral form, based on the basic knowledge and skills they acquire.

UNIT I

Banks: Origin of Banks – Definition of Bank – Classification of Banks – Banking system – Unit Banking – Branch Banking – Functions of Modern Commercial Banks – Credit Creation by Commercial Banks.

UNIT II

Services Banking: Automated Teller Machine – Merchant Banking – Mutual Fund – Factoring service – Customer service – Credit card, debit card – E-banking, Privatization of commercial banks – Place of private sector banks in India.

UNIT III

Central Banking: Functions – Credit Control Measures – Qualitative and quantitative credit control measures – Role of RBI in regulating and controlling banks.

UNIT IV

Money Market: Features – Deficiencies in the Indian Money Market.

UNIT V

Special Banks: State Bank of India — Commercial banks and rural financing – Regional Rural Banks – Place of Co-operative banks in the Indian banking scene. Development Banking – IDBI – ICICI.

TEXT BOOK

1. Natarajan, Parameswaran. (2002), Indian Banking, : Sultan Chand and sons, New Delhi.

REFERENCES

1. Santhanam. (2001) Banking and Financial System Margham Publications, Chennai.
2. Vasant Desai. (1991), Indian Banking Nature Performance and Problem, Himalaya Publishing House, Mumbai.
3. Sundaram K.P.M. and Sundaram E.N. (1996) Modern Banking, Sultan Chand and Sons, New Delhi.

Course Objectives

This course enables the students to

- To learn about the atomic structure.
- To understand the quantum numbers and electronic configuration.
- To learn the different types of bonding.
- The basic principles of basic physical and inorganic chemistry. It enables the students to gain knowledge of chemistry involved in industries.
- To learn the electronic and structural properties of an atom.
- Understand the interdisciplinary nature of chemistry and to integrate knowledge of mathematics, physics and other disciplines to a wide variety of chemical problems

Course Outcomes (COs)

On successful completion of this course, the student will be able to:

1. State the location, relative charge, and atomic mass of the sub-atomic particles.
2. Perform quantitative calculations based on the relationship between wavelength, energy, and the speed of light.
3. Define wavelength, frequency, and energy of a photon.
4. Identify, and rank the different types of light radiation.
5. Describe the photoelectric effect and relate the energy and/or intensity of the photons to the work function and kinetic energy of the ejected electrons.
6. Understand the relationship between discrete electron energy levels and atomic absorption and emission spectra.

UNIT-I

Atomic Structure: Bohr's theory and its limitations, dual behaviour of matter and radiation, de-Broglie's relation, Heisenberg Uncertainty principle. Hydrogen atom spectra. Need of a new approach to Atomic structure. Time independent Schrodinger equation and meaning of various terms in it. Significance of ψ and ψ^2 , Schrödinger equation for hydrogen atom.

UNIT-II

Quantum numbers: Significance of quantum numbers, orbital angular momentum and quantum numbers ml and ms . Shapes of s , p and d atomic orbitals, nodal planes. Discovery of spin, spin quantum number (s) and magnetic spin quantum number (ms). Rules for filling electrons in various orbitals, Electronic configurations of the atoms. Stability of half-filled and completely filled orbitals, concept of exchange energy. Relative energies of atomic orbitals, Anomalous electronic configurations.

UNIT-III

Ionic Bonding: General characteristics of ionic bonding. Energy considerations in ionic bonding, lattice energy and solvation energy and their importance in the context of stability and solubility of ionic compounds. Statement of Born-Landé equation for calculation of lattice energy, Born-Haber cycle and its applications, polarizing power and polarizability. Fajan's rules, ionic character in covalent compounds, bond moment, dipole moment and percentage ionic character.

UNIT-IV

Covalent bonding: VB Approach: Shapes of some inorganic molecules and ions on the basis of VSEPR and hybridization with suitable examples of linear, trigonal planar, square planar, tetrahedral, trigonal bipyramidal and octahedral arrangements.

Concept of resonance and resonating structures in various inorganic and organic compounds.

UNIT-V

MO Approach: Rules for the LCAO method, bonding and antibonding MOs and their characteristics for $s-s$, $s-p$ and $p-p$ combinations of atomic orbitals, nonbonding combination of orbitals, MO treatment of homonuclear diatomic molecules of 1st and 2nd periods (including idea of $s-p$ mixing) and heteronuclear diatomic molecules such as CO, NO and NO⁺. Comparison of VB and MO approaches

3. J.E. Huheey, E. A. Keiter, R. L. Keiter and O. K. Medhi, Inorganic Chemistry: Principles of Structure and Reactivity, Pearson Education India,(2006).

Course Objectives

This course enables the students to

- Know the basic concept of computers.
- Understand the concept of Ms-word, Ms-Excel.
- Be able to work in Ms-PowerPoint.
- Knowledge about internet and the usage of E-Mailservices.
- Introduce the fundamentals of computing devices and reinforce computer vocabulary
- Provide foundational or “computer literacy” curriculum that prepares students for life-long learning of computer concepts and skills.

Course Outcomes (COs)

On successful completion of this course, the student will be able to:

1. Understand the fundamental hardware components that make up a computer’s hardware and the role of each of these components
2. Understand the difference between an operating system and an application program, and what each is used for in a computer
3. Describe some examples of computers and state the effect that the use of computer technology has had on some common products
4. Describe the usage of computers and why computers are essential components in business and society.
5. Utilize the Internet Web resources and evaluate on-line e-business system.
6. Describe various types of networks network standards and communication software.

UNIT I

Introduction- Characteristics of computers- development of computers- generations of computers- classification of computers-the computer system- types of Input/ Output and memory devices- computer software-categories of software.

UNIT II

Starting with MS Office Word – Working with Text – working with tables-Checking spelling and grammar-adding graphics to document- Mail merge- printing a document – Advanced features of MS Office Word-Keyboard shortcuts.

UNIT III

Starting with MS Office Excel- Working with Excel workbook-working with worksheet-formulas and functions-inserting charts-sorting-importing data-printing in excel- Advanced features of MS Office Excel.

UNIT IV

Starting with MS Office PowerPoint – Working with PowerPoint- Working with different views- Designing Presentations- Slide Show- Printing in PowerPoint.

UNIT V

The Internet-Evolution of Internet-Owner of Internet- Anatomy of Internet – Internet Terminology- Getting Connected to Internet- Web Brower- Electronic Mail- Search engines- Uses of internet to society.

TEXT BOOK

1. Fundamentals of Computers: For Undergraduate Courses in Commerce and Management, ITL Education Solutions.2011. Pearson, New Delhi.

REFERENCES

1. Pradeep K.Sinha, Priti Sinha. Computer Fundamentals, 2007, 6th Edition BPB Publications, New Delhi.
2. V. Rajaraman. Fundamentals of Computers, Prentice-Hall Of India Pvt. Limited,2003.
3. Wallace Wang.Microsoft Office 2007 For Dummies,1stEdition Wiley PublishingInc.

Course Objectives

This course enables the students to

- This course in curriculum is an introduction to the multimedia and its applications.
- This course enables students to understand how the web pages are designed interactively.
- How to critically evaluate website quality, learn how to create and maintain quality web pages learn to create and manipulate images.
- Gain the skills and project-based experience needed for entry into web design and development careers
- Set up a document, Incorporate Color Techniques
- Format the InDesign text to look professional

Course Outcomes (COs)

On successful completion of this course, the student will be able to:

- Identify and describe the function of the general skill sets in the multimedia industry.
- Identify the basic components of a multimedia project.
- Identify the basic hardware and software requirements for multimedia development and playback.
- Identify a range of concepts, techniques and tools for creating and editing the interactive multimedia applications.
- Identify the current and future issues related to multimedia technology.
- Both theoretical and practical aspects in designing multimedia systems surrounding the emergence of multimedia technologies using contemporary hardware and software technologies.

UNIT I

Multimedia – An overview: Introduction – Multimedia presentation and production – Characteristics of Multimedia presentation – Hardware and Software Requirements – Uses of Multimedia. Text: Types of text - Font - Text File formats. Image: Image data representation – Image file formats – Image processing software. Graphics: Advantages of graphics – Uses – Components of a graphics system.

UNIT II

Audio: Sound waves – Types and properties of sound – Components of audio system – Digital audio - Musical Instrument Digital Interface (MIDI) – Audio file formats – Audio processing software. Video: Motion video – Television systems – Video file formats – Video processing software. Animation: Uses of animation – Computer based animation – Animation file formats – Animation software.

UNIT III

Introducing Photoshop elements: About elements – Welcome screen – Create mode – Menu bar – Toolbox – Options bar – Panels. Organizing images: Obtaining images – Tagging images - Searching for images - Opening and saving images. Selecting Areas – Layers – Text and Drawing Tools.

UNIT IV

Understanding Flash: Understanding Flash basic elements – Creating a simple animation. Learning Flash Toolbox: Learning the toolbox – Using tools. Learning Flash Panels: Understanding the panels. Using timeline and layers: Understanding how timeline works – Understanding layers. Drawing objects: Drawing lines and fills – Using colors – Rotating, skewing and scaling – Grouping objects.

UNITV

Creating animation – How animation works – Creating motion tweens – Creating shape tweens. Understanding masks – Creating masks. Creating symbols and using the library: Learning about symbols – Creating symbols – Using libraries. Learning Basic ActionScript concepts: ActionScript basics – Data type basics.

TEXT BOOKS

1. Ranjan Parekh, 2013, Principles of Multimedia, 2nd Edition, Tata McGraw hill . (Unit I, UnitII)
2. Nick Vandome, 2011, Photoshop Elements 9, Tata McGraw hill. (Unit III)
3. Brian Underdahl, 2002, Macromedia Flash MX – A Beginners Guide, Dreamtech Press. (Unit IV, UnitV)

REFERENCES

1. Tay Vaughan, 2002, Fundamentals of Multimedia, 5th Edition, TataMcGraw-Hill.
2. Bill Sanders. 2001. Flash5 Action Script, 1st Edition, Dream Tech Press, NewDelhi

Course Objectives

This course enables the students to

- To impart knowledge on both Aptitude and Soft skills to the students
- To critically evaluate and demonstrate various principles involved in solving mathematical problems
- Adopt new and faster methods of calculations.
- Reinforcing competencies in soft skills which are crucial in a social setting
- Become self-confident individuals by mastering inter-personal, team management, and leadership skills.
- Take part effectively in various selection procedures adopted by the recruiters

Course Outcomes (COs)

On successful completion of this course, the student will be able to:

1. Solve the problem of finding time, speed and distance.
2. Apply the concept of permutation and combination in appropriate problems
3. Acquire the knowledge of data sufficiency.
4. Improve the English communication skills.
5. Improve the skills of resume writing and attitude.
6. Get knowledge of personality development and acquire the knowledge of how to attend the interview.

UNIT - I

Time, Speed and Distance, Time and Work, Pipes and Cisterns, Geometry, Data Arrangement

UNIT – II

Analogy, Logic based Venn diagram, Probability, Permutation and Combination, Logarithms

UNIT – III

Data Sufficiency, Clocks, Calendar, Reading Comprehension, Sentence Correction, Sentence Completion, Spotting the Errors, Jumbled Sentences

UNIT – IV

Synonyms, Antonyms, Verbal Analogy, Statements and Assumptions, Group Discussion

UNIT - V

Resume Writing, Introduction to HR rounds, Time Management, Attitude and Behaviour

Course Objectives:

- To train the students in understanding the concepts of communication.
- To be familiar with the four basic skills of English.
- To train students in developing their written communication.
- To train students in developing their presentation skills.
- To acquire the skill of making grammatically correct sentences.
- To reflect originality on the application of soft skill views and express in writing their views.

Course Outcome:

1. Students have acquired proficiency in communication.
2. Students have become adept in written communication and presentation skills.
3. Developed the skill of writing in English and that of public speaking.
4. Establish and maintain social relationships.
5. Develop communication skills in business environment.
6. Enhanced communication competency through LSRW skills

UNIT I – Concept of Communication – Barrier to Communication –Body language – Personality Development – Etiquette and Manners- Soft Skills – Emotional Intelligence

UNIT II – Listening Comprehension – Reading Comprehension – Paragraph writing – Precis Writing – Writing Resume and Covering Letter -Speaking – Welcome Address, Vote of Thanks, Compering, Debates, Role Play, Dialogues – Vocal Communication Techniques. Voice, Quality, Volume, Pitch

UNIT III – Dicto Composition – Letter Writing (Informal, Letters to the Editor etc) – Term paper – Book reviews

UNIT IV – Business Correspondence – Layout of Business Letter – Formal Styles of Business Letters – Letters of Acceptance, Appointment, Resignation, Complaint, Sending E-mails.

UNIT V – Effective Presentation – Planning – Audience Analysis –Logical Sequencing – Timing of the Presentation – Conclusion – Answering Queries – Group Discussion – Interview.

Course Objectives

This course enables the students to learn

- The concepts of essentials of vector function, Gradient, Divergence Curl of a vector and its geometrical applications.
- The integration of vectors Line Integral, Surface Integral and Volume Integral.
- The Fourier series, Fourier transforms and its applications.
- The Z transform and Inverse Z transform.
- Compute the curl and the divergence of vector fields
- Use the fundamental theorem of line integrals

Course Outcomes (COs)

On successful completion of this course, the students will be able to

1. Understand the concepts of partial derivatives and directional derivatives.
2. Use of line integrals of vector functions and their applications and also understand Gauss divergence theorem, Green's theorem and Stoke's theorem.
3. Understand the various concepts of Fourier series.
4. Know about the definition and properties of Fourier transforms
5. Solve the finite difference equations using Z transform.
6. Study the properties of Z-Transforms.

UNIT I

Introduction – Scalars and vectors – Differentiation of vectors – Derivative of a vector function – Some important results – Partial derivatives – Gradient, Divergence and Curl of a vector – Directional derivatives – Level surfaces.

UNIT II

Introduction – Integration of vectors – Line integral – Surface integrals. Volume integrals : Gauss divergence theorem – Green's theorem – Stoke's theorem.

UNIT III

Fourier series – Definition – Finding Fourier coefficients for a given periodic function with period 2π – Odd and Even functions – Half Range Series

UNIT IV

Definition of Fourier Transform-Properties of Fourier Transform- Inverse Fourier transform- Convolution theorem-Finite Fourier Sine & Cosine Transform – Parseval's theorem.

UNIT V

Introduction - Properties of Z- Transforms – Z- Transforms of some basic functions. Inverse Z Transforms - Z Transforms in solving finite difference equations.

TEXT BOOKS

1. Kandasamy P., Thilagavathy K., and K. Gunavathy, 2007 .Engineering Mathematics Vol. III , S. Chand & Company Ltd, New Delhi. (For Unit-I&II)
2. Veerarajan T., 2010. Engineering Mathematics - Semester II , Tata mcgraw Hill Company, New Delhi. (For Unit- III to V)

REFERENCES

1. Sundaram V., Balasubramanian R., and K.A. Lakshminarayanan., 2001. Engineering Mathematics Vol. III , Vikas publishing house PVT., LTD, New Delhi.
2. Janardhanan Pillay C.P., 2004. Vector Analysis and Differential Equations, Ajith Book Centre, P.O. Kanniyampuram, Ottapalam.

Course Objectives

This course enables the students to learn

- The mathematical concepts in optimal use of resources like LPP, TP, Assignment problems etc.
- Impart the basic concepts and applications of linear programming.
- The concepts of Queuing theory and its different types.
- Inventory Control and Stochastic Model.
- To introduce students to use quantitative methods and techniques for effective decisions-making.
- To impart the knowledge of formulation of practical problems using the linear programming method and its extensions.

Course Outcomes (COs)

On successful completion of this course, the students will be able to

1. Solve the Linear programming problems by using simplex method, Big M method and Duality method.
2. Get the Knowledge in Transportation models and Assignment problem.
3. Identify the basic analysis of queuing systems.
4. Identify the basic analysis of various inventory models.
5. Acquire the knowledge of Network representation.
6. Understand the role and application of PERT/CPM for project scheduling.

UNIT I

Linear Programming: Formulation of LPP – Graphical solution to LPP – Simplex method – Big M method- Duality in LPP.

UNIT II

Transportation model: Introduction – Mathematical Formulation – Finding initial Basic Feasible solutions – Optimum solution for non-degeneracy and degeneracy model - Unbalanced Transportation problems and Maximization case in Transportation problem.

The Assignment problem - Mathematical formulation of the problem – Hungarian method – Unbalanced Assignment problem- Maximization case in Assignment problem.

UNIT III

Queuing theory: Introduction – Characteristics of queuing system. Poisson process and Exponential Distribution – Classification of Queues. Single server – Infinite Capacity (M/M/1):(∞/FIFO), Single server – Finite Capacity (M/M/1):(N/FIFO), Multi server – Infinite Capacity (M/M/C):(∞/FIFO) and Multi server – Finite Capacity (M/M/C):(N/FIFO) models

Sequencing: Introduction – Definition. Processing n-jobs through 2 machines, Processing n-jobs through 3 machines.

UNIT IV

Inventory Control: Introduction – Costs involved in inventory – Deterministic EOQ models – Purchasing Model without and with shortage, Manufacturing Model without and with shortage – Stochastic Model - Price

break.

UNIT V

PERT and CPM: Network representation – Calculation of Earliest expected time, latest allowable occurrence time. CPM - various floats for activities – critical path. PERT –Time estimates in PERT- Probability of meeting scheduled date of completion of projects.

TEXT BOOK

1.Kanthi Swarup, Gupta P.K., and Man Mohan., 2003. Operations Research, Sultan Chand & Sons, NewDelhi.

REFERENCES

1. Anand Sharma, 2004 .Operations Research , Himalaya Publishing House , NewDelhi.
2. Kalavathy.S, 2002 .Operations Research , Vikas Publishers House Pvt Ltd., Trichy.
3. Sundaresan V., Ganapathy Subramanian K.S., and Ganesan K., 2005.OperationsResearch (Resource Management Techniques), A. R. Publications, Nagapatinam.
4. Sharma J.K., 2009.Operations Research: Theory and Applications, Macmillan Publishers India Ltd, NewDelhi.

Course Objectives

This course enables the students to learn

- Geometry and its applications in the real world
- The basic concepts in Straight line, Sphere, Cone and Cylinder.
- The application of Geometrical figures.
- Geometric ideas in the language of the mathematician.
- Accurately identify the equations, properties and graphs of the parabola, circle and ellipse
- Demonstrate the ability to use trigonometric functions to find the parts of a right triangle and to solve problems involving right triangles

Course Outcomes (COs)

On successful completion of the course, students will be able to:

1. Evaluate the angle between the lines, direction cosines
2. Describe the basic concepts in planes and to find the shortest distance between two given lines.
3. Explain the concepts of sphere and intersection of two spheres.
4. Acquire the knowledge on basic concepts Cone and find the equation of a right circular cone with vertex at the origin.
5. Understand the definition and concept of Cylinder.
6. Evaluate the problems related to cylinder and right circular cylinder.

UNIT I

Rectangular Cartesian co-ordinates – Distance between points – Direction cosines – Direction ratios – Angle between the lines – Conditions for perpendicularity and parallelism.

UNIT II

Straight line : Symmetrical form of the equations of a line – The plane and the straight line – Coplanar lines – The shortest distance between two given lines.

UNIT III

Sphere: Definition – Equation of the sphere – Length of the tangent – The plane section of a sphere – Equation of a circle on a sphere – Intersection of two spheres.

UNIT IV

Cone : Definition – Quadric cone – Cone whose vertex is at the origin .

Right circular cone : Definition –Equation of a right circular cone with vertex at the origin – Enveloping cone.

UNIT V

Cylinder : Definition – Equation of the cylinder – Right circular cylinder.

TEXT BOOK

1. Manicavachagom Pillay T.K., and T.Natarajan., 1996. Analytical Geometry 3D, S.Viswanathan printers & Publishers, Pvt Ltd, Madras.

REFERENCES

1. Venkataraman. M.K, 2000. Engineering Mathematics, Second Edition, TheNational Publishing Company, Chennai.
2. Kandasamy P., Thilagavathy K., and K.Gunavathy ., 2008. Engineering Mathematics, S.Chand Company Ltd, Ram Nagar, New Delhi.
3. Duraipandian.P ,Laxmi Duraipandian and D.Muhilan ., 2000. Analytical Geometry 3D ,Emerald Publishers, Pvt. Ltd, Chennai.

. Course Objectives

This course enables the students to

- Know the area of cost and management accounting.
- Identify the major differences and similarities between financial and management accounting.
- Understand the role of management accountant in an organization, and the importance of upholding ethical standards
- Expose students to methods and techniques needed by managers for performing functions such as costing, cost allocations, preparation of flexible budgets and variance analysis.
- Enhance the abilities of learners to develop the concept of management accounting and its significance in the business.
- Enable the learners to understand, develop and apply the techniques of management accounting

Course Outcomes (COs)

On successful completion of this course, the student will be able to:

1. Asses the significance and role of cost accounting
2. Import the knowledge on the nature of elements of cost and cost sheet preparation
3. Enrich the knowledge on the preparation of various budgets
4. Analyze the Financial Statement Analysis
5. Prepare budget and budgetary control
6. Acquire knowledge of Profit analysis.

UNIT I

Cost Accounting – Definition, meaning and scope – Relationship of Cost accounting with financial accounting and management accounting – Methods of costing – cost analysis – concepts and classifications – Elements of cost – preparation of cost sheet and tender — limitations of cost accounting.

UNIT II

Management Accounting – meaning, nature and Scope and functions of management accounting – relationship between management accounting, and financial accounting-role of management in decision making

UNIT III

Working Capital- concepts, kinds, importance of working capital-working capital requirements and their computation- sources of working capital - forecasting of working capital requirements

UNIT IV

Budget, Budgeting and budgetary control – definition, importance, essentials, classification of budgets, master budgets, preparation of different budgets – steps in budgetary control.

UNIT V

Standard costing – Advantages and disadvantages- Difference between budgetary control and standard costing- Variance- Types of variance- material and labor variances only.

Course Objectives

This course enables the students to

- Know about the HR principles on an organization
- Impart the knowledge on wage and salary administration
- Understand the other benefits avail by the employees.
- Develop, implement, and evaluate employee orientation, training, and development programs.
- Help the students focus on and analyze the issues and strategies required to select and develop manpower resources
- Develop relevant skills necessary for application in HR related issues

Course Outcomes (COs)

On successful completion of this course, the student will be able to:

1. Understand the fundamentals of HR and its interface with other functions in the organization
2. Understand the behavioral aspects at individual as well as organizational level
3. Study the tools & techniques in people management
4. Understand the strategic role of HR and global standards
5. Contribute to the development, implementation, and evaluation of employee recruitment, selection, and retention plans and processes.
6. Administer and contribute to the design and evaluation of the performance management program.

UNIT I

Introduction to HRM: Definition, Objectives and Functions of HRM –Role and Structure of Personnel Functions in Organization, Personal Principles and Policies.

UNIT II

Human Resource Planning: - Characteristics of HRP, Need for Planning HRP Process job Analysis, Job Design, Job Description, Job Specification. Selection Process - Placement and Induction, Training and Development, Promotion, Demotions, Transfers, Separation.

UNIT III

Wage and Salary Administration: - Factors Principles, Compensation Plan, Individuals, Group Incentives, Bonus, Fringe Benefits, and Job Evaluation Systems.

UNIT IV

Employee Maintenance and Integration:- Welfare and Safety, Accident Prevention, Administration of Discipline, Employee Motivation, Need and Measures.

UNIT V

Personnel Records and Reports: - Personnel Research and Personnel Audit, Objectives, Scope and Importance.

TEXT BOOK

S.S.Khanka. (2000), Human Resource Management, Sultan Chand & Sons, New Delhi.

REFERENCES

1. CS. Venkataraman and BK.Srivastva:-Personnel Management and HumanResources.
2. Yodder, Dale and Paul.DStandohar – Personnel Management and Industrial Relations.
3. Prasad, Lallan and A.M.Banerjee –Management ofHR

Course Objectives

This course enables the students to

- Learn about the fundamentals of Organic Chemistry
- Understand the Stereochemistry.
- Learn about saturated and unsaturated hydrocarbons
- Study of Catalytic hydrogenation and Carbons
- Acquire a foundation of chemistry of sufficient breadth and depth to enable them to understand and critically interpret the primary chemical literature.
- Professionalism, including the ability to work in teams and apply basic ethical principles.

Course Outcomes (COs)

On successful completion of this course, the student will be able to:

1. The electronic structure of atoms and its influence on chemical properties
2. The principles influencing reactivity, including acid-base behaviors and reaction networks important in nutrition and metabolism
3. The principles influencing reactivity, including acid-base behaviors and reaction networks important in nutrition and metabolism
4. Balancing simple chemical reactions and strategies to balance them
5. The fundamental properties of atoms, molecules, and the various states of matter
6. Simple quantum mechanical treatments of atoms and molecules

UNIT I

Electronic effects: Physical Effects, Electronic Displacements: Inductive Effect, Electromeric Effect, Resonance and Hyperconjugation. Cleavage of Bonds: Homolysis and Heterolysis.
Structure, shape and reactivity of organic molecules: Nucleophiles and electrophiles.

UNIT II

Reactive Intermediates and Aromaticity:

Reactive Intermediates: Carbocations, Carbanions and free radicals.

Strength of organic acids and bases: Comparative study with emphasis on factors affecting pK values.

Aromaticity: Benzenoids and Hückel's rule.

UNIT III

Stereochemistry: Conformations with respect to ethane, butane and cyclohexane. Interconversion of Wedge Formula, Newmann, Sawhorse and Fischer representations. Concept of chirality (upto two carbon atoms). Configuration: Geometrical and Optical isomerism; Enantiomerism and Diastereomerism. Threo and erythro; D and L; cis – trans nomenclature; CIP Rules: R/ S (for upto 2 chiral carbon atoms) and E / Z Nomenclature (for upto two C=C systems).

UNIT IV

Alkanes and Alkynes:

Alkanes: (Upto 5 Carbons). Preparation: Catalytic hydrogenation, Wurtz reaction, Kolbe's synthesis, from Grignard reagent. Reactions: Free radical Substitution: Halogenation.

Alkynes: (Upto 5 Carbons) Preparation: Acetylene from CaC_2 and conversion into higher alkynes; by dehalogenation of tetra halides and dehydrohalogenation of vicinal-dihalides. Reactions: formation of metal acetylides, addition of bromine and alkaline KMnO_4 , Ozonolysis and oxidation with hot alk. KMnO_4 .

UNIT V

Alkenes: (Upto 5 Carbons) Preparation: Elimination reactions: Dehydration of alkenes and dehydrohalogenation of alkyl halides (Saytzeff's rule); cis alkenes (Partial catalytic hydrogenation) and trans alkenes (Birch reduction).

Reactions: cis-addition (alk. KMnO_4) and trans-addition (bromine), Addition of HX (Markownikoff's and anti-Markownikoff's addition), Hydration, Ozonolysis, oxymecuration- demercuration, Hydroboration-oxidation.

Course Objectives

This course enables the students to

- To impart knowledge on both Aptitude and Soft skills to the students
- To critically evaluate and demonstrate various principles involved in solving mathematical problems.
- Adopt new and faster methods of calculations
- Reinforcing competencies in soft skills which are crucial in a social setting
- Work together as a team, for the benefit of their own, and the organization's, success
- Become more effective communicators and leaders

Course Outcomes (COs)

On successful completion of this course, the student will be able to:

1. Solve the problem of finding time, speed and distance.
2. Apply the concept of permutation and combination in appropriate problems
3. Acquire the knowledge of data sufficiency.
4. Improve the English communication skills.
5. Improve the skills of resume writing and attitude.
6. Develop the personality development and acquire the knowledge of how to attend the interview.

UNIT - I

Time, Speed and Distance, Time and Work, Pipes and Cisterns, Geometry, Data Arrangement

UNIT – II

Analogy, Logic based Venn diagram, Probability, Permutation and Combination, Logarithms

UNIT – III

Data Sufficiency, Clocks, Calendar, Reading Comprehension, Sentence Correction, Sentence Completion, Spotting the Errors, Jumbled Sentences

UNIT – IV

Synonyms, Antonyms, Verbal Analogy, Statements and Assumptions, Group Discussion

UNIT - V

Resume Writing, Introduction to HR rounds, Time Management, Attitude and Behaviour

Course Objectives

This course enables the students to learn

- The Real and Complex number systems and the field axioms
- About the Upper bounds, lower bounds
- The concept of a set theory, countable and uncountable sets.
- Euclidean Space and its properties.
- The development of the mathematical skills to solve problems involving convolution, filtering, modulation and sampling.
- To appreciate how mathematics is used in design (e.g. conformal mapping);

Course Outcomes (COs)

On successful completion of this course, the student will be able to

1. Understand the basic concepts of real and complex numbers.
2. Acquire the knowledge in relations and functions of sets.
3. Examine the different types of sets and its properties.
4. Describe the Weierstrass theorem and Cantor intersection Theorem.
5. Express the covering and compactness in metric spaces.
6. Evaluate the limit, continuity of complex and vector valued functions.

UNIT I

The Real and Complex number systems the field axioms, the order axioms –integers –the unique Factorization theorem for integers –Rational numbers –Irrational numbers –Upper bounds, maximum Elements, least upper bound –the completeness axiom–some properties of the supremum–properties of the integers deduced from the completeness axiom– The Archimedean property of the real number system .

UNIT II

Basic notions of a set theory: Notations –ordered pairs –Cartesian product of two sets – Relations and functions – further terminology concerning functions –one –one functions and inverse –composite functions –sequences –similar sets–finite and infinite sets –countable and uncountable sets – uncountability of the real number system.

UNIT III

Elements of point set topology: Euclidean space \mathbb{R}^n –open balls and open sets in \mathbb{R}^n . The structure of open Sets in \mathbb{R}^n –closed sets and adherent points –The Bolzano –Weierstrass theorem– the Cantor intersection Theorem.

UNIT IV

Covering –Lindelof covering theorem –the Heine Borel covering theorem –Compactness in \mathbb{R}^n – Metric Spaces –point set topology in metric spaces –compact subsets of a metric space –Boundary of a set.

UNIT V

Convergent sequences in a metric space –Cauchy sequences –Completeness sequences –complete metric Spaces. Limit of a function –Continuous functions –continuity of composite functions. Continuous complex valued and vector valued functions.

TEXT BOOK

1.Apostol.T.M.,1990. Mathematical Analysis, Second edition, Narosa Publishing Company, Chennai.

REFERENCES

1. Balli. N.P., 1981. Real Analysis, Laxmi Publication Pvt Ltd, New Delhi.
2. Gupta . S.L ., and N.R. Gupta ., 2003.Principles of Real Analysis, Second edition, Pearson EducationPvt.Ltd,Singapore.

4. Rudin. W.,1976 .Principles of mathematical Analysis, Mcgraw hill, Newyork.
5. Sterling. K. Berberian, 2004. A First Course in Real Analysis, Springer Pvt Ltd, NewDelhi.

Course Objectives

This course enables the students to learn

- The concepts of complex numbers and analytic functions.
- The concept of conformal mapping and bilinear transformation.
- The basics of Power Series and its convergence.
- About the Bilinear Transformation and Complex Integration
- Techniques of complex analysis that make practical problems easy (e.g. graphical rotation and scaling as an example of complex multiplication)
- To understand how complex numbers provide a satisfying extension of the real numbers

Course Outcomes (COs)

On successful completion of this course, the student will be able to

1. Explain the basic concepts of complex number system and complex plane
2. Understand the ideas of analytic function and its properties.
3. Describe the convergence of power series and elementary functions
4. Evaluate cross ratio and construct conformal and bilinear transformation.
5. Perform integration on complex valued function.
6. Evaluate complex integration over a simple and closed curves.

UNIT I

Complex number system: Complex number-Field of a complex numbers-Conjugation –Absolute value of a complex number.Complex plane: Complex number by points- n^{th} root of a complex number-Angle between two rays- Elementary transformation- Stereographic projection.

UNIT II

Analytic functions: Limit of a function –continuity –differentiability – Analytical function defined in a region –necessary conditions for differentiability –sufficient conditions for differentiability – Cauchy-Riemann equation in polar coordinates –Definition of entire function.

UNIT III

Power Series: Absolute convergence –circle of convergence –Analyticity of the sum of a power series-Uniqueness of representation of a function by a power series- Elementary functions : Exponential, Logarithmic, Trigonometric and Hyperbolic functions. Harmonic functions: Definition and determination.

UNIT IV

Bilinear transformation-Circles and Inverse points-Transformation mappings $w=Z^2$, $w=Z^{1/2}$, $w=e^Z$, $w=\sin Z$, and $w=\cos Z$ -Conformal mapping-isogonal mapping.

UNIT V

Complex integration: Simple rectifiable oriented curves –Integration of complex functions- Definite integral- Interior and Exterior of a closed curve-Simply connected region-Cauchy's fundamental theorem-Cauchy's formula for higher derivatives- Morera's theorem.

6. Narayanan .S., T.K Manichavachagam Pillay, 1992. Complex Analysis.S.Viswanathan (printers & publishers) pvt Ltd, Madras.

Course Objectives

This course enables the students to learn

- The basic concepts to solve the algebraic and transcendental equations.
- Utilize computers to solve engineering problems which are impossible to solve by analytical means.
- To solve the simultaneous linear algebraic equations.
- To find the numerical solution for differential and integral equation.
- To prove results for various numerical root finding methods.
- To derive appropriate numerical methods to solve interpolation based problems.

Course Outcomes (COs)

On successful completion of the course, students will be able to:

1. Solve the algebraic and transcendental equations.
2. Evaluate the solution of simultaneous linear algebraic equations.
3. Relate the forward and backward differences and its operators.
4. Apply the Newton forward, backward and divided differences to find interpolation of equal and unequal intervals.
5. Express numerical integration and differentiation in applied areas.
6. Evaluate the numerical solution of ordinary differential equations.

UNIT I

Solution of algebraic and transcendental equations: Bisection method – Iterative method Regula Falsi method – Newton Raphson method – Horner's method – Graeffe's root squaring method.

UNIT II

Solution of simultaneous linear algebraic equations: Gauss elimination method – Gauss Jordan method – Method of triangularization – Crout's method – Gauss-Jacobi method – Gauss-seidel method.

UNIT III

Finite Difference: First and higher order differences – Forward and Backward differences – Properties of operator – Difference of a polynomial – Factorial polynomial – Error Propagation in difference table – operator E – Relation between Δ , E and D.

UNIT IV

Interpolation: Gregory Newton Forward and Newton Backward interpolation formula – Equidistant terms with one or more missing values – Interpolation with unequal intervals – Divided differences – Newton's divided difference formula – Lagrange's interpolation formula – Inverse interpolation formula.

UNIT V

Numerical Differentiation and Integration: Newton's Forward and backward differences to compute derivatives – Trapezoidal rule, Simpson's $1/3$ & $3/8$ rule. Solution of ordinary differential equations: R-K method (II order, III order and IV order).

TEXT BOOK

1. Venkataraman M.K., Fifth Edition, 2001. Numerical Methods in Science and Engineering, National publishing Company, Madras.

REFERENCES

1. Jain. M.K., Iyengar S.R.K., and R.K. Jain., 2004. Numerical Methods for Scientific and Engineering Computation, New Age International Publishers, New Delhi.
2. Vedamurthy V.N., N.Ch.S.N. Iyenger., 1999. Numerical Methods, Vikas Publishing House Pvt Ltd, New Delhi.
3. Kandaswamy. P., Thilagavathy K., and K. Gunavathy., 2013. Numerical Methods, S. Chand & Company Ltd., New Delhi.

Course Objectives

This course enables the students to learn

- Exercise user defined functions to solve real time problems.
- Illustrate flowchart and algorithm to the given problem.
- The basic structure of the programme, declaration and usage of variables.
- The basic MATLAB (matrix laboratory) programme.
- To develop an understanding of the elements of error analysis for numerical methods and certain proofs.
- To provide students with an introduction to the field of numerical \methods.

Course outcomes (COs)

On successful completion of this course, the student will be able to

1. Evaluate the roots of any algebraic equations.
2. Develop a program to solve linear algebraic equations in Gauss Jordan and elimination method.
3. Test the default programs for interpolation in Newton's forward and backward.
4. Predict the values using interpolation method.
5. Calculate the numerical solution of ordinary differential equations
6. Evaluate the integral and derivative by using numerical integration rules.

1. Roots of a given Algebraic Equation using Bisectionmethod.

2. Roots of a given Algebraic Equation using Newton Raphsonmethod.

3. Solution of linear algebraic equations using Gauss Eliminationmethod.

4. Solution of linear algebraic equations using Gauss Jordanmethod.

5. Solution of linear algebraic equations using Gauss Seidalmethod.

6. Interpolation using Newton's forward.

7. Interpolation using Newton's backward.

8. Interpolation using Lagrange'smethod.

9. Derivative using Newton's forward differenceformula.

10. Derivative using Newton's backward differenceformula.

11. The value of the given integral using Simpson's one thirdrule.

12. The value of the given integral using Trapezoidalrule.

Course Objectives

This course enables the students to learn

- Exercise user defined functions to solve real time problems.
- Illustrate flowchart and algorithm to the given problem.
- The basic structure of the programme, declaration and usage of variables.
- The basic MATLAB (matrix laboratory) programme.
- To understanding the MATLAB environment
- carry out simple numerical computations and analyses using MATLAB

Course outcomes (COs)

On successful completion of this course, the student will be able to

1. Explore the Basics of MATLAB and evaluate basic computation using input and output commands.
2. Built the inline and outline functions and solve matrix and array operations.
3. Express the script and function files.
4. Evaluate Eigen values and Eigen vectors using MATLAB.
5. Solve a linear system of equations using MATLAB.
6. Apply the MATLAB programme for solving Differential and Integral problems and find the Numerical solution.

UNIT I

Introduction - Basics of MATLAB, Input – Output, File types – Platform dependence – General commands.

UNIT II

Interactive Computation: Matrices and Vectors – Matrix and Array operations – Creating and Using Inline functions – Using Built-in Functions and On-line Help – Saving and loading data – Plotting simple graphs.

UNIT III

Programming in MATLAB: Scripts and Functions – Script files – Functions files-Language specific features – Advanced Data objects.

UNIT IV

Applications – Linear Algebra - Solving a linear system – Finding Eigen values and Eigen vectors – Matrix Factorizations.

UNIT V

Applications – Data Analysis and Statistics – Numerical Integration – ordinary differential equations – Nonlinear Algebraic Equations.

TEXT BOOK

1. Rudra Pratap, 2003. Getting Started with MATLAB-A Quick Introduction for Scientists and Engineers, Oxford University Press.

REFERENCES

1. William John Palm, 2005. Introduction to Matlab 7 for Engineers, McGraw-Hill Professional. New Delhi.
2. Dolores M. Etter, David C. Kuncicky, 2004. Introduction to MATLAB 7, Prentice Hall, New Delhi.
3. Kiranisingh.Y, Chaudhuri.B.B, 2007. Matlab Programming, Prentice-Hall Of India Pvt.Ltd, New Delhi.

Course Objectives

This course enables the students to learn

- The concept of algebraic structures and Mathematical Logics.
- lattices and its special categories which plays an important role in the field of computers.
- About the concepts of Relations and Functions.
- The fundamental concepts in graph theory, with a sense of some its modern applications.
- To solve problems using counting techniques and combinatorics.
- To apply algorithms and use definitions to solve problems to proof statements in elementary number theory

Course Outcomes (COs)

On successful completion of this course, students will be able to

1. Explore the mathematical logics in Tautology and theory of inference for predicate calculus.
2. Understand the basic concepts of relations and functions and composition of functions.
3. Describe the Phrase, structure grammar and context free grammar in Formal Languages and Automata
4. Express the partial ordering, Lattices and Boolean Algebra and Boolean functions in mathematical logics.
5. Describe paths, reachability, connectedness and matrix representation of directed and undirected graphs.
6. Apply the concepts of graph theory in real time problems.

UNIT-I

Mathematical logic: Connections well formed formulas, Tautology, Equivalence of formulas, Tautological implications, Duality law, Normal forms, Predicates, Variables, Quantifiers, Free and bound Variables. Theory of inference for predicate calculus.

UNIT-II

Relations and functions: Composition of relations, Composition of functions, Inverse functions, one- to- one, onto, one-to-one & onto, onto functions, Hashing functions, Permutation function.

UNIT-III

Formal languages and Automata: Grammars: Phrase–structure grammar, context-sensitive grammar, context-free grammar, regular grammar. Finite state automata- Deterministic finite automata and Non deterministic finite automata-conversion of nondeterministic finite automata to deterministic finite automata.

UNIT-IV

Lattices and Boolean algebra: Partial ordering, Poset, Lattices, Boolean algebra, Boolean functions, Theorems, Minimization of Boolean functions.

UNIT-V

Graph Theory: Directed and undirected graphs, Paths, Reachability, Connectedness, Matric representation, Euler paths, Hamiltonian paths, Trees, Binary trees simple theorems, and applications.

Course Objectives

This course enables the students to learn

- Mathematical concepts and principles to perform numerical and symbolic computations.
- To investigate and solve mathematical and statistical problems.
- To write clear and precise proofs.
- To communicate effectively in both written and oral form.
- To analyse hypotheses and conclusions of mathematical statements
- To understand the basics of modular arithmetic.

Course Outcomes (COs)

On successful completion of this course, students will be able to

1. Describe the divisibility theory, fundamental theorem of Arithmetic and theory of congruence.
2. Use Fermat's, little and Wilson theorems on congruence and number theoretic problems.
3. Establish the generalization of Fermat and Euler theorems also properties of phi function
4. Estimate the Primitive roots, indices and composite numbers.
5. Describe the basic concepts in Cryptography
6. Identify number theoretic concepts which are related to and used in cryptography

UNIT -I

Divisibility theory in integers, g.c.d, prime, fundamental theorem of Arithmetic, the theory of congruence.

UNIT -II

Fermat's theorem – Pierre de Fermat – Fermat's factorization method – the little theorem – Wilson theorem .

UNIT -III

Euler's generalization of Fermat's theorem – Euler's phi function – Euler's theorem – some properties of phi function.

UNIT -IV

Primitive roots and indices – the order of an integer – modulo n – primitive for primes composite numbers having primitive roots – the theory of indices. The Fermat conjecture – pythagorean Triples – The famous Last theorem.

UNIT -V

Cryptography – classical cryptography – some simple crypto system-Shannon's theory

TEXT BOOK

1. Neal Koblitz., 2006. A course in Number theory and Cryptography, 2nd Edition, Hindustan Book Agency, New Delhi.

REFERENCES

1. Stallings. W, 2000. Cryptography and Network Security, Prentice Hall India, NewDelhi.
2. Douglas Stinson, 2007. Cryptography theory and practise, Second edition, Chapman & Hall/CRC, NewDelhi.
3. David M Burton, 2006. Elementary number theory, 6th Edition, New age international Private limited, NewDelhi.

Course Objectives

This course enables the students to learn

- The mathematical theory of random variables and random processes
- To apply Stochastic Process in day to day life problems.
- How queueing theory are used as tools and mathematical models in the study of networks.
- The theoretical concepts and techniques for solving problems that arises in practice
- Expose the students to the basics of probability theory and random processes
- Understand the definition of a stochastic process and in particular a Markov processes

Course Outcomes (COs)

On successful completion of the course, students will be able to:

1. Describe the concepts and definitions of stochastic Processes, Markov chains.
2. Understand the ideas about Markov Process and Poisson Process in discrete state space
3. Explain the Markov process with continuous state space also analyze Brownian motion, Kolmogorov equations.
4. Discuss the Branching processes, properties of generating functions Branching process and Time Markov Branching Process.
5. Develop the concepts of stochastic processes in queueing systems.
6. Execute the stochastic processes models for real world problems.

UNIT I

Definition of Stochastic Processes – Markov chains: definition, order of a Markov Chain – Higher transition probabilities – classification of states and chains.

UNIT II

Markov Process with discrete state space: Poisson process – and related distributions – properties of Poisson process, Generalizations of Poisson Processes – Birth and death Processes – continuous time Markov Chains.

UNIT III

Markov processes with continuous state space: Introduction, Brownian motion – Wiener Process and differential equations for Wiener process, Kolmogorov equations – first passage time distribution for Wiener process – Ornstein – Uhlenbeck process.

UNIT IV

Branching Processes: Introduction – properties of generating functions of Branching process– Distribution of the total number of progeny, Continuous- Time Markov Branching Process, Age dependent branching process: Bellman-Harris process.

UNIT V

Stochastic Processes in Queuing Systems: Concepts – Queuing model M/M/1 – transient behavior of M/M/1 model – Birth and death process in Queuing theory: M/M/1 – Model related distributions – M/M/1 - M/M/S/S – loss system - M/M/S/M – Non birth and death Queuing process: Bulk queues – M(x)/M/1.

TEXT BOOK

1. Medhi. J, 2006. Stochastic Processes, 2nd Edition, New age international Private limited, New Delhi.

REFERENCES

1. K. Basu, 2003. Introduction to Stochastic Process, Narosa Publishing House, New Delhi.
2. Goswami and B. V. Rao, 2006. A Course in Applied Stochastic Processes, Hindustan Book Agency, New Delhi.
3. G. Grimmett and D. Stirzaker, 2001. Probability and Random Processes, 3rd Ed., Oxford University Press, New York.
4. Papoulis. A and Unnikrishna Pillai, 2002. Probability, Random variables and Stochastic Processes, Fourth Edition, McGraw-Hill, New Delhi.

Course Objectives

This course enables the students to

- Eradicates the fear of Mathematics and instills confidence.
- Improves calculation speed and numerical skills
- Get basic knowledge in solving numerical problems using different methods.
- Facilitates a habit of analytical thinking and measured approach towards any problem
- Make mathematics easy and interesting
- Carry out tedious and cumbersome mathematical operations in a simple way

Course Outcomes (COs)

On successful completion of the course, students will be able to

1. Solve the simple and compound Multiplication arithmetic problems.
2. Understand the concept of different types of division.
3. Factorize the fraction of different kinds
4. Evaluate the solution for linear and quadratic equations.
5. Solve the differentiation problems.
6. Explore the concepts of Integration in the way of vedic sutras.

UNIT I

Actual Applications of the Vedic sutras- Arithmetical Computations – Multiplication – Practical Application in Compound Multiplication.

UNIT II

Division by the Nikhilam method – Division by the Paravartya method – Argumental Division – Linking note -Recapitulation and conclusion.

UNIT III

Factorization of Simple Quadratics- Factorization of Harder Quadratics. .

UNIT IV

Simultaneous Simple Equations – Miscellaneous (simple) Equations – Quadratic Equations.

UNIT V

Factorization and Differential Calculus – Partial Fractions – Integration by Partial fractions.

TEXT BOOK:

1.Jagadguru Swami Sri Bharati KrisnaTirthaji Maharaja,2004. Vedic Mathematics, Motilal Bansaridass Publishers Pvt Limited, New Delhi.

Course Objectives

This course enables the students to learn

- The concepts and principles of quality planning and quality conformance.
- To investigate control charts and allied techniques.
- To demonstrate the basic concepts of attributes and variables inspection.
- The basic concepts of Acceptance Sampling.
- To introduce students to statistical quality control (SQC) emphasizing those aspects which are relevant for SQC's practical implementation.
- To understand the purpose and function of statistical quality control.

Course Outcomes (COs)

On successful completion of this course, students will be able to

1. Inspect the Quality conformance, quality adherence, quality assurance and management functions.
2. Identify total quality control in an industry.
3. Identify and apply various properties of control charts
4. Describe different types of control charts.
5. Explain the concept of sampling, attributes and variables inspection.
6. Discuss the different types of sampling plans and organize of quality control.

UNIT I

Total quality control in an industry. Quality planning, quality conformance, quality adherence. Quality assurance and quality management functions.

UNIT II

Control charts and allied techniques. Concept of quality and meaning of control. Concept of inevitability of variation-chance and assignable causes. Pattern of variation. Principles of rational sub-grouping.

UNIT III

Different types of control charts. Concept of process capability and its comparison with design specifications, CUSUM charts.

UNIT IV

Acceptance sampling. Sampling inspection versus 100 percent inspection. Basic concepts of attributes and variables inspection.

UNIT V

OC curve, Single, double, multiple and sequential sampling plans, Management and organization of quality control.

TEXTBOOK

1. D.C. Montgomery, 1985. Introduction to Statistical Quality Control, Wiley, New Delhi.

REFERENCES

1. Kandaswamy. P.K. Thilagavathy., and K. Gunavathy., 2004 . Probability statistics and Queueing theory, S. Chand & Company Ltd., New Delhi.

6. Ravichandran J., 2012. Probability and statistics for Engineers., First Edition, Wiley India.

Course Objectives

This course enables the students to learn

- About the continuous function, uniform continuity and connectedness
- The fundamental properties of the Real numbers.
- The concept of Riemann integrals.
- Concepts of Monotonic functions and its properties.
- About Riemann-Stieltjes integrals, sequences and series of functions
- Functions of bounded variation, grasp basic concepts about the total variation.

Course Outcomes (COs)

On successful completion of this course, students will be able to

1. Understand about the categories of open sets and closed sets.
2. Explain the components of a metric space and connectedness of sets.
3. Evaluate the derivatives and infinite derivatives of the given functions.
4. Explore the properties of monotonic functions, total and bounded variation of functions
5. Evaluate the Riemann Stieltjes integral and change of variables
6. Demonstrate an understanding of the theory of functions, continuity, differentiation and integration.

UNIT I

Examples of continuous functions –continuity and inverse images of open or closed sets –functions continuous on compact sets –Topological mappings –Bolzano’s theorem.

UNIT II

Connectedness –components of a metric space – Uniform continuity : Uniform continuity and compact sets – fixed point theorem for contractions –monotonic functions.

UNIT III

Definition of derivative –Derivative and continuity –Algebra of derivatives – the chain rule –one sided derivatives and infinite derivatives –functions with non-zero derivatives –zero derivatives and local extrema – Roll’s theorem –The mean value theorem for derivatives.

UNIT IV

Properties of monotonic functions –functions of bounded variation –total Variation –additive properties of total variation on (a, x) as a function of x – functions of bounded variation expressed as the difference of increasing functions.

UNIT V

The Riemann - Stieltjes integral : Introduction –Notation –The definition of Riemann –Stieltjes integral – linear properties –Integration by parts –change of variable in a Riemann –stieltjes integral – Reduction to a Riemann integral.

TEXT BOOK

1. Apostol. T.M., 1990. Mathematical Analysis, Second edition, Narosa Publishing Company, Chennai.

REFERENCES

1. Balli. N.P, 1981. Real Analysis, Laxmi Publication Pvt Ltd, New Delhi.
2. Gupta . S.L , and N.R. Gupta ., 2003. Principles of Real Analysis, Second edition, Pearson Education Pvt. Ltd, Singapore.
3. Royden .H.L , 2002. Real Analysis, Third edition, Prentice hall of India, New Delhi.
4. Rudin. W, 1976 .Principles of Mathematical Analysis, McGraw hill, New York.
5. Sterling. K. Berberian , 2004. A First Course in Real Analysis, Springer Pvt Ltd, New Delhi.

Course Objectives

This course enables the students to learn

- The concepts of analytic function of complex number system, complex function and complex integration
- The concept of Singularities, real definite integrals and Meromorphic functions.
- Identify and construct complex-differentiable functions.
- Express functions as infinite series or products.
- To identify and construct complex-differentiable functions
- To express functions as infinite series or product

Course Outcomes (COs)

On successful completion of this course, the student will be able to

1. Explain the fundamental concepts of complex analysis and mean value theorem and their role in modern mathematics and applied contexts.
2. Express the concepts of Taylor's and Laurent's series.
3. Evaluate the types of singularities of complex functions and its properties.
4. Understand the concepts of real definite Integrals.
5. Evaluate the poles and using integration of rational functions.
6. Describe the meromorphic function, Principles of argument and Rouché's theorem.

UNIT I

Zero's of a function-Cauchy's inequality-Liouville's theorem-Fundamental theorem of Algebra- Maximum modulus theorem- Gauss mean value theorem- Mean value of the value of a harmonic function on a circle- Term by term differentiation and integration of uniformly convergent series.

UNIT II

Taylor's series and Laurent's series : Taylor's series-Theorems and some related problems- Zero's of an analytic function- Laurent's series – Theorems and some related problems- Cauchy product and division.

UNIT III

Singularities – Isolated Singularities- Removable Singularity- Pole-Essential Singularity-Behaviour of a function at an isolated Singularity-Determination of the nature of Singularity-Problems- Residues- Residues theorem(statement only)- Problems.

UNIT IV

Real definite integrals: Evaluation using the calculus of residues – Integration on the unit circle – Integral with $-\infty$ and $+\infty$ as lower and upper limits with the following integrals:

- i) $P(x)/Q(x)$ where the degree of $Q(x)$ exceeds that of $P(x)$ at least 2.
- ii) $(\sin ax) \cdot f(x)$, $(\cos ax) \cdot f(x)$, where $a > 0$ and $f(z) \rightarrow 0$ as $z \rightarrow \infty$ and $f(z)$ does not have a pole on the real axis.
- iii) $f(x)$ where $f(z)$ has a finite number of poles on the real axis.

UNIT V

Meromorphic functions: Theorem on number of zeros minus number of poles –Principle of argument: Rouché's theorem – Theorem that a function which is meromorphic in the extended plane is a rational function.

TEXT BOOK

5. Narayanan .S., T.K Manichavachagam Pillay, 1992. Complex Analysis.S.Viswanathan (printers & publishers) pvt Ltd, Madras.

Course Objectives

This course enables the students to learn

- Group homomorphism, isomorphism, automorphism and its related properties.
- Effectively write abstract mathematical proofs in a clear and logical manner.
- Locate and use theorems to solve problems in number theory and theory of polynomials over a field
- Identifying unsolved yet relevant problem in a specific field.
- To compute determinants and know their properties.
- To present the relationships between abstract algebraic structures with familiar numbers systems such as the integers and real numbers

Course Outcomes (COs)

On successful completion of the course, students will be able to:

1. Expertise on Sets, mappings and binary operations and relations.
2. Understand the concept of Subgroups and its properties.
3. Describe the concepts of Homomorphism of groups.
4. Understand the basic concepts of Rings and its properties.
5. Apply the concept of a field extension to various mathematical problems
6. Evaluate ideals and subrings in Rings and quotient rings.

UNIT I

Sets – Mappings – Binary operations and Relations. Groups – Abelian group, Symmetric Group – Definitions and Examples – Basic properties.

UNIT II

Subgroups – Cyclic subgroup – Index of a group – Order of an element – Fermat theorem – A Counting Principle - Normal Subgroups and Quotient Groups.

UNIT III

Homomorphisms – Cauchy's theorem for Abelian groups – Sylow's theorem for Abelian groups Automorphisms – Inner automorphism - Cayley's theorem, permutation groups.

UNIT IV

Rings: Definition and Examples – Some Special Classes of Rings – Commutative ring – Field – Integral domain - Homomorphisms of Rings.

UNIT V

Ideals and Quotient Rings – More Ideals and Quotient Rings – Maximal ideal - The field of Quotients of an Integral Domain – Euclidean rings.

TEXT BOOK

1. Vasishtha.A.R., 2005. Modern Algebra, Krishna Prakasam Mandir , Meerut.

REFERENCES

2. Artin.M., 2008. Algebra, Pearson Prentice-Hall of India, New Delhi.
3. Fraleigh.J.B., 2004. A First Course in Abstract Algebra , Seventh edition , Pearson Education Ltd, Singapore.
4. Kenneth Hoffman., Ray Kunze., 2003. Linear Algebra, Second edition, Pearson Prentice Hall of India Pvt Ltd, New Delhi.

Course Objectives

This course enables the students to learn

- The fundamental concepts in Graph Theory and some of its modern applications.
- To apply graph theory based tools in solving practical problems
- Hands-on implementation of algorithms to evaluate the reliability of given networks by applications of programming techniques.
- The use of these methods in subsequent courses in the design and analysis of algorithms, computability theory, software engineering, and computer systems.
- To apply graph-theoretic terminology and notation
- To understand and prove theorems/lemmas and relevant results in graph theory.

Course Outcomes (COs)

On successful completion of the course, students will be able to:

1. Understand the concept of undirected graphs, complete graphs, bipartite, weighted graph, shortest path.
2. Evaluate the Eulerian path and Hamiltonian cycles in any graphs.
3. Describe the concept of trees and a minimal spanning tree for a given weighted graph.
4. Apply the knowledge of planar graphs to solve the real-life problem.
5. Apply the principles colouring concepts of graph theory in practical situations
6. Express the graphs in the way of adjacency, incident and circuit matrices.

UNIT I

Undirected graph- Basic concepts- incidence and Degree of vertices- isolated vertex – pendant vertex – Path and Circuits: Isomorphism – Sub graphs – Walks, Paths and Circuits – Connected graphs and concepts – Euler graphs – Hamilton graph – Complete graph – Traveling Salesman problem.

UNIT II

Trees – Definition – some properties of trees – Theorems – Rooted and Binary trees – Spanning trees. Cut set and cut vertices – some properties of a cut set – sets in a graph – Theorems – Fundamental circuits and cut sets – Connectivity and Separability – Theorems.

UNIT III

Planar graphs – Kuratowski's two graphs – Theorems – Different representation of a planar graph – Detection of planarity – Thickness and crossings.

UNIT IV

Colourings – Covering partitioning – Chromatic number Theorems – Chromatic partitioning – Independent set – Finding a maximal independent set – Dominating set – Finding minimal dominating set – Chromatic polynomial – Theorems. Coverings – Theorems – Four colour problem - Five colour Theorem.

UNIT V

Directed graph – Definition – Some types of di-graphs – Directed path and connectedness – Euler di- graphs – Theorems – Trees with direct edges - Theorems – odd trees – Matrix representation – incidence matrix – Theorems – Circuit matrix – Adjacency matrix – Tournaments.

TEXT BOOK

REFERENCES

1. Harary F., 1969. Graph Theory, Addison-Wesley publishing company, Inc., Amsterdam.
2. Bondy.J.A., and U.S.R.Murty., 2008. Graph theory and applications, Springer.
3. Balakrishnan, 2011, Graph theory, Springer publications.
4. West D.B., 2011. Introduction to Graph Theory, Prentice Hall, New Delhi.

Course Objectives:

The student should be made to:

- Understand the basic knowledge of fuzzy sets and fuzzy logic.
- To gain knowledge in fuzzy relations and fuzzy measures.
- Be exposed to basic fuzzy system applications.
- Explain the concepts of neural networks, fuzzy sets, and genetic algorithms.
- To develop the skills to gain a basic understanding of fuzzy set theory and fuzzy logic theory.
- To understand the concepts of fuzzy sets, knowledge representation using fuzzy rules, approximate reasoning, fuzzy inference systems.

Course Outcomes (COs)

On successful completion of this course, students will be able to

1. Distinguish the crisp sets and fuzzy sets and understand the fuzzy logic .
2. Describe the concepts of fuzzy union - fuzzy intersection - combinations operations
3. Develop the fuzzy set theory into fuzzy relations and fuzzy graphs
4. Apply basic fuzzy measures and approximate reasoning.
5. Understand the concepts of Fuzzy decision making
6. Illustrate the fuzzy concepts in real time problems.

UNIT I

Crisp sets and fuzzy sets - basic concept of fuzzy set - fuzzy logic - operations on fuzzy sets - general discussion fuzzy complements.

UNIT II

Fuzzy union - fuzzy intersection - combinations operations.

UNIT III

Fuzzy relations and fuzzy graphs - fuzzy relation on sets and fuzzy sets - composition of fuzzy relations - properties of the min-max composition - fuzzy graphs - special fuzzy relations.

UNIT IV

Fuzzy measures - general discussion - belief and plausibility measures - probability measures - possibility and necessity measures.

UNIT V

Fuzzy decision making - individual decision making - fuzzy ranking methods - fuzzy linear programming.

TEXTBOOK

1. George J. Klir and Bo Yuan, 1995. Fuzzy sets and fuzzy logic theory and applications, Prentice- Hall of India private limited, New Delhi.

REFERENCES

3. H.J. Zimmermann, 2006. Fuzzy set theory and its applications, Second Edition, Springer New Delhi.

Course Objectives:

The student should be made to:

- Understand the basic knowledge of Sets and subsets.
- Understand Lattices as algebraic Structures.
- To gain knowledge in diagrammatical representation of a poset.
- Be exposed to ideal lattice applications.

Course Outcomes (COs)

On successful completion of this course, students will be able to

1. Define Sets, subsets, mappings and binary compositions also discuss the mathematical induction.
2. Develop ability to create Diagrammatical Representation of a Poset, lattices and sub lattices.
3. Understand the concepts of Homomorphism and Isomorphism of Lattices.
4. Evaluate Ideals, principal ideals and dual ideals in a ring.
5. Describe the length and covering conditions of lattices.
6. Apply the direct products in Lattice theory.

UNIT I

Sets and subsets – Relations – Equivalence Classes – Mappings or Functions – Binary Compositions
– The Numbers – Mathematical Induction.

UNIT II

Diagrammatical Representation of a Poset– Isomorphism – Duality – Product of Two Posets – Semi-lattices –
Complete Lattices – Sub lattices.

UNIT III

Dual Ideals – Principal Ideals – Principal Dual Ideals – Prime Ideals.

UNIT IV

Complements-Length and Covering Conditions–Homomorphism–Quotient Lattices.

UNIT V

Direct Products-Ideal Lattice-Isomorphism Theorem-Distributive Lattices-Direct Products.

TEXT BOOK

1. George Gratzner, 2003. General Lattice Theory, Second Edition, Birkhauser Verlag , Germany.

REFERENCE

1. Vijay K Khanna, 2006. Lattices and Boolean Algebras, Vikas publishing house Pvt ltd, Second edition, New Delhi.

Course Objectives:

The student should be made to:

- Gain a clear knowledge about Astronomy and its applications to the real world.
- show how **astronomical** information is collected, processed, interpreted, and shared
- Provide hands-on experience using various types of **astronomical** tools and instrumentation
- Develop observational and analytical skills.
- Describe the science of cosmology and its relation to other fields of science
- Explain how the scientific method and quantitative arguments are used in cosmology

Course Outcomes (COs)

On successful completion of this course, students will be able to

1. Enable the students to understand the General description of the Solar system.
2. Describe the ideas of Celestial sphere and its coordinates.
3. Understand the theories of Dip, Twilight and Geocentric parallex.
4. Apply the Tangent formula and Cassinis formula to find the Refraction.
5. Apply Kepler's laws to find the Relation between true eccentric and mean anomalies
6. Use analytical and mathematical skills to solve problems

UNIT I

General description of the Solar system. Comets and meteorites – Spherical trigonometry.

UNIT II

Celestial sphere – Celestial co – ordinates – Diurnal motion – Variation in length of the day.

UNIT III

Dip – Twilight – Geocentric parallex

UNIT IV

Refraction – Tangent formula – Cassinis formula.

UNIT V

Kepler's laws – Relation between true eccentric and mean anomalies

TEXT BOOK

1. G V Ramachandran, 1965, Text Book of Astronomy, Mission Press, Palayamkottai.

REFERENCE

1. Kumaravelu and Susila Kumaravelu S. Kumaravelu, 1984, Muruga Bhavanam, Astronomy, Chidambara Nagar, Nagarkoil.

PROJECT

Semester–VI
L T PC
10 0 0 5

Course Objectives:

The student should be made to:

- Know the fundamental concepts of Control systems and mathematical modelling of the system
- The learner gain a clear knowledge about Scalar Product, Backlash, stability analysis
- Understand the concepts of calculus of variations which play an important role in the problems of differential systems.
- Learn the concept of time response and frequency response of the system.
- Teach the fundamental concepts of Control systems and mathematical modelling of the system.
- Teach the basics of stability analysis of the system

Course Outcomes (COs)

On successful completion of this course, students will be able to

1. Describe the vector spaces and linear transformations and time state equations.
2. Understand the concepts of Linear Continuous time models for Physical systems
3. Identify the non-linear and non0linearities in describing function.
4. Understand the significance of Stability analysis.
5. Analyze the Linear continuous time invariant systems
6. Formulate optimal control problems and calculus of variations.

UNIT I

Mathematical preliminaries: Fields, Vectors and Vector Spaces – Linear combinations and Bases – Linear Transformations and Matrices – Scalar Product and Norms – Eigen-values, Eigen Vectors and a Canonical form representation of linear operators

UNIT II

State variable analysis-Linear Continuous time models for Physical systems– Existence and Uniqueness of Solutions to Continuous-Time State Equations – Solutions of Linear Time Invariant Continuous-Time State Equations–State transition matrix and its properties.

UNIT III

Non linear systems-Introduction – Non Linear Systems - Types of Non-Linearities – Saturation – Dead-Zone -Backlash – Jump Phenomenon etc;– Singular Points – Introduction to Linearization of nonlinear systems, Properties of Non-Linear systems – Describing function–describing function analysis of nonlinear systems

UNIT IV

Stability analysis: stability in the sense of Lyapunov, Lyapunov's stability and Lyapunov's instability theorems -Stability Analysis of the Linear continuous time invariant systems by Lyapunov second method – Generation of Lyapunov functions – Variable gradient method – Krasovskii's method. State feedback controller design through Pole Assignment – State observers: Full order and Reduced order.

UNIT V

Optimal control: Introduction to optimal control - Formulation of optimal control problems – calculus of variations –fundamental concepts, functional, variation of functional –fundamental theorem of theorem of Calculus of variations – boundary conditions – constrained minimization – formulation using Hamiltonian method – Linear Quadraticregulator.

TEXT BOOKS

1. Modern Control System Theory by M.Gopal – New Age International-1984
2. Modern Control Engineering by Ogata.K – Prentice Hall –1997

REFERENCES

1. Optimal control byKircks

Course Objectives:

The student should be made to:

- Get basic knowledge about Circle, Cone, Parabola, Hyperbola, Ellipse etc.
- Understand the concepts & advance topics related to two & three dimensional geometry
- Study the application of Sphere, cone and cylinder.
- Analyze how to trace the curve.
- Study the geometrical structures and use in to real life problems.
- Develop their inductive and deductive reasoning skills and to apply these skills in the advanced study of geometric relationships

Course Outcomes (COs)

On successful completion of this course, students will be able to

1. Construct the conics, Central Conics and Paraboloids with the respective applications.
2. Understand geometrical terminology of sphere, radical plane and co-axal system..
3. Describe the basic concepts of cone and cylinder
4. Use geometrical results to determine the properties of conicoid.
5. Recognize the properties of paraboloids and its motions.
6. Develop their inductive and deductive reasoning skills in Geometrical figures.

UNIT I

General equation of second degree. Tracing of conics. Tangent at any point to the conic, chord of contact, pole of line to the conic, director circle of conic. System of conics. Confocal conics. Polar equation of a conic, tangent and normal to the conic.

UNIT II

Sphere: Plane section of a sphere. Sphere through a given circle. Intersection of two spheres, radical plane of two spheres. Co-axal system of spheres

UNIT III

Cones. Right circular cone, enveloping cone and reciprocal cone. Cylinder: Right circular cylinder and enveloping cylinder.

UNIT IV

Central Conicoids: Equation of tangent plane. Director sphere. Normal to the conicoids. Polar plane of a point. Enveloping cone of a coinoid. Enveloping cylinder of a coinoid.

UNIT V

Paraboloids: Circular section, Plane sections of conicoids. Generating lines. Confocal conicoid. Reduction of second degree equations.

TEXT BOOK

1. R.J.T. Bill, Elementary Treatise on Coordinary Geometry of Three Dimensions, MacMillan India Ltd.1994.

REFERENCES

1. **P.K. Jain and Khalil Ahmad: A Textbook of Analytical Geometry of Three Dimensions, Wiley Eastern Ltd.1999.**

Course Objectives

This course enables the students to learn

- The fundamental concepts of algebraic ring theory and fields.
- The basic central ideas of Polynomial ring.
- How to test if a polynomial is irreducible Finite Field (Galois Fields).
- How to convert the various matrix forms.
- Develop capabilities with an axiomatic treatment of transformation.
- Develop an understanding of the structure of sets with operations on them.

Course Outcomes (COs)

After successful completion of this course the students will be able to

1. Understand the concept and the properties of finite abelian groups.
2. Get pre-doctoral level knowledge in ring theory.
3. Attain good knowledge in field theory.
4. Define and study in details the properties of linear transformations.
5. Analyze the concept of trace and transpose.
6. Demonstrate capacity for mathematical reasoning through analyzing, proving and explaining concepts quadratic forms.

UNIT I

Another counting principle – application of theorems – Cauchy theorem – Sylow's theorem – Direct products – Finite Abelian groups.

UNIT II

Ring Theory- Basic definition- More ideals and quotient rings- Euclidean rings-A Particular Euclidean Rings –Polynomial Rings-Polynomial over the Rational Field.

UNIT III

Fields – Extension Fields-Finite Extension of F – Some basic Definitions and Theorem – Roots of a Polynomial – More about Roots – The elements of Galois theory.

UNIT IV

Linear Transformations-The Algebra Of Linear Transformation – Characteristic Root-Matrices-Canonical Forms –Triangular form-Nilpotent Transformations–Jordan form.

UNIT V

Trace and Transpose – Trace of T-Symmetric Matrix –Determinants–Hermitian Transformation, Unitary Transformation and Normal Transformation – Real quadratic forms.

TEXT BOOK

1. Herstein.I.N.,2010. Topics in Algebra ,Second edition, Willey and sons Pvt Ltd, Singapore.

REFERENCES

1. Artin.M., 2008. Algebra, Prentice-Hall of India, New Delhi.
- 2.Fraleigh.J.B., 2004. A First Course in Abstract Algebra , Seventh edition , Pearson Education Ltd, Singapore.

4. Vashista.A.R., 2005. Modern Algebra, Krishna Prakashan Media Pvt Ltd, Meerut.

Course Objectives

This course enables the students to learn

- The basic principles of Riemann – Stieltjes Integral.
- Apply mathematical concepts and principles to infinite series.
- How to identify sets with various properties such as convergence.
- Have the knowledge of Lebesgue integral of functions and their properties.
- Understand the importance of undefined terms, definitions, and axioms.
- Use a variety of proof techniques to prove theorems using axioms, definitions, and previous results.

Course Outcomes (COs)

On successful completion of this course, students will be able to

1. Get specific skill in Riemann Stieltjes integral and Lebesgue integral.
2. Attain knowledge in infinite series.
3. Demonstrate an understanding of the uniform convergence and differentiation.
4. Enrich their knowledge of measure theory and extremum problems.
5. Solve given problems at a high level of abstraction based on Implicit function.
6. Describe the fundamental properties of the real numbers that underpin the formal development of real analysis.

UNIT I

The Riemann – Stieltjes Integral:

Introduction – Basic Definitions – Linear Properties – Integration by parts – Change of variable in a Riemann – Stieltjes Integral – Reduction to a Riemann Integral – Step functions as integrators – Reduction of a Riemann – Stieltjes Integral to a finite sum – Monotonically increasing – Additive and linear properties – Riemann condition – Comparison theorems – Integrators of bounded variation – Sufficient condition for Riemann stieltjes integral.

UNIT II

Infinite series and infinite products:

Introduction – Basic definitions – Ratio test and root test – Dirichlet test and Able's test – Rearrangement of series – Riemann's theorem on conditionally convergent series – Sub series - Double sequences – Double series – Multiplication of series – Cesaro summability.

UNIT III

Sequences of functions:

Basic definitions – Uniform convergence and continuity - Uniform convergence of infinite series of functions – Uniform convergence and Riemann – Stieltjes integration – Non uniformly convergent

sequence – Uniform convergence and differentiation – Sufficient condition for uniform convergence of a series.

UNIT IV

The Lebesgue integral:

Introduction- The class of Lebesgue – integrable functions on a general interval- Basic properties of the lebesgue integral- Lebesgue integration and sets of measure zero- The Levi monotone convergence theorem- The lebesgue dominated convergence theorem-

Applications of Lebesgue dominated convergence theorem- Lebesgue integrals on unbounded intervals as limit of integrals on bounded intervals- Improper Riemann integrals- Measurable functions.

UNIT V

Implicit functions and extremum problems:

Introduction – Functions with non zero Jacobian determinant – Inverse function theorem – Implicit function theorem – Extrema of real valued functions of one variable and several variables.

TEXT BOOK

1. Rudin. W.,1976 .Principles of mathematical Analysis, Mcgraw hill, Newyork .

5. Sterling. K. Berberian ., 2004.A First Course in Real Analysis, Springer Pvt Ltd, New Delhi.

Course Objectives

This course enables the students to learn

- To develop the working knowledge on different numerical techniques.
- To solve algebraic and transcendental equations.
- Appropriate numerical methods to solve differential equations.
- To provide suitable and effective methods for obtaining approximate representative numerical results of the problems.
- To solve complex mathematical problems using only simple arithmetic operations. The approach involves formulation of mathematical models of physical situations that can be solved with arithmetic operations.
- Provide a basic understanding of the derivation, analysis, and use of these numerical methods, along with a rudimentary understanding of finite precision arithmetic and the conditioning and stability of the various problems and methods.

Course Outcomes (COs)

On successful completion of this course, students will be able to

1. Identify the concept of numerical differentiation and integration.
2. Provide information on methods of iteration.
3. Solve ordinary differential equations by using Euler and modified Euler method.
4. Study in detail the concept of boundary value problems.
5. Attain mastery in the numerical solution of partial differential equations.
6. Apply numerical methods to obtain approximate solutions to mathematical problems.

UNIT I

Solutions of Non Linear Equations: Newton's method-Convergence of Newton's method- Bairstow's method for quadratic factors.

Numerical Differentiation and Integration:

Derivatives from difference tables – Higher order derivatives – divided difference. Trapezoidal rule – Romberg integration – Simpson's rules.

UNIT II

Solutions of system of Equations: The Elimination method: Gauss Elimination and Gauss Jordan Methods – LU decomposition method.

Methods of Iteration: Gauss Jacobi and Gauss seidal iteration-Relaxation method.

UNIT III

Solutions of Ordinary Differential Equations: One step method: Euler and Modified Euler methods –Rungekutta methods. Multistep methods: Adams Moulton method – Milne's method

UNIT IV

Boundary Value Problem and Characteristic value problem : The shooting method : The linear shooting method – The shooting method for non-linear systems.

Characteristic value problems – Eigen values of a matrix by Iteration-The power method.

UNIT V

Numerical Solution of Partial Differential Equations: Classification of Partial Differential Equation of the second order – Elliptic Equations. Parabolic equations: Explicit method – The Crank Nicolson difference method. Hyperbolic equations – solving wave equation by Explicit Formula.

TEXT BOOK

1. Gerald C.F., and P.O.Wheatley., 2006. Applied Numerical Analysis, sixth edition, Dorling Kindersley (India) Pvt. Ltd., New Delhi.

REFERENCES

1. Jain. M.K., Iyengar. S.R.K.,and R.K .Jain., 2009. Numerical Methods for Scientific and Engineering Computation, New Age International Publishers, New Delhi .
2. Burden R.L., and J.Douglas Faires., 2007. Numerical Analysis, Seventh edition, P.W.S.Kent Publishing Company, Boston.
3. Sastry S.S., 2008. Introductory methods of Numerical Analysis, Fourth edition, Prentice Hall of India, New Delhi.

Course Objectives

This course enables the students to learn

- In-depth understanding of functional, logic, and programming paradigms.
- How to implement several programs in languages other than the one emphasized in the core curriculum.
- This course provides an introduction to the basic concepts and techniques of numerical solution of algebraic equation.
- This course is to provide students with an introduction to the field of numerical analysis.
- Develop and apply the appropriate numerical techniques for your problem, interpret the results, and assess accuracy.
- This module are to make the students familiarize with the ways of solving complicated mathematical problems numerically.

Course Outcomes (COs)

On successful completion of this course, the student will be able to

1. Know the concepts for problem solving.
2. Acquire new knowledge in computing, including the ability to learn about new ideas and advances, techniques, tools, and languages, and to use them effectively; and to be motivated to engage in life-long learning
3. Comprehend important issues related to the development of computer-based systems in a professional context using a well-defined process.
4. Be familiar with programming with numerical packages.
5. Be aware of the use of numerical methods in modern scientific computing.
6. To develop the mathematical skills of the students in the Euler method.

List of Practical

1. Solution of non-linear equation-Bairstow's method for quadratic factors.
2. Solution of simultaneous equations-Gauss Elimination.
3. Solution of simultaneous equations-Gauss Jordan.
4. Solution of simultaneous equations-Gauss Jacobi.
5. Solution of simultaneous equations-Gauss Seidal.
6. Solution of simultaneous equations-Triangularisation.
7. Numerical integration-Trapezoidal rule.
8. Numerical integration-Simpson's rules.
9. Solution for ordinary differential equation-Euler method.

10. Solution for ordinary differential equation- Runge Kutta Second order.
11. Solution for parabolic equation - Explicit method.
12. Solution for parabolic equation - The Crank Nicolson method.

Course Objectives

This course enables the students to learn

- The formulation and solutions of second order ordinary differential equations and get exposed to physical problems with applications.
- The concept of solve the system of first order equations.
- Linear homogeneous and non homogeneous equations with constant coefficients.
- Understanding the elementary linear oscillations.
- Understand all of the concepts relating to the order and linearity of ordinary differential equations, analytic and computational solution methods for ordinary differential equations, and the real-world applications of ordinary differential equations.
- Apply your understanding of the concepts, formulas, and problem solving procedures to thoroughly investigate relevant physical models.

Course Outcomes (COs)

On successful completion of this course, students will be able to

1. Model a simple physical system to obtain a first and second order differential equation.
2. Understand the basic notions of linearity, superposition, existence and uniqueness of solution to differential equations and use these concepts in solving linear differential equations.
3. Identify homogeneous equations, homogeneous equations with constant coefficients and exact linear differential equations.
4. Solve higher order and system of differential equations of Successive approximation.
5. Understand the difficulty of solving problems for elementary linear oscillations.
6. Identify, analyze and subsequently solve physical situations whose behavior can be described by ordinary differential equations.

UNIT I

Second order linear equations with ordinary points – Legendre equation and Legendre polynomial – Second order equations with regular singular points – Bessel equation.

UNIT II

System of first order equations – existence and uniqueness theorems – fundamental matrix.

UNIT III

Non homogeneous linear system – linear systems with constant coefficient – Linear systems with periodic coefficients.

UNIT IV

Successive approximation – Picard's theorem – Non uniqueness of solution – continuation and dependence on initial conditions – existence of solution in the large existence and uniqueness of solution in the system.

UNIT V

Fundamental results – Sturm's comparison theorem – elementary linear oscillations – comparison theorem of Hille-Winter – Oscillations of $x'' + a(t)x = 0$ elementary non linear oscillations.

TEXT BOOK

3. George F. Simmons, Differential Equations with application and historical notes, 1991. Second edition, McGraw-Hill.

Course Objectives

This course enables the students to learn

- An introduction to the object-oriented programming paradigm in Java.
- Covers software design, implementation, and testing using Java. Introduces object-oriented design techniques and problem solving.
- Emphasizes development of secure, well-designed software projects that solve practical real-world problems.
- Why Java is useful for the design of desktop and web applications.
- How to implement object-oriented designs with Java.
- Identify Java language components and how they work together in applications.

Course Outcomes (COs)

On successful completion of this course, students will be able to

1. Expose the students to the best object-oriented programming paradigm, java and strengthen their.
2. Use an integrated development environment to write, compile, run, and test simple object-oriented Java programs.
3. Read and make elementary modifications to collection and Utilities.
4. Know the concept of Input Output Classes.
5. Document a Java program using Javadoc.
6. Use a version control system to track source code in a project.

UNIT I

Introduction to Object Oriented Programming: Object Oriented Paradigm and Concepts-Structured versus Object Oriented Approach. Java Language: Features of Java -Environment-Java Architecture-Java Development Kit-Types of Java Program. Variable Declaration and Arrays: Data Types-Java Tokens –Variable Declaration – Type Casting and Conversion – Arrays, Operators, And Control Statements: Selection Constructs – Iteration Constructs –Jump Statements.

UNIT II

Introduction to classes: Instance variables, Class variables, Instance Methods, Constructors, Class methods, Declaring Objects, Garbage Collection, Method Overloading - Constructor Overloading - This Reference. Inheritance: Super class variables- Method Overriding - final Keyword, Abstract Classes and Interfaces.

UNIT III

Packages and Access Modifiers: Package Declaration – import statement - Access Protection. Strings: Creation – Operation on strings - Character Extraction Methods – Comparison –Searching and Modifying –String Buffer Class. Collection and Utilities: Collection of Objects – Interfaces and Classes –Iterators – List, Set, Map Implementations.

UNIT IV

Input Output Classes: I/O Operations –Hierarchy of Classes – File class – Input Stream, Output Stream, FilterInputStream, FilterOutputStream, Reader and Writer classes – Random Access File class –Stream Tokenizer. Applets: Basics – Life Cycle –Methods –Graphics Class- Color, Font, and Font Metrics Class.

UNIT V

Exception Handling: Fundamentals – Hierarchy of Classes – Types of Exception. Multithreaded Programming: Thread Model – Runnable Interface - Thread Class – Synchronization and Deadlock. AWT Components: AWT Classes – Basic Component and Container Classes – Frame Window in an Applet.

java.sun.com/docs/books/tutorial/
www.en.wikipedia.org/wiki/Java

Course Objectives

This course enables the students to learn

- Gain knowledge about basic Java language syntax and semantics to write Java programs and use concepts such as variables, conditional and iterative execution methods etc.
- Understand the fundamentals of object-oriented programming in Java, including defining classes, objects, invoking methods etc and exception handling mechanisms.
- Understand the principles of inheritance, packages and interfaces.
- Understand the concepts and features of object oriented programming.
- learn java's exception handling mechanism, multithreading, packages and interfaces.
- To develop skills in internet programming using applets and swings.

Course Outcomes (COs)

On successful completion of this course, students will be able to

1. Identify classes, objects, members of a class and relationships among them needed for a specific problem.
2. Write Java application programs using OOP principles and proper program structuring.
3. Demonstrate the concepts of polymorphism and inheritance.
4. Write Java programs to implement error handling techniques using exception handling.
5. To understand fundamentals of object-oriented programming in Java which includes defining classes, invoking methods, using class libraries.
6. To create Java application programs using sound OOP practices such as interfaces, APIs and error exception handling.

List of Practical

1. Write a program to find the sum of series $1+x+x^2+x^3+\dots$.
2. Write a program to input a number in command line and find its factorial using recursion.
3. Write a program to find maximum and sum of an array.
4. Define a class for Employee with name and date of appointment. Create employee objects and sort them as per their date of appointment.
5. Write a program to perform string operations.
6. Write a program to accept strings using I/O streams and arrange them in alphabetical order.
7. Write a program to add / insert an element to ArrayList using Java ListIterator.
8. Write a program to create a window and draw cross lines.
9. Write an applet program to draw several shapes and name them.
10. Write a program for multiplication tables by multithreading.

11. Write a program to create an exception for marks out of bounds. If mark is greater than 100 throw an exception.
12. Write an applet program to create menus.
13. Write an applet program to perform operations in list box
14. Write a Java Program to design a registration Form using Applet with all the AWT controls.

Course Objectives

This course enables the students to learn

- To learn the concepts of Oriented circles and level curves.
- Fundamental concepts of complex integration.
- To know the concepts of harmonic function.
- To develop the skill of contour integration to evaluate complicated real integrals via residue calculus.
- The development of the complex variable in boundary behaviour.
- Contour integral using parametrization, fundamental theorem of calculus and Cauchy's integral formula.

Course Outcomes (COs)

On successful completion of this course, students will be able to

1. Explain the role of the Conformal mapping.
2. Evaluate complex contour integrals and some of their consequences.
3. Determine the Taylor series or the Laurent series of an analytic function in a given region
4. Describe the convergence properties of a power series.
5. Know the basic properties of singularities of analytic functions.
6. Demonstrate familiarity with a range of examples of these concepts of conformal mapping.

UNIT I

Conformal mapping-Linear transformations- cross ratio- symmetry- Oriented circles-families of circles-level curves.

UNIT II

Complex integration-rectifiable Arcs- Cauchy's theorem for Rectangle and disc-Cauchy's integral formula-higher derivatives .

UNIT III

Harmonic functions-mean value property-Poisson's formula-Schwarz theorem, Reflection principle-Weierstrass theorem- Taylor series and Laurent series.

UNIT IV

Partial Fractions- Infinite products – Canonical products-The gamma function – Stirling's Formula – Entire functions – Jensen's formula.

UNIT V

Riemann Mapping Theorem – Boundary Behaviour – Use of Reflection Principle – Analytical arcs – Conformal mapping of polygons- The Schwartz - Christoffel formula.

TEXT BOOK

1. Lars V.Ahlfors.,1979. Complex Analysis, Third edition, Mc-Graw Hill Book Company, New Delhi.

REFERENCES

2. Choudhary.B., 2003. The Elements of Complex Analysis ,New Age International Pvt.Ltd , New Delhi.
3. Vasishtha A.R ., 2005. Complex Analysis, Krishna Prakashan Media Pvt. Ltd., Meerut.
4. Walter Rudin., 2012.Real and Complex Analysis ,3rd edition, Mc Graw Hill Book Company, Newyork.

Course Objectives

This course enables the students to learn

- Topological properties of sets.
- The properties of compact spaces and connected spaces.
- To explore the foundations of linear subspace.
- The concepts of metric spaces and topological spaces.
- Metric spaces and metrizability of topological spaces; separation axioms.
- Interior, closure and boundary: applications to geographic information systems

Course Outcomes (COs)

On successful completion of this course, students will be able to

1. Know concept of metric spaces.
2. Acquire knowledge about various types of topological spaces and their properties.
3. Know the result of Compactness problems and theorems.
4. Admire the deep mathematical results like Urysohn's lemma.
5. Create examples and counterexamples in the fundamental concepts of separation space.
6. Formulate and analyze topological problems in connected space.

UNIT I

Metric spaces: Definitions and some examples. Open sets - Theorems – Closed sets- Theorems – convergence- Cantor's Intersection Theorems – completeness - Baire's theorem. continuous mappings- Some Theorems.

UNIT II

Spaces of continuous functions: Basic definition for linear subspace- normed linear space- Banach space- Euclidean and unitary spaces.

Topological spaces and continuous functions: Topological spaces: Definitions and examples – Theorems – Open bases and Open sub base.

UNIT III

Compactness: Compact spaces – Heine- Borel Theorem - Product of spaces – Tychonoff's theorem and locally compact spaces - Tychonoff's Generalized Heine-Borel Theorem – Compactness for metric spaces – Lebesgue's covering lemma – Ascoli's theorem.

UNIT IV

Separation: T_i spaces and Hausdorff spaces – Theorems – Complete regular spaces and normal spaces – Urysohn's lemma and the Tietze extension theorem – Urysohn imbedding theorem – Stone-Cech compactification.

UNIT V

Connectedness: Connected spaces – Theorems - components of a space - Theorems – Totally disconnected spaces - Theorems – locally connected spaces - Theorems.

TEXT BOOK

1. Simmons.G.F., 2004. Introduction to Topology and Modern Analysis, Tata Mc Graw Hill, New Delhi.

REFERENCES

2. Deshpande.J.V., 1990. Introduction to topology, Tata Mc Graw Hill, New Delhi.
3. James Dugundji., 2002. Topology, Universal Book Stall, New Delhi.
4. Joshi.K.D., 2004. Introduction to General Topology, New Age International Pvt Ltd, New Delhi.

Course Objectives

This course enables the students to learn

- The basic concepts of integer linear programming.
- How to solve quadratic programming problems, dynamic programming problems and non-linear programming problems.
- Classical optimization techniques and numerical methods of optimization.
- Know the basics of different evolutionary algorithms.
- Explain Integer programming techniques and apply different optimization techniques to solve various models.
- Enumerate the fundamental knowledge of Linear Programming and Dynamic Programming problems.

Course Outcomes (COs)

After successful completion of this course the students will be able to

1. Understand the concept of linear programming and integer programming.
2. Develop optimal decision policy skill.
3. Familiarize with real life applications of inventory models.
4. Skill in decision analysis.
5. Mastery in Beale's method and simplex method.
6. Use classical optimization techniques and numerical methods of optimization.

UNIT I

Integer Linear Programming : Types of Integer Linear Programming Problems - Concept of Cutting Plane - Gomory's All Integer Cutting Plane Method - Gomory's mixed Integer Cutting Plane method - Branch and Bound Method. - Zero-One Integer Programming – Real life application in Integer Linear Programming.

UNIT II

Dynamic Programming: Characteristics of Dynamic Programming Problem - Developing Optimal Decision Policy - Dynamic Programming Under Certainty - DP approach to solve LPP.

UNIT III

Probabilistic Inventory Model: Real life application -Continuous review models- Probabilistic Economic order quantity (EOQ) Model. Single-period models – No setup model – setup model. Multi period model.

UNIT IV

Decision Analysis: Real life application - Decision making under certainty- Analytic hierarchy process.. Decisions under Risk- Decision Trees-based expected value criterion, variations of the expected value criterion. Decisions Under Uncertainty Real life application in Decision Analysis

UNIT V

Non-linear Programming Methods: Examples of NLPP - General NLPP - Graphical solution - Quadratic Programming - Wolfe's modified Simplex Methods - Beale's Method.

TEXT BOOK

5. Sivarethina Mohan. R., 2005. Operations Research, First edition, Tata Mc Grawhill Publishing Company Ltd, New Delhi.

Course Objectives

This course enables the students to learn

- The basic concepts of solution of first order partial differential equation and its applications.
- About initial and boundary value problems for PDEs of first and second order which includes Laplace Equation, Diffusion Equation and Wave Equation.
- Introduce students to how to solve linear Partial Differential with methods.
- Technique of separation of variables to solve PDEs and analyze the behavior of solutions in terms of eigen function expansions.
- Solutions of PDEs are determined by conditions at the boundary of the spatial domain and initial conditions at time zero.
- Basic questions concerning the existence and uniqueness of solutions, and continuous dependence of initial and boundary data.

Course Outcomes (COs)

After successful completion of this course the students will be able to

1. Classify linear and Nonlinear first order differential equations with constant coefficients.
2. Solve the linear partial differential equations with constant coefficient equations.
3. Describe the method of separable variables and integral transforms.
4. Solve the elementary Laplace equation with symmetry.
5. Acquire the knowledge of wave equation and vibrating membranes.
6. Enrich their knowledge about diffusion equations with sources.

UNIT I

First Order Partial Differential Equations:

Non linear partial differential equation of first order – Cauchy method of characteristics – Compatible systems of first order equations – Charpit's methods – Special type of first order equations – Jacobi method.

UNIT II

Second Order Partial Differential Equations:

Partial differential equations of second order – The origin of second order equations – Linear partial differential equations with constant coefficient equations with variable coefficients.

UNIT III

Method of separation of variables – The method of integral transforms.

UNIT IV

Laplace Equation:

Elementary solutions of Laplace equations-Families of Equi-potential surfaces-Boundary Value problems-separation of variables-problems with axial symmetry.

UNIT V

Elementary solutions of one dimensional wave equation-Vibrating membranes - Applications of calculus of variations-elementary solutions of diffusion equation-Separation of variables.

TEXT BOOK

5. John.F, 1979. Partial Differential equations, Third edition, Narosa publication co, New Delhi.

Course Objectives

This course enables the students to learn

- How to use Newton's laws of motion to solve advanced problems involving the dynamic motion of classical mechanical systems.
- Applications of differential equations in advanced mathematical problems.
- To solve dynamics problems such as conservation of energy and linear and angular momentum.
- Parameters defining the motion of mechanical systems and their degrees of freedom.
- The components of a force in rectangular or nonrectangular coordinates. • Determine the resultant of a system of forces.
- Complete and correct free-body diagrams and write the appropriate equilibrium equations from the free-body diagram.

Course Outcomes (COs)

On successful completion of this course students will be able to

1. Understand the concept of the D'Alembert's principle.
2. Derive the Lagrange's equation for holonomic and non holonomic constraints.
3. Classify Scleronomic and Rheonomic systems.
4. Solve the problems of Hamilton equations of motion.
5. Study of the canonical transformations.
6. Know the concept of Hamilton Jacobi Theory.

UNIT I

Survey of Elementary principles: Constraints - Generalized coordinates, Holonomic and non-holonomic systems, Scleronomic and Rheonomic systems. D'Alembert's principle and Lagrange's equations – Velocity – dependent potentials and the dissipation function – some applications of the Lagrange formulation.

UNIT II

Variation principles and Lagrange's equations: Hamilton's principle – Some techniques of calculus of variations – Derivation of Lagrange's Equations from Hamilton's principle – Extension of Hamilton's principle to non-holonomic systems – Conservation theorems and symmetry properties.

UNIT III

Hamilton Equations of motion: Legendre Transformations and the Hamilton Equations of motion- canonical equations of Hamilton – Cyclic coordinates and conservation theorems – Routh's procedure - Derivation of Hamilton's equations from a variational principle – The principle of least action.

UNIT IV

Canonical transformations: The equations of canonical transformation – Examples of Canonical transformations – Poisson Brackets and other Canonical invariants – integral invariants of Poincare, Lagrange brackets.

UNIT V

Hamilton Jacobi Theory: Hamilton Jacobi equations for Hamilton's principle function – Harmonic oscillator problem - Hamilton Jacobi equation for Hamilton's characteristic function – Separation of variables in the Hamilton-Jacobi equation.

TEXT BOOK

1. H. Goldstein, Classical Mechanics (2nd Edition), Narosa Publishing House, New Delhi.

REFERENCES

1. F. Gantmacher, 1975. Lectures in Analytic Mechanics, MIR Publishers, Moscow.
2. I.M. Gelfand and S.V. Fomin, Calculus of Variations, Prentice Hall, New Delhi.
3. S.L. Loney, , 1979. An Elementary Treatise on Statics, Kalyani Publishers, New Delhi.

Course Objectives

This course enables the students to learn

- The concept of algebraic structures, lattices and its special categories which plays an important role in the field of computers.
- The fundamental concepts in graph theory, with a sense of some its modern applications.
- Some fundamental mathematical concepts and terminology.
- Learn some different types of discrete structures.
- Introduce students to the techniques, algorithms, and reasoning processes involved in the study of discrete mathematical structures.
- Introduce students to set theory, inductive reasoning, elementary and advanced counting techniques, equivalence relations, recurrence relations, graphs, and trees.

Course Outcomes (COs)

On successful completion of this course, students will be able to

1. Develop new algebraic structures.
2. Think critically and analytically by modeling problems from social and natural sciences with the help of theory of graphs.
3. Apply discrete mathematics in formal representation of various computing constructs
4. Work effectively in groups on a project that requires an understanding of graph theory.
5. Demonstrate different traversal methods for trees and graphs.
6. Recognize the importance of analytical problem-solving approach.

UNIT I

Algebraic Structures: Introduction- Algebraic Systems : Examples and General Properties : Definition and examples - Some Simple Algebraic Systems and General properties - Homomorphism and isomorphism - congruence relation - Semigroups and Monoids : Definitions and Examples - Homomorphism of Semigroups and Monoids.

UNIT II

Lattices: Lattices as Partially Ordered Sets: Definition and Examples - Principle of duality - Some Properties of Lattices - Lattices as Algebraic Systems – Sublattices - Direct product, and Homomorphism.

UNIT III

Some special Lattices - e.g. Complete, Complemented and Distributive Lattices - Boolean Algebra: Definition and Examples - Subalgebra - Direct product and Homomorphism - join irreducible - atoms and antiatoms.

UNIT IV

Graph Theory: Definition of a graph - applications, Incidence and degree - Isolated and pendant vertices - Null graph, Path and Circuits: Isomorphism - Subgraphs, Walks -Paths and circuits - Connected graphs , disconnected graphs – components - Euler graph.

UNIT V

Trees: Trees and its properties - minimally connected graph - Pendant vertices in a tree - distance and centers in a tree - rooted and binary tree. Levels in binary tree - height of a tree - Spanning trees - rank and nullity.

TEXT BOOKS

2. S. Wiitala, Discrete Mathematics- A Unified Approach, McGraw-Hill Book Co, New Delhi.
3. Seymour Lipschutz, Discrete Mathematics, Schaum Series, McGraw-Hill Publishing Company Ltd, New Delhi.

Course Objectives

This course enables the students to learn

- The fundamental concepts in Graph Theory and some of its modern applications.
- The use of these methods in subsequent courses in the design and analysis of algorithms, computability theory, software engineering, and computer systems.
- Apply graph-theoretic terminology and notation.
- Analyze new networks using the main concepts of graph theory.
- Central theorems about trees, matching, connectivity, colouring and planar graphs.
- Describe and apply some basic algorithms for graphs.

Course Outcomes (COs)

On successful completion of this course, students will be able to

1. Understanding the basic concepts of graphs, directed graphs, and weighted graphs and able to present a graph by matrices.
2. Overview of properties of trees and a minimal spanning tree for a given weighted graph.
3. Identify induced subgraphs, cliques, matchings, covers in graphs.
4. Understand Eulerian and Hamiltonian graphs.
5. Know the concept of domination in graphs.
6. Determine whether graphs are Planer and/or non planer.

UNIT-I

Graphs – Introduction – Isomorphism – Sub graphs – Walks, Paths, Circuits – Connectedness – Components – Euler Graphs – Hamiltonian Paths and Circuits – Trees – Properties of trees – Distance and Centers in Tree – Rooted and Binary Trees - Spanning trees – Fundamental Circuits.

UNIT II

Spanning Trees in a Weighted Graph – Cut Sets – Properties of Cut Set – All Cut Sets – Fundamental Circuits and Cut Sets – Connectivity and Separability – Network flows – 1-Isomorphism – 2-Isomorphism – Combinational and Geometric Graphs – Planer Graphs – Different Representation of a Planer Graph.

UNIT III

Incidence matrix – Submatrices – Circuit Matrix – Path Matrix – Adjacency Matrix – Chromatic Number – Chromatic partitioning – Chromatic polynomial - Matching - Covering – Four Color Problem – Directed Graphs – Types of Directed Graphs.

UNIT IV

Graph Colourings - Vertex Colouring - Edge Colouring - Planar Graphs - Map Colouring Problem - Decompositions and Hamilton Cycles - Circuits and Cycles - Labeling Graphs

UNIT V

Domination in graphs: Introduction – Terminology and concepts – Applications – Dominating set and domination number – Independent set and independence number – History of domination in graphs.

TEXT BOOKS

1. Harary F, 1972. Graph Theory, Addison- Wesley publications. (for unit I, II, III).
2. Deo N, 1974. Graph Theory with Applications to Engineering and Computer Science, Prentice Hall Inc. (for unit IV).
3. Arumugam.S, Ramachandran.S, 2003. Invitation to graph theory, scitech publications, Chennai. (for unit V).

Course Objectives

This course enables the students to learn

- The theoretical fundamentals of theory of elasticity.
- The ability to use the principles of theory of elasticity in engineering problems.
- To solve advanced solid mechanics problems using classical methods and to characterize materials with elastics constitutive relations.
- To make students understand the principle of strain energy function.
- Be proficient with basic concepts in continuum mechanics of solids, including of strain, internal force, stress and equilibrium in solids.
- Be able to characterize materials with elastic constitutive relations.

Course Outcomes (COs)

On successful completion of this course the student will be able to

1. Know the concept of Tensor Analysis.
2. Analyze solid mechanics problems using classical methods and energy methods.
3. Apply various failure criteria for general stress states at points.
4. Get advanced knowledge about stresses, strains.
5. Understand the theory of elasticity including strain/displacement and Hooke's law relationships.
6. Apply the concept of strain energy function.

UNIT I

Tensor Analysis:

Co-ordinate transformations-contravariant and covariant vectors and tensors-symmetric and anti-symmetric tensors- metric tensor – conjugate tensor-associated tensors –Christoffel's symbols and transformations laws – covariant derivative – permutation symbols and tensors – relative and absolute tensors.

UNIT II

Analysis of strain:

Deformation –Affine transformation – infinitesimal affine deformations – A geometrical interpretation of components of strain – strain quadric of Cauchy – Principal strains and invariants general infinitesimal deformation – examples of strain – saint-Venant's equations of compatibility – finite –deformations.

UNIT III

Analysis of Stress:

Body and surface forces – stress tensor – equations of equilibrium in Cartesian co-ordinates – transformation of co-ordinates –stress quadric of Cauchy principal stresses – invariants of stress tension – maximum normal and shear stresses- Mohr's diagram – examples of stress.

UNIT IV

Equation of elasticity

Generalized Hooke's law- homogeneous isotropic medium – elastic module for isotropic media – simple tension – pure shear – hydrostatic pressure – equilibrium equations for an isotropic elastic solid – Beltrami- Michell compatibility equations.

UNIT V

Dynamical equations of isotropic elastic solid – strain energy function – uniqueness of solution – statement of Saint – Venant's principle.

TEXT BOOKS

1. Dipak Chatterjee, 2003. Vector Analysis, Prentice Hall Of India, New Delhi. (for unit-I, II, III)
2. S.P. Timoshenko, J.N. Goodier, Theory of Elasticity. (for unit-IV, V)

REFERENCES

1. P.D.S. Verma, Theory of Elasticity.
2. Murray Spiegel, 2010. Vector Analysis, Schaum's series.
3. I.S Sokolnikoff, Mathematical Theory of Elasticity.

Course Objectives

This course enables the students to learn

- To understand fundamentals of magnetohydrodynamics which describes the dynamics of electrically conducting fluids
- To figure out the applications of magnetohydrodynamics to the various science and engineering fields
- Basics of electromagnetic theory and vector calculus.
- Able to understand the concept of flow and Stability.
- The basic properties of electrically-conducting fluids.
- The role of the Lorentz force and its relevance to plasma confinement, dynamo theory and the dynamics of magnetic waves.

Course Outcomes (COs)

On successful completion of this course the student will be able to:

1. Provide the details of the derivation of ideal and resistive MHD equations.
2. Demonstrate the basic properties of ideal MHD.
3. Describe electromagnetic boundary conditions.
4. Explain MHD waves.
5. Describe the derivation of fluid equations, energy equation.
6. Describe electromagnetic fields in the energy and momentum fluxes.

UNIT I

Review of equation of motions of viscous compressible fluid flow –Introduction of MHD-Electromagnetic field equations-Maxwell's equations and their Physical significance- Maxwell's equations in the moving frame of reference-Invariance under Galilean Transformation-Electromagnetic effects and the magnetic Reynolds number-induction equation –Alfven's Theorem-Physical Significance-Consequence of Alfven's Theorem-Ferraro's Law of irritation-The magnetic Energy- the mechanical equations and the mechanical effects-Electromagnetic stresses.

UNIT II

Magneto hydrostatics and steady states-Hydro magnetic equilibrium and forces free magnetic fields-boundary conditions – Boundary conditions in the case of force free magnetic fields-free surface of an isolated fluid mass- Chandrasekhar's theorem-General solution of force free magnetic field when is constant-some examples of force free fields.

UNIT III

Hydromagnetics of the laboratory- steady laminar motion-Hartmann flow (MHD Poiseuille's flow)- Domination of viscous forces over magnetic forces and vice versa-physical significance- Important dimensionless of MHD and their physical significance-electromagnetic boundary conditions-tensor

electrical conductivity, Hall current and ion slip – simple flow problems with tensor electrical conductivity.

UNIT IV

Magneto hydrodynamic waves- Waves in an infinite fluid of infinite electrical conductivity- Alfven waves in incompressible fluid in viscid fluid of infinite electrical conductivity-Waves of finite amplitude –propagation of velocity and current density with Alfven velocity-MHD waves in incompressible fluid- Alfven wave and two magneto acoustic waves- the limit of zero magnetic Prandtl number significance.

UNIT V

Stability of hydro magnetic systems- theory and applications-methods of investigation-small perturbations and instability-Energy principle-normal mode analysis-simple illustrative examples-the stability of Hartman layer-Squire's theorem-Orr-Summerfield equation-Instability of linear pinch-methods of stabilize- Flute Instability- A general criterion for stability-Bernstein's method of small oscillations(normal mode analysis) for hydro magnetic stability-jeans criterion for Gravitational stability- Chandrasekhar's generalization for MHD and rotating fluids.

TEXT BOOK

3. G.W.Sutton and A.Sherman.,1965. Engineering Magneto hydrodynamics., McGraw HillBook Co.
4. S.Chandrasekhar.,1961.Hydro dynamic and Hydro dynamic stability Oxford university press.

Course Objectives

This course enables the students to learn

- The fundamental theories of actuarial science as they apply in life insurance, general insurance and superannuation.
- How to assess the suitability of actuarial, financial and economic models in solving actuarial problems
- Interpretation and critically evaluating the articles in the actuarial research literature.
- About the concept of educational annuity plan.
- Understand the Premium Conversion tables for calculation of Policy values.
- The concept of Premiums for Annuity Plans.

Course Outcomes (COs)

On successful completion of this course the student will be able to

1. Explain the basic concepts of accounts and calculations of interest rates in banking / financial institution system.
2. Define Annuity and Summarize / calculate different values Annuities.
3. Leant about how to read Mortality Table and from that how to calculate the Probability of Survival and Death.
4. Describe about Premiums of Life Insurance and Endowment Assurance (Pure, Double and Marriage) and Educational Annuity plan.
5. Find the Annuity values for various Annuities.
6. Calculation of Net Premiums for Assurance Plans.

UNIT I

Accumulated Value – Present Value – Formula for present value- Annuities Certain- present Values- Amounts - Deferred Annuities –Perpetuities - Present Value of an Immediate Annuity Certain – Accumulated Value of Annuity – Relation between S_n and a_n – Present Value of Deferred Annuity Certain – Accumulated Value of a term of n years – Perpetuity – Present Value of an Immediate Perpetuity of 1 p.a. – Present Value of a Perpetuity due of 1 p.a. – Deferred Perpetuity with Deferment Period of m years – Mortality Table – The Probabilities of Survival and Death.

UNIT II

Life Insurance Premiums – General considerations - Assurance Benefits – Pure Endowment Assurance – Endowment Assurance – Temporary Assurance or Term Assurance - Whole Life Assurance – Pure Endowment Assurance – Endowment Assurance – Double Endowment Assurance – Increasing Temporary Assurance – Increasing Whole Life Assurance – Commutation Functions D_x , C_x , M_x and R_x – Expressions for Present Values of Assurance Benefits in terms of Commutation Functions – Fixed Term (Marriage) Endowment – Educational Annuity Plan.

UNIT III

Life Annuities and Temporary Annuities – Commutation Functions N_x – To Find the Present Value of an Annuity Due of Re.1 p.a. for Life – Temporary Immediate Life Annuity – Expression for $a_x : n$ – Deferred Temporary Life Annuity – Variable Life Annuity – Increasing Life Annuity – Commutation Function S_x – Increasing Temporary Life Annuity – Tables of Life Annuity and Temporary Life Annuity – Variations in the Present Values of Annuities – Life Annuities Payable at Frequent Intervals.

UNIT IV

Net Premiums for Assurance Plans – Natural Premiums – Level Annual Premium – Symbols for Level Annual Premium under Various Assurance Plans – Mathematical Expressions for level Annual Premium under Level Annual Premium under Various Plans for Sum Assure of Re. 1 – Net Premiums – Consequences of charging level Premium – Consequences of withdrawals – Net Premiums for Annuity Plans – Immediate Annuities – Deferred Annuities.

UNIT V

Premium Conversion tables – Single Premium Conversion tables – Annual Premium Conversion Tables – Policy Values – Two kinds of Policy values – Policy value in symbols – Calculation of Policy Value for Unit Sum Assure – Numerical Example : Retrospective Method and Comparison with Prospective Value – Derivative of Theoretical Expressions for Policy Value, tV_x by the Retrospective Method and Prospective Method – Other Expressions for Policy Value – Surrender Values – Paid up Policies – Alteration of Policy Contracts.

TEXT BOOK

1. Mathematical Basis of Life Insurance - Insurance Institute of India.

Course Objectives

This course enables the students to learn

- Develop the working knowledge on different numerical techniques.
- Solve algebraic and transcendental equations.
- Appropriate numerical methods to solve differential equations.
- About the concept of solving ordinary differential equations.
- Understand the idea about the basics of numerical methods for the analysis of experimental results.
- Develop practical skills in the use of numerical methods, including using software.

Course Outcomes (COs)

On successful completion of this course, students will be able to

1. How to find the concept of newton's method Raphson method.
2. Provide information on methods of iteration.
3. Study in detail the concept of boundary value problems.
4. Identify the concept of numerical differentiation and integration.
5. Attain mastery in the numerical solution of ordinary differential equations.
6. Solve ordinary differential equations by using euler and modified euler method.

UNIT I

Solution of algebraic and transcendental equations: Newton Raphson method- Bairstow method – Illustrations of the methods (case studies).

UNIT II

Solution of simultaneous linear algebraic equations: Gauss elimination method – Gauss Jordan method – Factorization method – Iteration method – Gauss-Jacobi method – Gauss-seidel method. Illustrations of the methods (case studies)

UNIT III

Interpolation: Gregory Newton Forward and Newton Backward interpolation formula –Interpolation with unequal intervals — Lagrange's interpolation formula – Inverse interpolation formula. Illustrations of the methods (case studies)

UNIT IV

Numerical Differentiation and Integration: Newton's Forward and backward differences to compute derivatives – Trapezoidal rule, Simpson's 1/3 & 3/8 rule. Illustrations of the methods (case studies)

UNIT-V

Numerical methods for solving ordinary differential equations – Taylor series (I order) – Euler and Modified Euler method – Runge kutta methods (II order, III order and IV order). Illustrations of the methods (case studies)

TEXT BOOK

1. Venkataraman .M.K., Fifth Edition, 2001. Numerical Methods in Science and Engineering, National publishing Company, Madras.

REFERENCES

1. Jain. M.K., Iyengar. S.R.K.,and R.K .Jain., 2004. Numerical Methods for Scientific and Engineering Computation, New Age International Publishers, New Delhi .
2. Sastry .S.S,2009, Engineering mathematics, PHI learning Pvt. Ltd, New Delhi.
3. Balagurusamy.E.,2000, Numerical Methods, Tata McGraw-Hill Education, New Delhi.

Course Objectives

This course enables the students to learn

- The concept of Banach spaces and related theorems
- The specific techniques for bounded operators over normed and Hilbert spaces.
- The demonstrate significant applications of the theory of functional analysis.
- The ideas and some of the fundamental theorems of functional analysis.
- Understand how to use the main properties of compact operators.
- Apply the spectral analysis of compact self-adjoint operators to the resolution of integral equations.

Course Outcomes (COs)

After successful completion of this course the students will be able to

1. Develop Banach spaces from vector spaces.
2. Describe the open mapping theorem.
3. Discuss Hilbert spaces and its properties.
4. Study in detail about the adjoint of an operator.
5. Handle complex problems concerning topics within the area of Functional Analysis.
6. Understand and apply fundamental theorems from the theory of normed and Banach spaces.

UNIT I

Banach Spaces- Normed linear space – Definitions and Examples-Theorems. Continuous Linear Transformations – Some theorems- Problems. The Hahn- Banach Theorem –Lemma and Theorems. The Natural imbedding of N in N^{**} -Definitions and Theorems.

UNIT II

The Open Mapping Theorem- Theorem and Examples –Problems. The closed graph theorem. The conjugate of an operation- The uniform boundedness theorem- Problems.

UNIT III

Hilbert Spaces- The Definition and Some Simple Properties – Examples and Problems. Orthogonal Complements - Some theorems .Ortho-normal sets – Definitions and Examples- Bessel's inequality- The conjugate space H^* .

UNIT IV

The Adjoint of an operator – Definitions and Some Properties-Problems. Self- adjoint operators – Some Theorems and Problems. Normal and Unitary operators –Theorems and Problems. Projections - Theorems and Problems .

UNIT V

Banach algebras: The definition and some examples of Banach algebra – Regular and singular elements – Topological divisors of zero – The spectrum – The formula for the spectral radius.

TEXT BOOK

1. Balmohan V., and Limaye., 2004. Functional Analysis, New Age International Pvt. Ltd, Chennai.

REFERENCES

1. Simmons. G.F., 1963. Introduction to Topology & Modern Analysis, Tata McGraw-Hill Publishing Company Ltd, New Delhi.

3. Choudhary .B, and Sundarsan Nanda., 2003. Functional Analysis with Applications, New Age International Pvt. Ltd, Chennai.
4. Ponnusamy.S., 2002. Foundations of functional analysis, Narosa Publishing House, Chennai.

Course Objectives

This course enables the students to learn

- The concepts of fluid, its properties and behavior under various conditions of internal and external flows.
- The fundamentals of Fluid Dynamics, which is used in the applications of Aerodynamics, Hydraulics, Marine Engineering, Gas dynamics etc.
- To imbibe basic laws and equations used for analysis of static and dynamic fluids
- About the Two-Dimensional Motion of the fluid.
- Identify the fundamental kinematics of a fluid element.
- State the conservation principles of mass, linear momentum, and energy for fluid flow.

Course Outcomes (COs)

On successful completion of this course, students will be able to

1. Classify and exploit fluids based on the physical properties of a fluid.
2. Compute correctly the kinematical properties of a fluid element.
3. Apply the concept of Bernoulli's theorem in steady motion.
4. Understand both flow physics and mathematical properties of governing Navier-Stokes equations and define proper boundary conditions for solution.
5. Provide the student with the basic mathematical background and tools to model fluid motion.
6. Develop a physical understanding of the important aspects that govern incompressible flow that can be observed in a variety of situations in everyday life.

UNIT I

Introductory Notions – Velocity – Stream Lines and Path Lines – Stream Tubes and Filaments – Fluid Body – Density – Pressure. Differentiation following the Fluid – Equation of continuity – Boundary conditions – Kinematical and physical – Rate of change of linear momentum – Equation of motion of an in viscid fluid.

UNIT II

Euler's momentum Theorem – Conservative forces – Bernoulli's theorem in steady motion – energy equation for in viscid fluid – circulation – Kelvin's theorem – vortex motion – Helmholtz equation.

UNIT III

Two Dimensional Motion – Two Dimensional Functions – Complex Potential – basic singularities – source – sink – Vortex – doublet – Circle theorem. Flow past a circular cylinder with circulation – Blasius Theorem – Lift force. (Magnus effect)

UNIT IV

Viscous flows – Navier-Stokes equations – Vorticity and circulation in a viscous fluid – Steady flow through an arbitrary cylinder under pressure – Steady Couette flow between cylinders in relative motion – Steady flow between parallel planes.

UNIT V

Laminar Boundary Layer in incompressible flow: Boundary Layer concept – Boundary Layer equations – Displacement thickness, Momentum thickness – Kinetic energy thickness – integral equation of boundary layer – flow parallel to semi infinite flat plate – Blasius equation and its solution in series.

TEXT BOOKS

1. Milne Thomson .L.M., 1968. Theoretical Hydrodynamics , Fifth edition, Dover Publications INC, NewYork.(for unit I,II)
2. Curle.N., and H.J.Davies, Modern Fluid Dynamics Volume-I , D Van Nostrand Company Ltd., London. (for unit III,IV,V)

REFERENCES

1. Yuan.S.W, 1976. Foundations of Fluid Mechanics, Prentice- Hall ,India.
2. Shanthi swarup,2003,"Fluid dynamics" Krishna prakasan media Pvt Ltd,Meerut.

Course Objectives

This course enables the students to learn

- Range of mathematics tools with emphasis on engineering applications.
- To think quantitatively and analyse problems critically.
- How to apply integral equations to the ordinary differential equation.
- Converting the IVPs and BVPs to the corresponding integral equations and Fredholm and Volterra integro-differential equations.
- Equip with the methods of finding Laplace transform and Fourier Transforms of different functions.
- Fundamental concepts of Fourier series, Fourier transforms and Laplace transforms and their applications to differential equations.

Course Outcomes (COs)

On successful completion of this course the students will be able to,

1. Calculate the Laplace equation in half plane of standard functions both from the definition and by using tables.
2. Equation with separable kernel and Fredholm alternative approximation Method.
3. Select and combine the necessary Laplace transform techniques to solve second-order ordinary differential equations.
4. Calculate both real and complex forms of the Fourier series.
5. Calculate the Fourier transform of elementary functions from the definition.
6. Calculate the variational problem in parametric form.

UNIT I

Fourier transforms: Fourier Transforms – Definition of Inversion theorem –Fourier cosine transforms - Fourier sine transforms – Fourier transforms of derivatives -Fourier transforms of some simple functions - **Fourier transforms of rational function.**

UNIT II

The convolution integral – convolution theorem – Parseval's relation for Fourier transforms – solution of PDE by Fourier transform – Laplace's Equation in Half plane – Laplace's Equation in an infinite strip - **The Linear diffusion equation on a semi-infinite line** - The two-dimensional diffusion equation.

UNIT III

Integral equations: Types of Integral equations–Equation with separable kernel- Fredholm Alternative Approximate method – Volterra integral equations–Classical Fredholm theory – Fredholm's First, Second, Third theorems.

UNIT- IV

Application of Integral equation to ordinary differential equation – initial value problems – Boundary value problems – singular integral equations – Abel Integral equation .

UNIT V

Calculus of variations: Variation and its properties – Euler’s equation – Functionals of the integral forms - Functional dependent on higher order derivatives – functionals dependent on the functions of several independent variables – variational problems in parametric form.

TEXT BOOKS

2. Larry C. Andrews and Bhimson K. Shivamoggi,1999. The Integral transforms for Engineers , Spie Press, Washington.

Course Objectives

This course enables the students to learn

- To understand the basic concepts in probability generating functions, sample moments and their functions, sampling, significance tests and statistical measures
- Probability distributions, significance of testing hypothesis and its interpretation,
- Estimation, ANOVA and their applications in various disciplines.
- Understand the concept of estimation.
- The knowledge of fixed-sample and large-sample statistical properties of point and interval estimators.
- Understanding of how to design experiments and surveys for efficiency.

Course Outcomes (COs)

After successfully completed this module the students will be able to

1. Explain the concepts of probability, including conditional probability.
2. Explain the concepts of random variable, probability distribution, distribution function, expected value, variance and higher moments, and calculate expected values and probabilities associated with the distributions of random variables.
3. Summarize the main features of a data set and test statistical hypotheses.
4. Define basic discrete and continuous distributions, be able to apply them and simulate them in simple cases.
5. Explain the concepts of analysis of variance and use them to investigate factorial dependence.
6. Describe the main methods of estimation and the main properties of estimators, and apply them.

UNIT I

Probability: Random Events – Preliminary remarks – random events and operations performed on them – the system of axioms of the theory of probability – conditional probability – Bayes theorem – Independent Events – functions of random variables – Multidimensional random variables – Some probability distributions – the binomial distribution – the Poisson distribution - the uniform distribution - the normal distribution.

UNIT II

Sample moments and their functions: Notion of a sample and a statistic - Distribution functions of X , S^2 and (X, S^2) - Chi-square distribution - Student t-distribution - Fisher's Z-distribution - Snedecor's F-distribution - Distribution of sample mean from non-normal populations.

UNIT III

Significance test: Concept of a statistical test - Parametric tests for small samples and large samples Chi-square test - Kolmogorov Theorem-Smirnov Theorem-Tests of Kolmogorov and Smirnov type The Wald-Wolfovitz and Wilcoxon-Mann-Whitney tests - Independence Tests by contingency tables.

UNIT IV

Estimation: Preliminary notion -Consistency estimation -Unbiased estimates -Sufficiency -Efficiency -Asymptotically most efficient estimates -methods of finding estimates -confidence Interval.

UNIT V

Analysis of Variance: One way classification and two-way classification. Hypotheses Testing: Poser functions -OC function-Most Powerful test -Uniformly most powerful test -unbiased test.

TEXT BOOK

REFERENCES

1. Meyer, 1969. Introduction to Probability and Statistical applications, Oxford and IBH Publishing Co.Pvt Ltd. New Delhi.
2. Sheldon M. Ross, 1995. Introduction to probability and statistics for engineers and scientists, Third edition, Academic press.
3. Heinz Bauer, 1995.Probability Theory, Narosa Publishing House, London.
4. Parimal Mukhopadhyay, 1991. Theory of Probability, New central book agency, Calcutta.

Course Objectives

This course enables the students to learn

- Perspective on the broader impact of measure theory in ergodic theory.
- To apply the general principles of measure theory and integration.
- About the concept of Measurable spaces.
- To understand the basic concepts Riemann integral and Lebesgue integral.
- Basic knowledge of measure theory needed to understand probability theory, statistics and functional analysis.
- Develop the ideas of Lebesgue integration and its properties.

Course Outcomes (COs)

After successful completion of this course the students will be able to:

1. Get a clear view of the fundamentals of measure theory.
2. Acquaint with the proofs of the fundamental theorems underlying the theory of Lebesgue integration.
3. Identify the broader impact of measure theory in ergodic theory and ability to pursue further studies in this area.
4. Mastery in the measure spaces and its properties.
5. Apply the theorems of monotone and dominated convergence and Fatou's lemma.
6. Apply Lebesgue decomposition and the Radon-Nikodym theorem.

UNIT I

Lebesgue Measure: Introduction – Outer measure – Measurable sets and Lebesgue Measure – A non measurable set – Measurable set – Measurable functions – Littlewood's three principles.

UNIT II

The Lebesgue Integral: The Riemann integral – The Lebesgue integral of a bounded function over a set finite measure – The integral of a non negative function – The general Lebesgue integral – Convergence in measure.

UNIT III

Differentiation of monotone function, Functions of bounded variation-differentiation of an integral-Absolute continuity.

UNIT IV

Measure spaces-Measurable functions-Integration-General convergence Theorems.

UNIT V

Signed measures-The Radon-Nikodym theorem-the L^p spaces.

TEXT BOOK

1. Royden H.L, 2004. Real Analysis, Third Edition, Prentice – Hall of India Pvt.Ltd, New Delhi.

REFERENCES

1. Keshwa Prasad Gupta, 2005. Measure Theory, Krishna Prakashan Ltd, Meerut.
2. Donald L. Cohn, 1994. Measure Theory, United States.
3. Paul R. Halmos, 1955. Measure Theory, Princeton University Press Dover Publications.
4. Rudin W, 1986. Real and Complex Analysis, 3rd Edition, Mcgraw – Hill, New Delhi.

Course Objectives

This course enables the students to learn

- Enrich the fundamental of mathematical modeling skills.
- The construction and analysis of mathematical models inspired by real life problems
- Several modeling techniques and the means to analyze the resulting systems.
- To analyze a model and to apply an appropriate method to calculate a solution in order to predict the behavior of the system.
- Assess and articulate what type of modeling techniques are appropriate for a given physical system.
- Make predictions of the behavior of a given physical system based on the analysis of its mathematical model.

Course Outcomes (COs)

On successful completion of this course the student will be able to

1. Solve problems involving dynamic models, and probabilistic models.
2. Understand the use of modern technology in solving real-world to Epidemic models.
3. Problems through ordinary differential equations, probability theory, graphs.
4. Formulate a mathematical model given a clear statement of the underlying scientific principles.
5. Solve basic linear difference equations and solve application problems.
6. Know the concept of mathematical modeling through Graphs.

UNIT I

Mathematical Modeling through Ordinary Differential Equations of First order: Linear Growth and Decay Models – Non-Linear Growth and Decay Models – Compartment Models – Dynamics problems – Geometrical problems.

UNIT II

Mathematical Modeling through Systems of Ordinary Differential Equations of First Order: Population Dynamics – Epidemics – Compartment Models – Economics – Medicine, Arms Race, Battles and International Trade – Dynamics.

UNIT III

Mathematical Modeling through Ordinary Differential Equations of Second Order: Planetary Motions – Circular Motion and Motion of Satellites – Mathematical Modelling through Linear Differential Equations of Second Order – Miscellaneous Mathematical Models.

UNIT IV

Mathematical Modeling through Difference Equations : Simple Models – Basic Theory of Linear Difference Equations with Constant Coefficients – Economics and Finance – Population Dynamics and Genetics – Probability Theory.

UNIT V

Mathematical Modeling through Graphs: Solutions that can be Modeled through Graphs – Mathematical Modeling in Terms of Directed Graphs, Signed Graphs, Weighted Digraphs and Un oriented Graphs.

TEXT BOOK

1. J.N. Kapur, 1988. Mathematical Modeling, Wiley Eastern Limited, New Delhi,.

REFERENCES

1. J. N. Kapur, 1981. Mathematical Models in Biology and Medicine Affiliated East –West Press Pvt Limited, New Delhi.

3. Frank.R.Giordano, Maurice. D.Weir, WilliamP. Fox, 2003, A first course in Mathematical Modelling, Vikash Publishing House, UK.

Course Objectives

This course enables the students to learn

- To enable the students to enrich the fundamental of angle between two lines.
- The construction and analysis of rectangular Cartesian co-ordinates, straight lines
- The geometrical structures such as sphere, cone etc which are all have a wide application in the field of engineering.
- The properties of four basic three-dimensional shapes.
- Identify the number of parameters necessary to express a point in the three-dimensional coordinate system.
- Understand the concept concept of three dimensional analytical geometry.

Course Outcomes (COs)

On successful completion of the course, students will be able to:

1. Expertise on rectangular cartesian co-ordinates in space.
2. Know about equation of plane.
3. Understand the concept of straight line in space.
4. Acquire the knowledge on basic concepts of sphere, cone, cylinder.
5. Understand the concept of transformation of rectangular axes.
6. Recognize three-dimensional shapes in the world around them.

UNIT I

Rectangular Cartesian co-ordinates in space, Concept of a geometric vector (directed lines segment). Projection of a vector on a co-ordinate axis, inclination of a vector with an axis, co-ordinates of a vector, direction cosines of a vector, distance between two points. Division of a directed line segment in a given ratio, the equation of a surface and the equation of a curve.

UNIT II

Equation of plane: General, intercept and normal form. The sides of a plane, signed distance of a point from a plane. Equation of a plane passing through the intersection of two planes. Angle between two intersecting planes, bi-sectors of angle between two intersecting planes, Parallelism and perpendicularity of two planes.

UNIT III

Straight line in space: Its equation in symmetrical (canonical) and parametric forms. Direction ratio and direction cosines, canonical equation of the line of intersection of two intersecting planes. Angle between two lines. Condition for Parallelism and perpendicularity of two straight lines, of a straight

line and a plane, Equations of skew lines, Distance of a point from a straight line. Shortest distance between two skew lines.

UNIT IV

Sphere, Cone, Cylinder: Surface of revolution, Ruled surface: study of their shapes and canonical equations. Enveloping cone and enveloping cylinder. Tangents, tangent planes, normals and generating lines of quadrics.

UNIT V

Transformation of rectangular axes: Translation, rotation and their combinations. General equation of second degree in three variables: reduction to canonical (normal) forms. Classification of quadrics and their equation in canonical forms.

TEXTBOOK

1. Arup Mukherjee, Naba Kumar Bej, 2010. Analytical Geometry of Two & Three dimensions (Advanced Level), Books and allied (P) Ltd. Kolkata.

REFERENCES

1. M.C. Chaki: A Text Book of Analytic Geometry.
2. S.L. Loney: Co-ordinate Geometry.
3. J.T. Bell: Co-ordinate: Geometry of Three Dimensions.

Course Objectives

This course enables the students to learn

- The fundamental concepts of the theory of the finite element method:
- To enrich the global interpolation and the solution of one dimensional heat and wave equations.
- The purpose of Galerkin method, global & local finite element models in one dimension.
- This course provides an introduction to finite elements method with a focus on one and two dimensional problems in structures, heat transfer, static and dynamics.
- Basic principles of finite element analysis procedure.
- The design and heat transfer problems with application of FEM.

Course Outcomes (COs)

On successful completion of this course the student will be able to

1. Develop the ability to generate the governing FE equations for systems governed by partial differential equations.
2. Understand the application and use of the FE method for heat transfer problem.
3. Understand the use of the basic finite elements for structural applications using truss, beam, frame, and plane elements.
4. Comprehend quantitative and analytical methods.
5. Understand the concepts Lagrangian and Hermit elements methods in FEM.
6. Recognize the need for, and engage in life long learning.

UNIT I

Finite Element Method: Variation formulation–Raayleigh- ritz minimization- weighted residuals- Galerkin method applied to boundary value problems.

UNIT II

Global and local finite element models in one dimension-derivation of finite element equation.

UNIT III

Finite element interpolation-polynomial elements in one dimension, two dimensional elements-natural coordinates-triangular elements-rectangular elements.

UNIT IV

Lagrangian and Hermit elements for rectangular elements-global interpolation functions.

UNIT V

Local and global forms of finite element equations-boundary conditions-methods of solutions for a steady state problems –Newton-Raphson continuation-one dimensional heat and wave equations.

Course Objectives

This course enables the students to learn

- Improve mathematical proof writing skills.
- Cater mathematical verbal communication skills.
- Afford problem-solving skills.
- Combinatorial proofs of identities and inequalities.
- Model and analyze computational processes using analytic and combinatorial methods.
- Structures to represent mathematical and applied questions, and they will become comfortable with the combinatorial tools commonly used to analyze such structures.

Course Outcomes (COs)

On successful completion of this course, students will be able to

1. Cognition in various combinatorial methods.
2. Solve recurrence relations through computational skills.
3. Apply the inclusion/exclusion principle.
4. Develop fundamental knowledge of combinatorics and Euler function.
5. Analyze combinatorial objects satisfying certain properties and answer questions related to Necklace problem.
6. Know the concept of Burnside's lemma.

UNIT I

Basic Combinatorial Numbers – Stirling numbers of the second kind – Recurrence formula for P_{nm} .

UNIT II

Generating functions – Recurrence relations- Bell's formula.

UNIT III

Multinomial – Multinomial theorem- Inclusion and Exclusion principle.

UNIT IV

Euler function –Permutations with forbidden positions –the Menage Problem.

UNIT V

Problem of Fibonacci –Necklace problem – Burnside's lemma.

TEXTBOOK

1. V. Krishnamurthy, 2002, Combinatorics: Theory and Applications, East West Press Pvt. Ltd.

REFERENCES

1. V.K. Balakrishnan, 1995 Theory and problems of Combinatorics, Schaums outline series, McGraw Hill Professional.

2. Alan tucker, 2002, Applied Combinatorics, Fourth edition, John wiley & Sons, New York.

Course Objectives

This course enables the students to learn

- The basic concepts in automata theory and theory of computation.
- To identify different formal language classes and their relationships.
- This course focuses on the basic theory of Computer Science and formal methods of computation like automata theory, formal languages, grammars.
- Design automata, regular expressions and context free grammars for accepting or generating a certain language.
- Design grammars and recognizers for different formal languages
- Determine the decidability and intractability of computational problems.

Course Outcomes (COs)

On successful completion of this course the students will be able to:

1. Understand the definition of Automata.
2. Know about the different concepts in automata theory and formal languages such as formal proofs, non-deterministic automata, regular expressions, regular languages context-free grammars, context-free languages.
3. Discuss the acceptability of a string by finite automation.
4. Applications of Pumping Lemma.
5. Design automata, regular expressions and context-free grammars accepting or generating certain languages.
6. Acquire concepts relating to the theory of computation and computational models including decidability and intractability.

UNIT I

Definition of an Automation - Description of Finite Automaton – Transition systems - Property of transition functions - Acceptability of a string by a finite Automaton - Non deterministic finite automaton - The equivalence of DFA and NDFA.

UNIT II

Formal Languages - Basic Definitions and examples - Chomsky classification of Languages - Languages and their relation - Recursive and Recursively Enumerable sets- Operations on Languages.

UNIT III

Regular expressions - Finite Automata and Regular expressions.

UNIT IV

Pumping Lemma for Regular sets - Applications of Pumping Lemma - Closure Property of Regular sets - Regular sets and Regular grammars.

UNIT V

Context free Languages and Derivation trees - Ambiguity in Context free grammars - Simplification of Context free grammars (examples only).

TEXTBOOK

1. K L P Mishra and N Chandrasekaran, 1999. Theory of Computer Science, Prentice Hall of India, New Delhi.

REFERENCES

1. John E. Hopcroft and J.D. Ullman, , 2006. Introduction to Automata theory, Languages and Computation, Third Edition, Prentice Hall.
2. A.V. Aho and J.D. Ullman, 1999. Principles of compiler design, Narosa Publishing Company, London.
3. Rakesh Duke, Adesh Pandey and RiTu Gupta, 2007. Discrete Structures and Automata theory. Narosa Publishing Company, New Delhi.

Course Objectives

This course enables the students to learn

- To understand the basic concepts in probability generating functions, sample moments and their functions, sampling, significance tests and statistical measures
- Probability distribution and their applications in various disciplines.
- This course introduces the key concepts in probability and distribution theory, including probability laws, random variables, expectation and variance, conditional probabilities, functions of random variables and multivariate probability distributions.
- Analyze statistical data graphically using frequency distributions and cumulative frequency distributions.
- Providing students with a formal treatment of probability theory.
- Equipping students with essential tools for statistical analyses at the graduate level.

Course Outcomes (COs)

After successfully completed this module the students will be able to

1. Explain the concepts of probability, including conditional probability.
2. Explain the concepts of random variable, probability distribution, distribution function, expected value, variance and higher moments, and calculate expected values and probabilities associated with the distributions of random variables.
3. Know the concept of conditional distributions.
4. Explain the concepts of various types of distributions.
5. Understand the concept of Bernoulli's law of large numbers.
6. Apply the concept of the gamma distribution.

UNIT I

Random Events – Preliminary remarks – random events and operations performed on them – the system of axioms of the theory of probability – conditional probability – Bayes theorem. Independent Events – Random variables – the concept of random variable – the distribution function – random variables of the discrete type and the continuous type – functions of random variables.

UNIT II

Multidimensional random variables – marginal distributions – conditional distributions – Independent random variables – Parameters of the distributions of a random variable. Expectation, moments moment generating functions and characteristic functions.

UNIT III

Conditional expectation and distribution, Chebyshev inequality – absolute moments. Modes of convergence, Weak and strong laws of large numbers, Central limit theorem.

Probability generating functions – some probability distributions - One point and two point distributions – the Bernoulli scheme.

UNIT IV

The binomial distribution – the Poisson scheme. The generalized binomial distribution – the Poisson scheme. The generalized binomial distributions and the Poisson distributions, uniform distribution - the normal distribution.

UNIT V

The gamma distribution – the Cauchy and Laplace distributions – Limit theorems – preliminary remarks – Stochastic convergence – Bernoulli's law of large numbers - the convergence of a sequence of distribution functions – the Levy-Cramer theorem – The de Moivre Laplace theorem – the Lindeberg-Levy theorem.

5. Gupta. S.C. and V.K. Kapoor, 2006. Fundamentals Of Mathematical Statistics, Sultan chand & Sons, New Delhi.

Course Objectives

This course enables the students to learn

- The introduction and different architectures of fuzzy sets.
- The applications of fuzzy networks.
- To cater the knowledge of fuzzy Logic Control and use these for controlling real time systems.
- Solve problems that are appropriately solved by neural networks, fuzzy logic, and genetic algorithms.
- The concepts of fuzzy sets, knowledge representation using fuzzy rules, approximate reasoning, fuzzy inference systems, and fuzzy logic control and other machine intelligence applications of fuzzy logic.
- The importance of tolerance of imprecision and uncertainty for design of robust & low cost intelligent machines.

Course Outcomes (COs)

On successful completion of this course, students will be able to

1. Obtain the fundamentals and types of fuzzy networks.
2. Have a broad knowledge in developing the different algorithms for fuzzy Logic.
3. Analyze constructing Fuzzy sets and operations.
4. Acquire a broad knowledge in Fuzzy relation equation.
5. The basic mathematical elements of the theory of Fuzzy systems and neural networks.
6. Explain the concepts of neural networks, fuzzy logic, and genetic algorithms.

UNIT I

Classical logic: An overview-Multivalued logics-Fuzzy Propositions-Fuzzy quantifiers-linguistic hedges-Inference from conditional fuzzy propositions-Inference from conditional and qualified propositions-Inference from qualified propositions.

UNIT II

Uncertainty based in formations-Information and uncertainty-Non specificity of crisp sets- Non specificity of Fuzzy sets-Fuzziness of fuzzy sets- Uncertainty in evidence theory-Summary of Uncertainty measures-Principles of Uncertainty.

UNIT III

Constructing Fuzzy sets and operations- General discussion-Method of construction: An overview-Direct method with one expert- Direct method with multiple experts- Indirect method with one expert- Indirect method with multiple experts-Constructions from sample data.

UNIT IV

Fuzzy expert systems: An overview-Fuzzy implications-selection of Fuzzy implications-Multi conditional approximate reasoning-The role of Fuzzy relation equation-Interval-valued approximate reasoning.

UNIT V

Fuzzy systems-General discussion-Fuzzy controllers: An overview and examples-Fuzzy systems and neural networks- Fuzzy neural networks- Fuzzy Automata-Fuzzy dynamic systems.

TEXTBOOKS

2. H.J. Zimmermann, 2006. Fuzzy set theory and its applications, Second Edition, Springer New Delhi,.

Course Objectives

This course enables the students to learn

- Understand the basic concepts Hille-Yosida theorem.
- Regularity of mild solutions for analytical semi groups and their applications in various disciplines.
- Able to understand the concept of semi groups.
- Understanding of classical control theory.
- Development of the bounded linear operators in semigroups.
- Use of the inhomogeneous initial value problem.

Course Outcomes (COs)

After successfully completed this module the students will be able to

1. Explain the concepts of control theory such as bounded linear operators.
2. Explain the concepts of semi groups of compact operators etc which is a powerful tool in solving the differential systems.
3. Familiar with controllability, exponential stability.
4. Understand the concept of basic concepts in control theory.
5. Analysis of linear and nonlinear systems.
6. Analyze the concept of stability for controllability.

UNIT I

Bounded Linear Operators:

Uniformly continuous semi groups of bounded linear operators – Strongly continuous semi groups of bounded linear operators – The Hille-Yosida theorem – The Lumer Phillips theorem.

UNIT II

Semi groups of Compact operators:

Semi groups of Compact operators – Differentiability – Analytic semigroups – Fractional powers of closed operators.

UNIT III

Abstract Cauchy Problem:

The Homogeneous Initial value problem – The inhomogeneous initial value problem – Regularity of mild solutions for Analytical semi groups.

UNIT IV

Basic Concepts in Control Theory:

Introduction- Fixed point methods- Observability of linear and nonlinear systems.

UNIT V

Controllability and exponential stability.

Undergraduate Programme – B.Sc Microbiology Programme Outcomes

Programme Outcomes of UG Microbiology: Students of all undergraduate microbiology degree Programmes at the time of graduation will be able to

- a. Scientific Knowledge: Microbiology majors able to make observations, develop hypotheses, and design and execute experiments using advanced methods. Able to discuss science and scientific methodology. They will have a good knowledge of Intellectual Property Rights.
- b. Laboratory Skills: Microbiology students will master the following laboratory skills: aseptic culture techniques, microscopy, use of appropriate methods to identify microorganisms and to use high laboratory equipments. They are able to practice safe microbiology, using appropriate protective and emergency procedures. Student able to gain the good knowledge of the development process and the planning process involved in the microbial products and enhance the entrepreneurship.
- c. Data analysis skills: Systematically collect, record, and analyze data, identify sources of error, interpret the results, and reach logical conclusions.
- d. Problem-Solving Skills: Microbiology students will be able to analyze and interpret results from a variety of microbiological methods, and apply these methods to analogous situations. Use mathematical and graphing skills and reasoning to solve problems in microbiology.
- e. Communication Skills: Microbiology majors will demonstrate competence in written and oral communication.
- f. Cooperation/Social Responsibility: Microbiology majors able to understand and appreciate the value of cooperating and working effectively with peers and be able to demonstrate a commitment to the process of developing such skills.
- g. Able to understand the importance of microorganisms in various industries such as pharmaceuticals, food, biofertilizers and biopesticides etc, Students will have a major knowledge on concepts of immunology, biotechnology, molecular biology, biochemistry, genetics. Able to explain the beneficial and harmful role of microorganisms in environment.

Programme Specific Outcomes (PSOs)

- h. Students will have a major knowledge on concepts of immunology, biotechnology, molecular biology, biochemistry, chemistry, genetics. Able to explain the beneficial and harmful role of microorganisms in environment. Able to understand the importance of microorganisms in various industries such as pharmaceuticals, food, biofertilizers and biopesticides etc,
- i Describe how microorganisms are used as *model systems* to study basic biology, genetics, metabolism and ecology.
- j. Identify ways microorganisms play an *integral role* in disease, and microbial and immunological methodologies are used in disease treatment and prevention.

PROGRAMME EDUCATIONAL OBJECTIVES (PEOs)

Programme Educational Objectives of UG Microbiology: The major objectives of the undergraduate course is

PEO-I: To impart knowledge on basic concepts of microbiology. To understand the beneficial and harmful role of microorganisms in the environment.

PEO-II: To understand the fundamentals of physiological reactions including metabolic pathways and biochemical reactions in microorganisms.

PEO-III: To develop human resource and entrepreneurs in Microbiology with the ability to independently start their own ventures or small biotech units in the field of biotechnology.

PEO-IV: Understand modern microbiology - practices and approaches with an emphasis in technology application in pharmaceutical, medical, industrial, environmental and agricultural areas.

PEO-V: Become familiar with public policy, bio-safety, and intellectual property rights issues related to microbiology applications nationally and globally

PEO-VI: Gain experience with standard bioinstrumentations and molecular tools and approaches utilized: manipulate genes, gene products and organisms.

PEO-VII: To demonstrate the written and oral communication skill .To develop the problem solving and data interpretation skills. To develop leadership skills and competitive spirit

பகுதி – I, தமிழ்

15LAU101 :

தமிழ் முதல் தாள்

பருவம் I

5-H,5-C

அலகு – I : இக்கால இலக்கியம்

தத்துவம் : மகாகவி பாரதியார் – பகைவனுக்கு அருள்வாய்.

கவிஞர் ந.பிச்சமூர்த்தி – கிளிக்கூண்டு

இயற்கை : பாவேந்தர் பாரதிதாசன் – அழகின் சிரிப்பு – ஞாயிறு.

சமுதாயம் : கவிக்கோ அப்துல் ரகுமான் – இன்றைய நிலை

அறிவியல் : கவிஞர் சிற்பி பாலசுப்பிரமணியன் – காலம்.

பெண்ணியம் : கவிஞர் சிவரமணி – வையகத்தை வெற்றிகொள்ள

குழலியல் : அன்பாதவன் - மரணம்

காதல் : வைரமுத்து - காதல் உயில்

தன்னம்பிக்கை பா.விஜய் - தன்னம்பிக்கை

அலகு – II : அற இலக்கியம்

1. திருக்குறள் - தேர்ந்தெடுக்கப்பட்ட குறள்கள் 20

2. நான்மணிக்கடிகை - தேர்ந்தெடுக்கப்பட்ட ஐந்து பாடல்கள்

3. திரிகடுகம் - தேர்ந்தெடுக்கப்பட்ட ஐந்து பாடல்கள்

அலகு – III : சிற்றிலக்கியம்

1. நரிவிருத்தம் - அறன் வலியுறுத்தல்

2. தமிழ் விடு தூது - தமிழின் சிறப்புரைத்தல்

3. மதுரை மீனாட்சியம்மைப் பிள்ளைத்தமிழ் - தொடுக்கும் கடவுள் பழம்பாடல்

அலகு – IV : சிறுகதை

1. புதுமைப்பித்தன் - நிகும்பலை

2. தனுஷ்கோடி ராமசாமி - கந்தகக் கிடங்கிலே

3. கந்தர்வன் - துண்டு

4. வாஸந்தி - வடிகால்

5. சி.ஆர். ரவீந்திரன் - வழுக்குமரம்

அலகு- V : மொழிப்பயிற்சி

1. விண்ணப்பங்கள் எழுதுதல் மற்றும் கடிதப் பயிற்சி

2. மொழிபெயர்ப்புப் பயிற்சி

பாட நூல்: கற்பகச்சோலை – தமிழ் ஏடு. கற்பகம் பல்கலைக்கழகத் தமிழ்த் துறை வெளியீடு.

Part I TAMIL 2015. Karpagam University, Coimbatore – 21.

Instruction Hours / week: L: 4 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVE:

- To help students enhance their Language skills
- To introduce different kinds of literary works
- To familiarize different genres of Literature
- To instruct moral values through literature.
- To improvise their productive and receptive skills
- To strengthen the basic knowledge about grammar

COURSE OUTCOME:

- Develop the four types of skills
- Reading and comprehending literary works
- Genres of literature to provide moral education
- Develop communication skills in business environment
- Interpersonal skills will be developed.
- Betterment of language competence

UNIT - I

Prose: Google Guys (Extract) – Richard L Brandt

Poetry: The Blind Pedlar – Osbert Sitwell

Short Story: A Garden So Rich – Christie Craig

Vocabulary: Prefixes, Antonyms, Sentence Completion

Grammar: Articles, Adverbs, Pronouns

Composition: Proverb Expansion

UNIT - II

Prose: Happiness 101 – Geeta Padmanabhan

Poetry: An Old Woman – Arun Kolatkar

Vocabulary: Suffixes, Analogies

Grammar: Nouns, Adjectives

Composition: Dialogue Writing

UNIT - III

Prose: Structured Procrastination – John Perry

Short Story: The Umbrella Man – Roald Dahl

One-Act Play: The Boy Who Stopped Smiling – Ramu Ramanathan

Vocabulary: Synonyms, Euphemisms, Word Definitions

Grammar: Verbs, Conjunctions and Interjection, Indirect/Reported Speech

UNIT - IV

Poetry: No Sentence – Anjum Hassan

One-Act Play: While the Auto Waits- O' Henry

Vocabulary: Words Often Confused, Anagrams

Grammar: Prepositions, Voice- Active and Passive

Composition: Letter Writing- Informal

UNIT - V

Short Story: The Bird – Amar Jalil

One-Act Play: The Cellphone Epidemic – Claudia I. Haas

Vocabulary: Portmanteau Words, One Word Substitute

Grammar: Questions, Pronunciation

Composition: Letter Writing- Formal

TEXT BOOK

Rao, G. Chandralekha and *et al.* Spring 2013. Emerald Publishers: Chennai.

REFERENCE

Syamala, V. English for Communication. 2006. Emerald Publishers: Chennai.

Instruction Hours / week: L: 5 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVES

1. To provide a strong, fundamental foundation in microorganisms for advanced studies in biological sciences, particularly to improve their **skills** in microbiology field.
2. To identify and understand the principle components of a light microscope
3. To provide an overview of culture preservation techniques
4. To explain why the study of fungi such as yeast and molds is within the discipline of microbiology
5. To demonstrate the microscope application
6. To explain different sterilization techniques followed in microbiology field

COURSE OUTCOMES

1. After completion of this course paper, the students clearly understand the contributions of various scientists for development of microbiology field and **skills** associated with it.
2. This course will demonstrate the diversity of microbes and their applications.
3. Students will know about the various field of Microbiology
4. Students will know how to utilize the microscope for bacterial specialized structure analysis
5. Able to understand the ultra structure of the bacteria
6. Familiarize with sterilization techniques

UNIT – I

History and scope of Microbiology – Discovery of microorganisms, Theory of Spontaneous generation - Recent developments and Golden age of microbiology. Modern microbiology.

UNIT – II

Origin and evolution of cell – cell structure - basic properties of cells – Ultra structure of prokaryotic cell- Bacteria - Capsule, Slime layer, Cell wall- Plasma membrane, Flagella- pili, Mesosome, Spores.

UNIT – III

Microscopy Principles working and application of Simple, compound, dark-field, phase contrast, fluorescent and electron microscopes – Scanning electron microscopy (SEM), Confocal and Scanning Transmission electron microscopy (STEM), Transmission electron microscopy (TEM).

UNIT – IV

Sterilization and disinfection, Principles, Methods of sterilization - Physical methods - Hot air sterilizer - Arnold sterilizer – Autoclave – Filtration – Radiation, Chemical sterilization. Phenol coefficient test, Quality control and Sterility testing. Estimation of microorganisms - Dilution techniques, Plate count, cell mass, direct count, MPN count.

UNIT –V

Observation of living microorganisms- Wet mount, motility. Stains and staining reactions - Simple and differential staining - Gram, Spore, Capsule, Acid fast and Haemocytometer. Culture techniques - Agar slants, Agar deeps, broth culture. Types of media - Solid media, assay media. Preparation of auxenic culture and pure culture techniques. Maintenance and preservation of cultures – Slants – Lyophilization - Glycerol storage - Cryopreservation. Culture collection centers in India and International levels.

BASIC MICROBIOLOGY PRACTICAL – I

**Semester – I
5H – 3C**

Instruction Hours / week: L: 0 T: 0 P: 5 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVES

To develop **skills** related to

- Isolation and culture techniques of bacteria
- The external feature of bacteria and colony characteristics. Various staining techniques
- Measurement of pH
- Counting of microorganism in the environment
- Sterilization and phenol coefficient test and antibiotic usage
- Laboratory precautions and Biosafety measures.

COURSE OUTCOME (CO'S)

1. This practical paper will build the student to describe and distinguish the bacterial colonies.
2. They will gain the knowledge on microscope and its handling
3. Students will able to analyze the morphology of bacterial
4. Students able to handle the pathogens safely.
5. Students able to describe size of the bacteria
6. Students able to handle the instruments in the microbiology laboratory

EXPERIMENTS

1. Laboratory Precautions
2. Microscope – Bright field and Dark field
3. Micrometry
4. Measurement of pH
5. Preparation of cleaning solutions
6. Usage of Antibiotics and disinfectants in microbiology laboratory
7. Phenol coefficient test
8. Culture media preparation – liquid and solid medium
9. Selective and Differential media
10. Staining of bacteria- Gram, spore, capsule, flagella

Instruction Hours / week: L: 4 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVES

To make the student acquire sound knowledge with the

1. Principles of Chemical bonding
2. Stereoisomerism, Inter halogen compounds,
3. Chemistry of Silicones and awareness to Pollution.
4. To learn the concept of Dyes, mechanism of action Sulpha drugs,
5. To learn the Photochemical laws, Chemical kinetic law
6. To know the applications of Chromatography which that helps students in their employability.

COURSE OUTCOMES

This paper presents the basic Principles of Chemistry. So it enables the students to learn about

1. The fundamental aspects of Chemistry that helps students in their employability.
2. concept of Dyes, mechanism of action Sulpha drugs,
3. Photochemical laws, Chemical kinetic law
4. Students able to perform Chromatography
5. Separate the compounds from natural sources
6. Chemical bonding

UNIT - I

Chemical Bonding: Molecular orbital theory-linear combination of atomic orbitals-bonding and antibonding molecular orbitals-energy level diagram-bond order- M.O. configuration of H_2 , N_2 and F_2 molecules. Diborane: Preparation, properties and structure. $NaBH_4$: Preparation and uses. Borazole: Preparation and properties. Interhalogen compounds: ICl , BrF_3 , IF_5 - preparation, properties, uses and structure. Basic properties of iodine. Compounds of sulphur: Sodium hydrosulphite- preparation, properties, uses and structure. Per acids of sulphur: Preparation, properties, uses and structure.

UNIT - II

Industrial Chemistry: Silicones: Synthesis, properties and uses. Fuels gases: Natural gas-water gas-semi water gas-carbureted water gas-producer gas- oil gas (Manufacturing details not required). Fertilizers: NPK fertilizer-ammonium sulphate-urea-superphosphate of lime-triple superphosphate-potassium nitrate-ammonium nitrate. Pollution: Water, air and soil pollution-sources and remedies-acid rain-ozone hole-greenhouse effect.

UNIT - III

Covalent Bond and Stereoisomerism: Covalent Bond: Orbital overlap, hybridization and geometry of CH_4 , C_2H_4 and C_2H_2 . Polar effects: Inductive effect-electromeric effect- mesomeric effect- steric effect- hyperconjugation. **Stereoisomerism:** Elements of symmetry-polarised light and optical activity-isomerism in tartaric acid-racemisation- resolution- geometrical isomerism of maleic and fumaric acids-keto-enol tautomerism of acetoacetic esters.

UNIT - IV

Dyes, Chemotherapy and Vitamins: Dyes: Terms used chromophore, auxochrome, bathochromic shift and hypsochromic shift- classification of dyes – based on chemical structure and application- one example each for azo, triphenylmethane, vat and mordant dyes- preparation. **Chemotherapy:** Preparation, uses and mechanism of action sulpha drugs- preparation and uses of prontosil, sulphadiazine and sulphafurazole-structure and uses of penicillins and chloromycetin. **Vitamins:** Diseases caused by the deficiency of vitamins A, B₁, B₂, C and D-sources of these vitamins.

UNIT - V

Elements of Photochemistry, Chemical Kinetics and Chromatography: Elements of Photochemistry: Photochemical laws-Beer Lambert's law-Grotthuss-Draper law-Stark-Einstein law (statement only). **Chemical Kinetics:** Rate-order-molecularity-pseudo first order reactions-zero order reactions-determination of order of reaction-measurement of order and rates of reactions-effect of temperature on reaction rate-energy of activation. **Chromatography:** Principles and applications of Column, Paper and Thin Layer Chromatography.

TEXT BOOKS

1. V.Veeraiyan and A.N.S. Vasudevan, 2005. Text Book of Allied Chemistry (II Edition), Highmount Publishing House, Chennai.
2. B.R.Puri and L.R.Sharma, 2002. Principles of Inorganic Chemistry, Shoban lal & Company Ltd., Jalandar
3. B.S.Bahl and Arun Bahl 2005. Advanced Organic Chemistry, S.Chand & Company Ltd., New Delhi
4. Puri, Sharma and Pathania 2003. Physical Chemistry, Vishal Publishing Company Ltd., Jalandhar

REFERENCE

1. R.Gopalan and S.Sundaram,2003.Allied Chemistry (III Edition), Sultan Chand & Sons., New Delhi.

Instruction Hours / week: L: 0 T: 0 P: 3 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVES

On successful completion of the course the students should have **skills** associated with

- Qualitative analysis.
- Elements and functional groups of a mixture by systematic analysis.
- Stereoisomerism, Inter halogen compounds,
- Chemistry of Silicones and Pollution.
- To learn the concept of Dyes,
- mechanism of action Sulpha drugs

COURSE OUTCOMES

This paper presents the basic Principles of qualitative analysis in Chemistry. So it enable the students to learn about

- The fundamental aspects of Chemistry that helps students in their **employability**.
- concept of Dyes, mechanism of action Sulpha drugs,
- Photochemical laws, Chemical kinetic law
- Students able to perform Chromatography
- Separate the compounds from natural sources
- Organic compounds and elements

COURSE OUTCOMES

Contents

Systematic analysis of an organic compound, preliminary tests, detection of elements present, aromatic or aliphatic, saturated or unsaturated, nature of the functional group, confirmatory tests—aldehydes, ketones, amines, diamide, carbohydrates, phenols, acids, esters & nitro compounds.

Note: Each student should analyse minimum 6 compounds.

2. A.O. Thomas, 2010. Practical Chemistry for B.Sc. Main Students, Scientific Book Centre, Cannanore-1, Kerala.
3. V.Venkateswaran, R.Veerawamy and A. R. Kulandaivelu, 2004. Basic Principles of Practical Chemistry, 2nd Edition, S. Chand Publications, New Delhi.

Instruction Hours/week: L: 2 T: 0 P: 0 Marks: Internal: 100 External: Nil Total: 100

COURSE OBJECTIVES

- To improve the integral development as human begins
- To train the students towards sustainable lifestyle
- To improve their confidence as an **entrepreneur**
- To create awareness about the values and their significance and role
- To imbibe the concept of discipline and freedom
- To motivate the students about the roles and responsibility

COURSE OUTCOME (CO'S)

Upon completion of this course

1. The students fit for the future.
2. develop a sense of competitive spirit, co-operation, leadership, diligence, punctuality, **entrepreneurship**.
3. Team-spirit as well as to provide a backdrop for the development of their creative talents
4. Able to manage the time in the all condition
5. They will apply positive thinking always
6. Able to develop their personality

UNIT – I

Concept of Self, self-esteem and self-confidence. Concept of personality, determinants and disorganisation of it. Personality development – meaning.

UNIT – II

Goal setting – meaning and importance; steps in goal setting Manners and Etiquette – meaning need and importance; means to improve. Positive thinking.

UNIT – III

Discipline – meaning. Concept of Roles and Responsibility Time Management – Meaning and steps for effective time management.

UNIT – IV

Interpersonal relationship – meaning and importance; means to improve it. Healthy friendship.

UNIT – V

Family Relationship importance of it; Means to improve. Spirituality – meaning. Its relationship with Altruism, sacrifice, self control, tolerance and truthfulness.

TEXT BOOKS

1. Karpagam Academy of Higher Education, Study Material, 2015.

Instruction Hours / week: L: 2 T: 0 P: 0 Marks: Internal: 100 External: Nil Total: 100**COURSE OBJECTIVES**

- To gain the Soft skills that helps in the student's employability
- To critically evaluate and demonstrate various principles involved in solving mathematical problems
- To adopt new and faster methods of calculations.
- Reinforcing competencies in soft skills which are crucial in a social setting
- To know about quantitative aptitude and profit and loss
- To know the parts of speech in higher level

COURSE OUTCOME (CO'S)

- Students able to achieve the analytical and reasoning competencies
- Able to improve their communication and presentation skills helps in their employability
- Students will be able to set their future goal
- Can improve the Interpersonal skill
- Students able to understand the problems on age
- They will be able to interpret the data

UNIT - I

Introduction to Quantitative Aptitude, Speed Maths, Problems on Numbers, Averages, Ratios and Proportions, Problems on Ages

UNIT - II

Number Series, Blood Relation, Image Analysis, Direction Sense, Syllogism, Coding and Decoding

UNIT – III

Percentages, Data Interpretation, Profit and Loss, Simple Interest and Compound Interest

UNIT – IV

Parts of Speech, Tense, Subject Verb Agreement, Active and Passive Voice, Articles, Prepositions

UNIT - V

Conditional Clause, Degrees of Comparison, Goal Setting, Interpersonal Skills

Instruction Hours / week: L: 5 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

பகுதி – I, தமிழ்

15LAU201 :

தமிழ் இரண்டாம் தாள்

பருவம் II

5-H,5-C

அலகு – I : பக்தி இலக்கியம்

1. சைவம் - மூவர் தேவாரத்திலிருந்து தேர்ந்தெடுக்கப்பெற்ற 15 பாடல்கள்
2. வைணவம் - ஆண்டாள் நாச்சியாரின் திருப்பாவையிலிருந்து 11 பாடல்கள்

அலகு – II : சங்கஇலக்கியம்

அ). எட்டுத்தொகை

நற்றிணை: 1. இலை இல பிடவம், திணை – முல்லை,

ஆசிரியர் – விழிக்கட் பேதைப் பெருங்கண்ணனார்.

2. மடல் மா ஊர்ந்து, திணை – குறிஞ்சி, ஆசிரியர் – மடல் பாடிய மாதங்கீரனார்.

குறுந்தொகை: 1. உள்ளார் கொல்லேர, திணை – பாலை, ஆசிரியர் – பெருங்கடுங்கோ.

2. யாரினும் இனியன், திணை – மருதம், ஆசிரியர் – வடமவண்ணக்கன் தாமோதரனார்.

ஐங்குறுநூறு: 1. நுண்ணோர் புருவத்த, திணை – குறிஞ்சி, ஆசிரியர் – கபிலர்.

2. அவறொறுந் தேரை, திணை – முல்லை, ஆசிரியர் – பேயனார்.

பதிற்றுப்பத்து – ததைந்த காஞ்சி, ஆசிரியர் – பாலைக் கௌதமனார்.

பரிபாடல் - வையை - திரை இரும் பனிப் பெளவம், ஆசிரியர் - மையோடக் கோவனார்.

கலித்தொகை - கடும் புனல் கால் பட்டு, திணை - பாலை, ஆசிரியர் - பெருங்கடுங்கோ.

அகநானூறு - 1. ஆடு அமைக் குயின்ற, திணை - குறிஞ்சி, ஆசிரியர் - கபிலர்.

2. யான் எவன் செய்கோ தோழி, திணை - பாலை, ஆசிரியர் - நோய்பாடியார்.

Instruction Hours / week: L: 4 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100
End Semester Exam: 3 Hours

COURSE OBJECTIVE:

- To help students enhance their Language skills
- To introduce different kinds of literary works
- To familiarize different genres of Literature
- To instruct moral values through literature.
- To improvise their productive and receptive skills
- To strengthen the basic knowledge about grammar

COURSE OUTCOME:

- Develop the four types of skills
- Reading and comprehending literary works
- Genres of literature to provide moral education
- Develop communication skills in business environment
- Interpersonal skills will be developed.
- Betterment of language competence

UNIT - I

Prose: The Unexpected- Robert Lynd

Poetry: The Village Schoolmaster – Oliver Goldsmith

Short Story: The Lion's Share – Arnold Bennett

Vocabulary: Homonyms

Grammar: Irregular Verbs

UNIT - II

Prose: Travel by Train – J. B. Priestly

Poetry: The Gift of India – Sarojini Naidu

Grammar: Sentence patterns

Composition: Reading Comprehension

UNIT - III

Prose: Women's Education is Almost More Important than the Education of Boys and Men – Indira Gandhi

Short Story: The Necklace – Guy De Maupassant

One-Act Play: The Referee – W.H. Andrews and Geoffrey Dearmer

Vocabulary: Similes

Grammar: Discourse Markers

Composition: Report Writing

UNIT - IV

Poetry: Ozymandias – P.B. Shelley

One-Act Play: The Pot of Broth- W.B. Yeats

Vocabulary: Collective Nouns
Grammar: Correction of Sentences
Composition: Picture Reading

UNIT - V

Short Story: The Silver Butterfly– Pearl S. Buck

One-Act Play: The Bear – Anton Chekov

Vocabulary: Acronyms

Grammar: Question Tags

Composition: Drafting Advertisement

TEXT BOOK

Wings of Communication 2014. Board of Directors. Emerald Publishers: Chennai

REFERENCE

Syamala, V. English for Communication. 2006. Emerald Publishers: Chennai.

Instruction Hours / week: L: 5 T: 0 P: 0**Marks: Internal: 40 External: 60 Total: 100****End Semester Exam: 3 Hours****COURSE OBJECTIVES**

- It gives brief description on the microbial metabolism and its energetic
- It deals with the various aerobic and an aerobic processes through which the organisms obtain and utilize the energy for their growth and to produce industrially important products that helps the students to become better **entrepreneurs**
- Explains photosynthesis and photosynthetic bacteria
- To study the structure, function, energy metabolism, growth and regulatory mechanisms of microorganisms.
- The students will learn about the metabolic diversity exhibited by microorganisms
- The students will learn about regulatory networks that support their survival and growth of the microorganism.

COURSE OUTCOME (CO'S)

1. The students will be able to understand and predict the various metabolic reactions in microbial cell.
2. This will make them predict the intermediate products which can be employed in industrial production processes.
3. Students will understand the growth, nutrition and environmental factors
4. Students able to assess the prokaryotes by observing the biochemical reaction
5. This course will support them to interpret the fermentation using microbes
6. Able to summarize the nutrients uptake system in the prokaryotes

UNIT – I

Microbial evolution and Diversity – Taxonomic ranks - Classification system – phenetic and Phylogenetic – Major characteristics – Classical, Molecular – Assessing microbial phylogeny- The Major divisions of Life.

UNIT – II

Classification of bacteria - Bergey's manual and its importance. Photosynthetic bacteria- Cyanobacteria – Archaeobacteria.

UNIT – III

Eukaryotic algae – classification of algae, growth and reproduction of Chlamydomonas, volvox, Red algae and diatoms – brown algae. Actinomycetes.

UNIT – IV

Classification and Taxonomy of fungi – Alexopolous – Distribution – general characteristics of divisions – Economical importance of Fungi.

UNIT – V

Classification, nutrition, reproduction, characteristics and importance of Protozoa – *Entamoeba histolytica*, *Giardia*, *Trichomonas*, *Plasmodium*. Classification of Virus – DNA, RNA viruses

Instruction Hours / week: L: 0 T: 0 P: 5 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 6 Hours

COURSE OBJECTIVES

- To provide a strong base in the fundamentals of bacteria.
- To learn techniques and methods used in the cultivation and isolation of bacteria.
- To develop **skills** related to preservation of bacterial cultures.
- To learn about bacterial specialized structure using staining methods
- To learn the bacterial special structure capsule and spore
- To measure the bacterial size

COURSE OUTCOME

After Completion of this course candidate can able to demonstrate:

1. Theory and practical skills in staining procedures
2. Various Culture media and their applications
3. Various microbial culture techniques to obtain isolation of pure cultures
4. Bacterial endospore and capsule
5. Able to analyze the Bacterial size
6. Able explain the bacterial motility and flagella

EXPERIMENTS

1. Nutrient agar slant, nutrient broth
2. Pure culture techniques - Pour plate, spread plate and looping method
3. Enumeration of bacteria, fungi and actinomycetes from soil
4. Cultural characteristics of microorganisms - Colony morphology on solid media
5. Maintenance of cultures - Agar slants, agar deep
6. Motility test – Hanging drop method
7. Fungal wet mount – Lactophenol cotton blue mount
8. Observation of representative forms of algae and fungi
9. Methods of sterilization Physical (heat, filtration and UV) and chemical (alcohol)

Instruction Hours / week: L: 4 T: 0 P: 0

Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVES

1. To make the student to be conversant with the extraction of Metals
2. To learn about Coordination Chemistry, Preparation, Properties Uses and Structure of Naphthalene
3. To acquire sound knowledge on Heterocyclic Compounds.
4. To make the student acquire sound knowledge of Electrochemistry, Biological functions of Amino acids and Proteins,
5. To acquire sound knowledge on Thermodynamic laws, Entropy, Enthalpy change
6. To familiarize with Principles of Electroplating that improve their skills in the Chemistry

COURSE OUTCOMES

This paper presents the basic principles of Chemistry. So it enables the students to learn about the fundamental aspects of Chemistry that improve their skills in the Chemistry and familiarize with

1. The extraction of Metals
2. Coordination Chemistry, Preparation, Properties
3. Structure of Naphthalene
4. Heterocyclic Compounds.
5. Electrochemistry, Biological functions of Amino acids and Proteins,
6. Thermodynamic laws, Entropy, Enthalpy change that improve their skills in the Chemistry

UNIT-I

Metals and Coordination Chemistry: Metals: General methods of extraction of metals-methods of ore dressing-types of furnaces-reduction methods-electrical methods-types of refining-Van Arkel process-Zone refining. **Coordination Chemistry:** Nomenclature-theories of Werner, Sidgwick and Pauling-chelation and its industrial importance-EDTA-haemoglobin-chlorophyll-applications in qualitative and quantitative analysis.

UNIT-II

Aromatic Compounds and Heterocyclic Compounds: Aromatic Compounds: Aromaticity-Huckel's $(4n+2)$ rule- aromatic electrophilic substitution in benzene- mechanism of nitration, halogenation, alkylation, acylation and sulphonation. Naphthalene: Isolation, preparation, properties and structure. **Heterocyclic Compounds:** Preparation and properties of pyrrole, furan, thiophene and pyridine.

UNIT-III

Amino acids, Proteins and Carbohydrates: Amino acids: Classification, preparation and properties. Peptides-preparation of peptides (Bergmann method only). **Proteins:** Classification, properties, biological functions and structure. **Carbohydrates:** Classification, preparation and properties of glucose and fructose- discussion of open chain and ring structures of glucose and fructose-glucose-fructose interconversion.

UNIT-IV

Energetics: Type of systems-processes and their types - isothermal, adiabatic, reversible, irreversible and spontaneous processes-statement of first law of thermodynamics-need for the second law of thermodynamics-heat engine-Carnot cycle-efficiency-Carnot theorem-thermodynamics scale of temperature-Joule-Thomson effect- Enthalpy- Entropy and its significance-Free energy change.

UNIT-V

Electrochemistry: Kohlrausch law-conductometric titrations-hydrolysis of salts-galvanic cells-E.M.F.-standard electrode potentials-reference electrodes- electrochemical series and its applications-buffer solution-buffer solution in the biological systems-pH and its determination-principles of electroplating.

TEXT BOOKS

Instruction Hours / week: L: 0 T: 0 P: 3 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVES

On successful completion of the course the students should have **skills** associated with

1. About the quantitative analysis.
2. estimation of sample present in a solution by volumetric analysis
3. To make the student to be conversant with the extraction of Metals
4. To acquire sound knowledge on Heterocyclic Compounds.
5. To make the student acquire sound knowledge of Electrochemistry, Biological functions of Amino acids and Proteins,
6. To familiarize with Principles of Electroplating that improve their **skills** in the Chemistry

COURSE OUTCOMES

This paper presents the basic Principles of quantitative analysis in Chemistry. So it enables the students to improve their **skills** in Practical Chemistry and conversant with

1. The extraction of Metals
2. Coordination Chemistry, Preparation, Properties
3. Structure of Naphthalene
4. Heterocyclic Compounds.
5. Electrochemistry, Biological functions of Amino acids and Proteins,
6. Thermodynamic laws, Entropy, Enthalpy change that improve their **skills** in the Chemistry

Contents

I. VOLUMETRIC ANALYSIS

A. Acidimetry & Alkalimetry

1. Estimation of sodium carbonate using standard sodium hydroxide.
2. Estimation of sodium hydroxide using standard sodium carbonate.
3. Estimation of sulphuric acid using standard oxalic acid.
4. Estimation of potassium permanganate using standard sodium hydroxide.

B. Permanganometry

1. Estimation of ferrous sulphate using standard Mohr's salt.
2. Estimation of oxalic acid using standard ferrous sulphate.
3. Estimation of calcium-direct method.

REFERENCES

Instruction Hours / week: L: 2 T: 0 P: 0 Marks: Internal: 100

Total: 100

Course Objectives

- To create the awareness about environmental problems among people.
- To develop an attitude of concern for the environment.
- To motivate public to participate in environment protection and improvement.
- To Demonstrate proficiency in quantitative methods, qualitative analysis, critical thinking, and written and oral communication needed to conduct high-level work as interdisciplinary scholars and/or practitioners.
- To create awareness among the students to know about various renewable and nonrenewable resources of the region, enables environmentally literate citizens (by knowing the environmental acts, rights, rules, legislation, etc.)
- To make appropriate judgments and decisions for the protection and **skills** associated with improvement of the earth.

Course Outcomes (COs)

1. Master core concepts and methods from ecological and physical sciences and their application in environmental problem solving.
2. Master core concepts and methods from economic, political, and social analysis as they pertain to the design and evaluation of environmental policies and institutions.
3. Appreciate the ethical, cross-cultural, and historical context of environmental issues and the links between human and natural systems.
4. Understand the transnational character of environmental problems and ways of addressing them, including interactions across local to global scales.
5. Apply systems concepts and methodologies to analyze and understand interactions between social and environmental processes.
6. Reflect critically about their roles and identities as citizens, consumers and environmental actors in a complex, interconnected world.

UNIT - I: Eco system and natural resources: Environment – Definition – components - Ecosystem -Definition, Concept, Scope, importance, structure and functions of ecosystem. Energy flow, Ecological succession. Food chains and food webs. Classification of ecosystem. Natural resources: Forest resources; water resources

UNIT - II: Environmental pollution: Cause, effects and control measures of Air pollution, water pollution, soil pollution, marine pollution, noise pollution, thermal pollution and nuclear hazards pollution. Solid waste management.

UNIT - III: Biodiversity and its conservation: Introduction- Definition, genetic, species and ecosystem diversity, biogeographical classification of India- Value of biodiversity: Consumptive, productive uses; social, ethical, aesthetic and option values. Threats to biodiversity: habitat loss, poaching of wildlife, man-wildlife conflicts.

UNIT - IV: Social issues and the environment: Urban problems related to energy- water conservation and management -Rain water harvesting- water shed management. Resettlement and

Rehabilitisaion. Natural resources and associated problems and sustainable utilization. Environmental Education.

UNIT - V: Environment ethics: Environmental Ethics - Gender equity, ethical basis of environment education and awareness, conservation ethic and traditional value systems of India. Valuing nature, cultures, social justice, Human heritage, equitable use of resources, preserving resources for future generation, common property resources, Ecology and its uses and its degradation, Introduction to Environmental Protection Act (EPA).

TEXT BOOKS

1. Agarwal, K.M., P.K. Sikdar and S.C. Deb, 2002. A Text Book of Environment, Mac Millan India Ltd, Kolkatta, India.
2. Kotwal, P.C. and S. Banerjee, 2002. Biodiversity Conservation – In Managed forest and protected areas, Agrobios, India.

3. Shaw, R and Krishnamurthy, R.R. 2009. Disaster management: global challenges and local solutions Universities Press (India) Private Ltd, Hyderabad.
4. Sorokin Pitirim. A, 1942. Man and Society In Calamity. New York: Dutton
5. Patrick L.Abbott, 2008. Natural Disasters, Mc Graw Hill, New York. Page: 1-7.

Instruction Hours / week: L: 4 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVE:

- To help students enhance their Language skills
- To introduce different kinds of literary works
- To familiarize different genres of Literature
- To instruct moral values through literature.
- To improvise their productive and receptive skills
- To strengthen the basic knowledge about grammar

COURSE OUTCOME:

- Develop the four types of skills
- Reading and comprehending literary works
- Genres of literature to provide moral education
- Develop communication skills in business environment
- Interpersonal skills will be developed.
- Betterment of language competence

UNIT - I

Listening: Listening comprehension – Listening for Specific Information –Note Taking – Interpreting Charts and Diagrams.

UNIT - II

Speaking: Essentials of effective communication – Greeting and Introducing – Making requests – Asking for permission – Giving and Denying Permission – Offering and Accepting Help – Asking for and Declining Help – Giving Instructions and Orders - Talking about likes and dislikes.

Telephone Skills – Understanding telephone conversation – handling calls – leaving messages – making requests - giving instructions and orders

Discussion Skills – Giving your opinion – agreeing and disagreeing – Making suggestions – Interrupting – questioning – reporting – Dealing with questions.
(Completing dialogues)

UNIT - III

Reading: Reading – Reading with a purpose –Skimming and Scanning – locating main points – reading critically – Sequencing of sentences – Reading comprehension.

UNIT - IV

Writing: Paragraph Writing – Descriptive and Narrative. Safety Instructions/ Suggestions. Expansion of Abbreviations – Spellings- Report writing.

Translation- Translating short sentences and passages from English to Tamil and from Tamil to English.

UNIT - V

Vocabulary: Improve English vocabulary: Synonyms – Antonyms – Prefixes – Suffixes – Idioms – Collocations – Different types of English – British and American (Choose the best answer type from a database of 50 words each for each topic)

Functional Grammar: Forming questions, getting answers – Articles – Parts of Speech – Punctuation – Common mistakes in English (Homophones)(Exercise based).

3. Spoken English Part I & II (for Tamil speakers), Orient Longman Pvt. Ltd.
4. Dr. J. John Love Joy, Dr.Francis M.Peter S.J. “Lets Communicate – Basic English for Everyone”, Vaigarai Publications, 1st Edition, Dindigul 2007.

Instruction Hours / week: L: 4 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVES

- It develops the **skills** on the microbial metabolism and its energetic
- It describes the groups of microorganisms based on nutritional characteristics
- It explains the biosynthesis of microorganisms.
- It deals with the various aerobic and an aerobic processes through which the organisms obtain and
- Utilize the energy for their growth.
- Explains photosynthesis and photosynthetic bacteria.

COURSE OUTCOME (CO'S)

1. The students will be able to understand and predict the various metabolic reactions in microbial cell.
2. This will make them predict the intermediate products which can be employed in industrial production processes.
3. This will help the students to understand the basics in metabolism to develop the basic skills on metabolism.
4. The students can able to understand the physiological characteristics of microorganisms.
5. The students can able to explore the microorganism's biochemical pathways.
6. Students can understand the nutritional cycle of the microorganisms in various conditions.

UNIT – I

Microbial nutrition – common nutrient requirements, Nutritional groups of microorganisms- Growth factors – Uptake of nutrients by cell – Passive, Facilitated diffusion, Active transport, Group translocation , and Iron uptake.

UNIT – II

Different phases of growth - Growth curve - generation time - Measurement of microbial growth. Batch, Continuous and Synchronous culture, Diauxic growth, Influence of environmental factors on growth.

UNIT – III

Carbohydrate metabolism – EMP, ED pathway, TCA cycle, Aerobic respiration, oxidative phosphorylation, electron transport chain, substrate level phosphorylation, ATP generation. Anaerobic respiration and carbon dioxide as electron acceptors.

UNIT – IV

Biosynthesis of cell wall of Gram positive and Gram negative bacteria. Nucleotide biosynthesis – Biosynthesis of purine, pyrimidine. Biosynthesis of amino acids – Glutamate family of amino acids.

UNIT – V

Photosynthesis – bacteria and cyanobacteria, photosynthetic pigments – oxygenic (cyanobacterial) and Anoxygenic (Purple, green sulphur and purple non sulphur) photosynthesis. Fixation of carbon dioxide - C₃ cycle.

4. White, D., 2003. Physiology and Biochemistry of Prokaryotes. 2nd Edition. Oxford University Press. New York.
5. Voet D and Voet JG. 2003. Biochemistry. John Wiley and sons New York.

Instruction Hours / week: L: 4 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVES

To develop skills related to

- Understand the principles of various instruments used in the life sciences
- Ability to operate the instruments in order to develop their employment opportunities.
- Data analysis and interpretations
- It explains the Biosafety level on handling different bioinstrumentation techniques.
- It describes the principles and applications of centrifugation and chromatographic techniques in detail.
- Develops clear understanding on laboratory techniques and methodologies.

COURSE OUTCOME

1. It offers the students with an opportunity to gain basic **skills** on the bioinstrumentation and concepts of principles
2. It will help to understand the advanced technologies in Bioinstrumentation.
3. It will make the students to understand the principles of all bioinstrumentation in life science.
4. Students can able to apply the concept in their research and activities.
5. Better understanding on biomedical research and laboratory techniques.
6. Application in medical, Industry and environmental field

UNIT – I

Basic instruments and Spectroscopy: Principles and instrumentation of pH Meter, incubator, hot air oven, autoclave, colony counter and biological safety cabinet. Properties of electromagnetic radiations. Principles, instrumentation and applications of colorimeter and UV-Visible light spectrophotometer.

UNIT – II

Chromatographic techniques: Introduction, principles of chromatography. Instrumentation of paper and thin layer chromatography (TLC). Principles of column chromatography, Low pressure liquid chromatography (LPLC) and High performance liquid chromatography (HPLC).

UNIT – III

Centrifugation techniques: Introduction, principles of sedimentation, types and safety aspects of centrifuges. Principles and applications of differential centrifugation, density gradient centrifugation. Instrumentation of low speed, high speed and ultra speed centrifuges.

UNIT – IV

Electrophoretic techniques: Principles, instrumentation and applications of agarose gel electrophoresis, Sodium doecyl sulphate – polyacrylamide gel electrophoresis (PAGE). Factors affecting electrophoresis system.

UNIT – V

Radioisotope techniques: Introduction, nature of radioactivity, types of radioactive decay, units of radioactivity. Principles and instrumentation of Geiger Muller counter, solid and liquid scintillation counter. Bio-safety in radioisotope laboratory.

7. Alan S, Morris, 2005. 3rd Edition. Measurements and Instrumentation Principles. Linacre House, Jordan hill, Oxford Professional Publishing Ltd.

Instruction Hours / week: L: 0 T: 0 P: 5 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 6 Hours

COURSE OBJECTIVES

- To enhance the students knowledge on various aspects of microbial physiology like growth, extremophiles studies and chemical characterization of microbes.
- To provide the updated **employment** opportunities present in advanced microbiological techniques.
- To explain the basic identification procedures for all groups of microorganisms.
- To describe the biochemical pathways of microorganisms.
- It develops the skill based analysis on microbiological assays.
- Students can be able to differentiate different group of microorganisms based on their metabolism.

COURSE OUTCOME

1. To students will get the knowledge of microbial physiology and characterization.
2. It will help the students to enhance the knowledge in latest technologies of Microbiology.
3. It explains the anaerobic microorganisms' cultivation methods.
4. The students can be able to determine the growth parameters of microorganisms.
5. It will describe the overall chemical characterization of microorganisms.
6. Fundamental classification of microorganisms groups will be performed.

Contents

1. Cultivation of anaerobic microorganisms – Wrights tube – Mc' Intosh anaerobic jar-Candle jar method.
2. Measurement of microbial growths– Turbidity methods – Determination of generation time
3. Chemical characterization –
 - a) Indole
 - b) MR
 - c) VP
 - d) Citrate utilization tests
 - e) TSI test
 - f) Catalase
 - g) Oxidase
 - h) Urease
 - i) Hydrogen sulphide production test
 - j) Carbohydrate fermentation tests
 - k) Starch
 - l) Casein hydrolysis tests
 - m) Gelatin hydrolysis tests

Instruction Hours / week: L: 4 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVES

- An introduction to know about the biological substance which has the medicinal value.
- It aids to improve the biopharmaceutical components and technical skills.
- To study the origin, types and action of drugs.
- It will help to study the effects on drugs on human health and legislations on them.
- Acquire knowledge on the action and effects of drugs on human health.
- It will explain the fundamentals of purification techniques.

COURSE OUTCOME

1. It provides the basic concept about the components and technique involved in the field of biopharmacy.
2. It will nourish the **entrepreneurial** skills in the bio pharmacy field.
3. It will make the students to understand the extraction
4. purification methods from natural sources.
5. Students can able to perform all chromatographic techniques.
6. It will help the students to understand the bioactive compounds analysis from plant extracts .

UNIT – I

Phytochemistry: Biosynthesis of primary and secondary metabolites - alkaloids, terpenoids. Phenolic compounds and coumarins. Classification and sources of alkaloids. Major classes in phenolic compounds – carotenoids, flavonoids, tannins and phenolic acids. Classification of terpenoids.

UNIT – II

General extraction and isolation techniques for compounds from plants. Techniques involved in extraction of phytochemicals – Percolation, Soxhlet extraction, Supercritical Fluid extraction, Pilot scale extraction, reflux and other methods.

UNIT – III

Isolation and purification techniques – Thin layer and Column chromatography. Chemical fingerprinting – HPLC and HPTLC.

UNIT – IV

Biotechnology of medicinal plants: Production of secondary metabolites from cultured plant cells, elicitation, immobilization and biotransformation. Medicinal plants – Plant DNA isolation.

UNIT – V

Bioactive studies: Anticancer, antidiabetic, anti-inflammatory, hepatoprotectives, antimicrobials from medicinal plants. Antioxidants of plant origin – Reactive Oxygen Species (ROS), antioxidant polyphenols.

3. Irfan A. Khan and Atitya Khanum, (Eds.) 2004. Role of Biotechnology in medicinal and Aromatic plants, Vols. I-X. Ukaaz Publications, Hyderabad.

Instruction Hours / week: L: 4 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVES

- On successful completion of the course the students should have understood the Basic skills on handling the bio-molecules, polysaccharides, lipids, proteins, nucleic acids, vitamins and minerals.
- It will explain the basic concepts on carbohydrates and their structural properties.
- Students can able to distinguish types of lipids and their properties.
- It will determine the genetic concepts of nucleic acid in all living forms.
- Students will study different types of enzymes and their activities.

COURSE OUTCOMES

1. To enable the students to learn the basic **skill** oriented knowledge on the functions, structures and biological importance of lifeless chemical compounds.
2. Students can able to define the structural identification of sugar molecules.
3. It will narrate the fundamentals of enzyme analysis and their activation sites.
4. Students can be able to differentiate different types of lipids.
5. Students can understand the fundamentals on nucleic acid synthesis
6. Students can understand the protein synthesis.

UNIT - I

Carbohydrates: Monosaccharides-Definition, classification, structure and properties. Disaccharides-Definition, types, structure and biological importance. Polysaccharides-types and properties.

UNIT - II

Lipids:- Definition, Classification and properties of lipids- Phospholipids, Glycolipids and Sphingolipids. Types of fatty acids -saturated, unsaturated and essential fatty acids. Classification and significance of lipoproteins. Importance of steroids, structure and biological significance of cholesterol.

UNIT - III

Amino acids: Classification of amino acids, essential amino acids, reactions of amino and carboxyl groups of amino acids. Proteins: Definition, classification and function of Proteins, structural levels of organization Denaturation and isoelectric point of Proteins.

UNIT - IV

Nucleic acids: Components of DNA and RNA. Double helical structure of DNA. Structure and types of RNA. Denaturation and renaturation of DNA. Genetic code. Protein synthesis (an outline)

UNIT - V

Enzymes: Classification of enzymes with examples, coenzymes and cofactors (structures not needed). Active site: Lock and Key model, Induced fit hypothesis. Factors affecting enzyme activity. Types of inhibition of enzyme action. Chemical and industrial applications of enzymes.

3. Robert K. Murray, Daryl K. Granner, Peter A. Mayes, Victor W. Rodwell, 2012, Harper's Biochemistry, 29th edition, McGraw-Hill Medical, London.

Instruction Hours / week: L: 4 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVE

- This paper aims at introducing students to the basic and applied entrepreneur aspects of plant biotechnology.
- It explains the fundamental requirements for plant tissue culture techniques.
- The students can able to study the different composition medium used for the plant tissue culture.
- It will demonstrate the transgenic plants and resistant plants propagation techniques.
- Students can able to distinguish the advanced genetic engineering techniques.
- It will explain the different media and hormone requirements for plant tissue culture.

COURSE OUTCOME

1. This **skill** oriented subject will enable for learning the techniques to save endangered species which will be useful for mankind.
2. Students can able to understand the history of plant tissue culture and related advanced genetic studies.
3. Students can able to understand the genetic engineering
4. Students can able to understand the genomic organization of plants.
5. It will distinguish the mitochondrial genome organization.
6. It will helps the students to understand the skill based technology involved in plant biotechnology

UNIT - I

Introduction: History of plant tissue culture, callus culture, cell suspension culture, regeneration, micropropagation, anther culture, meristem culture, embryo culture, somatic hybridization.

UNIT - II

Culture media: Composition of media, types of media, nutrient contents and hormone requirement. Preparation of media, sterilization of media, types of sterilization, surface sterilization.

UNIT -III

Genetic engineering A: Structure and organisation of plant genome, regulation of plant genome expression, transcriptional, translational and post transcriptional regulation of plant genome. Transposons, chloroplast and mitochondrial genome.

UNIT - IV

Genetic engineering B: Vector for the production of transgenic crop, plant virus vector, Transformation techniques, electroporation, particle gun bombardment, Agrobacterium, Integration of transgene.

UNIT - V

Applications: Transgenic plants, herbicides resistance, pest or insect resistance plants; Molecular farming and pharming: carbohydrates, lipids, therapeutic proteins, edible vaccines, purification strategies- oleosin partition technology.

TEXT BOOKS

1. Singh, B.D. 1998. Text Book of Biotechnology, Kalyani Publishers.
2. Neal Stewart, C. 2008. Plant Biotechnology and Genetics. John Wiley & Sons Inc., NJ.

REFERENCE

1. Slater, A., W. Nigel and M.R. Fowler. 2008. Plant Biotechnology, Oxford University Press, Oxford.

Instruction Hours / week: L: 0 T: 0 P: 3 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVES

- To make students familiar with practical techniques used for studying biomolecules.
- These techniques like extraction of biomolecules and
- Analysis of using methods like soxhlet and chromatography.
- It will ensure the students with **employment** oriented knowledge and methodologies.
- It will demonstrate the practical knowledge to do chromatographic techniques.
- Students will understand the biochemical analysis using various methodologies.

COURSE OUTCOME

1. The students will get the job oriented knowledge about various methods of analyzing biomolecules.
2. It will make the students to gain basic knowledge on bioinstrumentation techniques.
3. Students can do analysis on biomolecules analysis using various extraction methods.
4. Students able to know the solvents role in extraction
5. It will help the students to apply technical skills on research oriented activities.
6. The concept of this practical will make the students to get familiar with bioactive compound analysis for their entrepreneurial requirements.

Experiments:

1. Extraction Techniques
 - a. Percolation
 - b. Soxhlet method
2. Thin Layer Chromatography
3. Column chromatography
4. Analysis of a compound in HPLC
5. Analysis of a compound in HPTLC

REFERENCES

1. Trease, G E and M. C. Evans, Textbook of Pharmacognosy 1979. 12th ed. Balliere Tindal, London.
2. Harborne, J. B. 1984. Phytochemical Methods. London: Chapman and Hall Ltd, London.
3. Lloyd R. Snyder, Joseph J. Kirkland, Joseph I. Glajch, 1997, Practical HPLC method development, John Wiley and Sons 2nd Edition, USA.

Instruction Hours / week: L: 0 T: 0 P: 3

Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVES

- To bring an effective practical skill oriented techniques for studying the biomolecules.
- The analysis techniques for carbohydrates and amino acids will provide an entrepreneurial knowledge.
- The study aimed to help the students to study carbohydrates analysis.
- It will explain the amino acid analysis for protein related studies in life science.
- This course will help the students to develop practical knowledge on bio molecules.
- The students can understand the lipid characterization based on numbers.

COURSE OUTCOME

- The **skilled** study will provide strong platform on various methods of analyzing biomolecules.
- The students will analyze the biomolecules for various studies and research activities.
- Students can be to differentiate the carbohydrates from protein
- Students able to know the amino acids and lipid classes.
- This course will make the students to exhibit the laboratory analysis on drug discovery from various sources.
- This course will make the students to understand the fundamentals of biochemistry analysis.

Contents**I. QUALITATIVE ANALYSIS**

1. Analysis of carbohydrates: a. Monosaccharides- Pentose- Arabinose.
Hexoses- Glucose, Fructose,
b. Disaccharides- Sucrose, Maltose, and Lactose
c. Polysaccharide- Starch.
2. Analysis of Amino acids: a. Histidine b. Tyrosine.
c. Tryptophan d. Arginine
e. Alanine f. Methionine

II. CHARACTERISATION OF LIPIDS [Group experiment]

1. Determination of acid number.
2. Determination of iodine number.

REFERENCES

1. Jayaraman J. 2007. Laboratory Manual in Biochemistry, New Age International Publishers, New Delhi.
2. Sadasivam S and A. Manickam. 2009. Biochemical Methods, New Age International Publishers, New Delhi.
3. Singh.S.P.2009. Practical Manual of Biochemistry, CBS Publishers, New Delhi.

Instruction Hours / week: L: 0 T: 0 P: 3 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVES

- This study will impart the basic **skilled** concept of plant biotechnology
- Understand the concept of advanced technology for plant breeding.
- It help the students to understand the culture media preparation for plant propagation.
- It explains the explants preparation for plant tissue culture techniques.
- The students can distinguish the micro propagation of plants for advanced genetic engineering techniques.
- Students can understand the somatic embryogenesis and its fundamentals.

COURSE OUTCOME

1. This course is an employment oriented study with comprehensive techniques with more advantages.
2. This course will help the students to understand the advanced agricultural technologies.
3. Able to develop new variety of plants
4. This skill based techniques will make them to apply the skills in the field trial studies.
5. It will explain the students to undergo artificial seed preparation techniques.
6. This course will make the students to do research in agriculture for sustainable production.

Experiments:

1. Culture Media preparation
2. Sterilization process
3. Preparation of explants
4. Surface sterilization
5. Callus induction and differentiation
6. In vitro germination of seed
7. Isolation of protoplast
8. Somatic embryogenesis
9. Micropropagation
10. Artificial seed preparation
11. Hairy root culture

REFERENCES

1. Aneja,K.R., 2004. Experiments in microbiology plant pathology and biotechnology. IV Edition, New age International Pvt. Ltd., Publisher, New Delhi

Instruction Hours/week: L: 4 T: 0 P: 0 Marks: Internal: 100 Total: 100 Marks

COURSE OBJECTIVES

- Know the basic **skilled** concept of computers.
- Understand the concept of Ms-word, Ms-Excel.
- Be able to work in Ms-PowerPoint.
- Knowledge about internet and the usage of E-Mail services.
- It will describe the basic operating system in computers.
- This course will deliver all basic concepts for Internet Technology.

COURSE OUTCOME

1. This course provides student with a comprehensive study of the introduction to computers.
2. It provides the knowledge of office package.
3. This course also intends to teach the usage of internet on the employment basis.
4. Students can able to perform MS Office programs
5. It will help the students to understand the Internet and its components.
6. This skill based course will make the students to explore in entrepreneurial too.

UNIT - I

Introduction- Characteristics of computers- development of computers- generations of computers- classification of computers-the computer system- types of Input/ Output and memory devices- computer software-categories of software.

UNIT - II

Starting with MS Office Word – Working with Text – working with tables-Checking spelling and grammar- adding graphics to document- Mail merge- printing a document – Advanced features of MS Office Word- Keyboard shortcuts.

UNIT - III

Starting with MS Office Excel- Working with Excel workbook-working with worksheet-formulas and functions-inserting charts-sorting-importing data-printing in excel- Advanced features of MS Office Excel.

UNIT - IV

Starting with MS Office PowerPoint – Working with PowerPoint- Working with different views- Designing Presentations- Slide Show.- Printing in PowerPoint.

Unit - V

The Internet-Evolution of Internet-Owner of Internet- Anatomy of Internet – Internet Terminology- Getting Connected to Internet- Web Brower- Electronic Mail- Search engines- Uses of internet to society.

TEXT BOOK

1. Fundamentals of Computers: For Undergraduate Courses in Commerce and Management, ITL Education Solutions.2011. Pearson, New Delhi.

REFERENCES

1. Pradeep K.Sinha ,Priti Sinha. 2007. Computer Fundamentals, 6th Edition BPB Publications, New Delhi.
2. V. Rajaraman, 2003.. Fundamentals of Computers, Prentice-Hall of India Pvt. Ltd.
3. Wallace Wang 2007. Microsoft Office. For Dummies,1st Edition Wiley Publishing Inc.

Instruction Hours/week: L: 4 T: 0 P: 0 Marks: Internal: 100 Total: 100 Marks

COURSE OBJECTIVES

- This course in curriculum is an introduction to the multimedia and its applications in entrepreneurship.
- This course enables students to understand how the web pages are designed interactively.
- How to critically evaluate website quality, learn how to create and maintain quality web pages learn to create and manipulate images.
- To gain the skills and project-based experience needed for entry into web design and development careers.
- To explore the basic computer knowledge in advanced multimedia tool.
- The students can to able to analyze the advanced tools in multimedia technology.

COURSE OUTCOME

1. This course provides student with a comprehensive study of the introduction to computers.
2. It provides the knowledge of office package. This course also intends to teach the usage of internet.
3. Acquire basic **entrepreneurial skills** on Multimedia devices.
4. Understand current trends in multimedia by experiencing a variety of applications and development packages.
5. This course will help the students to perform graphics programs.
6. Better understanding on the advanced multimedia tools in computer operating system.

UNIT - I

Multimedia – An overview: Introduction – Multimedia presentation and production – Characteristics of Multimedia presentation – Hardware and Software Requirements – Uses of Multimedia. Text: Types of text - Font - Text File formats. Image: Image data representation – Image file formats – Image processing software. Graphics: Advantages of graphics – Uses – Components of a graphics system.

UNIT - II

Audio: Sound waves – Types and properties of sound – Components of audio system – Digital audio - Musical Instrument Digital Interface (MIDI) – Audio file formats – Audio processing software. Video: Motion video – Television systems – Video file formats – Video processing software. Animation: Uses of animation – Computer based animation – Animation file formats – Animation software.

UNIT - III

Introducing Photoshop elements: About elements – Welcome screen – Create mode – Menu bar – Toolbox – Options bar – Panels. Organizing images: Obtaining images – Tagging images - Searching for images - Opening and saving images. Selecting Areas – Layers – Text and Drawing Tools.

UNIT - IV

Understanding Flash: Understanding Flash basic elements – Creating a simple animation. Learning Flash Toolbox: Learning the toolbox – Using tools. Learning Flash Panels: Understanding the panels. Using timeline and layers: Understanding how timeline works – Understanding layers. Drawing objects: Drawing lines and fills – Using colors – Rotating, skewing and scaling – Grouping objects.

UNIT - V

Creating animation – How animation works – Creating motion tweens – Creating shape tweens. Understanding masks – Creating masks. Creating symbols and using the library: Learning about symbols – Creating symbols – Using libraries. Learning Basic ActionScript concepts: ActionScript basics – Data type basics.

TEXT BOOKS

1. Ranjan Parekh, 2013, Principles of Multimedia, 2nd Edition, Tata McGraw hill . (Unit I, Unit II)
2. Nick Vandome, 2011, Photoshop Elements 9, Tata McGraw hill. (Unit III)
3. Brian Underdahl, 2002, Macromedia Flash MX – A Beginners Guide, Dreamtech Press. (Unit IV, Unit V)

REFERENCES

1. Tay Vaughan, 2002, Fundamentals of Multimedia, 5th Edition, Tata McGraw-Hill.
2. Bill Sanders. 2001. Flash5 Action Script, 1st Edition, Dream Tech Press, New Delhi

Instruction Hours / week: L: 2 T: 0 P: 0 Marks: Internal: 100 External: Nil Total: 100

COURSE OBJECTIVES

- To impart knowledge on both Aptitude and Soft skills to the students
- To critically evaluate various principles involved in solving mathematical problems
- To demonstrate data arrangements
- To adopt new and faster methods of calculations.
- Reinforcing competencies in soft skills
- To develop softskill which are crucial in a social setting

COURSE OUTCOME**Upon completion of the course students able to**

1. Achieve the analytical competencies
2. Improve their communication **skills**
3. Achieve the reasoning competencies
4. Move with professionals
5. Success in group discussion
6. Presentation **skills** on basis of employment.

UNIT - I

Time, Speed and Distance, Time and Work, Pipes and Cisterns, Geometry, Data Arrangement

UNIT – II

Analogy, Logic based Venn diagram, Probability, Permutation and Combination, Logarithms

UNIT – III

Data Sufficiency, Clocks, Calendar, Reading Comprehension, Sentence Correction, Sentence Completion, Spotting the Errors, Jumbled Sentences

UNIT – IV

Synonyms, Antonyms, Verbal Analogy, Statements and Assumptions, Group Discussion

UNIT - V

Resume Writing, Introduction to HR rounds, Time Management, Attitude and Behaviour

Instruction Hours / week: L: 4 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVE:

- To help students enhance their Language skills
- To introduce different kinds of literary works
- To familiarize different genres of Literature
- To instruct moral values through literature.
- To improvise their productive and receptive skills
- To strengthen the basic knowledge about grammar

COURSE OUTCOME:

1. Develop the four types of skills
2. Reading and comprehending literary works
3. Genres of literature to provide moral education
4. Develop communication skills in business environment
5. Interpersonal skills will be developed.
6. Betterment of language competence

UNIT - I

Concept of Communication – Barrier to Communication –Body language – Personality Development – Etiquette and Manners- Soft Skills – Emotional Intelligence

UNIT - II

Listening Comprehension – Reading Comprehension – Paragraph writing – Precis Writing – Writing Resume and Covering Letter -Speaking – Welcome Address, Vote of Thanks, Compering, Debates, Role Play, Dialogues – Vocal Communication Techniques. Voice, Quality, Volume, Pitch

UNIT - III

Dicto Composition – Letter Writing (Informal, Letters to the Editor etc) – Term paper – Book reviews

UNIT - IV

Business Correspondence – Layout of Business Letter – Formal Styles of Business Letters – Letters of Acceptance, Appointment, Resignation, Complaint, Sending E-mails.

UNIT - V

Effective Presentation – Planning – Audience Analysis –Logical Sequencing – Timing of the Presentation – Conclusion – Answering Queries – Group Discussion – Interview.

TEXT BOOK

Bachelor of Science, Microbiology, 2015. Karpagam Academy of Higher Education, Coimbatore, India – 641 021.

1. Juneja. P. Om and Aarati Mujumdar, “*Business Communication -Techniques and Methods*”, Orient Blackswan Pvt. Ltd., Hyderabad: 2010.

REFERENCES

2. Balasubramanian M and G Anbalagan. Performance in English. 2007. Anuradha Publications: Kumbakonam
3. Mohan, Krishna and Meenakshi Raman. 2008, Effective English Communication, Tata McGraw Hill: New Delhi.
4. Selley, John. Oxford Guide to Effective Writing and Speaking. 2005. OUP: New Delhi.

Instruction Hours / week: L: 6 T: 0 P: 0

Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVES

- To focus on the basic principles of genetics incorporating the concepts of classical, molecular and population genetics.
- Compilation is required for recent advances in genetic principles for strong foundation in Biotechnology that improve their chances of employability in biotechnological industries
- To explain the mutagen and process of mutation
- To explain about DNA as a genetic material
- To paraphrase the genetic material structure and model
- To explain the concept of recombination, linkage mapping and elucidate the gene transfer mechanisms in prokaryotes and eukaryotes

COURSE OUTCOME (CO'S)

1. This course provided candidates with basic knowledge and understanding of Molecular Biology with special reference to microbial genome.
2. Students undertaking this course will be able to describe the nature of molecular world and its application in modern Microbiological sectors.
3. Students able to understand the properties, structure and function of genes in microorganism at the molecular level
4. Describe the importance of genetic code and operon concept
5. Discuss the molecular mechanisms underlying mutations and repair mechanisms
6. Able to summarize the concept of recombination, linkage mapping and elucidate the gene transfer mechanisms in prokaryotes and eukaryotes

Unit – I

Historical development – Mendelian principles – Morgan's Hypothesis– DNA as a genetic material, Experimental evidence – Chromosomal theory of inheritance.

Unit – II

Structure and function of DNA and RNA - DNA replication – Enzymology of DNA replication – Different modes of DNA Replication - Models of DNA replication -Types of DNA replication-Eukaryotic DNA replication. Organization of gene and chromosome.

Unit – III

Genetic code - transcription – translation – Polypeptide synthesis (maturation and processing of RNA), Regulation of Gene expression- Operon concept – lactose, tryptophan and arabinose,

Unit – IV

Mutagens -Mutagenesis -Mutation – Spontaneous and Induced-Types of Mutation –Mutant detection- Mutant selection- Luria and Delbruck experiment-Ames test. DNA repair mechanisms.

Unit – V

Genetic recombination in bacteria – Conjugation, transformation, transduction. Importance in Genetics - Linkage and genetic mapping

5. Lewin, 2007 Genes IX, 9th Edition, Jones & Bartlett.
6. Watson, J.D., and Baker, T.A., Bell, S.P. Gannm, A. and Levine, M. 2004. Molecular Biology of Genes. 5th Edition, Pearson Education.

Instruction Hours / week: L: 6 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVES

- To provide a strong base in the fundamentals of bacteria.
- To learn techniques and methods used in the cultivation and isolation of bacteria.
- To develop **skills** related to preservation of bacterial cultures.
- To learn about bacterial specialized structure using staining methods
- To learn the bacterial special structure capsule and spore
- To measure the bacterial size

COURSE OUTCOME (CO'S)

Students able understand and perform

1. Various Culture media and their applications
2. Various microbial culture techniques to obtain isolation of pure cultures of bacteria
3. Bacterial endospore and capsule
4. Able to analyze the Bacterial size
5. Identification of bacteria
6. Able explain the bacterial motility and flagella

UNIT – I

Scope of clinical Bacteriology - Safety precautions in Bacteriology laboratory – Aseptic collection – transportation – handling of pathological specimens (blood, urine, sputum, pus and stool) – Microscopic examination of pathological specimens – Antibiotic susceptibility testing (Kirby Bauer method).

UNIT – II

Definitions of pathogens, saprophytes and commensals - Infections – Sources and methods – Infectious disease cycle – Definitions of Endemics, Epidemics and Pandemics - Investigation of epidemics and its control.

UNIT – III

Gram positive bacteria: Morphology, cultural characteristics, pathogenecity and laboratory diagnosis. *Staphylococcus aureus*, *Streptococcus pyogenes*, *Bacillus anthracis*, *Corynebacterium diphtheriae*, *Clostridium tetani* and *Mycobacterium tuberculosis*.

UNIT – IV

Gram negative bacteria: Morphology, cultural characteristics, pathogenecity and laboratory diagnosis. *E. coli*, *Klebsiella pneumoniae*, *Proteus vulgaris*, *Pseudomonas aeruginosa*, *Vibrio cholerae*, *Salmonella enterica* (typhi), *Shigella dysenteriae* and *Treponema pallidum*.

UNIT – V

Normal microbial flora of the human body (skin, intestinal tract, genitourinary tract and respiratory tract). Pyrexia of unknown origin. Bacteria in blood and tissues - Vaccines and Antibiotics.

2. Jawetz, E., J.L. Melnic and E.A. Adelberg, 2001. Review of Medical Microbiology. 22nd Edition. Lange Medical Publishers, NY.
3. Thomas, P.A., 2007. Clinical Microbiology. Orient Longman Private Ltd, New Delhi.

Instruction Hours / week: L: 0 T: 0 P: 5 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 6 Hours

COURSE OBJECTIVES

- To make students practically familiar with skilled techniques on microbiology mainly includes the mutation technique and identification of major bacterial pathogens.
- Upon completion, students gained the knowledge of most common medically important organism and the infections they cause.
- Different approaches, techniques and tools used to identify pathogens and control them.
- Diagnostic approaches for microbial pathogens 14
- Developing efficient vaccines and new drugs

COURSE OUTCOME

1. To educate students about mutagenesis and pathogenic bacteria isolation.
2. To nurture the students with basic **employment** skills in advanced microbiology field
3. The students will be able to analyze the bacteria growth and growth condition
4. Able to identify the various factors for optimal growth of *E.coli*.
5. Understand the basic microbial structure and functions of various physiological groups of prokaryotes.
6. Able to utilize the various Culture media in the proper physical condition for fermentation
7. Able to explain the microbial metabolism – Autotrophy and heterotrophy modes of nutrition
8. Students able to understand the physical and chemical growth requirements of bacteria and thermal death time of bacteria.

Contents

1. Mutant isolation of gradient plate method
2. Mutagenesis by UV radiation
3. Isolation of streptomycin- resistant mutants by replica plating techniques
4. Extraction of nucleic acid from *E.coli*
5. Unidirectional transfer of genetic material- Bacterial conjugation
6. Genetic recombination in bacteria by transformation
7. Identification of major bacterial pathogens – *Escherichia coli*, *Klebsiella*, *Proteus*, *Salmonella*, *Shigella*, *Pseudomonas*, *Staphylococcus aureus*, *Streptococcus pyogenes*
8. Preparation of antibiotic disc
9. Antibiotic sensitivity testing – disc diffusion method.

3. Jayaram, J. 2002. Lab Manual in Biochemistry. New Age International P. Ltd., Publishers, New Delhi.

Instruction Hours / week: L: 0 T: 0 P: 0 Marks: External:100

Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVES

- To strengthen the knowledge of personal health care to students
- To know the content on vaccine and its schedule throughout the life time for all age group.
- Diagnostic approaches for microbial pathogens
- Developing efficient vaccines and new drugs
- How to maintain hygiene
- To know about parenting

COURSE OUTCOME:

Introducing the basics about the health care and to study various types of vaccines to control the life time Infectious disease.

1. Students able to know the ethical, cross-cultural, and historical context of environmental issues and the links between human and natural systems.
2. Understand the transnational character of environmental problems and ways of addressing them, including interactions across local to global scales.
3. Apply systems concepts and methodologies
4. Analyze and understand interactions between social and environmental processes.
5. Reflect critically about their roles and identities as citizens and consumers
6. Environmental actors in a complex, interconnected world.

UNIT – I

Vaccination: History –Types of vaccines –conventional and modern vaccines, Route of administrations –mechanisms of inducing immunity.

UNIT – II

Vaccination schedule for adults - Hepatitis B vaccines, MMR – Tetanus - Varicella vaccines. Vaccines for travelers.

UNIT – III

Vaccines for 50 - year-old adult - types and routes. Vaccines for 65 – year - old adult - types and routes. Vaccines for healthcare workers.

UNIT – IV

Child health management - General health - Types of infection in child - Growth and development – Nutrition and fitness - Positive parenting.

UNIT – V

Vaccination schedule in children – New born - Child below 5yrs - Child below 10years Vaccines at adolescent age. Vaccine risks and safety.

5. Reed, G. (Editor), 1998. Prescott and Dunn's Industrial Microbiology. 4th Edition, CBS Publishers and Distributors, New Delhi.

Instruction Hours / week: L: 4 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVES

1. It explains the concept, principles on control and management of manufacturing and quality control testing of biopharmaceutical products.
2. It includes a view on regulatory issues involving the trends in biopharmaceutical industry and changing regulatory needs related to products.
3. To Understand the basics of pharmaceutical microbiology and important microorganism playing role pharmaceutically
4. To understand different products of microbial origin playing key role in pharmaceutical applications.
5. To understand role of secondary metabolites in pharmaceutical industry.
6. To understand good practices and regulation involved in utilizing microbial product for pharmaceutical application

COURSE OUTCOME

1. Provides knowledge in the large scale production of industrial product, providing the trends to cater the needs of industry.
2. This will help the students to enhance their employment knowledge on microbiology based commercial products.
3. The aim of the course is to give the students broad theoretical and practical skills in industrial microbiology.
4. This course covers the principles of various processes associated with the production and recovery of different bio-products derived from microorganisms.
5. The students will be able to discuss the role of microorganisms in industry,
6. The students will be able to carry out experiments to produce microbial metabolites.

UNIT – I

Pharmacognosy: Authentication of medicinal plants – Organoleptic and other pharmacognostic studies. Anatomical studies of medicinal plants.

UNIT – II

Analysis of drugs from biological samples, extraction of drugs by various methods as LLE, SPE and Membrane filtration. Factors affecting extraction of drugs.

UNIT – III

Various types of raw materials used in the drug industry for the manufacture of finished products. General method of analysis to determine the quality of raw materials used in drug industry.

UNIT – IV

Indian Standard Specifications (ISI) laid down for sampling and testing of various drugs in finished form by the Bureau of Indian Standards.

UNIT – V

Toxicity testing in drugs and Safety and Legislation of drugs. Intellectual Property Rights (IPR) - patents, copy rights, trade marks. Patenting of biological material. Organic cultivation of medicinal plants.

Instruction Hours / week: L: 4 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVE

- To familiarize the students with the basic cellular processes at molecular level
- To make students familiar with practical techniques used for studying biochemical structure and analysis of biochemical methods.
- To expertise in Qualitative/Quantitative tests of carbohydrates, reducing sugars, Protein and lipids
- To study the protein secondary and tertiary structures
- To study the effect of temperature, pH and heavy metals on enzyme activity.
- To gain the knowledge on vitamin estimation

COURSE OUTCOME

1. The practical knowledge and the skills associated about various techniques used in Biochemistry.
2. The skill in qualitative and quantity analysis of carbohydrates, protein and lipid
3. An understanding in protein secondary and tertiary structures
4. An insight in enzyme activity and its physical factors influence the activity
5. Knowledge on vitamin estimation
6. Cognitive skill and students able to solve the numerical problems

UNIT I

Buffers: Concept of acid base indicators, buffer systems of blood and body fluids. Components of the pH meter and the concept of pH. Chromatography: Paper, TLC, Molecular sieve and affinity chromatography- principal and applications.

UNIT II

Electrophoresis: Paper and Gel- Principles and applications of colorimetry and spectrophotometry. Isotopes: Definition and units of radioactivity: examples of natural and heavy isotopes in biological investigations.

UNIT III

Bioenergetics: Basic principles of thermodynamics – entropy, enthalpy and free energy; highenergy phosphates, oxidation-reduction reactions. Mitochondria: - Respiratory chain and oxidative phosphorylation.

UNIT IV

Metabolic pathways: Carbohydrate metabolism: Glycolysis, TCA cycle, HMP shunt, Glycogenesis and glycogenolysis. Lipid metabolism: Beta-oxidation, biosynthesis of saturated fatty acids- Palmitic acid.

UNIT V

Protein metabolism: General pathway of amino acid metabolism – deamination, transamination and decarboxylation. Urea cycle. Inter-relationship of carbohydrate, fat and protein metabolism (Flow chart only).

TEXT BOOKS

1. Ambika, S, 2004. Fundamentals of Biochemistry for Medical Students, CIT Chennai.
2. Deb C., 2011, Fundamentals of Biochemistry, 9th edition New Central Book Agency, Calcutta.

3. Robert K. Murray, Daryl K. Granner, Peter A. Mayes, Victor W. Rodwell, 2012,
4. Harper's Biochemistry, 29th edition, McGraw-Hill Medical, London.

Instruction Hours / week: L: 4 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVE

- To provide an experience for the students in an interdisciplinary research program connecting animal genomics with animal reproduction and biotechnology.
- Identification and characterization of animal breeds,
- Developing DNA - based diagnostics and genetically engineered vaccines for animals,
- Studying animal genomics and its varied applications
- Developing embryo - transfer technology, cloning, transgenic animals.
- DNA forensics, cloning, wildlife conservation, stem cell research and bio - processing technologies are other important areas of animal biotechnology

COURSE OUTCOME

1. This course explores technologies using molecular biology, embryo manipulation
2. cell and tissue culture to manipulate the genomes of animals for ways to improve the live stock for food production and biomedical purpose.
3. Different culture medium for tissue culture
4. Learn the transgenic animal model.
5. Handling different instruments in lab.
6. Able to understand the importance of animal tissue culture

UNIT - I

Scope of Animal Tissue Culture: Laboratory design: aseptic techniques – handling instruments: Microscopes, Clean-bench, and bio safety.

UNIT - II

Animal Cell Culture Media: Natural and artificial media – their constituents; Physicochemical properties of media; Serum and serum-free media.

UNIT - III

Primary Cell Culture: Isolations of tissues, Methods of tissue disaggregation, Suspension culture, Monolayer culture, organ culture – types, Continuous cultures.

UNIT -IV

Embryology: Gametogenesis and fertilization in animals; types of cleavage pattern; role of maternal contributions in early embryonic development; *In vitro* fertilization.

UNIT - V

Transgenic Animals: Production and applications; transgenic animals: sheep, fish; Expression of bovine growth hormone; production of human proteins in milk and meat.

TEXT BOOKS

1. Freshney, R.I. 2004. Animal Cell Culture: A Practical Approach. V Edn., John Wiley & Sons, NY.

4. Jenkins, N., 1999. Animal Cell Biotechnology Methods and Protocol. Humana Press, Totowa, New Jersey and Panima Publishing Corporation, New Delhi.

Instruction Hours / week: L: 0 T: 0 P: 3 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVES

1. To educate and enrich students on various methods of pharmacognosy and phyto chemical screening.
2. It includes a view on regulatory issues involving the trends in biopharmaceutical industry and changing regulatory needs related to products.
3. To Understand the basics of pharmaceutical microbiology and important microorganism playing role pharmaceutically
4. To understand different products of microbial origin playing key role in pharmaceutical applications.
5. To understand role of secondary metabolites in pharmaceutical industry.
6. To understand good practices and regulation involved in utilizing microbial product for pharmaceutical application

COURSE OUTCOME

1. Imparts skilled knowledge on good manufacturing practices and food spoilage of different types of foods.
2. Develop skills on Food and drug based microbiological analysis.
3. To encourage students to the entrepreneurs and develop the capacity for setting up small scale enterprises with respect to food and pharmaceuticals within the country.
4. To organize functions for creating awareness about the importance of safe processed nutritious food.
5. To provide diagnostic analysis of food and pharmaceutical products.
6. The students will be able to discuss the role of microorganisms in industry, as well as to carry out experiments to produce microbial metabolites.

Contents

1. Pharmacognosy –
 - a. Organoleptic studies
 - b. Chemical analysis of plant power
2. Anatomical studies
3. Phytochemical screening
 - Test for alkaloids
 - Test for flavonoids
 - Test for glycosides
 - Test for terpenoids
 - Test for saponins

REFERENCES

Instruction Hours / week: L: 0 T: 0 P: 3 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

Course Objectives

1. Provides much information related to carbohydrate, fat and protein metabolism that takes place in our body.
2. Interrelationship between carbohydrate, fat and protein metabolism.
3. Role of purine and pyrimidines in nucleic acid metabolism. Various disorders related to each metabolism
4. The course learning objectives is to provide the core principles and specialized knowledge of Carbohydrates, Lipids, Proteins, Vitamins, Porphyrin, cellular transport, law of thermodynamics, Lipid and Nitrogen metabolism.
5. Conceptual knowledge of Proteins and its classification. Primary, secondary, super secondary, tertiary and quaternary structure. The peptide bond- Ramachandran plot.
6. The knowledge of vitamins, its classification, porphyrins and porphyrin ring system.

COURSE OUTCOME

1. The practical knowledge and the skills associated about various techniques used in Biochemistry.
2. The skill in qualitative and quantity analysis of carbohydrates, protein and lipid
3. An understanding in protein secondary and tertiary structures
4. An insight in enzyme activity and its physical factors influence the activity
5. Knowledge on vitamin estimation
6. Cognitive skill and students able to solve the numerical problems

I. Quantitative estimation of the following in unknown solution.

1. Estimation of glucose (Anthrone method)
2. Estimation of phosphorus (Fiske-Subbarow method)
3. Estimation of urea (Dam TSC method)
4. Estimation of uric acid (Caraway method)
5. Estimation of iron (Wong's method)
6. Estimation of protein (Lowry's method)
7. Estimation of DNA (Diphenylamine method)
8. Estimation of RNA (Orcinol method)

II. Separation techniques (Group experiments)

1. Paper chromatography of sugars or amino acids (ascending)
2. Separation and identification of amino acids from mixture using TLC

Instruction Hours / week: L: 0 T: 0 P: 3 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

Course Objectives

- 1.To provide an experience for the students in an interdisciplinary research program connecting animal genomics with animal reproduction and biotechnology.
2. Identification and characterization of animal breeds,
- 3.Developing DNA - based diagnostics and genetically engineered vaccines for animals,
- 4.Studying animal genomics and its varied applications
- 5.Developing embryo - transfer technology, cloning, transgenic animals
- 6.DNA forensics, molecular diagnostics, cloning, wildlife conservation, stem cell research and bio - processing technologies are other import areas of animal biotechnology.

Course Outcome

1. Aseptic laboratory techniques in animal tissue culture
2. Preparation of Animal Tissue Culture Medium
3. Preparation of Primary culture
4. Quantification of cells by trypan blue dye exclusion method.
5. Identification of leukocyte subsets.
6. Determination of total leukocyte count
7. Cryopreservation of cell lines.

Instruction Hours / week: L: 5 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVES

- Discuss the fundamental mechanisms underlying protective immune responses and discuss the recent advances and emerging themes in immunology research.
- Describe the fundamental mechanisms underlying immunologic disease and associate these mechanisms with strategies for therapeutic modulation of the immune system.
- To provide overview of immune system, antigen antibody structure and interactions.
- To develop understanding of innate and adaptive immunity along with major cells and molecules involved.
- To integrate immunology with health and enrich the knowledge for autoimmune disorders, hypersensitivity reaction.

COURSE OUTCOME

1. Introducing the science of immunology
2. Know various types of immune systems their classification structure
3. Know the mechanism of immune activation.
4. Appreciate the basic immunological principles underlying biotherapeutics,
5. Recognize the commonality among diverse organ-specific disease states, and infer the mechanisms of therapeutic effect.
6. Understand and develop the [skill](#) related to immunological techniques.

UNIT – I

History of Immunology - Host parasitic relationships, Microbial infections, virulence and host resistance. Immunity - Innate immunity, Acquired immunity, Cell mediated Immunity, Humoral Immunity. Structures, composition and functions of cells and organs involved in immune system

UNIT – II

Antigens - types, properties, Haptens, adjuvants - vaccines – types, Toxoids - antitoxins. Immunoglobulins - structure, isotypes and properties - Theories of antibody production.

UNIT – III

Antigen - Antibody reactions – *In vitro* methods: Agglutination, precipitation, complement fixation, Immunofluorescence, ELISA, RIA, Immuno haematology – Blood groups – Blood transfusion reactions – Rh in-compatibilities.

UNIT – IV

Complement pathways – classical and alternative, function of complement components. Hypersensitivity reactions – Types and mechanisms. Auto immune diseases – Organ specific, Hashimoto's thyroiditis, Systemic, Rheumatoid arthritis. Immuno deficiency disease – DiGeorge syndrome.

UNIT – V

Major histocompatibility complex, Structure and function of Class - I and II MHC molecules. Transplantation immunology - Graft versus host reaction. Tumor Immunology.

Instruction Hours / week: L: 5 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVES

- Describe the structure and replication strategies of the individual viruses discussed, including the processes of entry into cells, control of gene transcription and where relevant translation and gene product stability, control of and mechanism(s) of genome replication, virion assembly and egress from the cell.
- The course covers the following objectives:
- Knowledge on history, general characters of viruses and how viruses are classified on basis of architecture and genetic material.
- Discerning the plant and animal viruses and their replication strategies inside the host and also methods used in cultivation and detection of viruses.
- Comprehend the bacteriophages and other phages and their application.
- Knowledge on some common plant and animal diseases caused by different viruses, viruses transmission and control.

COURSE OUTCOME (CO'S)

1. Upon paper completion, students will have **skill-based** knowledge on structure of plants, animal, bacteria and viruses.
2. This paper also enables the student on isolation, propagation of various viruses.
3. It will help the students to understand the plant and animal viruses.
4. Students can distinguish the viruses According to their characteristic features.
5. It will explain the research activities involved in virology studies.
6. Skill based viral analysis can be performed in medical research.

UNIT – I

Early development of virology - Classification of viruses based on their genetic material - Virus cultivation – purification and assay of viruses.

UNIT – II

The structure of viruses - virion – general properties of viruses – viral symmetry (Helical capsid, icosahedral capsid and complex) - Nucleic acid – viral envelopes and enzymes, viral replications.

UNIT – III

Classification of Bacteriophage - Reproduction of double stranded DNA phage (T4- phage) – one step growth experiment - Reproduction of single stranded DNA phage (phage Φ X174)

UNIT – IV

Classification and reproduction of animal and plant viruses - Viruses and cancer - General properties of viroids and prions.

UNIT – V

Morphology, Replication, and Pathogenesis of plant viruses (Tobacco mosaic virus, Cauliflower mosaic virus, Gemini virus) - Morphology, Replication, and Pathogenesis of animal viruses (Human immunodeficiency virus, Rabies virus, Pox virus, Herpes viruses and Influenza viruses).

Instruction Hours / week: L: 5 T: 0 P: 0**Marks: Internal: 40 External: 60 Total: 100****End Semester Exam: 3 Hours****COURSE OBJECTIVES**

- To encode the importance of the role of microorganisms in food industries both in beneficial and harmful ways.
- To obtain a good understanding of food microbiology and become qualified as microbiologist in food industries.
- To know the role of microbes which make crop output more and increase the fertility of crops.
- To provide students a basic understanding of environmental and agricultural microbiology including; microbial diversity in the environment in relation to environment and agricultural welfare, ecosystem wellness, microbial interactions with pollutants in the soil and environment and the fate of microbial pathogens in the environment and agricultural fields.
- Topics covered in detail include soil microbiology, aquatic microbiology, aero microbiology, biofertilizers and pesticides, microbial waste recycling and bioremediation etc.
- These topics were elaborated to students with their theoretical and practical use.
- The students will develop set of skills to recognise the ecological problems and critical evaluation of the human impacts on pollution, climate changes and as well as environmental protection.
- Familiarize students with general principles and subject knowledge in the field of environment and agricultural microbiology and to make students aware with current research in environmental and agricultural microbiology

COURSE OUTCOME

1. Provides job-oriented information about the role of microorganisms in many food, and beverage industries both in production and spoilage processes.
2. Develop job based output on industrial based technologies on Food microbiology.
3. It will explain the interactions between microorganisms and the food environment,
4. Know the Factors influencing their growth and survival.
5. Students able to apply these principles to understanding and solving problems in current environmental and agricultural issues.
6. Explain why microbiological quality control programmes are necessary in food production.

UNIT – I

Food and microorganisms – Important microorganisms in food – Fungi, Bacteria; Intrinsic and extrinsic parameters of food affecting microbial growth – Sources of contamination of food.

UNIT – II

Food preservation – principles – Food preservation using low temperature – characteristics of psychrotrophs – high temperature food preservation – characteristics of thermophiles – preservation of foods by drying chemicals and radiation – limitations – commercial application.

UNIT – III

Food borne diseases - Food poisoning - Food borne infection and Intoxication- Food control agencies- Microbiological criteria for food, microbial quality control and food laws, HACCP.

UNIT – IV

Biological Nitrogen fixation -symbiotic and non-symbiotic microorganisms, Root nodule formation - Nitrogen fixers – Hydrogenase – Nitrogenase – *Nif* gene – regulation - Biochemistry of Nitrogen fixation, Interaction of microbes with plants.

UNIT – V

Biofertilizer - Rhizobium, Azospirillum, Azotobacter, phosphobacteria, Plant Growth Promoting Rhizobacteria (PGPR) - Blue Green Algae (BGA) and Azolla - Production and quality control of biofertilizers., field application and crop response.

Instruction Hours / week: L: 5 T: 0 P: 0

Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVES

- Learn the occurrence, abundance and distribution of microorganism in the environment and their role in the environment and also learn different methods for their detection and characterization
- Understand the basic principles of environment microbiology and be able to apply these principles to understanding and solving environmental problems – waste water treatment and bioremediation
- To provide students a basic understanding of environmental and agricultural microbiology including; microbial diversity in the environment in relation to environment and agricultural welfare, ecosystem wellness, microbial interactions with pollutants in the soil and environment and the fate of microbial pathogens in the environment and agricultural fields.
- Topics covered in detail include soil microbiology, aquatic microbiology, aero microbiology, biofertilizers and pesticides, microbial waste recycling and bioremediation etc.
- These topics were elaborated to students with their theoretical and practical use.
- The students will develop set of skills to recognise the ecological problems and critical evaluation of the human impacts on pollution, climate changes and as well as environmental protection.

COURSE OUTCOME

1. It provides a comprehensive overview of biogeochemical processes relevant to environmental scientists and engineers mediated by microorganisms.
2. It will impart the student to develop their **entrepreneurial** knowledge on ecological behavior of microorganism.
3. It will distinguish biogeochemical cycles
4. This course will determine microbial role in nutrient cycling
5. This course can able to determine water quality,
6. It will explain the degradation of natural organic compounds and able to understand the pollutants in the environment.

UNIT - I

Aero biology : Droplet nuclei, aerosol, assessment of air quality-solid, liquid impingement methods. Air borne diseases – causative agent – viruses, bacteria and fungi and preventive measures.

UNIT - II

Aquatic microbiology: Water ecosystems - types of fresh water (ponds, lake, streams) marine habitats (estuaries, mangroves, deep sea, hydrothermal vents, salt pans, coral reefs). - Food chain. Potability of water- microbial assessment of water quality- water purification - Major water borne diseases and their control measures.

UNIT - III

Waste treatment: Types of wastes - solid and liquid wastes characterization; treatments- physical, chemical, biological; solid waste treatment – saccharification, gasification, composting. Liquid waste treatment- trickling- activated sludge - oxidation pond- oxidation ditch.

UNIT - IV

Bioremediation: Utilization for solid wastes - (SCP, mushroom, yeast): fuel (ethanol, methane) fertilizer (composting). Subterranean microbes and bioremediation. Waste disposal-solid, liquid, sewage.

UNIT - V

Positive and negative roles of microbes in environment: biodegradation of recalcitrant compounds - lignin - pesticides; bioaccumulation of metals and detoxification –biopesticides, biodeterioration of paper, leather, wood textiles, metal corrosion. Mode of deterioration- organisms involved -its disadvantages- mode of prevention. GMO and their impact.

4. Ralph Mitchell and Ji-Dong Gu, 2010. Environmental Microbiology. 2nd Edition. Wiley-Blackwell, A John Wiley and Sons, Inc., Publications.

Instruction Hours / week: L: 5 T: 0 P: 0

Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVE

- To give knowledge about urine analysis
- Hematology and blood analysis
- Blood Banking and basics of medical microbiology, clinical biochemistry, parasitology
- Serological test with reference to infection
- To test the stool sample for parasite
- To understand the abnormalities identification using human sample

COURSE OUTCOME

1. be skilled in current laboratory practices as entry-level practitioners.
2. demonstrate the ability to think critically and solve problems in a laboratory setting.
3. demonstrate the ability to communicate verbally and in writing.
4. act as ethical and responsible members of the health care team.
5. Diagnosis of different disease in clinic
6. It help in self employment by keeping diagnostic lab.

UNIT - I

Organization of the clinical laboratory and role of medical laboratory technicians. Safety regulations, first aid and clinical Laboratory records. General Comments on specimen collection.

UNIT - II

Haematology – Introduction, specimen collection and laboratory preparation in haematology, routine haematological tests. Clinical biochemistry – specimen required, Routine biochemical tests.

UNIT - III

Principles of Immunohaematology, Clinical significance of blood transfusion. Collection and processing of blood for transfusion. Transfusion reaction and hemolytic disease of new born. Blood grouping.

UNIT - IV

Slide Agglutination test: VDRL, WIDAL, ASO, CRP. Stool Examination: Microscopic examination of Ova, Cyst, Pus Cells. Hanging Drop Examination.

UNIT - V

Clinical pathology and urine analysis, Laboratory examinations of miscellaneous body fluids, semen analysis.

Instruction Hours / week: L: 5 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVES

1. This course has been designed to provide the student knowledge about eco friendly product which Play a crucial role in determining its future use and applications in environmental management.
2. Provides detailed idea about biofertilizer production and plant disease.
3. These topics were elaborated to students with their theoretical and practical use.
4. The students will develop set of skills to recognise the ecological problems and critical evaluation of the human impacts on pollution, climate changes and as well as environmental protection.
5. To apply these principles to understanding and solving problems in current environmental and agricultural issues.
6. Familiarize students with general principles and subject knowledge in the field of environment and agricultural microbiology.

COURSE OUTCOME

- To promote **entrepreneurship** skills and create awareness in production of Organic Inputs
- To acknowledge the participants with quality standards of Organic Farming inputs
- This course will determine microbial role in nutrient cycling
- This course can able to determine water quality,
- It will explain the degradation of natural organic compounds and selected pollutants in the environment.
- Students aware with current research in environmental and agricultural microbiology

UNIT – I

Introduction to Biofertilizers- Different types – its Application in Agriculture – Advantages of Biofertilizers over chemical fertilizers

UNIT – II

Types of carrier material used – its sterilization and processing – Glassware sterilization – Packing materials – Media preparation.

UNIT – III

Strain selection – Inoculum development – Mass production – Packaging – Quality control of different Biofertilizers (Rhizobium, Phosphate solubilizers, Azotobacter, Azospirillum, Mycorrhizae, Azolla, Algae)

UNIT – IV

Methods of application of Biofertilizers – Effects of Biofertilizer on crop yield – N₂ Fixation, phosphate solubilization – pot experiment – field trials.

UNIT – V

Methods and application of Biofertilizers in different crops – Groundnut, Rice and Vegetables

TEXT BOOKS

1. Subba Rao, N.S., 1999. Biofertilizers in Agriculture and Agroforestry. Oxford and IBH, New Delhi.

Instruction Hours / week: L:5 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

SCOPE

The facility design provides an overview of the concepts of manufacture herbal medicine in today's regulatory environment.

COURSE OBJECTIVES

- Be able to advise and educate effectively to create a comprehensive wellness plan incorporating herbal, dietary and lifestyle recommendations integrating self-awareness and lessons of nature
- Possess knowledge of traditional herbal systems as well as an understanding of the principles and practices of modern Western herbalism
- Have a foundational understanding of biomedicine, pharmacology, herbal preparations, history, clinical assessment, safety, and plant identification and wild crafting.
- To impart knowledge on herbal formulation
- To develop knowledge on effective drug therapy
- To promote and nurture research activities.

COURSE OUTCOME

- Be able to demonstrate basic **skills** in herb identification, harvesting, and preparation
- Be able to address potential safety concerns including herb-drug interactions
- Be able to grow personally and professionally and to participate actively in the field of herbalism through writing, research, public speaking, and/or professional affiliation
- This course will determine microbial role in nutrient cycling
- This course can able to determine water quality,
- It will explain the degradation of natural organic compounds and selected pollutants in the environment.

UNIT – I

Pharmacognosy – History of Indian systems of medicine - Siddha, Ayurvedha, and Unani systems of medicine. Medicinal plants, their chemical constituents and medicinal uses - Future of pharmacognosy.

UNIT – II

Classification of medicinal plants - Vernacular name and family - Geographical source, cultivation, collection, and processing for market and commerce in crude drugs.

UNIT – III

Organoleptic evaluation - Morphological and histological studies, chemical constituents of medicinal plants- Therapeutic and other pharmaceutical uses..

UNIT – IV

Preparation of plant samples, extraction and phytochemical screening of medicinal plants. Storage of plant samples. Propagation of medicinal plants - Micro and macro propagation conservation of rare medicinal and aromatic plants.

UNIT – V

Drug adulteration - methods of Drug evaluation, Herbal food - Food processing - packaging - Herbal sale and Export of medicinal plants - marketing - Intellectual property rights - Export laws

Instruction Hours / week: L:0 T: 0 P: 0**Marks: External:100 Total: 100****End Semester Exam: 3 Hours****COURSE OBJECTIVES**

- To detail the importance of computer in field of life sciences.
- To obtain good understanding about the interpretation of biological data base.
- To uptake knowledge in latest tools and technology.
- Program aims to develop students' understanding of medical microbiology with hand on experience in the isolation of the bacteria from different sources.
- It gives the knowledge about the pathogenicity, understanding the biofilm formation in bacteria, role of biofilm in pathogenicity and there antibiotics resistance pattern of pathogenic bacteria (Environmental source, Agricultural part), which is useful for public awareness.
- Understanding of application of Virus (bacteriophage) in transduction
- Impart basic understanding of bioinformatics approaches for bacterial/viral/fungal identifications and drug design
- Develop competence to integrate biological information with computational softwares

COURSE OUTCOME

1. To develop the **skills** on various search engines and software tools involved in bioinformatics
2. To design new drugs
3. Molecular interaction studies
4. Docking studies
5. Active site of binding
6. working with phylogeny trees

UNIT - I

Bioinformatics - definition, concept, scope, relevance of bioinformatics. Recent development in bioinformatics. Applications and scope of bioinformatics.

UNIT - II

Databases: Gene banks, objectives, types of databases- flat files, relational databases, objective oriented databases, hypertext databases, web interfaces; Resource databases- Generalized (DNA, protein) and specialized databases. Search tools: Data mining, BLAST and FASTA.

UNIT - III

Phylogenetic analysis: Concept of phylogenetic trees, phylogenetic trees and multiple alignment methods - distance matrix, character based evaluation of methods, evaluation of phylogenies, steps in constructing alignments and phylogenies, working with phylogeny trees - with suitable software-EMBOSS

UNIT - IV

Gene prediction: Approaches and methods, tools- GRAIL, GenLang, BCM, GeneFinder, Procrustes, GeneParser. Prediction of protein structure- Methods for structure prediction for known and unknown folds, prediction of protein function.

UNIT - V

Genomics: Gene mapping, sequence assembly and gene expression, DNA microarrays, microarray design and data analysis. Proteomics: Definition, proteome analysis; tools for proteome analysis, protein protein interactions; metabolic and genetic networks, concept of E- cell.

Instruction Hours / week: L: 0 T: 0 P: 5 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 9 Hours

COURSE OBJECTIVES

- To make the students better to understand the aspects of skilled manufacturing practices, kinds of pathogenic microorganisms in food and quality control in food and pharmaceutical industries.
- Develop industry-oriented skills on developing drugs and food.
- To make the students to understand the food quality systems and advancement universally.
- It will explain the students about all kinds of bio safety levels in laboratories.
- To train the students to be competent working professionals in the food industry and pharmaceutical industry.
- To help the students to explain the production of quality food by imparting better nutritional, sanitation & hygiene concepts.

COURSE OUTCOME

1. Imparts skilled knowledge on good manufacturing practices and food spoilage of different types of foods.
2. Develop skills on Food and drug based microbiological analysis.
3. develop the capacity for setting up small scale enterprises with respect to food and pharmaceuticals within the country.
4. To organize functions for creating awareness about the importance of safe processed nutritious food.
5. To provide diagnostic analysis of food and pharmaceutical products.
6. The students will be able to discuss the role of microorganisms in industry, as well as to carry out experiments to produce microbial metabolites

Contents

1. Analysis of Blood grouping and Rh typing
2. Performance of WIDAL – slide and tube test
3. Identification of antibodies by Passive agglutination – RPR, ASO, RA and CRP
4. Ouchterlony's double immuno diffusion
5. Enumeration of leucocytes by Leishmann stain
6. Isolation of coliphages from sewage sample.
7. Demonstration of Cultivation of virus using embryonated egg.
8. Assessment of milk quality by MBRT
9. Identification of Bacteria and Fungus from spoiled food and vegetables.
10. Bacteriology analysis of food samples (TPC)
11. Isolation of free living and symbiotic organisms
12. Cultivation of Mushroom
13. Isolation of micro-organisms from air
14. Bacteriological examination of water by MPN test.
15. To determine dissolved oxygen of water.
16. To determine BOD
17. To determine COD
18. Demonstration of waste water treatment plant.

INTERNSHIP PROGRAMME

Semester – V
2C

Instruction Hours / week: L: 0 T: 0 P: 0

Marks: Internal: 50 Total: 50

Instruction Hours / week: L: 5 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVES

- The use of microorganisms for the production of food, either human or animal, the microorganisms used in industrial processes may be natural isolates; laboratory selected mutants or genetically engineered organisms
- To encompass the use of microorganisms in the manufacture of food or industrial products.
- To impart theoretical knowledge of role of microbes in industrial production of different biochemicals/bio-molecules.
- The theory syllabus covers area such as design of bioreactors, media formulations and factors affecting the industrial production of bio-chemicals along with approaches that can be used for enhanced production.
- Role of micro-organism in production of organic acids, alcohols, wine, vinegar, enzymes, vitamins, antibiotics, amino-acids and steroids.

COURSE OUTCOME

1. Industrial microbiology encompasses the use of microorganisms in the manufacture of food or industrial products.
2. Provides [skill](#) development in the large scale production of industrial product, providing the trends to cater the needs of industry
3. To organize functions for creating awareness about the importance of safe processed nutritious food.
4. To provide diagnostic analysis of food and pharmaceutical products.
5. The students will be able to discuss the role of microorganisms in industry,
6. Able to carry out experiments to produce microbial metabolites.

UNIT – I

History and development of Industrial microbiology - Industrially important strains – screening methods, preservation techniques – strain development – mutation, recombinant DNA technology and plasmid fusion.

UNIT – II

Media for industrial fermentation process - media formulation, sterilization of media – Fermentor designing - body construction, mass transfer, oxygen transfer, effect of viscosity- Scale up process.

UNIT – III

Fermentation types – submerged fermentation, solid state fermentation, batch fermentation, continuous fermentation – Types of fermentors – Tower, fed batch and airlift, Components of CSTR – Down stream process - cell disruption, centrifugation, precipitation, intracellular and extra cellular liquid extraction and product formulation.

UNIT – IV

Role of microorganism in the pharmaceutical sciences - Microbial spoilage, preservation and Sterilization of pharmaceutical products.

UNIT – V

Role of precursors and steering agents - in production of antibiotics, vitamins and enzymes - standardization and Quality control of Pharmaceutical products – Antiseptics, disinfectants, Injectables, IV fluids and pyrogen testing.

Instruction Hours / week: L: 5 T: 0 P: 0

Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVES

- The main objective of the IPR is to make the students aware of their rights for the protection of their invention done in their project work.
- To demonstrate with products and ask the student to identify the different types of IPR's.
- Provide knowledge on database concept, management, retrieval along with utilization in gene and protein analysis.
- Impart basic knowledge of patenting, intellectual property rights, laws available and copyrights.
- Impart basic knowledge of technology in microbes to develop new variety

COURSE OUTCOME

Upon completion of the course students able to

1. develop **skills** in the basic tools in recombinant technology, various concepts of cloning vectors and the cloning strategies
2. Familiarize with the principles of bioethical concepts
3. Emphasize on IPR issues and need for knowledge in patents in biotechnology
4. Learn about the applications of microbes in biotransformations, therapeutic and industrial biotechnology
5. Describe aspects of genetically engineered microbes for industrial application
6. This paper imparts knowledge on applications of microorganisms in various fields and helps to gain **employability** in pharmaceutical industries

UNIT – I

Restriction enzymes – types and nomenclature - classification, Target site of enzymes, Host controlled restriction and modification, Star activity and uses - Nucleases, methylases - ligases. Joining of DNA fragments with vector - linkers, adaptors and homopolymer tailing.

UNIT – II

Cloning vectors: Plasmid as Cloning Vectors, Binary vectors and co-integrate vectors. Plasmids types in Gram negative bacteria - *E. coli* - PBR322. Bacteriophage λ and M13, Cosmids - phagemid, Yeast vectors, Shuttle vectors, Ti – plasmid and Ri plasmid. Prokaryotic hosts: *E. coli*, Eukaryotic hosts - yeast cells.

UNIT – III

Gene cloning - basic steps in cloning, construction of cDNA and genomic libraries-selection and screening method of recombinants. Cloning strategies – transformation techniques and transfection. Blotting techniques: Southern, Northern and Western. PCR – methods and application. Finger printing.

UNIT – IV

Patenting – fundamental requirements – patenting multicellular organisms – patenting and fundamental research. Patenting the genes, patenting biological materials and biotechnology. Discrepancies in biotechnology / chemical patenting. Patenting Process.

UNIT – V

Intellectual Property Rights – historical perspective – recent developments, IPR in India, IPR and the rights of farmers in developing countries.

Instruction Hours / week: L: 5 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVES

- Learners familiar with current developments and advances in the field of Mycology and Parasitology.
- Establish basic theoretical knowledge in the fields of Mycology and Parasitology. And to study the properties and various infections caused by the fungal, protozoan and helminthes.
- Describe basic morphology, life cycle, pathogenesis, lab diagnosis and treatment of parasites and fungi.
- Perform appropriate laboratory techniques used in the processing of specimens and identification of parasites and fungi.
- Describe basic principle and procedures of isolation of fungus and parasites from clinical samples like stool, vaginal swab etc.
- Perform appropriate laboratory techniques used in the processing of specimens and identification of parasites and fungi.

COURSE OUTCOME

1. Involves the identification, classification, and characterization of pathogenic species.
2. This paper imparts employability in hospital laboratories.
3. Properly use aseptic techniques, including sterilization.
4. Know General parasitological concepts and identification in stool sample
5. microbes, pathogens and their control Learning methods for antimicrobial susceptibility testing
6. In this course the students will observe and perform experiments related to clinical microbiology and virology which will enhance their laboratory skills, and scientific knowledge.

UNIT – I

General Properties of Fungi - Medically important fungi – diagnosis of fungal disease - routine mycological techniques - antifungal agents

UNIT – II

Superficial mycosis - Cutaneous mycosis - Systemic mycosis - Opportunistic mycosis - Subcutaneous mycosis

UNIT – III

Introduction to Parasitology - protozoa-amoebae – flagellates - Laboratory techniques in parasitology - Ova, cyst analysis direct and concentration methods. Blood smear examination - antiprotozoan therapy.

UNIT – IV

Protozoan infections - *Entamoeba histolytica*, *Plasmodium falciparum*, *Leishmania donovani* - *Giardia intestinalis* *Trichomonas vaginalis*.

UNIT – V

Helminthic infections – *Taenia solium*. Trematodes - *Schistosoma haematobium*, Nematodes - *Trichuris trichiura* - *Ascaris lumbricoides*, *Ancylostoma duodenale*, *Wuchereria Bancrofti*.

6. Parija, S.C., 2008. A Text book of Medical Parasitology. 3rd Edition. All India Publishers and Distributors, New Delhi.

Instruction Hours / week: L: 5 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVE

- 1.To expand student's knowledge of applied microbial ecology
- 2.The main goal is to know and understand the role of microbes in biogeochemical processes in different ecosystems. The students will learn the basic microbiological principles, the methods in microbial ecology and their theoretical and practical use.
- 3.The knowledge can give the base for understanding processes and changes in the environment.
- 4.The students can get some skills to recognise the ecological problems and critical evaluation of the human impacts on pollution, climate changes and as well as environmental protection.
- 5.The lectures will be implemented with individual practical work in the laboratory and presentations of the seminars.
- 6.The students can get general competences in microbial ecology

COURSE OUTCOME

1. Provides a comprehensive skilled overview of biogeochemical processes relevant to environmental scientists and engineers mediated by microorganisms.
2. Understand various plant microbes interactions especially rhizosphere and their applications especially the biofertilizers and their production techniques
3. Understand the basic principles of environment microbiology and be able to apply these principles to understanding and solving environmental problems – waste water treatment and bioremediation
4. Know the Microorganisms responsible for water pollution especially Water-borne pathogenic microorganisms and their transmission
5. Comprehend the various methods to determine the Sanitary quality of water and sewage treatment methods employed in waste water treatment
6. Provide learning opportunities to critically evaluate research methodology and findings.

UNIT – I

Definition of Bioremediation - Types of pollution - organic, inorganic in soil, water and air - Remediation by bacteria, fungi, microalgae and green plants.

UNIT – II

Bioaccumulation and biomagnification processes - microbial remediation by natural attenuation - biostimulation - bioaugmentation.

UNIT – III

Application of immobilized microbes in soil decontamination - use of genetically engineered microorganism and bioremediation.

UNIT – IV

Biodegradation of organic compounds - humification and polymerization reaction - bio-transformation of metal and metal compounds - phyto -remediation use of microalgae, green plants to remove pollutants

UNIT – V

Phyto-extraction - Types of phytoextraction - induced phyto-extraction and continuous phyto-extraction - phyto-degradation - rhizofiltration - phyto-stabilisation - phyto-volatilisation of metals - phyto-remediation of organic. Bioavailability and uptake. Biotransformation and compartmentalization.

5. Raina, M., Maier, Ian L. Pepper and Charles P. Gerba, 2008. Environmental Microbiology. 2nd Edition. Academic Press. NY.

Instruction Hours / week: L: 5 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVES

- To demonstrate an understanding at an advanced level of microbial virulence mechanisms
- To understanding of various infections (microbial causes, pathogenesis, transmission of infection, diagnosis, prevention and treatment)
- To Understand the basics of pharmaceutical microbiology and important microorganism playing role pharmaceutically
- To understand different products of microbial origin playing key role in pharmaceutical applications
- To understand role of secondary metabolites in pharmaceutical industry.
- To understand good practices and regulation involved in utilizing microbial product for pharmaceutical application

COURSE OUTCOME

- Students Work cooperatively as part of a small group and Critically assess and interpret scientific literature
- Students can develop the **skills** on diagnostic strategy and learn independently
- Able to apply the secondary metabolites in pharmaceutical industry.
- Able to identify a unknown organisms in clinical samples,
- Able to describe the pathogenesis of pathogens
- Able analyze the Drug in quantitatively and qualitatively

UNIT – I

History of chemotherapy. Types of antimicrobial agents, Paul Ehrlich and his contributions to chemotherapy. Development of synthetic drugs, development of antibiotics, Chemical non-medicinal antimicrobials- sanitizers, disinfectants, aantiseptics. Selective toxicity and target sites of drug action.

UNIT – II

Bactericidal and bactedriostatic agents, Factors affecting static and cidal activity, phenols and phenolic compounds, alcohols, halogens, heavy metals, dyes, detergents, aldehydes.

UNIT – III

Assay methods of antimicrobial agents – Phenol coefficient, qualitative assay of drugs (drug sensitivity testing), quantitative assays – liquid tube assay (MIC), agar tube assay. Agar plate assay.

UNIT – IV

Principles of chemotherapy and Drug Resistance The physical and lab diagnosis, tests for sensitivity, choice drug determination, dosage,route of administration, combined drug therapy.

UNIT – V

Mode of action of important drugs – Cell wall inhibitors (betalactam drugs), membrane inhibitors (polymyxin), Ribosomal inhibitors (aminoglycosides – streptomycin), folic acid inhibitors (sulfa drugs), antifungal drugs (nystatin).

Instruction Hours / week: L: 0 T: 0 P: 5 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 9 Hours

COURSE OBJECTIVES

- To focus on the basic principles of Genetics incorporating the concepts of classical, molecular and population genetics.
- Compilation is required for recent advances in genetic principles for strong foundation in Biotechnology.
- To obtain a fundamental knowledge of the basic principles of system microbiology through a series of required topics in genomics, transcriptomics, proteomics, and metabolomics, highthroughput biological techniques and bioinformatics.
- To obtain depth of knowledge in selected areas of system microbiology through advance level
- Role of micro-organism in production of organic acids, alcohols, wine, vinegar, enzymes, vitamins, antibiotics, amino-acids and steroids.

COURSE OUTCOME (CO'S)

1. Students undertaking this practical shall be able to describe the key concept in the basic Microbial Genetics
2. Effectively understand the implication of mutation and its characteristics.
3. Further, the experiments would allow students to recall and relate the information gained from Microbial Genetics theory paper and [skills](#) associated with it.
4. Students able demonstrate the gene transfer techniques.
5. Students can estimate the genetic materials.
6. Able to distinguish the plasmid and Genomic DNA.

Contents

1. Isolation of genomic DNA from bacteria
2. Isolation of plasmid DNA from bacteria
3. weight by Agarose gel electrophoresis
4. Determination of molecular weight by SDS PAGE electrophoresis (Demo)
5. Isolation of antibiotic producers from soil microbes
6. Production of Penicillin by batch fermentation
7. Cellulase production test
8. Identification of clinically important fungi – *Candida albicans*
9. Identification of *Aspergillus sp.* by Lacto phenol cotton blue mounting
10. Identification of *Mucor sp.* by Lacto phenol cotton blue mounting
11. Identification of *Rhizopus sp.* by Lacto phenol cotton blue mounting
12. Identification of *Fusarium sp.* by Lacto phenol cotton blue mounting
13. Identification of *Penicillium sp.* by Lacto phenol cotton blue mounting
14. Observation of parasites – *Entamoeba sp.* *Plasmodium sps.* *Ascaris sp.* *Taenia sp.*
15. Observation of parasites – Blood smear examination

PROJECT VIVA VOCE

**Semester – VI
10H – 6C**

Instruction Hours / week: L: 10 T: 0 P: 0 Marks: Internal: 60 External: 90 Total: 150

Instruction Hours / week: L: 0 T: 0 P: 0

Marks: External: 100 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVE

1. This paper provides information about the role of microorganisms in products development.
2. To understand basic of managements such as nature scope, evolution, level and components of management
3. Understanding important concepts of entrepreneurship such as Planning, decision making, leadership, organizations and authority
4. Understand basic requirements for establishing a bio-based startup and company
5. Understand food spoilage microorganisms; the microbiology of food preservation and food commodities; fermented and microbial foods; principles and methods for the microbiological examination of foods; micro biological quality control, and quality schemes.
6. The students will develop set of skills to recognise the ecological problems and critical evaluation of the human impacts on pollution, climate changes and as well as environmental protection.

COURSE OUTCOME

1. To encode the importance of the role of microorganisms in food industries
2. To obtain a good understanding of industrial microbiology and become an **Entrepreneur**.
3. To obtain knowledge in patenting and start up a career in Life Sciences.
4. It provides information about the role of microorganisms in products development.
5. To understand basic of managements such as nature scope, evolution, level and components of management
6. Understanding important concepts of entrepreneurship such as Planning, decision making, leadership, organizations and authority

UNIT - I

Entrepreneur – development and activity, institutes involved. Contributions of government to entrepreneurs and risk assessment. Industrial Microbiology - Definition, scope and historical development.

UNIT - II

Fermentation products- Bakers yeast, food and feed yeasts. Bacterial and Fungal Amylases. Proteolytic Enzymes, Pectinases and Invertases.

UNIT - III

Mushroom cultivation and Composting- Cultivation of *Agaricus campestris*, *Agaricus bisporus*, and *Volvariella volvaciae*; Preparation of compost, filling tray beds, spawning, maintaining optimal temperature, casing, watering, harvesting, storage.

UNIT - IV

Biofertilizers- Historical background, Chemical fertilizers versus biofertilizers, organic farming. *Rhizobium* sp, *Azospirillum* sp, *Azotobacter* sp, as Biofertilizers.

UNIT - V

Patents and secret processes, History of patenting, composition, subject matter and characteristics of a patent, Inventor, Infringement, cost of patent. Patents in India and other countries.

Instruction Hours / week: L: 0 T: 0 P: 0 Marks: External: 100 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVES

- Comprehensive and detailed understanding of genetic methodology
- To know the quantification of heritable traits in families and populations provides insight into cellular and molecular mechanisms.
- The knowledge required to to design, execute, and analyze the results of genetic experimentation in animal and plant model systems.
- To Understand the Genetic constituents of bacteria with special emphasis on inheritance and mutations
- To understand the mechanism of genetic transfers in microbes
- To understand different techniques used to study the microbial genetics and utilizing the microbial phenomenon in different biotechnological applications

COURSE OUTCOME

1. The ability to recognize the experimental rationale of genetic studies
2. Insight into the mathematical, statistical, and computational basis of genetic analyses that use genome-scale data sets in systems biology settings.
3. This course will helps to understand and develop the **employability** skill in genetic technologies in industries related to biotechnology, pharmaceuticals, energy, and other fields.
4. It provides the **entrepreneurial** ability to characterize, isolate and identify different microbes.
5. It includes a detailed study of characterization, etiology, pathogenicity and clinical systems.
6. Students able to apply the knowledge in gene sequencing

UNIT – I

Molecular definition of a gene – simple and complex transcription units. Chromosomal organization of genes and noncoding DNA – Nonfunctional DNA, Protein-coding genes, tandemly repeated genes code rRNA, tRNAs and histones. Mobile DNA – movements of mobile elements DNA or an RNA intermediate.

UNIT – II

Structural organization of eukaryotic chromosomes – eukaryotic nuclear DNA associates with histone proteins to form chromatin, modification of histone tails, non-histone proteins and scaffold proteins. Eukaryotic chromosomes contains one linear DNA molecule.

UNIT – III

Methods for DNA sequencing – chain termination DNA sequencing, conventional DNA sequencing. Sequence assembly by short gun methods and clone contig methods. Whole genome shotgun sequencing.

UNIT – IV

Locating the genes in a genome sequence – gene location by sequence inspection, ORF method. Experimental techniques for gene location – hybridization test method, cDNA sequencing for gene mapping, exon-intron boundaries.

UNIT – V

Functions of individual genes – computer analysis of gene function, homology evolutionary relationship. Assigning gene function by experimental analysis – functional analysis by gene inactivation, individual gene inactivation by homologous recombination and without homologous recombination.

Instruction Hours / week: L: 0 T: 0 P: 0**Marks: External: 100 Total: 100****End Semester Exam: 3 Hours****COURSE OBJECTIVES**

- Describe the source and variability of raw food material and their impact on food processing operations.
- Describe the source and variability of raw food material and their impact on food processing operations.
- Explain the principles and current practices of processing techniques and the effects of processing parameters on product quality.
- Explain the properties and uses of various packaging materials.
- The course aims to provide instruction in the general principles of food microbiology.
- The course covers the biology and epidemiology of food borne microorganisms of public health significance, including bacteria, yeasts, fungi, protozoa and viruses,
- To understand food spoilage microorganisms; the microbiology of food preservation and food commodities; fermented and microbial foods; principles and methods for the microbiological examination of foods; micro biological quality control, and quality schemes.

COURSE OUTCOME

1. Apply the scientific method to food science problems and quantitative reasoning skills to food science data
2. Apply critical thinking and analytical evaluation to contemporary food science information and literature
3. Apply principles from general chemistry, biology, physics, statistics, and mathematics to food science problems
4. Describe the source and variability of raw food material and their impact on food processing operations.
5. Explain the principles and current practices of processing techniques
6. Able to know the effects of processing parameters on product quality.

UNIT - I

Historical developments and importance of food microbiology. Human nutrition, nutritive value of food and dietary requirement. Nutrients deficiency diseases.

UNIT - II

Microbiology of vegetable, fruits, cereal and cereal products, juice; bread, confectionary, beverages. Food standards and rules, laws governing food Quality Control; Various types of packaging

UNIT - III

Quality assessment, Spoilage and Methods of Preservation of Fish; Canning, Freezing, Drying, Salting, Smoking and Curing. Processing of poultry meat and egg, Spoilage and control measures. Quality control of processed fish; poultry meat and eggs.

UNIT - IV

Construction of cold storage - types of freezers -plate contact freezer, air blast freezer, cryogenic freezing and refrigerated vans. Types of driers - roller drier, tray drier, spray drier, freeze drier, fluidized bed drier and solar drier.

UNIT - V

Classification and characterization of food industrial wastes from processing industry. Beverage industry; Fish, Meat and Poultry industry, Sugar industry and Dairy industry; Waste disposal methods.

15MBP101 FUNDAMENTALS OF MICROBIOLOGY AND CLASSIFICATION
4H – 4C

Instruction Hours / week: L: 4 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURE OBJECTIVES

- The course is designed to provide a basic understanding on the fundamental aspects of microbiology from historical development.
- To improve the proficiency and knowledge of the candidate on the study of microbial techniques for well exploitation of microorganisms.
- To comprehend the various methods for identification of unknown microorganisms
- This course enables the students to understand various physical and chemical means of sterilization and also learn various techniques for isolation of pure cultures.
- This course figures out them to know about culture collection and maintenance of microbial cultures.
- The beneficial and harmful manifestations of microorganisms especially of bacteria and their role in microbial mineralization and disease processes

COURSE OUTCOME (CO'S)

1. Understand the basic microbial structure and functions of various physiological groups of prokaryotes and eukaryotes.
2. Learn the theory and practical skills in microscopy handling and staining techniques know various culture media and their applications.
3. Study microbial nutritions- Autotrophy and heterotrophy modes of nutrition.
4. Identify the unknown organisms by using microbial tools.
5. Demonstrate electricity generation from the organic matter.
6. Understand the microbial transport systems and the modes and mechanisms of energy conservation in microbial metabolism – Autotrophy and heterotrophy

UNIT – I

History of Microbiology. Microbial evolution and Diversity – Taxonomic ranks - Classification system – Phenetic and Phylogenetic Haeckel's three-kingdom concept, Whittaker's Five-kingdom concept, Three-domain concept of Carl Woese.

UNIT – II

Microscopy –Simple, Compound, Dark-field, Phase contrast, Fluorescent and Electron microscopes. (SEM and TEM), Confocal microscopy – Principles and their applications. Stains and Staining techniques: Simple, Differential staining methods.

UNIT – III

Classification of bacteria - Bergey's manual and its importance. Classification of algae Clamydomonas, volvox, diatoms, red and brown algae. Classification of virus – DNA, RNA viruses. Classification and taxonomy of fungi – Alexopolous. Economical importance of Fungi. Classification of protozoa – *Entamoeba histolytica*, *Giardia*, *Trichomonas*, *Plasmodium*.

UNIT – IV

Sterilization and disinfection, culture methods: Auxenic and synchronous, aerobic and anaerobic, culture media and nutritional types, growth curve, generation time and growth kinetics. Factors influencing microbial growth. Preservation methods and quality control.

UNIT – V

Modern Microbiology: Molecular taxonomy, 16S/18S rRNAs and its importance in identification of microorganisms. Phylogenetic tree, Molecular tools in assessing microbial diversity, Metagenomics, prebiotics and probiotics and their applications, microbial fuel cells.

Instruction Hours / week: L: 4 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100**End Semester Exam: 3 Hours****COURSE OBJECTIVES**

- To gain the knowledge with the various inner and outer structures of prokaryotes and eukaryotes in detail.
- To provide information on sources of energy and its utilization by microorganisms. Microorganisms play important role in environment as producers, consumers and decomposers.
- To impart knowledge on metabolic function and biochemical reaction going on inside the microbial cell.
- To teach metabolic pathways, their regulation and engineering, and methods used in their elucidation.
- To teach students about cell cycle, growth and methods to determine microbial growth.
- Understand the microbial transport systems and the modes and mechanisms of energy conservation in microbial metabolism – Autotrophy and heterotrophy

COURSE OUTCOME (CO'S)

1. The students will be able to understand and predict the various metabolic reactions in microbial cell.
2. This will make them to predict the intermediate products which can be employed in industrial production processes.
3. The students will be able to know how bacterial and archaeal structure lead to function, how metabolic processes are regulated.
4. The course makes them to understand how microbes respond to environmental stressors, and how microbes can be manipulated to enhance their growth or the production of desired products.
5. Know the various Physical and Chemical growth requirements of bacteria and get equipped with various methods of bacterial growth measurement
6. The students will be able to understand how the organisms communicate to the population by using various mechanisms.

UNIT – I

Microbial Anatomy:- Prokaryotic cell structure and organization, cell membrane, plasma membrane, cytoplasmic matrix, inclusion bodies, ribosome, nucleoid, prokaryotic cell wall, capsule, slime layers, S layers, pili and fimbriae, flagella and motility. Eukaryotic cell structure and its organelles. Lichens and microalgae: Structural organization and their properties; mycoplasma, basic structure of viruses.

UNIT – II

Formation of specialized structures:- Endo and exospores, endospore formation in *Bacillus* sp. Exospore formation in *Streptomyces*: Sporulation in fungi: *Aspergillus* sp., *Penicillium* sp.: Biofilm and biosurfactants in bacteria. Spore cycle, factors affecting spore formation.

UNIT – III

EMP, HMP and ED pathway, TCA cycle, Glyoxylate cycle. Aerobic respiration and anaerobic respiration. Generation of energy - substrate level and oxidative phosphorylation – ATP generation. Lipid metabolism.

UNIT – IV

Biosynthesis of fatty acids, nucleotide, amino acids, proteins, phospholipids, Archaeal lipids. Cell wall biosynthesis of Gram positive and Gram negative bacteria. Toxins- characterization, mechanism of action. Cell membrane synthesis and synthesis of secondary metabolites.

UNIT – V

Photosynthesis – Oxygenic and anoxygenic – The prototrophic prokaryotes- purple photosynthetic bacteria, sulfur oxidizing and reducing bacteria – methanogenesis – assimilation of carbondioxide – photosynthetic pigments, bioluminescence. Quorum sensing cell signaling – mechanism and applications.

- 5.Know the various Physical and Chemical growth requirements of bacteria and get equipped with various methods of bacterial growth measurement
- 6.The students will be able to understand how the organisms communicate to the population by using various mechanisms.

UNIT – I

Genetics – historical introduction – Mendelian principles – nucleic acid as genetic information carriers: Experimental evidence– The duplex DNA – chemical and physical structure of DNA – circular and superhelical DNA - different forms of DNA. DNA replication – enzymology of DNA replication- different modes, models and types of DNA replication- Eukaryotic DNA replication.

UNIT – II

Mutagen – mutation – mutagenesis - Luria Delbruck experiments and its significance –molecular basis of mutation–spontaneous and induced mutations - Different types of mutation - mutant detection - mutant

selection – carcinogenicity testing. DNA damage -types of damage (deamination, oxidative damage, alkylation, Pyrimidine dimers) - DNA repair mechanism (base excision, nucleotide excision, recombination repair, SOS repair).

UNIT – III

Genetic code - DNA transcription in prokaryotes and eukaryotes. Transcriptional control and modification system– RNA translation in prokaryotes and eukaryotes. Polypeptide synthesis (maturation and processing of RNA) - Translational modification - Regulation of gene expression – Operon model (Lac, Trp, Ara) - Regulation of gene expression in eukaryotes.

UNIT – IV

Genetic recombination in bacteria – conjugation, transformation, transduction. Linkage and genetic mapping. Phage genetics (Replication cycle) – Phage T4 mutants (detection and isolation) – Genetic recombination – Genetic map of T4 phage, Gene mapping.

UNIT – V

Yeast genetics - Life cycle - metabolism – Genomes - extra chromosomal element - genetic nomenclature - tetrad analysis. Petite mutants (mutant isolation and complementation) - Gene conversion and gene mapping in Yeast. Genetic mapping in *Neurospora*. Genetic mapping in *Drosophila*.

Instruction Hours / week: L: 4 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100**End Semester Exam: 3 Hours****COURSE OBJECTIVES**

- Introduce the basic concept of qualitative and quantitative analysis of a given sample
- To Study various spectroscopic techniques and its instrumentation.
- To know the concept of separation science and its applications.
- To understand the basic laboratory skills that are essential for beginning-level employment in clinical, pharmaceutical, microbiology, biochemistry and biotechnology laboratories.
- To impart the concept of radiochemical analysis along with industrial analyzers
- To understand working of different laboratory equipment's used in microbiological laboratories

COURSE OUTCOME (CO'S)

1. This enables students to be able to explain bioinstrumentation techniques, design and application.
2. To know the concepts and operation of various lab instruments and related terms.
3. Acquire knowledge and lab skills to perform experiments in laboratory.
4. Connect the concepts of physics, chemistry and engineering principles in the instrumentation.
5. The students will be able to know all the basic principles, technology and applications of various instruments in life science.
6. Comprehend the techniques and the underlying principles in bioinstrumentation.

UNIT – I

Spectroscopy – properties of electromagnetic radiations, Instrumentation and applications of – UV Visible light spectroscopy, spectrofluorimeter, atomic spectroscopy, FTIR, NMR spectroscopy and MALDI –TOF. Flow cytometer.

UNIT – II

Centrifugation – principle, types of centrifuges, principles and applications of analytical and preparative centrifuge, density gradient and ultra centrifuge. Relative molecular mass determination and sedimentation coefficient. Sub-cellular Fractionation of cellular components.

UNIT – III

Chromatography - principle, instrumentation and applications of ion exchange chromatography, affinity, gel filtration and column chromatography. Low pressure liquid chromatography (LPLC) and high

performance liquid chromatography (HPLC) and fast protein liquid chromatography (FPLC), gas liquid chromatography mass spectroscopy (GC – MS).

UNIT – IV

Electrophoresis - principle, instrumentation and applications of agarose gel electrophoresis, sodium doecyl sulphate – polyacrylamide gel electrophoresis (SDS-PAGE), native PAGE, isoelectric focusing, immuno electrophoresis, pulse field gel electrophoresis, capillary electrophoresis, gel documentation – applications.

UNIT – V

Radioisotopic techniques – introduction, nature of radio activity, types and rate of radio active decay, units of radio activity, detection and measurement of radio activity. Principle, instrument and applications of Geiger-Muller counter, solid and liquid scintillation counter and autoradiography. Biosafety methods in radio active laboratory.

Instruction Hours / week: L: 4 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVES

- To educate the students about concepts of designs of water distribution systems, sewer networks, working principles and design of various physical, chemical and biological treatment systems of water and wastewater.
- To study about the biofertilizers, plant disease and increasing soil fertility.
- To impart a skilled knowledge on Microbes and environment and ecological importance.
- The main goal is to know and understand the role of microbes in biogeochemical processes in different ecosystems. The students will learn the basic microbiological principles, the methods in microbial ecology and their theoretical and practical use.
- The knowledge can give the base for understanding processes and changes in the environment.
- The students can get some skills to recognise the ecological problems and critical evaluation of the human impacts on pollution, climate changes and as well as environmental protection.

COURSE OUTCOME (CO'S)

1. This course will provide the student insights into these invaluable areas of Environmental microbiology, which play a crucial role in determining its future use and applications in environmental management.
2. Students able to know detailed idea about biofertilizer production and plant disease.
3. Students able to become Entrepreneur after understanding this process and product development.
4. This course will determine microbial role in nutrient cycling
5. This course can able to determine water quality.
6. It will explain the degradation of natural organic compounds and selected pollutants in the environment.

UNIT – I

Aquatic environment - microbiology of water - water pollution and water borne pathogens. Bacteriological examination of water, indicator organism. Microbiology of sewage. Chemical and biochemical characteristic of sewage. methods of sewage treatment - physical screening, chemical, biological (sludge digestion; activated sludge, aerating filters, oxidation pond).

UNIT – II

Microbiology of air - Microbial contaminants of air, sources of contamination, microbial indicators of air pollution. Enumeration of bacteria in air. Air samplers and Sampling techniques. Air sanitation.

UNIT – III

Bioremediation – contaminated soil, aquifers, marine pollutants, air pollutants, stimulation of oil spills degradation. Bioremediation of air pollutants. Bioleaching – recovery of metal from ores – oxidation of minerals – testing for biodegradability.

UNIT – IV

Biological nitrogen fixation - symbiotic and non-symbiotic microorganisms, root nodule formation, nitrogen fixers, hydrogenase, Nitrogenase, *Nif* gene regulation. Biochemistry of nitrogen fixation, Rhizosphere- R: S ratio, Interaction of microbes with plants. Bioconversion of agricultural wastes.

UNIT – V

Biofertilizer - Application of biofertilizers and biomanures – A combination of biofertilizer and manure applications with reference to soil, seed and leaf sprays. Laboratory and field application; Cost-benefit analysis of biofertilizer and biomanure production.

Instruction Hours / week: L: 0 T: 0 P:4 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 9 Hours

COURSE OBJECTIVES

- This course is put forward with the objectives of equipping the candidates with practical knowledge on basic techniques involved in the isolation, characterization and identification of different types of microorganism.
- Know various Culture media and their applications and also understand various physical and chemical means of sterilization.
- Know General bacteriology and microbial techniques for isolation of pure cultures.
- Master aseptic techniques and be able to perform routine culture handling tasks safely and effectively.
- Comprehend the various methods for identification of unknown microorganisms.
- Understand the microbial transport systems and the modes and mechanisms of energy conservation in microbial metabolism

COURSE OUTCOME

1. A student able to skillfully isolate and identify the microorganisms using different microbiological techniques needed in laboratory.
2. To enhance the ability of the student skills in medical laboratories and research sectors.
3. Demonstrate practical skills in the use of tools, technologies and methods common to microbiology.
4. To apply the scientific method and hypothesis testing in the design and execution of experiments
5. To develop theoretical and practical skills in the design and execution of experiments.
6. Know the various Physical and Chemical growth requirements of bacteria and get equipped with various methods of bacterial growth measurement.

1. Micrometry
2. Measurement of pH
3. Staining techniques: Simple, Gram, Negative and Endospore
4. Motility determination - Hanging drop and SIM inoculation
5. Cultivation of anaerobic microorganisms – Wrights tube – Mc Intosh anaerobic jar - roll tube methods.
6. Permanent slide preparation
7. Lactophenol cotton blue mounting of fungi - *Aspergillus* sp, *Mucor* sp, *Rhizopus* sp, *Fusarium* sp, *Penicillium* sp
8. Measurement of microbial growth – Viable count – Direct count – Turbidity methods

9. Biochemical characterization
 - a) Indole
 - b) MR
 - c) VP
 - d) Citrate utilization tests
 - e) TSI test
 - f) Catalase
 - g) Oxidase
 - h) Urease
 - i) Nitrate
 - j) Hydrogen sulphide production test
 - k) Litmus milk reduction test
 - l) Carbohydrate fermentation tests
 - m) Amino acid utilization
 - n) Hydrolysis of polymers- Starch, Lipid, Casein, Gelatin.

Instruction Hours / week: L: 0 T: 0 P: 4 Marks: Internal: 40 External: 60 Total: 100**COURSE OBJECTIVES**

- To acquire skill on the different molecular mechanism of gene transfer, mutations and separation of nucleic acids.
- This course is put forward with the objectives of equipping the candidates with practical knowledge on basic techniques.
- To impart skills of isolation, characterization and identification of different types of microorganism.
- Know various Culture media and their applications and also understand various physical and chemical means of sterilization.
- To make students understand the principles of Genetics
- Students will learn the basic principles of inheritance at the molecular, cellular and organismal levels.

COURSE OUTCOME

1. A student undertaking this course will be learning the principles behind the molecular techniques which would enable him to work in competent molecular biology based laboratories.
2. Imparts knowledge on the different aspects of genetics and pedigree analysis.
3. Students will apply their knowledge of to selected examples of changes or losses in cell function.
4. Identify the organs and tissue systems of plants, and explain their respective function.
5. Impart knowledge on applications of microorganisms in various fields
6. Provides skill development on microbial products.

EXPERIMENTS

1. Spontaneous Mutation – gradient plate technique
2. Induced Mutagenesis-chemical and physical - UV
3. Replica plating technique.
4. Isolation of Mutants and Revertants
5. Transformation in Bacteria
6. Bacterial Conjugation
7. Induction of Lac operon
8. Measurement of growth-one step growth curve using a T even phage
9. Titration of phages (T4)
10. Nuclear staining for nucleic acid identification.
11. Spectrophotometric estimation of protein – BSA
12. Analysis of amino acid by Paper chromatography
13. Analysis of amino acid by Thin layer chromatography
14. Purification of metabolites by column chromatography

15. Analysis of amino acid by HPLC

Instruction Hours / week: L: 5 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVES

- Virology, often considered a part of microbiology or of pathology, is the study of biological viruses and virus like agents.
- Viral structure, classification and evolution, their ways to infect and exploit cells of virus reproduction, the disease they cause.
- The techniques to isolate and culture them and their potential uses in research and therapy.
- To know how viruses are classified
- To understand the architecture of viruses
- To understand the interactions between viruses and the host immune system

COURSE OUTCOMES

1. Describe the structure and replication strategies of the viruses, the processes of entry into cells, control of gene transcription and where relevant translation and gene product stability, control of and mechanism of genome replication, virion assembly and egress from the cell.
2. Define the process of virus latency and describe in molecular terms control of the process and activation of viral genomes during reactivation.
3. Describe the growth behavior differences between normal cells and cells transformed by oncogenic DNA and RNA viruses.
4. Integrate experimental strategies learned in the context of viral systems into the design of experiments involving other systems.
5. Discern the replication strategies of representative viruses from the seven Baltimore classes
6. To understand the interactions between viruses and the host immune system

UNIT – I

Historical perspective of virology - Scope of virology -Viral classification and properties of viruses – Replication of viruses, cultivation of viruses (animal inoculation, Embryonated egg and tissue culture) - properties of viroids and Prions.

UNIT – II

Animal viruses- DNA viruses - morphology, replication, pathogenesis and laboratory diagnosis of Pox virus, Adeno virus, Hepatitis viruses – type A,B and D. Herpes simplex viruses, oncogenic viruses- Papova virus,- oncogenes and Oncogenesis.

UNIT – III

Animal viruses - RNA viruses - morphology, replication, pathogenesis and laboratory diagnosis of Poliovirus. Rabies virus, Influenza virus, mumps virus, Measles virus and rubella virus, Retro virus - HIV virus. Dengue and Japanese Encephalitis, SARS, Swine Flu.

UNIT – IV

Plant viruses – RNA viruses – TMV, Cowpea mosaic virus, Bromomosaic viruses, Satellite viruses – Double stranded DNA viruses – CaMV – Single stranded DNA viruses – Gemini virus. Structure and replication of Bacteriophage (T4) – Filamentous phage (ΦX174).

UNIT – V

Common type of hospital infections – hospital waste disposal. Viral vaccines and interferons - Antiviral drugs - strategies to develop AIDS vaccines - Rabies vaccines preparation (animal and cell culture) and their immunization dosage.

Instruction Hours / week: L: 5 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVES

- Medical Bacteriology introduces basic principles and then applies clinical relevance of many etiological agents responsible for global infectious diseases.
- The infectious disease cycle of the pathogens enables to solve the epidemics.
- The territory covered by infections and the immune response
- We focus on pathogenic mechanisms in order to foster a student's ability to solve problems in their future clinical career and able to establish the medical laboratory.
- This course provides learning opportunities in the basic principles of medical microbiology and infectious disease
- It covers mechanisms of infectious disease transmission, principles of aseptic practice, and the role of the human body's normal microflora

COURSE OUTCOMES

1. Demonstrate an understanding at an advanced level of microbial virulence mechanisms and host response to infection.
2. Application of molecular techniques to medical microbiology; biochemical and genetic mechanisms of antimicrobial agent activity, microbial susceptibility and resistance to antimicrobials.
3. Demonstrate an understanding of skin and respiratory tract infections (microbial causes, pathogenesis, transmission of infection, diagnosis, prevention and treatment) by being able to identify unknown organisms in clinical samples, and describe the pathogenesis of important pathogens.
4. It also provides opportunities to develop informatics and diagnostic skills, including the use and interpretation of laboratory tests in the diagnosis of infectious diseases.
5. To understand the importance of pathogenic bacteria in human disease with respect to infections of the respiratory tract, gastrointestinal tract, urinary tract, skin and soft tissue.
6. Recall the relationship of this infection to symptoms, relapse and the accompanying pathology.

UNIT – I

Laboratory precaution and guidelines – Aseptic collection – transportation – handling and examination of pathological specimens – methods of isolation, identification and interpretation of pathogenic organisms – antibiotic susceptibility testing..

UNIT – II

Infections – types – methods – infectious disease cycle. Definitions of Epidemics, Endemics Pandemics and investigation of epidemics and control. Definition of pathogens, Saprophytes and Commensals. **Quality control in microbiology lab.**

UNIT – III

Gram positive organisms: Morphology, cultural characteristics, antigenic property, pathogenicity, laboratory diagnosis and treatment. *Staphylococcus* sp., *Streptococcus* sp., *Bacillus* sp., *Corynebacterium* sp., *Clostridium* sp. and *Mycobacterium* sp.

UNIT – IV

Gram negative organisms: Morphology, cultural characteristics, antigenic property, pathogenicity, laboratory diagnosis and treatment. *E.coli*, *Klebsiella* sp., *Proteus* sp., *Pseudomonas* sp., *Vibrio* sp., *Salmonella* sp., *Shigella* sp., *Treponema* sp., *Neisseria* sp. and *Haemophilus* sp.

UNIT – V

Nosocomial infection – Urinary tract infection, Respiratory tract infection, Sexually transmitted disease – Immunoprophylaxis – Vaccines and antibiotics.- Phage typing and bacteriocin typing.

COURSE OUTCOMES

1. Demonstrate an understanding at an advanced level of microbial virulence mechanisms and host response to infection.
2. Application of molecular techniques to medical microbiology; biochemical and genetic mechanisms of antimicrobial agent activity, microbial susceptibility and resistance to antimicrobial agents.
3. Demonstrate an understanding of skin and respiratory tract infections (microbial causes, pathogenesis, transmission of infection, diagnosis, prevention and treatment) by being able to identify unknown organisms in clinical samples, and describe the pathogenesis of important pathogens.
4. It also provides opportunities to develop informatics and diagnostic skills, including the use and interpretation of laboratory tests in the diagnosis of infectious diseases.
5. To understand the importance of pathogenic bacteria in human disease with respect to infections of the respiratory tract, gastrointestinal tract, urinary tract, skin and soft tissue.
6. Recall the relationship of this infection to symptoms, relapse and the accompanying pathology.

UNIT – I

Introduction to microbial technology, restriction enzymes – nomenclature – types – and its properties, isolation of DNA, plasmids and RNA. Handling and quantification of nucleic acids, radiolabelling and non radiolabelling of nucleic acids, gel electrophoresis - Blotting techniques – Southern, Northern and Western blotting techniques.

UNIT – II

Cloning vectors: Plasmid as cloning vectors - pBR322, Bacteriophage - ϕ , M13; Cosmid, phagemids. Yeast vector. Expression vectors. Prokaryotic hosts: *E.coli*, Eukaryotic hosts: Yeast cell. Gene cloning - basic steps, cloning construction of cDNA, selection and screening method of recombinants. Biolabelling of genes and proteins.

UNIT – III

Transgenic plants: Methodology, development of herbicide resistance plants, delayed fruit ripening, Biocontrol agents - Insecticidal toxin of BT, cry gene and baculovirus. Transgenic animals. Methodology, development of transgenic mice – its application. DNA diagnostic in medical forensics. Biosafety and Bioethics.

UNIT – IV

Patenting – fundamental requirements – patenting multicellular organisms – patenting and fundamental research. Patenting of biological materials, Product patents, conditions for patenting, Patenting of liveforms, regulating recombinant technology, Food and food ingredients. Trade secrets. How do write a patent?.

UNIT – V

Discrepancies in biotechnology / chemical patenting. IPR – historical perspective – recent developments – IPR in India, IPR and the rights of farmers in developing countries.

Instruction Hours / week: L: 4 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100**End Semester Exam: 3 Hours****Course Objectives**

- To educate the students about concepts of designs of water distribution systems, sewer networks, working principles and design of various physical, chemical and biological treatment systems of water and wastewater.
- To study about the biofertilizers, plant disease and increasing soil fertility.
- To impart a skilled knowledge on Microbes and environment and ecological importance.
- The main goal is to know and understand the role of microbes in biogeochemical processes in different ecosystems. The students will learn the basic microbiological principles, the methods in microbial ecology and their theoretical and practical use.
- The knowledge can give the base for understanding processes and changes in the environment.
- The students can get some skills to recognise the ecological problems and critical evaluation of the human impacts on pollution, climate changes and as well as environmental protection.

COURSE OUTCOME (CO'S)

7. This course will provide the student insights into these invaluable areas of Environmental microbiology, which play a crucial role in determining its future use and applications in environmental management.
8. Students able to know detailed idea about biofertilizer production and plant disease.
9. Students able to become Entrepreneur after understanding this process and product development.
10. This course will determine microbial role in nutrient cycling
11. This course can able to determine water quality.
12. It will explain the degradation of natural organic compounds and selected pollutants in the environment.

UNIT – I

Marine microorganisms: collection, preservation, enumeration (total and viable counts), isolation of culture and identification based on morphological, physiological and biochemical characteristics. International and national collection centres.

UNIT – II

Extremophiles: Thermophiles, basophiles, halophiles, psychrophiles, acid – alkaliphiles, oligotroph, toxotolerant, xerotolerant, endolith – Extremophiles and their environment, biodiversity. Genomics of extremophiles, phylogeny of extremophiles, 16S RNA classification in mitochondrial DNA genome, RAPD, RFLP studies.

UNIT – III

Microbiology of degradation of xenobiotic environment: Ecological considerations, decay behaviour, degradative plasmids, hydrocarbons, oil pollution, surfactants, pesticides, Bioremediation:- Factors affecting bioremediation – role of microbes in the marine nutrient cycles – diseases of marine organisms and its impact on marine biodiversity.

UNIT – IV

Brief account of photosynthetic and accessory pigments: Chlorophyll – bacterial chlorophyll – carotenoids – rhodopsin, phycobilliprotein, carbohydrates, anabolism – autotrophy – photosynthesis – autotrophic generation of ATP, fixation of CO₂ – Calvin cycle– C₃ and C₄ pathway.

UNIT – V

Bar coding of marine organisms: Genome sequencing and physical mapping of genome. Composting of domestic, agricultural and industrial wastes, vermicomposting. SCP production; Mushroom cultivation.

Instruction Hours / week: L: 4 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100**End Semester Exam: 3 Hours****COURSE OBJECTIVES**

- About collection, interpretation and presentation of statistical data
- The analytics of data, probability, and hypothesis testing of samples
- The essential role of statistics in present, future use and applications of Biology.
- To equip students with a basic understanding of the underlying principles of quantitative and qualitative research methods.
- Provide students with in-depth training on the conduct and management of research from inception to completion using a wide range of techniques
- The ethical and philosophical issues associated with research in education

COURSE OUTCOMES

1. Apply basic statistical concepts commonly used in health and medical sciences
2. Use basic analytical techniques to generate results
3. Interpret results of commonly used statistical analyses in written summaries.
4. Demonstrate statistical reasoning skills correctly and contextually.
5. Provide learning opportunities to critically evaluate research methodology and findings.
6. Enable students to be reflexive about their role and others' roles as researchers.

UNIT – I

Information networks-internet, web browsers, HTTP,HTML and URLs. EMBnet – NCBI, Virtual tourism. Introduction to Operating systems like Windows, UNIX & LINUX - Computer Viruses – Overview and prevention.

UNIT – II

Bioinformatics tools - Global Vs local alignment – Similarity searching –Pair wise alignment and multiple alignments – Biological Databases – Literature, Sequence and Structure – identification and retrieving data from databases.

UNIT – III

Protein information resources –primary sequence database, Composite protein sequence database, secondary database, and Composite protein structure database. Protein structure prediction - Proteomic tools at ExPASy server.

UNIT – IV

Protein structure comparison and classification – RNA structure analysis – Plasmid mapping and Primer designing– Structure visualization softwares – Phylogenetics – Tree types and construction methods.

UNIT – V

DNA sequencing –Specialized genomic resources. DNA microarray – principles and databases – Genomics and Proteomics – genes prediction, splices sites and regulatory regions – Drug designing and Commercial Bioinformatics.

Instruction Hours / week: L: 4 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100**End Semester Exam: 3 Hours****COURSE OBJECTIVE**

- This course has been intended to provide knowledge about the Bio nanomaterials synthesis and its advancement.
- To foundational knowledge of the Nanoscience and related fields.
- To make the students acquire an understanding the Nanoscience and Applications
- To help them understand in broad outline of Nanoscience and Nanotechnology.
- Understand the synthesis of nanomaterials and their application and the impact of nanomaterials on environment
- Apply their learned knowledge to develop Nanomaterial's.

COURSE OUTCOME (CO'S)

1. Students get an idea about application of nanotechnology in biology.
2. It provide analytical knowledge of trends and developments in the field of nanotechnology
3. Acquire knowledge in nanotechnology and how it will support the employment greatly.
4. Students able to construct hierarchy strategy in machine.
5. Able to describe self-application and machine phase biotechnology.
6. Students have an enhanced knowledge and understanding of chemical transformation and biomolecular sensing.

UNIT – I

Biotechnology to Bionanotechnology: Bionanomachines – Modern bionano materials – protein, nucleic acid, lipids used for carrying information – polysaccharides use in special structural roles – Present status of bionanotechnology.

UNIT – II

Molecular design for nanotechnology: Recombinant DNA technology – X-ray crystallography, NMR spectroscopy and electron microscopy, use in nanotechnology – Computer modeling to bionanomachines and computer assisted molecular design.

UNIT – III

Structural principles of Bionanotechnology: Natural bionanotechnology design for specific environment – Biomolecular structure as low materials – Hierarchical strategy in construction of nanomachines – protein folding – self organization – molecular recognition – flexibility.

UNIT – IV

Functional principles of Bionanotechnology: Information driven nano assembly – chemical transformation – biomolecular sensing – self application – machine phase bionanotechnology.

UNIT – V

Future of Bionanotechnology: Problems in bionanotechnology – Abide finger problem – Sticky finger problem – role of enzyme to solve these problems – Core studies – nonotube synthesis, nanoscale assembler, nanosurveillance – ethical consideration – respect for life, potential dangers, fuel

5. Ausubel, F. M., Brent R. Kingston R. E., Moore, D. D., Siedman, J. G., Smith, J. A. and Struhl K, 1999. Short protocols in Molecular Biology, Fourth Edition. Wiley, New York.

Instruction Hours / week: L: 4 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100**End Semester Exam: 3 Hours****COURSE OBJECTIVE**

- 1.To learn the information on an organism's evolutionary relationships based on phylogeny.
- 2.To emphasize on molecular analysis of the microorganisms for species confirmation.
- 3.To know molecular techniques
- 4.To study DNA, RNA and Protein
- 5.To know biochemical taxonomy
6. To study gene molecular level.

COURSE OUTCOME

- 1.Students can gain the knowledge to construct phylogenetic tree, multiple sequence alignment.
2. Able to understand the various groups of microorganisms are genetically related
3. Able to trace their evolution.
- 4.Student can get employment in the biodiversity division.
5. Students able to know the species at genetic level.
6. Students able to understand the DNA, RNA and Protein level of conformation.

UNIT – I

Introduction to microbial taxonomy – morphological taxonomy, biochemical taxonomy, and molecular taxonomy. Numerical taxonomy – basic concepts of taxonomy. Positive and negative aspects of each taxonomical methods. Morphological phylogeny

UNIT- II

Molecular taxonomy – G +C content, DNA – DNA hybridization, RFLP, RAPD, STRR & LTRR, REP – PCR, rRNA based DNA finger printing methods

UNIT – III

Microbial identification and taxonomy using 16SrRNA. 16S rRNA / Rdna fingerprinting - RT- PCR. DNA Isolation, amplification, Cloning, transformation, Blue-white screening.

UNIT – IV

Isolation of Plasmid, Dot blot /Southern blot using specific probes.16S rDNA sequencing by chain-termination method. GenBank –guidelines. NCBI, EMBL & DDBJ – retrieving sequences.

UNIT – V

Molecular phylogeny – tree terminology, phylogenetic trees – MEGA, Phylip, RAPDistance. Cladogram, additive trees and ultrametric trees, rooted, unrooted trees and tree shapes.

Instruction Hours / week: L: 4 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100**End Semester Exam: 3 Hours****COURSE OBJECTIVES**

- This course encompasses the use of microorganisms in the manufacture of food or industrial products.
- The use of microorganisms for the production of food, either human or animal, the microorganisms used in bio processes may be natural isolates; laboratory selected mutants or genetically engineered organisms.
- To know the basics and concepts of various biotechnological related terms
- Elucidate the significance of transgenic plants as bioreactors for the production of enzymes.
- Address bioethical and biosafety issues related to plant transgenics
- Elucidate the molecular techniques involved in gene manipulation and rDNA technology

COURSE OUTCOME

1. This course will enable the students to design the various microbial fermentation products and their production, purification for various applications
2. To know the process protocol for the, synthesis and characterization of nanoparticles
3. Explain the gene transfer methods for the production of transgenic animals
4. Gain experimental knowledge to perform animal biotechnology related experiments
5. Explain the application of biotechnology in medical and its allied fields, gene therapy, genetic counseling
6. Address the bioethical issues & concerned linked to medical biotechnology

UNIT-I

Design of a basic fermenter, bioreactor configuration, design features, computer control of fermentation process, measurement and control of process. Reactors for specialized applications: Tube reactors, packed bed reactors, fluidized bed reactors, cyclone reactors, trickle flow reactors, their basic construction and types for distribution of gases.

UNIT – II

Transport phenomena in fermentation: Gas- liquid exchange and mass transfer, oxygen transfer, critical oxygen concentration, heat transfer, aeration/agitation, its importance. Sterilization of Bioreactors, nutrients, air supply, products and effluents, process variables and control, scale-up of bioreactors.

UNIT – III

Growth of cultures in the fermenter. Importance of media in fermentation, media formulation and modification . Kinetics of growth in batch culture, continuous culture with respect to substrate utilization, specific growth rate, steady state in a chemostat, fed-batch fermentation, yield of biomass, product, calculation for productivity. Storage of cultures for repeated fermentations, scaling up of process from shake flask to industrial fermentation.

UNIT – IV

Biomass separation by centrifugation, filtration, flocculation and other recent developments. Cell disintegration: Physical, chemical and enzymatic methods. Extraction: Solvent, two phase, liquid extraction, whole broth, aqueous multiphase extraction. Purification by different methods. Concentration by precipitation, ultra-filtration, reverse osmosis. Drying and crystallization.

UNIT – V

Isolation, selection and improvement of microbial cultures. Strain improvement for the selected organism: Use of recombinant DNA technology, protoplast fusion techniques for strain improvement. Improvement of characters other than products and its application in the industry. Preservation of cultures after strain improvement programme.

Instruction Hours / week: L: 0 T: 0 P: 0**Marks: External: 100****Total: 100****End Semester Exam: 3 Hours****COURSE OBJECTIVES**

- 1.To make an awareness of physically, socially and psychologically well being.
2. To know the Health awareness
- 3.To know the disease mechanism
- 4.To prevent the disease.
5. Healthy diet habit.
- 6.Normal exercise for body.

COURSE OUTCOME (CO'S)

- 1.Students get an idea about nutritional food, proper diet and routine exercise.
- 2.To make an awareness of physically, socially and psychologically well being.
- 3.To know the Health awareness
- 4.To know the disease mechanism
- 5.To prevent the disease
6. Students able to understand the importance of fitness in leading healthy life

UNIT - I

Definition of Health and wellness - Factors affecting health and wellness. Physiological, psychological and social health.

UNIT - II

Fitness - Definition, basic components of physically active life style in preventing obesity, osteoporosis, heart disease, and diabetes, Physical fitness tests - for flexibility, muscle endurance (any 3 tests for each) and cardio vascular endurance.

UNIT - III

Nutrition and exercise - energy requirement for, aerobic and anaerobic exercises, carbohydrate loading, water and dehydration, special foods. Importance of exercise in preventing life style diseases - Diabetes, CVD, hypertension, obesity and osteoporosis.

UNIT - IV

Sports nutrition - special foods - Nutrition and performance of athletes and players, dietary modifications and diet plan, sports supplementation.

UNIT - V

Special nutritional needs for monitoring, space, military and sea voyage.

Instruction Hours / week: L: 0 T: 0 P: 5 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 9 Hours

COURSE OBJECTIVES

- To obtain outstanding practical skill in various techniques in Microbial Biotechnology and Agricultural Microbiology.
- The course provides the basics of microbiology to build a foundation for more advanced studies in microbiology and biotechnology
- In this course students will learn key methods of microbial production (e.g. fermentation, recombinant protein production and purification).
- Practice in research project planning, in different methods for biotechnology, and for conducting scientific research project.
- To develop an understanding of the major principles of and current issues in the several topical areas that collectively constitute Microbiology Techniques.
- It will distinguish the students to acquire practical skills on advanced laboratory analysis.

COURSE OUTCOME (CO'S)

1. This practical course renders a candidate the knowledge of advanced techniques involved in Microbial Biotechnology and Agricultural Microbiology.
2. Candidates would be able to understand and perform molecular techniques which forms an integral part of core Microbiology.
3. This practical course renders a candidate the knowledge of advanced techniques involved in microbial biotechnology.
4. He/she will be able to judge how microbes and enzymes could be applied in industry.
5. Candidates would be skilled enough to perform a molecular technique which forms an integral part of industrial microbiology.
6. Students can develop entrepreneur skills for applications in biotechnology based industries.

EXPERIMENTS

1. Isolation of plasmid DNA from Bacteria
2. Isolation of chromosomal DNA from Bacteria
3. Determination of molecular weight by SDS Polyacrylamide gel electrophoresis
4. Isolation of microbes from soil
5. Isolation of free-living N₂ fixation from soil - Azotobacter
6. Isolation of symbiotic nitrogen fixers from root nodule - Rhizobium
7. Isolation of phosphate solubilisers, ammonifiers and denitrifiers
8. Study of Mycorrhizae, Cyanobacteria and Azolla
9. Determination of Dissolved oxygen of water

10. Determination of BOD (Biochemical Oxygen Demand) of water
11. Determination of COD (Chemical Oxygen Demand) of water

Instruction Hours / week: L: 0 T: 0 P: 5 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 9 Hours

COURSE OBJECTIVES

- To acquire practical knowledge in numerous diagnostic tests and procedures used in the microbiology laboratory.
- To understand the importance of diagnostic procedures and gain skills related to the laboratory experiments.
- To learn the techniques pertaining to amplification of biological molecules
- To provide hands-on experience to determine microorganisms in clinical samples
- To understand the importance of diagnostic procedures and gain skills related to the laboratory experiments.
- It helps the students to study the advanced laboratory diagnosis procedures.

COURSE OUTCOME (CO'S)

1. This course provides the current medical aspects on the clinical diagnosis of infection providing the combined treatment of bacteriology and virology.
2. It will also provide opportunities for a student to develop diagnostic skills in microbiology, including the practical application and interpretation of laboratory tests for the diagnosis of infectious diseases.
3. It will also provide opportunities for a student to develop diagnostic skills in microbiology, including the practical application and interpretation of laboratory tests for the diagnosis of infectious diseases.
4. The significance of bacterial genetic variation (in drug resistance, pathogenesis or virulence and variation, diagnosis, and vaccination), and manipulation of cloned DNA.
5. To know the Virulence of bacteria, bacterial virulence factors and their regulation.
6. To understand drug resistance, drug-bacteria relationship, clinical implications, and prevention

EXPERIMENTS

1. Laboratory diagnosis of pyogenic infections – tuberculosis – enteric fever – diarrhea – UTI – anaerobic infections
2. Isolation and identification of *Candida albicans*
3. Antibiotic sensitivity test disc preparation
4. Antibiotic sensitivity test – Kirby - Bauer, Stroke's method
5. MIC determination by Broth dilution technique, filter paper disc assay
6. Wet mount preparation of parasites- Saline, iodine
7. Identification of parasites-formal ether concentration, floatation methods
8. Morphological examination of fungi in tissues

9. Cultivation of viruses-Egg inoculation
10. Isolation of coli phage from sewage using membrane filter technique.
11. Examination of plant diseases: Wilt of potato, Citrus canker, Rice dwarf virus

Instruction Hours / week: L: 4 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours**COURSE OBJECTIVES**

- Imparting advanced technological knowledge through a detailed study of topics such as immunodiagnosis, assessment of cell mediated immunity and current trends in immunology of diseases.
- The students will be able to identify the cellular and molecular basis of immune responsiveness.
- The students will be able to describe the roles of the immune system in both maintaining health and contributing to disease.
- The students will be able to describe immunological response and how it is triggered and regulated.
- The students will be able to demonstrate a capacity for problem-solving about immune responsiveness.
- Students will be able to transfer knowledge of immunology into clinical decision-making through case studies presented in class.

COURSE OUTCOME (CO'S)

1. To strengthen the technical skill on the immune system, their structure and classification, genetic control of antibody production, Types, structure of antigens and immunodiagnostics.
2. To obtain knowledge of through Molecular immunology, hypersensitive immune reaction and Latest trends in immunology.
3. Upon completion students will gain knowledge of immune system, cells involved along with complement system and autoimmunity.
4. Develop understanding about immune system, antigen antibody interactions.
5. Gain theoretical knowledge of various diseased conditions generated due to interplay of immune system components.
6. Introducing the **employment** aspect of immunology and to study various types of immune systems their classification structure and mechanism of immune activation.

UNIT – I

Immunity – types. Cells of the immune system - lymphoid cells, mononuclear cells, granulocytic cells and mast cells. T & B – cell maturation, activation and differentiation. Organs of the immune system - primary and secondary lymphoid organs – cutaneous / mucosal - associated lymphoid tissues

UNIT – II

Antigens - factor influence immunogenicity - Epitopes - Haptens - study of antigenicity. Immunoglobulins – structure – types and biological activities. Antigenic determinants. Monoclonal antibodies.

UNIT – III

Hypersensitive reactions – Type. Complement system - classical, alternative and lectin pathways, biological consequences. T - cell receptor. Cytokines – Structure, functions and receptors. Major Histocompatibility complex, classes, structure and its functions.

UNIT – IV

Autoimmune diseases: Antigen processing and presentation - Transplantation immunology - Transplantation antigens, HLA typing. Tumor immunology - treatment of tumors. Immune response to infectious disease.

UNIT – V

Antigen - Antibody reactions: Agglutination and precipitation. Complement fixation test, Immunofluorescence, ELISA, RIA, Immuno electron microscopy. Forensic serology, Immunohaematology – ABO, RH incompatibility.

Instruction Hours / week: L: 4 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours**COURSE OBJECTIVES**

- To encompass the employability use of microorganisms in the manufacture of food or industrial products.
- The aim of the course is to give the students broad theoretical and practical skills in food and industrial microbiology.
- This paper adds information about the role of microorganisms in many food, beverage and pharma industries both in production and spoilage processes.
- The students will be able to discuss the role of microorganisms in industry, as well as to carry out experiments to produce microbial metabolites.
- It will make the students to explore their practical skills in entrepreneurial activities.
- It will deliver the large-scale production of microbial products techniques in advanced level.

COURSE OUTCOME (CO'S)

1. Provides knowledge in the large-scale production of industrial product, providing the trends to cater the needs of industry.
2. This will help the students to enhance their employment knowledge on microbiology based commercial products.
3. The aim of the course is to give the students broad theoretical and practical skills in industrial microbiology.
4. To encode the importance of the role of microorganisms in food industries both in beneficial and harmful ways.
5. To obtain a good understanding of industrial microbiology and become qualified as microbiologist in food and other industries and candidate able to become entrepreneur after understanding this entire course.
6. Explain why microbiological quality control programmes are necessary in food production.

UNIT – I

Food and microorganisms – Important microorganisms in food – Fungi, Bacteria; Intrinsic and extrinsic parameters of food affecting microbial growth – sources of contamination of food. Food sanitation – indicators of food safety – Coliform bacteria.

UNIT – II

Food preservation – principles – factors affecting preservation – food preservation using temperature – low temperature food preservation – characteristics of psychrotrophs – high temperature food preservation – characteristics of thermophiles – preservation of foods by drying chemicals and radiation – limitations – commercial application.

UNIT – III

Food borne diseases - food poisoning - food borne infection and intoxication- Food control agencies - microbiological criteria for food, microbial quality control and food laws, Hazard Analysis Critical Control Point (HACCP).

UNIT – IV

History and chronological development of industrial microbiology. Industrially important strains – isolation and preservation. Inoculum development for various fermentation processes - strain development – mutation, recombinant DNA technology and protoplast fusion. Fermentation – submerged, solid state, batch and continuous.

UNIT – V

Fermentor design – scale-up process. Types of fermentors - Tower, cylindroconical, airlift and Components of CSTR. Downstream process – intracellular and extracellular product separation column chromatography, affinity. Production of beverages – beer, vitamins - vitamin B12, Riboflavin, antibiotics.

Instruction Hours / week: L: 4 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVES

- Medical Bacteriology introduces basic principles and then applies clinical relevance of many etiological agents responsible for infectious diseases.
- The infectious disease cycle of the pathogens enables to solve the epidemics.
- The territory covered by infections and the immune response
- We focus on pathogenic mechanisms in order to foster a student's ability to solve problems in their future clinical career and able to establish the medical laboratory.
- This course provides learning opportunities in the basic principles of medical microbiology and infectious disease
- It covers mechanisms of infectious disease transmission, principles of aseptic practice, and the role of the human body's normal microflora

COURSE OUTCOMES

1. Demonstrate an understanding at an advanced level of microbial virulence mechanisms and host response to infection.
2. Application of molecular techniques to medical microbiology; biochemical and genetic mechanisms of antimicrobial agent activity, microbial susceptibility and resistance to antimicrobial agents.
3. Demonstrate an understanding of skin and respiratory tract infections (microbial causes, pathogenesis, transmission of infection, diagnosis, prevention and treatment) by being able to identify unknown organisms in clinical samples, and describe the pathogenesis of important pathogens.
4. It also provides opportunities to develop informatics and diagnostic skills, including the use and interpretation of laboratory tests in the diagnosis of infectious diseases.
5. To understand the importance of pathogenic bacteria in human disease with respect to infections of the respiratory tract, gastrointestinal tract, urinary tract, skin and soft tissue
6. Recall the relationship of this infection to symptoms, relapse and the accompanying pathology.

UNIT – I

General Properties of Fungi - Isolation and identification of medically important fungi – diagnosis of fungal disease - routine mycological techniques - antifungal agents

UNIT – II

Superficial mycosis –Pityriasis versicolor, Tinea nigra, piedra. Cutaneous mycosis – Dermatophytes. Systemic mycosis –Opportunistic mycosis – Candidosis, Cryptococcosis, aspergillosis. Subcutaneous mycosis - Sporotrichosis, Chromoblastomycosis, Mycetoma

UNIT – III

Introduction to Parasitology - protozoa-amoebae – flagellates - Laboratory techniques in parasitology - Ova, cyst analysis direct and concentration methods. Blood smear examination - antiprotozoan therapy.

UNIT – IV

Protozoan infections - *Entamoeba histolytica*, *Plasmodium falciparum*, *Leishmania donovani* - *Giardia intestinalis* *Trichomonas vaginalis*, *Toxoplasma gondii*, *Pneumocystis carinii*

UNIT – V

Helminthic infections – *Taenia solium*. *Trematodes* - *Schistosoma haematobium*, Nematodes - *Trichuris trichiura* - *Ascaris lumbricoides*, *Ancylostoma duodenale*, *Wuchereria Bancrofti*.

Instruction Hours / week: L: 4 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVES

- About collection, interpretation and presentation of statistical data
- The analytics of data, probability, and hypothesis testing of samples
- The essential role of statistics in present, future use and applications of Biology.
- To equip students with a basic understanding of the underlying principles of quantitative and qualitative research methods.
- Provide students with in-depth training on the conduct and management of research from inception to completion using a wide range of techniques
- The ethical and philosophical issues associated with research in education

COURSE OUTCOMES

7. Apply basic statistical concepts commonly used in health and medical sciences
8. Use basic analytical techniques to generate results
9. Interpret results of commonly used statistical analyses in written summaries.
10. Demonstrate statistical reasoning skills correctly and contextually.
11. Provide learning opportunities to critically evaluate research methodology and findings.
12. Enable students to be reflexive about their role and others' roles as researchers.

UNIT-I

Definitions-Scope of Biostatistics- Variables in biology, collection, classification and tabulation of data- Graphical and diagrammatic representation.

Measures of central tendency – Arithmetic mean, median and mode. Measures of dispersion-Range, standard deviation, Coefficient of variation.

UNIT – II

Correlation – Meaning and definition - Scatter diagram –Karl pearson's correlation coefficient. Rank correlation.

Regression: Regression in two variables – Regression coefficient problems – uses of regression.

UNIT – III

Test of significance: Tests based on Means only-Both Large sample and Small sample tests - Chi square test - goodness of fit. Analysis of variance – one way and two way classification. CRD, RBD Designs.

UNIT – IV

Research: Scope and significance – Types of Research – Research Process – Characteristics of good research – Problems in Research – Identifying research problems. Research Designs – Features of good designs.

UNIT – V

Sampling Design: Meaning – Concepts – Steps in sampling – Criteria for good sample design. Scaling measurements – Techniques – Types of scale.

2. Kothari. C.R., 2004. Research Methodology – Methods and Techniques, Second edition, New Age International Pvt. Ltd, New Delhi.

Instruction Hours / week: L: 4 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100**End Semester Exam: 3 Hours****COURSE OBJECTIVES**

1. Offers advanced level training on gene sequencing, mapping,
2. Expression and proteomic techniques.
3. To know DNA replication
4. To know the Transcription
5. To know the protein translation
6. To know the techniques to study DNA, RNA, Protein

COURSE OUTCOME (CO'S)

1. Students able to understand the principle of gene sequencing, mapping, expression, experimental and analytical proteomics.
2. Candidate can perform advanced molecular techniques and can work in the different genomic laboratory.
3. Expression and proteomic techniques.
4. To know DNA replication
5. To know the Transcription
- To know the techniques to study DNA, RNA, Protein

UNIT – I

Genome Sequencing: Gene, genomes, sequencing. Genomes - methodology, chain termination method, chemical degradation method, shotgun sequencing and assembly of contiguous DNA sequence. cDNA and genomic library construction.

UNIT – II

Genomic Mapping – Different types of genome maps and their uses, genetic and physical mapping techniques. Map resources. Practical uses of genome maps, Genetic markers -RFLP, Mini and micro satellite, STS and EST, SSCP, RAPD, AFLP, SNPs.

UNIT – III

Gene expressions and microarrays - gene structure and pseudo genes. Concepts of microarrays, spotter analysis, Normalization – total intensity, using regression techniques, ratio statistics. Clustering gene expression profiles - hierarchical, single -linkage, complete linkage, and average linkage. Tools for microarray analysis- MADAM, spot finder, SAGE Applications of microarrays - Bioinformatics challenges in micro array design and analysis.

UNIT – IV

Experimental proteomics - proteome analysis- 2-D gel electrophoresis: general strategy, immobilized pH gradients, sample preparation, isoelectric focusing, second dimension PAGE, staining, transfer of proteins from 2D gels, image acquisition and analysis of 2-D gels.

UNIT – V

Analytical proteomics: RP-HPLC, Mass spectrometry – ESI MS and MALDI techniques and applications. Characterization of protein complexes – protein-protein interactions, yeast two-hybrid system and protein micro arrays.

Instruction Hours / week: L: 4 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100**End Semester Exam: 3 Hours**

- To inculcate the quality standards and the quality control practice followed in the industry.
- To bring awareness about biosafety and to enhance the entrepreneurship and employability.
- Knowledge of the principles and documentation of the quality system is a prerequisite for the course.
- Develop goal-oriented standards, policies, and procedures based on user-defined data quality requirements.
- Confirm that draft standards are acceptable to all users.
- Ensure that developed standards conform to the primary goals of the organization.

COURSE OUTCOME

1. Set up and Assess Food Quality Assurance Plans.
2. Create and Critically Evaluate quality specifications for raw materials, and associated final product and appropriate packaging.
3. Design and critically evaluate appropriate testing and recording procedures for raw materials and associated Final product.
4. Design, and evaluate processing documentation including Standard Operating procedures.
5. To realize the importance of significance of quality
6. Identify requirements of quality improvement programs

UNIT - I

An introduction to industrial microbiology. Definition of Quality assurance- roles and responsibilities of Quality assurance in industrial Microbiology. Roles and responsibilities of Quality control in industrial Microbiology.

UNIT - II

Antimicrobial agents – Definitions, properties, mode of action and applications. Antimicrobial agents for external usage - Chemical antimicrobial agents, synthetic antimicrobial agents, naturally antimicrobial agents.

UNIT - III

Sterilization – Types and methods of sterilization. Sterility testing and assessment of Microbial Contamination. Quality parameter to asses Natural products, Nutraceutical product, Pharmaceutical products.

UNIT - IV

Disinfection – Types and methods. Disinfection agents- properties and mode of action (Phenol, isopropyl alcohol and ethanol). Antibiotics and antimicrobial drug resistance, search for new antimicrobial agents.

UNIT - V

Quality assurance and Quality control – pharmacopeias, quality checking, routine examination and validation of industry. International disinfectant testing protocols, assessment of biocide effectiveness.

Instruction Hours / week: L: 4 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100**End Semester Exam: 3 Hours****COURSE OBJECTIVES**

- To study about the biofertilizers, plant disease and increasing soil fertility.
- To provide the knowledge on biomanure and biofertilizer and to become an entrepreneur in the field.
- To Provides detailed idea about biofertilizer production and plant disease.
- To provide the student knowledge about ecofriendly product which play a crucial role in determining its future use and applications in environmental management.
- The students will be able to make qualitative and quantitative description of the basic enzymatic phenomena and processes.
- To provide the student for entrepreneur.

COURSE OUTCOME (CO'S)

1. This course has been designed to provide the student knowledge about eco friendly product.
2. Product play a crucial role in determining its future use and applications in environmental management.
3. Provides detailed idea about biofertilizer production and plant disease.
4. To produce and impart training of ecofriendly agricultural inputs so as to nullify the ill effects of chemical fertilizers.
5. To demonstrate the know-how technology pertinent to microbiological and physico-chemical analyses of soil samples and their assessment.
6. Provides detailed **entrepreneurial** idea about biofertilizer production and plant disease.

UNIT – I

Fertilizer - importance and present status of types of fertilizers and application. Nitrogen; Carbon, phosphorus and sulphur cycles. Biogeochemical cycles associated with microorganisms.

UNIT – II

Biofertilizers – Nostoc, Anabaena, Gloeocapsa and Scytonema; Free living forms – Azotobacter, Azospirillum; Symbiotic forms – Rhizobium; Legume Association; *Pseudomonas*; Non-legume association.

UNIT – III

Mycorrhizal association - Vesicular arbuscular mycorrhizal association (VAM) –Actinomycetes associations in biofertilizer.

UNIT – IV

Biomanures- Properties, production and applications; Composts – production and applications. Agro wastes – Poultry manure and saw-dust.

UNIT – V

Vermi composting– Properties, production and applications Types of compost pits and biodegradation. Application of biofertilizers and biomanures.

Instruction Hours / week: L: 4 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100**End Semester Exam: 3 Hours****COURSE OBJECTIVES**

- To provide the knowledge on basics of biochemistry and its applications and to highlight the technical skill.
- To describe the classification and functions of lipids.
- To summarize the structure and classification of enzymes
- To state the Structure and types of DNA
- To analyse the functions and properties of phosphoglycerides
- To understand about storage and structural polysaccharides.

COURSEOUTCOME

1. Understand the structures of enzymes, proteins, carbohydrates and fats
2. Understand the functions of biomolecules
3. Analyze the process of metabolism
4. Understand of nucleic acids and their importance to combine and analyses information.
5. Explain the structure and mechanism of enzyme action
6. Summarize the DNA & RNA structure and base pairing schemes.

UNIT - I

Definition and scope of biochemistry, cellular basis of life, molecular composition of cells, elements and compounds of life Biochemical functions of cell organelles.

UNIT - II

Proteins- protein content of various type of cells, biological role of proteins; primary, secondary, tertiary, quaternary structure of proteins. Classification of proteins.

UNIT - III

Saccharides - Mono, oligo and polysaccharides; isomerism, chain and ring structure of carbohydrates, structure of starch, cellulose, glycogen and mucopolysaccharides.

UNIT - IV

Fatty acids- properties and nomenclature, essential and non-essential fatty acids. Classification of lipids and storage of lipids.

UNIT - V

DNA- Properties, structure, and importance. Prokaryotic and Eukaryotic cell differences. DNA as genetic material and genetic code

Instruction Hours / week: L: 4 T: 0 P: 0 Marks: Internal: 40 External: 60 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVES

- Aimed to provide training on various methods of handling.
- Concerning the care and use of laboratory animals.
- Laboratory animal care provides the proper handling and care for various species of animals used in research, testing, and in education.
- It extensively deals with the amended act on the Animal Welfare and the concept, availability, and use of research or testing methods that limit the use of animals or minimize animal distress.
- It extensively deals with the amended act on the Animal Welfare and the concept, availability, and use of research or testing methods that limit the use of animals or minimize animal distress.
- To study the preclinical studies.

COURSE OUTCOME (CO'S)

1. Laboratory animal care provides the proper handling and care for various species of animals used in research, testing, and in education.
2. It extensively deals with the amended act on the Animal Welfare and the concept, availability, and use of research or testing methods that limit the use of animals or minimize animal distress.
3. This course content will enhance the employment in drug testing field.
4. Validation for equipment, methods, cleaning and process
5. Students can develop their entrepreneurial skills in analysis of pens design and environment.
6. Ethical knowledge for use of animals in research.

UNIT – I

Modern methods of care, management breeding and maintenance of Laboratory animals – rabbit.

UNIT – II

Modern methods of care, management breeding and maintenance of Laboratory animals – mice.

UNIT – III

Modern methods of care, management breeding and maintenance of Laboratory animals – rat.

UNIT – IV

Modern methods of care, management breeding and maintenance of Laboratory animals– guinea pig.
Specific pathogen free animal – gnotobiotic animal

UNIT – V

Handling – various routes of inoculation and bleeding. Laboratory use of animals in microbiology - antibody production. Disposal of animal house wastes and carcasses.

Instruction Hours / week: L: 4 T: 0 P: 0 Marks: External: 100 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVES

- To study cell structure, functions of organelle and gain exposure on transportations through cell membrane and to focus on different receptors and model of signaling.
- Students will understand the structures and purposes of basic components of prokaryotic and eukaryotic cells, especially macromolecules, membranes, and organelles.
- Students will understand how these cellular components are used to generate and utilize energy in cells.
- To gain the knowledge base in genetics, molecular biology and cell physiology.
- To engage the students in review of scientific literature in the areas of cell mediated biomedical studies.
- Conceptualize and describe protein structure, folding and sorting

COURSE OUTCOME

1. Students upon completion of this paper will have clear knowledge on various cellular functions such as transportation and signaling.
2. It will enable the students to enter into cellular function level research for their future.
3. Students will understand the cellular components underlying mitotic and meiotic cell division.
4. Students will apply their knowledge of cell biology to selected examples of changes or losses in cell function.
5. Students will get the knowledge of common and advanced laboratory practices in cell and molecular biology
6. Conceptual knowledge of properties, structure, function of enzymes, enzyme kinetics and their regulation, enzyme engineering, Application of enzymes in large scale industrial processes

UNIT – I

Cell- Definitions and properties, cell theory. Ultrastructure of eukaryotic cell - plant and animal. Bacterial cell wall structure and composition and their functions.

UNIT – II

Plasma membrane - structure and functions. Transportaion – types and methods. Role of microtubules and microfilaments.

UNIT – III

Cell organelles – Endoplasmic reticulum, Golgi complex, Mitochondria, Chloroplast, Ribosomes, Lysosomes, Peroxisomes, Nucleus and Vacuoles.

UNIT – IV

Mitosis – properties and significance, mitotic cell division and five phases of mitosis.

UNIT – V

Meiosis - properties and significance, Phases of meiosis and Cellular aging:

End Semester Exam: 9 Hours

COURSE OBJECTIVES

- The general objectives of the lab will be to introduce immunology and basic serological techniques.
- To develop the skill in health clinic
- To enhance knowledge in research.
- To give employment opportunities.
- Technical skill of immunology techniques.
- To understand disease mechanisms.

COURSE OUTCOME (CO'S)

1. This practical is to provide the student with a basic knowledge and technical skill of immunology and make them to understand the significance to human disease.
2. Upon completion students will gain knowledge of immune system, cells involved along with complement system and autoimmunity
3. Develop understanding about immune system, antigen antibody interactions.
4. Gain theoretical knowledge of various diseased conditions generated due to interplay of immune system components.
5. After course completion, students can apply the knowledge in further studies and higher education.
6. Introducing the science of immunology and to study various types of immune systems their classification structure and mechanism of immune activation.

EXPERIMENTS

1. Separation of serum / plasma
2. ABO Blood grouping - Rh typing and cross matching. Estimation of hemoglobin content of human blood.
3. Agglutination tests.
 - WIDAL - slide and tube test
 - RA test.
 - RPR test.
 - ASO test.
 - CRP test.
 - \square -HCG test
4. ELISA- thyroid hormone analysis
5. Ouchterlony's Double Immunodiffusion test (ODD)
6. Counter immunoelectrophoresis (CIE)

Instruction Hours / week: L: 0 T: 0 P: 4 Marks: Internal: 40 External: 60 Total: 100**End Semester Exam: 9 Hours****End Semester Exam: 9 Hours****COURSE OBJECTIVE**

- This provides information on fermented food product production in food industries. To know the possible contamination of food products which may include bacteria and fungi.
- To develop the skill in Isolation of pathogen.
- To enhance knowledge in research.
- To give employment opportunities.
- Technical skill of industries techniques.
- To understand disease mechanisms.

COURSE OUTCOME (CO'S)

1. This practical adds a technical skill and good understanding of industrial microbiology
2. Students can develop the skills of an efficient microbiologist in food and beverage industries.
3. Provides necessary entrepreneurial information on the food, dairy Microbiology in safety and quality perspective.
4. It will help to study the importance in the prevention of contamination that might be caused by the microorganisms.
5. To Learn various methods for their isolation, detection and identification of microorganisms in food and employ in industries
6. Identify ways to control microorganisms in foods and thus know the principles involving various methods of food preservation

EXPERIMENTS

1. Production of enzymes – Solid state & Submerged fermentation – GUS assay – Amylase
2. Production of protease from submerged fermentation
3. Production of sauerkraut ,yoghurt, wine
4. Enumeration of Microorganisms from Food samples
5. Detection and enumeration of Microorganisms present in Utensils.
6. Analysis of Milk quality by MBRT
7. Detection of coliforms from water - MPN test
8. Isolation of plant pathogens – Bacteria and fungi
9. Citric acid production
10. Mushroom Cultivation
11. Immobilization technique (Sodium alginate method)
12. Bacterial endotoxin test (BET)

PROJECT VIVA VOCE

**Semester - IV
15C**

Instruction Hours / week: L: 0 T: 0 P: 0 Marks: Internal: 80 External: 120 Total: 200

Instruction Hours / week: L: 0 T: 0 P: 0

Marks: External: 100 Total: 100

End Semester Exam: 3 Hours

COURSE OBJECTIVES

- To study about the biofertilizers, plant disease and increasing soil fertility.
- To provide the knowledge on biomanure and biofertilizer and to become an entrepreneur in the field.
- To Provides detailed idea about biofertilizer production and plant disease.
- To provide the student knowledge about ecofriendly product which play a crucial role in determining its future use and applications in environmental management.
- The students will be able to make qualitative and quantitative description of the basic enzymatic phenomena and processes.
- To provide the student for entrepreneur.

COURSE OUTCOME (CO'S)

7. This course has been designed to provide the student knowledge about eco friendly product.
8. Product play a crucial role in determining its future use and applications in environmental management.
9. Provides detailed idea about biofertilizer production and plant disease.
10. To produce and impart training of ecofriendly agricultural inputs so as to nullify the ill effects of chemical fertilizers.
11. To demonstrate the know-how technology pertinent to microbiological and physico-chemical analyses of soil samples and their assessment.
12. Provides detailed **entrepreneurial** idea about biofertilizer production and plant disease.

UNIT - I

Entrepreneurship- Meaning, concept, Definition and Characteristics of an entrepreneur. Entrepreneurship as Process. Scope of Entrepreneurship in India.

UNIT - II

Motivation of Entrepreneur, Factors responsible For Emergence of Entrepreneurship, Type of Entrepreneur. Barriers to entrepreneurship. Scope of microbiologist as entrepreneur.

UNIT - III

Food and beverage –production of wine, beer, saukart, yogurt, cheese. Types and methods of food preservation. Food packaging-types and methods. Food standards and pharmacopeia.

UNIT - IV

Single cell protein (SCP)- production, processing and application of Spirullina, Azolla, Azospirillum, Rhizobium, Cynobacterium. Role of SCP, Mushroom cultivation- medicinal mushrooms.

UNIT - V

Coir pith degradation – preparation of bed, layering, culture inoculation, product harvesting.
Vermicomposting – methods, types of worms, pit preparation, product isolation and separation, packaging.

CHOICE BASED CREDIT SYSTEM (CBCS)

Syllabus
2015 – 2016

KARPAGAM ACADEMY OF HIGHER EDUCATION

(Deemed to be University)

(Established Under Section 3 of UGC Act 1956)

Eachanari Post, Coimbatore – 641 021

பாடத்திட்டப் பொதுநோக்கம்

- கீற்றல் வழி சிந்தனைத் திறனையும், கருத்து வெளிப்பாட்டுத் திறனையும், மேம்படுத்துதல்.
- ஆய்வுநோக்கை மேம்படுத்துதல்.
- இலக்கியங்கள் உணர்த்தும் வாழ்வின் நுட்பமான பகுதிகளை உணர்த்துதல்.
- மனித மனத்தினைப் பக்குவப்படுத்துதலில் இலக்கியம் தரும் பங்கினை உணர்த்துதல்.
- வளர்ந்து வரும் சமூகத்தில் அறஉணர்வு, பண்பாடு போன்றவை குறித்து அறிவூட்டல்.
- அரசுத் தேர்வுகளுக்கு மாணவர்களை ஆயத்தமாக்குதல்.

பாடத்திட்டப் பயன் விளைவு

- இந்திய குடியுரிமைப் பணி முதலான போட்டித் தேர்வுகளில், விருப்பப் பாடமாக இடம்பெறுகின்ற, 'தமிழ் இலக்கிய வரலாறு' குறித்த முழுமையான அறிமுகம் பெற்றிருத்தல்.
- கல்வெட்டியல், ஓலைச்சுவடியியல் மற்றும் தொல்லியல் சார்ந்த ஆவணத் தேடலுக்குரிய ஆய்வுமனப்பான்மையுடன், இலக்கியங்களை அணுகுதல்.
- தமிழின் வளர்ச்சித் துறையாகிய, 'அறிவியல் தமிழ்' ; 'இணைய தமிழ்' குறித்த பன்னோக்கு அணுகுமுறையிலான ஆய்வுச் சிந்தனை மேம்பாடு.
- வேலைவாய்ப்புக்குரிய சுயதிறன் மேம்பாட்டுடன், படைப்பாக்கத்திறன் மேம்பாடும் பெற்றிருத்தல் .
- சமுதாய மற்றும் வாழ்வியல் மதிப்புகளைப் பேணுவதற்குக் கருவியாக இலக்கியங்களை நாடுகின்ற மனப்பான்மை வளர்ச்சி.
- மொழிபெயப்புத் துறைசார்ந்த வேலைவாய்ப்புத் திறன் பெற்றிருத்தல்.

பகுதி - I, தமிழ்

15LAU101 :

தமிழ் முதல் தாள்

பருவம் I

5-H,5-C

அலகு - I : இக்கால இலக்கியம்

தத்துவம் : மகாகவி பாரதியார் - பகைவனுக்கு அருள்வாய்.

கவிஞர் ந.பிச்சமூர்த்தி - கிளிக்கூண்டு

இயற்கை : பாவேந்தர் பாரதிதாசன் - அழகின் சிரிப்பு - ஞாயிறு.

சமுதாயம் : கவிக்கோ அப்துல் ரகுமான் - இன்றைய நிலை

அறிவியல் : கவிஞர் சிற்பி பாலசுப்பிரமணியன் - காலம்.

பெண்ணியம் : கவிஞர் சிவரமணி - வையகத்தை வெற்றிகொள்ள

சூழலியல் : அன்பாதவன் - மரணம்

காதல் : வைரமுத்து - காதல் உயில்

தன்னம்பிக்கை பா.விஜய் - தன்னம்பிக்கை

அலகு - II : அற இலக்கியம்

1. திருக்குறள் - தேர்ந்தெடுக்கப்பட்ட குறள்கள் 20

2. நான்மணிக்கடிகை - தேர்ந்தெடுக்கப்பட்ட ஐந்து பாடல்கள்

3. திரிகடுகம் - தேர்ந்தெடுக்கப்பட்ட ஐந்து பாடல்கள்

அலகு - III : சிற்றிலக்கியம்

1. நரிவிருத்தம் - அறன் வலியுறுத்தல்

2. தமிழ் விடு தூது - தமிழின் சிறப்புரைத்தல்

3. மதுரை மீனாட்சியம்மைப் பிள்ளைத்தமிழ் - தொடுக்கும் கடவுள் பழம்பாடல்

அலகு - IV : சிறுகதை

1. புதுமைப்பித்தன் - நிகும்பலை

2. தனுஷ்கோடி ராமசாமி - கந்தகக் கிடங்கிலே

3. கந்தர்வன் - துண்டு

4. வாஸந்தி - வடிகால்

5. சி.ஆர். ரவீந்திரன் - வழுக்குமரம்

அலகு - V : மொழிப்பயிற்சி

1. விண்ணப்பங்கள் எழுதுதல் மற்றும் கடிதப் பயிற்சி

2. மொழிபெயர்ப்புப் பயிற்சி

பாட நூல்: கற்பகச்சோலை - தமிழ் ஏடு. கற்பகம் பல்கலைக்கழகத் தமிழ்த் துறை வெளியீடு.

Part I TAMIL 2015. Karpagam University, Coimbatore - 21.

Semester I**15ENU101****ENGLISH-I****L T P C**
4 - - 4

Course Objectives

- To enable the learners to acquire English language skills at a faster pace.
- To introduce different kinds of literary works
- To familiarize different genres of Literature
- To instruct moral values through literature.
- To improvise their productive and receptive skills
- To strengthen the basic knowledge about grammar.

Course Outcomes

1. Learn to reflect on the literary works and communicate flexibly.
2. Reading and comprehending literary works
3. Genres of literature to provide moral education
4. Develop communication skills in business environment
5. Interpersonal skills will be developed.
6. Betterment of language competence

UNIT I:

Prose: Google Guys (Extract) – Richard L Brandt

Poetry: The Blind Pedlar – Osbert Sitwell

Short Story: A Garden So Rich – Christie Craig

Vocabulary: Prefixes, Antonyms, Sentence Completion

Grammar: Articles, Adverbs, Pronouns

Composition: Proverb Expansion

UNIT II:

Prose: Happiness 101 – Geeta Padmanabhan

Poetry: An Old Woman – Arun Kolatkar

Vocabulary: Suffixes, Analogies

Grammar: Nouns, Adjectives

Composition: Dialogue Writing

UNIT III:

Prose: Structured Procrastination – John Perry

Short Story: The Umbrella Man – Roald Dahl

One-Act Play: The Boy Who Stopped Smiling – Ramu Ramanathan

Vocabulary: Synonyms, Euphemisms, Word Definitions

Grammar: Verbs, Conjunctions and Interjection, Indirect/Reported Speech

UNIT IV:

Poetry: No Sentence – Anjum Hassan

One-Act Play: While the Auto Waits- O' Henry

Vocabulary: Words Often Confused, Anagrams

Grammar: Prepositions, Voice- Active and Passive

Composition: Letter Writing- Informal

UNIT V:

Short Story: The Bird – Amar Jalil

One-Act Play: The Cellphone Epidemic – Claudia I. Haas

Vocabulary: Portmanteau Words, One Word Substitute

Grammar: Questions, Pronunciation

Composition: Letter Writing- Formal

Prescribed Texts:

1. Rao, G. Chandralekha and et al. Spring 2013. Emerald Publishers: Chennai.
2. Syamala, V. English for Communication. 2006. Emerald Publishers: Chennai
3. To enable the learners to acquire English language skills at a faster pace.
4. To train the learners to reflect on the literary works and communicate flexibly.

Semester – I**15PHU101****PROPERTIES OF MATTER AND MECHANICS****L T P C****6 - - 6****Course Objectives**

- To know how to use Newton's laws of motion
- To solve advanced problems involving the dynamic motion of mechanical systems and other advanced mathematics in the solution of the problems.
- To find the use of conservation of energy and linear and angular momentum
- To solve dynamics problems.
- To understand the concept of oscillations.
- To gain the knowledge on elasticity.

Course Outcomes (COs)

After successful completion of the course, the student is expected to

1. Understand the basic concepts of mechanics
2. Understand the concepts of simple harmonic motion
3. Define the motion of mechanical systems and their degrees of freedom.
4. Study the interaction of forces between solids in mechanical systems.
5. Application of the vector theorems of mechanics and interpretation of their results.
6. Analyse the mechanics as a systematic tool for problem solving.

UNIT-I

Gravitational fields and potentials: Nature of motion under central forces - Kepler's laws - Newton's law of gravitation - Gravitational potential and field - Gravitational potential and field due to (i) Spherical shell (ii) Solid sphere – Boys' method of determining 'G'

UNIT-II

Elasticity: Elastic constants of an isotropic solid - Relations connecting them - Poisson's ratio - Bending of beams - Uniform and non-uniform bending - Bending moment of a bent beam - cantilever - Static and dynamic methods - Torsion in a wire - Rigidity modulus determination by Static and dynamic methods.

UNIT-III

Surface tension: Surface tension and Surface energy- Pressure difference across a spherical surface- Pressure difference across a curved surface - Angle of contact - Angle of contact for water in a glass - Vapour pressure over a flat and curved surface - Variation of Surface tension with temperature - Jaegar's method - Quincke's method.

UNIT-IV

Viscosity: Streamline flow and Turbulent flow - Stoke's law - Stoke's method for the coefficient of viscosity - Poiseuille's method for the coefficient of viscosity - correction to Poiseuille's equation - Ostwald's viscometer - Variation of viscosity with temperature and pressure - Friction and Lubrication - Searle's viscometer - Viscosity of gases - Modification of Poiseuille's formula for gases - Rankine's method for determining the coefficient of viscosity of a gas.

UNIT-V

Motion of rigid body: Moment of inertia of a rod, disc, spherical shell, solid and hollow spheres - Theory of compound pendulum and Kater's pendulum - Determination of 'g' - Derivation of expressions for angular momentum and kinetic energy of a system of N particles.

Friction-Static Friction - Laws of Friction-Angle and cone of Friction - Motion up and down on a rough inclined plane.

Suggested Book

1. Mathur. D.S, 11th edition 2010, Elements of properties of matter, S. Chand .& company, New Delhi
2. Brijlal and N. Subramanyam, 1st edition 2004, Properties of matter, S. Chand & Company, NewDelhi.
3. Murugesan. R, Revised edition 2004, Properties of matter, S. Chand & Company, New Delhi.
4. Mathur.D.S., 2004 edition, Mechanics, S. Chand & Company, New Delhi.
5. Uppadahayay. J. C., 2003, Properties of Matter, Ram Prakash and Sons, Agra.
6. Katie Dicker 1st edition 2011 properties of matter Wind mills book ltd

	Semester – I	L T P C
15PHU111	PHYSICS PRACTICALS I	- - 5 3

Course Objective

- The objective of this course is to learn how to apply thermodynamic principles in order to interpret thermodynamic systems and predict their behaviors.
- To determine Stefan's Constant.
- To determine the coefficient of thermal conductivity of Cu by Searle's Apparatus.
- To apply the theoretical knowledge into the experiments and find the solutions.
- To apply the concepts and principles of black-body radiation to analyze radiation phenomena in thermodynamic systems.
- To experience the practical difficulties to find the physical constant values

Course Outcomes (COs)

After successful completion of the course, the student is expected to

1. Understand and analyze basic theory and principles of forces in mechanics and their relationship to engineering applications
2. Perform experiments on any material to identify the strength the given objects
3. Comment on the relation between frequency, length and tension of a stretched string under vibration.
4. Analyze motion, forces and motion, work and energy problems and their relationship to engineering applications.
5. Conduct experiments on wooden bar and to identify its the strength
6. Test a wire or cylindrical rod for its strength.

ANY TEN EXPERIMENTS

1. Thickness and length of a material – Vernier caliper & Screw gauge
2. Acceleration due to gravity – Simple pendulum
3. Acceleration due to gravity and moment of inertia – compound pendulum
4. Rigidity modulus – Torsional pendulum
5. Verification of laws of transverse vibration and frequency of fork – sonometer.
6. Young's modulus – non-uniform bending- pin and microscope
7. Young's modulus- non-uniform bending- optic lever
8. Young's modulus-cantilever
9. Co-efficient of viscosity-stoke's method.
10. Frequency of tuning fork- resonance column.

11. Surface tension of water- capillary rise
12. Stoke's formula- spectrometer.

Suggested Books

1. Ouseph C.C., U.J. Rao and V. Vijayendran 2007, Practical Physics and Electronics, S.Viswanathan (Printers & Publishers) Pvt. Ltd., Chennai
2. Singh S.P., 2003, Advanced Practical Physics – 1, 13th Edition, PragathiPrakashan, Meerut
3. Singh S.P., 2000, Advanced Practical Physics – 2, 12th Edition, PragathiPrakashan, Meerut
4. Gupta S.L. and V.Kumar, 2002, Practical Physics, 25th Edition, PragathiPrakashan, Meerut

Semester – I**15PHU102****ALLIED MATHEMATICS - I****L T P C****6 2 - 4****Course Objectives**

This course enables the students to learn

- The concepts of Matrices and their properties.
- Techniques of differentiation and integration.
- The basic concepts of linear algebra.
- The concepts of principles of mathematical induction.
- The solution and application of linear systems.
- The application of matrix, inverse of matrix and system of linear equations.

Course Outcomes (COs)

After successful completion of the course, the student is expected to

1. Solve simultaneous equations with the help of matrices.
2. Mastery in the concepts of vector and scalar fields.
3. Gain the intellectual knowledge of complex functions and their applications.
4. Solve equations with the help of Complex variables.
5. Acquire fundamental knowledge in the techniques of differentiation.
6. Know the properties of definite integrals.

UNIT I

Matrices: Different types of matrices – Inverse of a matrix – Solution of simultaneous equations by matrix method- Cayley-Hamilton theorem(Statement only)-Verification.

UNIT II

Vector calculus: Concepts of vector and scalar fields- Derivative of a vector - The Del operator, Gradient – Divergence of a vector – Curl of a vector- Directional derivative – Formula involving ∇ operator. Laplacian Operator.

UNIT III

Complex variables: Analytical function –Cauchy –Reimann equations – The necessary and sufficient condition for $f(z)$ to be analytic – Polar form of C-R equation-Properties of analytic function – Construction of analytic functions – Milne Thomson method.

UNIT IV

Differential calculus: Differentiation- Curvature and radius of Curvature in Cartesian and Polar form – Evolutes – Involute.

UNIT V

Integral Calculus: Definite and Indefinite integrals – Methods of Integration – Integration by substitution – Integration by parts.

Suggested Books

2. Manickavasagam Pillai.T.K , and S. Narayanan, 2002.“Calculus”, Volume I, and Volume II S.V Printers & Publishers, Chennai.(Unit IV , V)
3. Sastry .S.S,2009, Engineering mathematics, PHI learning Pvt. Ltd, New Delhi(Unit III).
4. Singaravelu.A.,2011, Engineering Mathematics Vol 1&Vol 2 Meenakshi Publications, Arpakkam.
5. Venkataraman.M.K., 2001. Engineering Mathematics Vol 2, National Publishing Company, Chennai.

Semester – I**15FCA101****FOUNDATION COURSE A - VALUE EDUCATION****L T P C****2 - - 1****Course Objectives**

- To improve the integral development of human begins
- To train the students towards sustainable lifestyle
- To create awareness about the values and their significance and role
- To imbibe the concept of discipline and freedom

UNIT – I

Concept of Self, self-awareness, self-esteem and self-confidence. Concept of personality, determinants and disorganisation of it. Personality development – meaning.

UNIT – II

Goal setting – meaning and importance; steps in goal setting Manners and Etiquette – meaning need and importance; means to improve. Positive thinking.

UNIT – III

Discipline – meaning. Concept of Roles and Responsibility Time Management – Meaning and steps for effective time management.

UNIT – IV

Interpersonal relationship – meaning and importance; means to improve it. Healthy friendship.

UNIT – V

Family Relationship importance of it; Means to improve. Spiritualism – meaning. Its relationship with Altruism, sacrifice, self control, tolerance and truthfulness.

TEXT BOOKS

1. Karpagam University Study Material, 2015.

Semester – I**15SSD101****SOFT SKILL DEVELOPMENT - I****L T P C**
2 - - -**Course Objectives**

- To achieve the analytical and reasoning competencies and to improve their communication and presentation skills.
- By practicing Quantitative Aptitude Objective Questions and Answers an individual for competitive exams, entrance exams, and interviews.
- Questions have practical as well as theoretical approach and discussion in forum option is good for explanations so that one can understand them easily and conceptually.
- Practice daily for good results and to learn and master various Quantitative Aptitude subjects.

Course Outcomes

1. To impart knowledge on both Aptitude and Soft skills to the students
2. To critically evaluate and demonstrate various principles involved in solving mathematical problems.
3. To adopt new and faster methods of calculations.
4. Reinforcing competencies in soft skills which are crucial in a social setting.
5. Students can able to solve the complex problems.
6. Students can improve their English fluency by using different verbal's and vocabularies.

UNIT - I

Introduction to Quantitative Aptitude, Speed Maths, Problems on Numbers, Averages, Ratios and Proportions, Problems on Ages

UNIT - II

Number Series, Blood Relation, Image Analysis, Direction Sense, Syllogism, Coding and Decoding

UNIT – III

Percentages, Data Interpretation, Profit and Loss, Simple Interest and Compound Interest

UNIT – IV

Parts of Speech, Tense, Subject Verb Agreement, Active and Passive Voice, Articles, Prepositions

UNIT - V

Conditional Clause, Degrees of Comparison, Goal Setting, Interpersonal Skills.

பகுதி - I தமிழ்ப் பாடத்திட்டம்

(இளநிலை அறிவியல் பட்ட வகுப்புகளுக்குரியது)

பாடத்திட்டப் பொதுநோக்கம்

- கற்றல் வழி சிந்தனைத் திறனையும், கருத்து வெளிப்பாட்டுத் திறனையும், மேம்படுத்துதல்.
- ஆய்வுநோக்கை மேம்படுத்துதல்.
- இலக்கியங்கள் உணர்த்தும் வாழ்வின் நுட்பமான பகுதிகளை உணர்த்துதல்.
- மனித மனத்தினைப் பக்குவப்படுத்துதலில் இலக்கியம் தரும் பங்கினை உணர்த்துதல்.
- வளர்ந்து வரும் சமூகத்தில் அறஉணர்வு, பண்பாடு போன்றவை குறித்து அறிவூட்டல்.
- அரசுத் தேர்வுகளுக்கு மாணவர்களை ஆயத்தமாக்குதல்.

பாடத்திட்டப் பயன் விளைவு

- இந்திய குடியுரிமைப் பணி முதலான போட்டித் தேர்வுகளில், விருப்பப் பாடமாக இடம்பெறுகின்ற, 'தமிழ் இலக்கிய வரலாறு' குறித்த முழுமையான அறிமுகம் பெற்றிருத்தல்.
- கல்வெட்டியல், ஓலைச்சுவடியியல் மற்றும் தொல்லியல் சார்ந்த ஆவணத் தேடலுக்குரிய ஆய்வுமனப்பான்மையுடன், இலக்கியங்களை அணுகுதல்.
- தமிழின் வளர்ச்சித் துறையாகிய, 'அறிவியல் தமிழ்' ; 'இணைய தமிழ்' குறித்த பன்னோக்கு அணுகுமுறையிலான ஆய்வுச் சிந்தனை மேம்பாடு.
- வேலைவாய்ப்புக்குரிய சுயதிறன் மேம்பாட்டுடன், படைப்பாக்கத்திறன் மேம்பாடும் பெற்றிருத்தல் .
- சமுதாய மற்றும் வாழ்வியல் மதிப்புகளைப் பேணுவதற்குக் கருவியாக இலக்கியங்களை நாடுகின்ற மனப்பான்மை வளர்ச்சி.
- மொழிபெயப்புத் துறைசார்ந்த வேலைவாய்ப்புத் திறன் பெற்றிருத்தல்

அலகு - I : பக்தி இலக்கியம்

1. சைவம் - மூவர் தேவாரத்திலிருந்து தேர்ந்தெடுக்கப்பெற்ற 15 பாடல்கள்
2. வைணவம் - ஆண்டாள் நாச்சியாரின் திருப்பாவையிலிருந்து 11 பாடல்கள்

அலகு - II : சங்கஇலக்கியம்

அ). எட்டுத்தொகை

நற்றிணை: 1. இலை இல பிடவம், திணை - முல்லை,

ஆசிரியர் - விழிக்கட் பேதைப் பெருங்கண்ணனார்.

2. மடல் மா ஊர்ந்து, திணை - குறிஞ்சி, ஆசிரியர் - மடல் பாடிய மாதங்கீரனார்.

குறுந்தொகை : 1. உள்ளார் கொல்லோ, திணை - பாலை, ஆசிரியர் - பெருங்கடுங்கோ.

2. யாரினும் இனியன், திணை - மருதம், ஆசிரியர் - வடமவண்ணக்கன் தாமோதரனார்.

ஐங்குறுநூறு : 1. நுண்ணேர் புருவத்த, திணை - குறிஞ்சி, ஆசிரியர் - கபிலர்.

2. அவறொறுந் தேரை, திணை - முல்லை, ஆசிரியர் - பேயனார்.

பதிற்றுப்பத்து - ததைந்த காஞ்சி, ஆசிரியர் - பாலைக் கௌதமனார்.

பரிபாடல் - வையை - திரை இரும் பனிப் பெளவம், ஆசிரியர் - மையோடக் கோவனார்.

கலித்தொகை - கடும் புனல் கால் பட்டு, திணை - பாலை, ஆசிரியர் - பெருங்கடுங்கோ.

அகநானூறு - 1. ஆடு அமைக் குயின்ற, திணை - குறிஞ்சி, ஆசிரியர் - கபிலர்.

2. யான் எவன் செய்கோ தோழி, திணை - பாலை, ஆசிரியர் - நோய்பாடியார்.

- புறநானூறு - 1. சிறப்பில் சிதடு முறுப்பில், திணை - பொதுவியல்,
ஆசிரியர் - உறையூர் முதுகண்ணன் சாத்தனார்.
2. இளையரு முதியரும் வேறுபுலம் படா - ஆசிரியர் - கயமனார்.

ஆ). பத்துப்பாட்டு - சிறுபாண் ஆற்றுப்படை - கடையெழு வள்ளல்களின் சிறப்பு,
நல்லியக்கோடனின் சிறப்பு, ஈகைத் திறம்.

அலகு - III : காப்பியங்கள்

1. மணிமேகலை - பாத்திரம் பெற்ற காதை - தீவதிலகை, மணிமேகலைக்குச் சொல்லியது,
சிறைக்கோட்டம் அறக்கோட்டமாக்கிய காதை - மணிமேகலை வேண்ட,
மாவண்கிள்ளி, சிறைக்கோட்டத்தை அறக்கோட்டமாக்கியது.

2. கம்பராமாயணம் - இலக்கியநயம் மிக்க, தேர்ந்தெடுக்கப்பெற்ற 41 பாடல்கள்.

அலகு - IV : கட்டுரைகள்

1. திருக்குறளில் மனிதவள மேலாண்மைக் கருத்துக்கள் - திருமிகு ஹரி விஜயலட்சுமி.
2. தமிழர் வளர்த்த நுண்கலைகள்: சிற்பமும் ஓவியமும் - தொ.மு. பாஸ்கரத் தொண்டைமான்.
3. சமயமும் தமிழும் - பேராசிரியர் அ.ச.ஞானசம்பந்தன்.
4. தமிழில் அறிவியல் - ஒரு பார்வை - பேராசிரியர் சிவகுமார்.
5. இன்றைய நெருக்கடிப் பிரச்சனைகள் - நீர்வளம் - முனைவர் ச. முத்துக்குமரன்.

அலகு - V : இலக்கணமும் மொழிப்பயிற்சியும்

1. எழுத்து, சொல், பொருள் இலக்கண எழுத்துப்பயிற்சிகள்
 2. பொதுக் கட்டுரைகள்
- பாட நூல்: கற்பகச்சோலை - தமிழ் ஏடு. கற்பகம் பல்கலைக்கழகத் தமிழ்த் துறை வெளியீடு.

Semester – II

15ENU201

ENGLISH – II

L T P C
4 - - 4

Course Objectives:

- To enable the learners to acquire English language skills through literature.
- To familiarize them with English literature.
- To acquire Grammar knowledge.
- To help learners imbibe cultural values.
- To acquire skill of making correct sentences.
- To reflect originality on the application of soft skills and express in writing their views.

Course Outcomes:

1. Learn to enjoy the ecstasy of literature.
2. The select literary pieces will develop the confidence level of the learners.
3. To get the social values.
4. To know the importance of communication
5. Get sound knowledge in English
6. Trained to communicate well for business purpose.

UNIT I:**Prose:** The Unexpected- Robert Lynd**Poetry:** The Village Schoolmaster – Oliver Goldsmith**Short Story:** The Lion's Share – Arnold Bennett**Vocabulary:** Homonyms**Grammar:** Irregular Verbs**UNIT II:****Prose:** Travel by Train – J. B. Priestly**Poetry:** The Gift of India – Sarojini Naidu**Grammar:** Sentence patterns**Composition:** Reading Comprehension**UNIT III:****Prose:** Women's Education is Almost More Important than the Education of Boys and Men –
Indira Gandhi**Short Story:** The Necklace – Guy De Maupassant**One-Act Play:** The Referee – W.H. Andrews and Geoffrey Dearmer**Vocabulary:** Similes**Grammar:** Discourse Markers**Composition:** Report Writing

UNIT IV:

Poetry: Ozymandias – P.B. Shelley

One-Act Play: The Pot of Broth- W.B. Yeats

Vocabulary: Collective Nouns

Grammar: Correction of Sentences

Composition: Picture Reading

UNIT V:

Short Story: The Silver Butterfly– Pearl S. Buck

One-Act Play: The Bear – Anton Chekov

Vocabulary: Acronyms

Grammar: Question Tags

Composition: Drafting Advertisement

Prescribed Texts

1. Wings of Communication 2014. Board of Directors. Emerald Publishers: Chennai

Reference

2. Syamala, V. English for Communication. 2006. Emerald Publishers: Chennai.

Course Objectives

- The objective of this course is to give awareness on different laws of thermodynamics and its effect on different aspects in life.
- The aim of statistical mechanics is to give knowledge on the laws of classical thermodynamics for macroscopic systems using the properties of its atomic particles.
- To apply the concepts and principles of black-body radiation to analyze radiation phenomena in thermodynamic systems.
- To apply the concepts and laws of thermodynamics to solve problems in thermodynamic systems such as gases, heat engines and refrigerators etc.
- To give knowledge on the statistical mechanics and explain the applications of thermodynamics.
- To provide the correlation of thermodynamical problems with statistical concepts.

Course Outcomes (COs)

After successful completion of the course, the student is expected to

1. Differentiate the terms heat and temperature and measure temperature using thermometer and convert one scale of temperature to another scale.
2. Understand specific heat capacity of gas and the different theories on specific heat capacity
3. Differentiate between principles and methods to produce low temperature, liquefy air, helium and hydrogen
4. Define postulates of kinetic theory of gases and arrive at theorem of equipartition of energy and derive Van der Waal's equation.
5. Identify and describe the statistical nature of concepts and laws in thermodynamics, in particular: entropy, temperature, chemical potential, Free energies, partition functions.
6. Fermi-Dirac and Bose-Einstein distributions to solve problems in some physical systems.
7. Apply the concepts and principles of black-body radiation to analyze radiation phenomena in thermodynamic systems.
8. Apply the concepts and laws of thermodynamics to solve problems in thermodynamic systems.

UNIT I

Definitions – Newton's law of cooling – specific heat of a liquid calendar and Barne's continuous flow method – two specific heats of a gas – specific heat of a gas by Joly's differential steam calorimeter – Regnault's method – Dulong and Petit's law – variation of specific heat ad atomic heat with temperature.

UNIT II

Transmission of heat : Conduction – Co-efficient of the thermal conductivity – Cylindrical flow of heat – determination of thermal conductivity of rubber and bad conductor – Lee's disc method. Conduction – Radiation – Black body – Wein's Law - Raleigh – Jean's Law – Stefan's law – Experimental Determination of Stefan's constant – Mathematical derivation of Stefan's law

UNIT III

Kinetic theory of gases: Maxwell's law of distribution of molecular velocities – Experimental verification – equilibrium speed distribution of velocities. Mean free path – transport phenomena – diffusion – viscosity and thermal conduction of gases – Vander walls equation – relation between Vander Wall's constant and critical constants.

UNIT IV

Laws of Thermodynamics: First law of thermodynamics – Isothermal and Adiabatic process – gas equation during an adiabatic process – Work done an adiabatic expansion of gas – equation of an adiabatic curve – isothermal processes – Determination of γ by Clement and Desorme's method – second law of thermodynamics – Carnot's engine- Working efficiency – Carnot's refrigerator – Carnot's Theorem.

UNIT V

Concept of entropy: Entropy Change in entropy in a reversible process and irreversible process – temperature entropy diagram – Entropy of a perfect gas – increase of entropy in any irreversible process – Thermo dynamics functions – Maxwell's thermodynamics

Text Books

2. Heat & Thermodynamics, Brijlal& N. Subramaniam ;revised edition 2010; S Chand & company
3. Heat – M. Narayanamurthi and N. Nagaratnam; springer
4. Heat and Thermodynamics – Zemansky and R.H. Deltanann; 7th edition 1996; Mcgraw hill
5. Heat and Thermodynamics – D.S. Mathur, S. Chand & Co, 5th edition 2004.
6. Heat and Thermodynamics – Agarwal, Singhal, Sathyaprakash 18th edition 2006 pragathi prakashen
7. Thermal Physics — Agarwal, Sathyaprakash 25th edition 2013 pragathi prakashen

Semester-II**15PHU211****PHYSICS PRACTICALS II****L T P C****- - 5 3**

Course Objectives

- To establish a grounding in electromagnetism in preparation for more advanced courses.
- Assess the contributions of physics to our evolving understanding of global change and sustainability while placing the development of physics in its historical and cultural context.
- Basic definitions (stress, strain, Hooke's law and Poisson's ratio) of elasticity
- Stress – Strain Diagram
- Determination of rigidity modulus and time period.
- Moment of Inertia and calculating MI of an irregular body

Course Outcomes (COs)

After successful completion of the course, the student is expected to

1. To gain knowledge and develop skills in the basic concept of electric forces.
2. Deal with liquids based on their viscosity
3. Compare the thermal conductivity of solids
4. Analyze the heat capacity of liquids
5. To understand Gauss law and its applications.
6. Distinguish first order and second order spectrum.

ANY TEN EXPERIMENTS

1. Co-efficient of thermal conductivity-Lee's disc method
2. Temperature coefficient of resistance of a thermistor-Post office box
3. Newton's law of cooling
4. Specific heat capacity of liquid - Joule's calorimeter
5. Stephan's law
6. Copper voltameter
7. Co-efficient of viscosity of water-Poiseuille's method
8. Potentiometer - temperature co-efficient of material
9. Meter bridge
10. Young's modulus-uniform bending - Koieng's method
11. Young's modulus-non uniform bending - Koieng's method
12. Spectrometer - μ of prism
13. Spectrometer – wavelength of a spectral line by grating

Suggested Books

1. Ouseph C.C., U.J. Rao and V. Vijayendran 2007, Practical Physics and Electronics, S.Viswanathan (Printers & Publishers) Pvt. Ltd., Chennai
2. Singh S.P., 2003, Advanced Practical Physics – 1, 13th Edition, Pragathi Prakashan, Meerut
3. Singh S.P., 2000, Advanced Practical Physics – 2, 12th Edition, Pragathi Prakashan, Meerut

Course Objectives

This course enables the students to learn

- The Concept of Fourier analysis and solving boundary value problems.
- Techniques of Fourier and Laplace transform to solve differential equations.
- Numerical techniques of differentiation and integration.
- To find the solution for physical problems.
- To get mathematical foundation to formulate and solve problems arising in physics

Course Outcomes (COs)

After successful completion of the course, the student is expected to

1. Appreciate the physical significance of Fourier series.
2. Understand the mathematical principles on transforms.
3. Apply mathematical foundation to formulate and solve problems arising in physics
4. Synthesize numerical techniques for practical problems
5. Apply their knowledge to find the solution for physical problems.
6. Solve the Fourier series problems and apply it for practical things.

UNIT I

Fourier series: Definition – Finding Fourier coefficients for a given periodic function with period 2π – Odd and Even functions – Half Range Series.

UNIT II

Fourier Transforms: Definition of Fourier Transform-Properties of Fourier Transform- Inverse Fourier transform-Convolution theorem-Finite Fourier Sine &Cosine Transform –Parseval's theorem.

UNIT III

Laplace Transforms: Definition of Laplace Transform - Properties of Laplace Transform, Inverse Laplace Transform. Application of Laplace Transform.

UNIT IV

Differential Equations: Types of Linear differential equations with constant coefficients – Simultaneous differential equations with constant coefficient.

UNIT V

Numerical methods: Solving simultaneous equations–Gauss Elimination method, Gauss Jordan method, Gauss – Seidel method. Numerical Integration – Trapezoidal Rule, Simpson's Rule.

Semester II**15FCB201****FOUNDATION COURSE – B
ENVIRONMENTAL STUDIES****L T P C
2 - - 1**

Course Objectives

- To create the awareness about environmental problems among people.
- To develop an attitude of concern for the environment.
- To motivate public to participate in environment protection and improvement.
- To understand the transnational character of environmental problems and ways of addressing them, including interactions across local to global scales.
- To apply systems concepts and methodologies to analyze and understand interactions between social and environmental processes.
- To gain knowledge on environmental issues.

Course Outcomes (COs)

After successful completion of the course, the student is expected to

1. Master core concepts and methods from ecological and physical sciences and their application in environmental problem solving.
2. Master core concepts and methods from economic, political, and social analysis as they pertain to the design and evaluation of environmental policies and institutions.
3. Appreciate the ethical, cross-cultural, and historical context of environmental issues and the links between human and natural systems.
4. Understand the transnational character of environmental problems and ways of addressing them, including interactions across local to global scales.
5. Apply systems concepts and methodologies to analyze and understand interactions between social and environmental processes.
6. Reflect critically about their roles and identities as citizens, consumers and environmental actors in a complex, interconnected world.
7. Demonstrate proficiency in quantitative methods, qualitative analysis, critical thinking, and written and oral communication needed to conduct high-level work as interdisciplinary scholars and / or practitioners.

Unit - I: Eco system and natural resources: Environment – Definition – components - Ecosystem -Definition, Concept, Scope, importance, structure and functions of ecosystem. Energy flow, Ecological succession. Food chains and food webs. Classification of ecosystem. Natural resources: Forest resources; water resources

Unit - II: Environmental pollution: Cause, effects and control measures of Air pollution, water pollution, soil pollution, marine pollution, noise pollution, thermal pollution and nuclear hazards pollution. Solid waste management.

Unit - III: Biodiversity and its conservation: Introduction- Definition, genetic, species and ecosystem diversity, biogeographical classification of India- Value of biodiversity: Consumptive, productive uses; social, ethical, aesthetic and option values. Threats to biodiversity: habitat loss, poaching of wildlife, man-wildlife conflicts.

Unit - IV: Social issues and the environment: Urban problems related to energy- water conservation and management -Rain water harvesting- water shed management. Resettlement and Rehabililisaion. Natural resources and associated problems and sustainable utilization. Environmental Education

Unit - V: Environment ethics: Environmental Ethics - Gender equity, ethical basis of environment education and awareness, conservation ethic and traditional value systems of India. Valuing nature, cultures, social justice, Human heritage, equitable use of resources, preserving resources for future generation, common property resources, Ecology and its uses and its degradation, Introduction to Environmental Protection Act (EPA).

Semester – II**15SSD201****SOFT SKILL DEVELOPMENT – I****L T P C****2 - - 1****Course Objectives**

- To achieve the analytical and reasoning competencies and to improve their communication and presentation skills.
- By practicing Quantitative Aptitude Objective Questions and Answers an individual for competitive exams, entrance exams, and interviews.
- Questions have practical as well as theoretical approach and discussion in forum option is good for explanations so that one can understand them easily and conceptually.
- Practice daily for good results and to learn and master various Quantitative Aptitude subjects.

Course Outcomes

1. To impart knowledge on both Aptitude and Soft skills to the students
2. To critically evaluate and demonstrate various principles involved in solving mathematical problems.
3. To adopt new and faster methods of calculations.
4. Reinforcing competencies in soft skills which are crucial in a social setting.
5. Students can able to solve the complex problems.
6. Students can improve their English fluency by using different verbal's and vocabularies.

UNIT - I

Introduction to Quantitative Aptitude, Speed Maths, Problems on Numbers, Averages, Ratios and Proportions, Problems on Ages

UNIT - II

Number Series, Blood Relation, Image Analysis, Direction Sense, Syllogism, Coding and Decoding

UNIT – III

Percentages, Data Interpretation, Profit and Loss, Simple Interest and Compound Interest

UNIT – IV

Parts of Speech, Tense, Subject Verb Agreement, Active and Passive Voice, Articles, Prepositions

UNIT - V

Conditional Clause, Degrees of Comparison, Goal Setting, Interpersonal Skills.

Semester – III

		L T P C
15ENU301	ENGLISH – III (Communicative English)	4 - - 4

Course Objective:

- To develop confidence to respond in English during situations where the use of English is imperative.
- To develop fluency in actual conversation in the English language.
- To develop speech skills necessary for confident and intelligent participations in Group Discussions and develop skills related to teamwork in work places.
- To develop confidence to respond in English during situations where the use of English is imperative.
- To develop fluency in actual conversation in the English language.
- To develop knowledge about business communication.

Course Outcome

After successful completion of the course, the student is expected to

1. Students learnt the basics and purposes of listening skill.
2. Students understand importance of speaking.
3. Students developed the speaking skills on telephone, business and also in travel
4. Learnt some effective vocabulary learning strategies.
5. Students will able to communicate clearly and effectively and handle their day to day affairs well with their knowledge of language skills.
6. Students understand importance of learning communicative English.

UNIT I

Listening: Listening comprehension – Listening for Specific Information –Note Taking – Interpreting Charts and Diagrams.

UNIT II

Speaking: Essentials of effective communication – Greeting and Introducing – Making requests – Asking for permission – Giving and Denying Permission – Offering and Accepting Help – Asking for and Declining Help – Giving Instructions and Orders - Talking about likes and dislikes.

Telephone Skills – Understanding telephone conversation – handling calls – leaving messages – making requests - giving instructions and orders

Discussion Skills – Giving your opinion – agreeing and disagreeing – Making suggestions – Interrupting – questioning – reporting – Dealing with questions. (Completing dialogues)

UNIT III

Reading: Reading – Reading with a purpose – Skimming and Scanning – locating main points – reading critically – Sequencing of sentences – Reading comprehension.

UNIT IV

Writing: Paragraph Writing – Descriptive and Narrative. Safety Instructions/ Suggestions. Expansion of Abbreviations – Spellings- Report writing.

Translation- Translating short sentences and passages from English to Tamil and from Tamil to English.

UNIT V

Vocabulary: Improve English vocabulary: Synonyms – Antonyms – Prefixes – Suffixes – Idioms – Collocations – Different types of English – British and American (Choose the best answer type from a database of 50 words each for each topic)

Functional Grammar: Forming questions, getting answers – Articles – Parts of Speech – Punctuation – Common mistakes in English (Homophones)(Exercise based)

Suggested Books:

1. Language in Use: Kenneth Anderson, Cambridge University Press.
2. Study Speaking: A course in Spoken English for Academic Purpose: Kenneth Anderson, Joan MacLean and Tony Lynch, Cambridge University Press, 2008.
3. Spoken English Part I & II (for Tamil speakers), Orient Longman Pvt. Ltd.
4. Dr. J. John Love Joy, Dr. Francis M. Peter S.J. “Let's Communicate – Basic English for Everyone”, Vaigarai Publications, 1st edition, Dindigul 2007.

Semester – III**15PHU301****ELECTRICITY AND MAGNETISM****L T P C****5 - - 5****Course Objectives**

- To establish grounding in electromagnetism in preparation for more advanced courses.
- The major concepts covered are: the abstraction from forces to fields using the examples of the gravitational, electric and magnetic fields, with some applications; the connection between conservative forces and potential energy; how charges move through electric circuits; the close connection between electricity and magnetism, leading to the discovery of electromagnetic waves.
- To use electromagnetic theory and principles in a wide range of applications.
- To understand the calculus along with physical principles
- To effectively solve problems encountered in everyday life, further study in science, and in the professional world.
- To gain confidence in their ability to apply mathematical methods to understand electromagnetic problems to real-life situations.

Course Outcomes (COs)

After successful completion of the course, the student is expected to

1. Apply knowledge of electricity and magnetism to explain natural physical processes and related technological advances.
2. Gain confidence in their ability to apply mathematical methods to understand electromagnetic problems to real-life situations.
3. Use an understanding of calculus along with physical principles to effectively solve problems encountered in everyday life, further study in science, and in the professional world.
4. Be able to use electromagnetic theory and principles in a wide range of applications.
5. Design experiments and acquire data in order to explore physical principles, effectively communicate results, and critically evaluate related scientific studies.
6. To develop an understanding of the principles of electricity and magnetism.

UNIT - I

Electrostatics: Gauss theorem, application of Gauss theorem - Electric intensity at a point immediately adjacent to a charged conductor - Energy stored in unit volume of an electric field. Spherical Capacitor - Cylindrical Capacitor - Force of attraction between charged plates of a Capacitor - change in energy of a parallel plate Capacitor when the distance between the plates is altered and when a dielectric slab is introduced between the plates - types of Capacitors - Guard ring Capacitor - Electrolytic Capacitor - Variable Capacitor.

Polarization in dielectric materials - Parallel plate Capacitor and dielectric slab - Boundary conditions - depolarization factor

UNIT - II

Magnetism: Properties of the magnetic field B - Divergence of B - Curl of B - Magnetic vector potential - Electron theory of magnetism - Dia, para and ferromagnetism – Ferri and Antiferro magnetism – Domain Theory of Ferrimagnetism - Magnetic field (B)-magnetization (M) - Magnetic field intensity (H) - Magnetic susceptibility and magnetic permeability - Magnetic materials and magnetization- Magnetic hysteresis - Area of the hysteresis loop - Ferro magnets- Determination of susceptibility - Curie balance method - Guoy's method.

UNIT - III

Thermal effects of electricity: Seeback effect-Laws of thermo e.m.f - Peltier effect - Peltier coefficient - Determination of Peltier coefficient at a junction - Thermo dynamical consideration of Peltier effect -Thomson effect -Thomson coefficient - emf generated in a thermocouple taking both Peltier effect at the junctions and Thomson effect in metals - Thermo electric power - applications of thermodynamics to thermocouple - Thermoelectric diagrams and their uses.

UNIT - IV

Inductive and capacitive effects: Growth and decay of current in an inductive - Resistive circuit - charging and discharging of a capacitance through a resistance - Charging and discharging of a capacitance through an inductance and a resistance - Discharge of a capacitance through an inductance - Oscillatory circuits.

Analysis of the A.C circuits (with the vector diagrams) containing (i) resistance and inductance (ii) capacitance and resistance (iii) resistance, inductance and capacitance - LCR series resonance circuit - LC parallel and L, R and C parallel resonance circuits -power consumed by the above circuits - q factor and band width of response of a tuned circuit-sharpness of resonance.

UNIT -V

Electric induction: Induced emf, Faraday's Law and Lenz's Law -The emf induced in a rotating coil -search coil - Eddy current - Electromagnetic damping - Self and mutual inductances - expressions and determination by experiment - Energy stored in an inductor - Artificial external pacemakers - Electromagnetic measurement of blood flow.

Charged particles in a uniform and constant electric field - Charged particles in an alternating electric field - Charged particles in a uniform and constant magnetic field -magnetic focusing - charged particles in combined electric and magnetic field when the fields are parallel and are in mutually perpendicular directions.

Suggested Books:

1. Brijlal and Subramanyam, 1st editon; 2004, Electricity and magnetism, S. Chand & Company, New Delhi
2. Murugesan. R, 9th edition 2014 , Electricity and magnetism, S. Chand & Company, New Delhi.
3. Nagarathinam and Lakshminarayanan, 2002, Electricity and magnetism, 2nd Edition, The National Publishing Inc., New Delhi.
4. Tewari. T.K., 1st edition 2005, Electricity and magnetism, S. Chand & Company, New Delhi.
5. Mathur. D.S., 2004, electricity and magnetism, S.Chand & Company, New Delhi.
6. Vasudeva. D.N., 2004, Electricity and magnetism, S. Chand & Company, New Delhi.

Semester – III**15PHU302****SOLID STATE PHYSICS****L T P C****4 - - 4**

Course Objective:

- This course integrates theory of Solid State Physics with experimental demonstrations in the Physics Lab.
- The course will provide a valuable theoretical introduction and an overview of the fundamental applications of the physics of solids.
- It includes theoretical description of crystal and electronic structure, lattice dynamics, and optical properties of different materials (metals, semiconductors, dielectrics, magnetic materials and superconductors), based on the classical and quantum physics principles.
- To calculate thermal and electrical properties in the free-electron model.
- To gain a basic knowledge of crystal systems and spatial symmetries.
- To know what phonons are, and be able to perform estimates of their dispersive and thermal properties.

Course Outcomes

After successful completion of the course, the student is expected to

1. Account for interatomic forces and bonds.
2. Have a basic knowledge of crystal systems and spatial symmetries.
3. Account for how crystalline materials are studied using diffraction, including concepts like form factor, structure factor, and scattering amplitude.
4. Know what phonons are, and be able to perform estimates of their dispersive and thermal properties.
5. Calculate thermal and electrical properties in the free-electron model.
6. Explain superconductivity using BCS theory
7. Outline the importance of solid state physics in the modern society.

UNIT 1

Crystallography: Distinction between crystalline and amorphous solids – Different features of the crystal – Crystal lattice – Basis – Crystal structure – Unit cell – Number of lattice points per unit cell- Bravais lattices – Miller indices – Elements of Symmetry – Structure of KCl and NaCl crystal – Atomic Packing – Atomic radius – Lattice constant and density- Crystal structure.

UNIT 2

Bond theory of solids – Classification of solids – Basics of Bond theory – Optical properties of solids – Specific heat capacity of solids – Dulong and Pettit's law – Einstein's theory of specific heat of solids – Fermi levels.

UNIT 3

Magnetic properties of materials : Introduction – Langevin's theory of diamagnetism – Langevin's theory of paramagnetism – Ferromagnetism – Weiss theory of Ferromagnetism – Nuclear magnetic resonance – Ferro electricity – Ferroelectric crystals – Quantum theory of paramagnetism – Cooling by adiabatic demagnetization of a paramagnetic salt.

UNIT 4

Free electron theory – Drude Lorentz theory – Explanation of Ohm's law – Electrical conductivity – Thermal conductivity – Wide-Mann and Franz ratio – Sommerfield model – Schotcky effect – Hall effect – Hall voltage and Hall coefficient – Mobility and Hall angle – Importance of Hall effect – Experimental determination of Hall coefficient.

UNIT 5

Dielectrics- Dielectric constant and displacement vector- Clausius-Mossotti relation- Atomic or molecular polarizability – Types of polarizability -Super conductivity – Phenomena – magnetic properties – Super conductor – Meissner effect – Experimental facts – Isotopes effect – Thermodynamic effect.

Suggested Books:

1. Gupta and Kumar; pragthiprakashen; Solid State Physics;
2. R Murugesan; S.Chand & Co; 2004 1st edition Modern Physics
3. Charles Kittel, Introduction to Solid State Physics, 7th edi 2000; willey eastern ltd, new delhi
4. A J Dekker; 2000; rev edition; Mcmillan India ltd Solid State Physics

Semester–III**15PHU311****PHYSICS PRACTICALS III****L T P C****- - 4 2**

Course Objective

The aim of the course is to make them to

- Understand and working of polarimeter.
- Understand the resolving power of different optical instruments.
- The objective of this course is to learn how to apply thermodynamic principles in order to interpret thermodynamic systems and predict their behaviors.
- To determine Stefan's Constant.
- To determine the coefficient of thermal conductivity of Cu by Searle's Apparatus.
- To apply the theoretical knowledge into the experiments and find the solutions.
- To experience the practical difficulties to find the physical constant values

Course Outcomes

After successful completion of the course, the student is expected to

1. Demonstrate the effect of magnetic field on current carrying conductors
2. Examine the effect horizontal component of earth's magnetic field on magnetic materials
3. Analyze the effects of refractive index of a medium using optical instruments
4. Gain knowledge on various theories of light.
5. Predict the curvature of a transparent medium.
6. Acquire skills to identify and apply formulas of optics and wave physics.
7. Understand the properties of light like reflection, refraction, interference, and diffraction etc., and applications of diffraction and polarization.

ANY TEN EXPERIMENTS

1. Spectrometer - i - i' curve
2. Spectrometer - i - d' curve
3. Spectrometer – dispersive power of grating
4. Potentiometer – emf of thermocouple
5. Newton's ring
6. Air wedge
7. Tan A
8. Tan B
9. Low and high range voltmeter calibration
10. Focal length of concave lens

11. Focal length of convex lens
12. Current – voltage sensitivity- B.G
13. Mutual inductance of coil – B.G

Suggested Books

1. Ouseph C.C., U.J. Rao and V. Vijayendran 2007, Practical Physics and Electronics, S.Viswanathan (Printers & Publishers) Pvt. Ltd., Chennai
2. Singh S.P., 2003, Advanced Practical Physics – 1, 13th Edition, PragathiPrakashan, Meerut
3. Singh S.P., 2000, Advanced Practical Physics – 2, 12th Edition, PragathiPrakashan, Meerut

Course Objectives

- The molecular orbital theory, preparation and properties of inorganic compounds.
- Theory of covalent bond, polar effects and stereochemistry of organic compounds.
- About important industrial chemicals like silicones, fuel gases and fertilizers and their impact on environment.
- To understand types and structure of different compounds.
- To understand types and structure of inorganic carbon compounds.
- To distinguish between intra and inter molecular hydrogen bonding.
- To understand the electro chemistry of chemicals.

Course Outcome

After successful completion of the course, the student is expected to

1. The molecular orbital theory, preparation and properties of inorganic compounds.
2. Theory of covalent bond, polar effects and stereochemistry of organic compounds.
3. About important industrial chemicals like silicones, fuel gases and fertilizers and their impact on environment.
4. Elements of photochemistry, chemical kinetics and chromatography.
5. Gain knowledge on bonding of elements, preparation of new compounds, properties of new materials, etc.,
6. Understand the concept of dye, properties of dye and their applications in day to day life.

Unit-I

Chemical Bonding: Molecular orbital theory-linear combination of atomic orbitals-bonding and antibonding molecular orbitals-energy level diagram-bond order- M.O. configuration of H_2 , N_2 and F_2 molecules. Diborane: Preparation, properties and structure. $NaBH_4$: Preparation and uses. Borazole: Preparation and properties. Interhalogen compounds: ICl , BrF_3 , IF_5 - preparation, properties, uses and structure. Basic properties of iodine. Compounds of sulphur: Sodium hydrosulphite- preparation, properties, uses and structure. Per acids of sulphur: Preparation, properties, uses and structure.

Unit-II

Industrial Chemistry: Silicones: Synthesis, properties and uses. Fuels gases: Natural gas-water gas-semi water gas-carbureted water gas-producer gas- oil gas (Manufacturing details not required). Fertilizers: NPK fertilizer-ammonium sulphate-urea-superphosphate of lime-triple superphosphate- potassium nitrate-ammonium nitrate. Pollution: Water, air and soil pollution-sources and remedies-acid rain-ozone hole-greenhouse effect.

Unit- III**Covalent Bond and Stereoisomerism:**

Covalent Bond: Orbital overlap, hybridization and geometry of CH_4 , C_2H_4 and C_2H_2 . Polar effects: Inductive effect- electromeric effect- mesomeric effect- steric effect- hyperconjugation.

Stereoisomerism: Elements of symmetry-polarised light and optical activity-isomerism in tartaric acid-racemisation- resolution- geometrical isomerism of maleic and fumaric acids-keto-enol tautomerism of acetoacetic esters.

Unit- IV**Dyes, Chemotherapy and Vitamins:**

Dyes: Terms used chromophore, auxochrome, bathochromic shift and hypsochromic shift-classification of dyes – based on chemical structure and application-one example each for azo, triphenylmethane, vat and mordant dyes- preparation.

Chemotherapy: Preparation, uses and mechanism of action sulpha drugs- preparation and uses of prontosil, sulphadiazine and sulphafurazole-structure and uses of penicillins and chloromycetin.

Vitamins: Diseases caused by the deficiency of vitamins A, B_1 , B_2 , C and D-sources of these vitamins.

Unit- V**Elements of Photochemistry, Chemical Kinetics and Chromatography:**

Elements of Photochemistry: Photochemical laws-Beer Lambert's law-Grotthuss-Draper law-Stark-Einstein law (statement only).

Chemical Kinetics: Rate-order-molecularity-pseudo first order reactions-zero order reactions-determination of order of reaction-measurement of order and rates of reactions-effect of temperature on reaction rate-energy of activation.

Chromatography: Principles and applications of Column, Paper and Thin Layer Chromatography.

Suggested Books

1. V.Veeraiyan & A.N.S. Vasudevan, Text Book of Allied Chemistry (II Edition), Highmount Publishing House, Chennai (2005).
2. B.R.Puri and L.R.Sharma, Principles of Inorganic Chemistry, Shobanlal & Company Ltd., Jalandar (2002).
3. B.S.Bahl&ArunBahl, Advanced Organic Chemistry, S.Chand & Company Ltd., New Delhi (2005).
4. Puri, Sharma &Pathania, Physical Chemistry, Vishal Publishing Company Ltd., Jalandhar (2003).
5. R.Gopalan&S.Sundaram, Allied Chemistry (III Edition), Sultan Chand & Sons., New Delhi (2003).

Semester – III**15PHU303B****ALLIED STATISTICS - I****L T P C****4 - - 4****Course Objectives**

This course enables the students to learn

- The Concept of Fourier analysis and solving boundary value problems.
- Techniques of Fourier and Laplace transform
- To solve differential equations.
- Numerical techniques of differentiation and integration.
- Basic concepts in probability theory and statistical measures.
- Commonly used probability distributions (both discrete and continuous).

Course Outcomes

After successful completion of the course, the student is expected to

1. Appreciate the physical significance of Fourier series
2. Understand the mathematical principles on transforms.
3. Apply mathematical foundation to formulate and solve problems arising in physics
4. Synthesize numerical techniques for practical problems.
5. Understand the mathematical concept of Regression.
6. Gain knowledge on Correlation apply it for interpretation.

UNIT I

Meaning and definition of statistics – sources of data – collection of data – primary and secondary data - methods of primary data collection –sources of secondary data – Classification of data . Diagrammatic representation– Bar diagram and Pie diagram – Graphic representation – Histogram, Frequency distribution, Ogives.

UNIT II

Measures of Central tendency - Arithmetic Mean, Median, Mode - problems on individual, discrete and continuous series, Harmonic Mean and Geometric Mean.

UNIT III

Measures of Dispersion – Range, Inter Quartile range, Quartile deviation, Mean Deviation, Standard deviation and Coefficient of variation – problems on individual, discrete and continuous series.

UNIT IV

Correlation – meaning and definition – types of Correlation – degrees of Correlation – Methods of finding Correlation coefficient – scatter diagram – Karl Pearson’s correlation coefficient – Rank correlation coefficient - Computation and interpretation.

UNIT V

Regression - meaning and definition - Regression equation Regression in two variables – two regression lines - X on Y and Y on X – properties of regression equation – problems using normal equations and regression coefficients.

Suggested Book

1. Pillai R.S.N., and Bagavathi V., 2002. Statistics , S. Chand & Company Ltd, New Delhi.
2. Dr.P.N.Arora, 1997, A foundation course statistics, S.Chand& Company Ltd, New Delhi.
3. Navnitham P.A , 2004, Business Mathematics And Statistics, Jai Publications, Trichy,
4. Gupta S.C., and Kapoor V.K., 1999. Fundamentals of Mathematical statistics, Sultan Chand & Sons, Educational Publishers, New Delhi.
5. Gupta S.P., 2001, Statistical methods, Sultan Chand & Sons, New Delhi.

Semester – III**15PHU303C****ALLIED BIOINFORMATICS - I****L T P C****4 - - 4****Course Objectives:**

- The course aims to provide students with a foundation in the basic concepts of Biophysics.
- Topics will include canonical and non-canonical structures of nucleic acids, structure of proteins, enzymes etc.
- Fundamental concepts that underlie biomolecular interactions will be discussed
- Biophysical methods that are employed for the structural analysis of these systems will be introduced at an elementary level.
- To apply chemical reaction to formulate and solve problems arising in physics.

Course Outcome

After successful completion of the course, the student is expected to

1. Demonstrate knowledge of the fundamental concepts in physics and chemistry that underlie biological processes.
2. Appreciate the physical significance of biomolecules.
3. Apply chemical reaction to formulate and solve problems arising in physics.
4. Understand the concept of Regression.
5. Gain knowledge on Comparative modeling and visualization of molecules.
6. Define the structural characteristics of nucleic acids and proteins and examine parameters that variously determine their stability and function(s).

UNIT-I

Introduction to Bioinformatics: Objectives, History of Bioinformatics, Human Genome Project, application of bioinformatics – Molecular medicine, biotechnology, agricultural, forensic analysis.

UNIT-II

Introduction to Biological databases-Types of databases, sequence databases-nucleic acid sequence databases-Gene bank, EMBL, DDBJ, protein sequence database- Swiss-Prot, PIR, PDB structural databases, Search and retrieval of Entrez, bibliographic databases-Pubmed.

UNIT-III

Sequence alignment-local, global, pairwise and multiple alignment, Similarity searching programs- BLAST, FASTA; Gene prediction strategies and programs- Genscan, Genemark.

UNIT-IV

Protein secondary structure prediction, three dimensional structure prediction, Comparative modeling and visualization of molecules. Visualization-Rasmol, Deep view.

UNIT-V

Source of data – Primary and secondary data. Classification and tabulation of data. Diagrammatic and graphic presentation of data. Measures of central tendency: arithmetic mean, median, mode. Measures of variation: range, quartile deviation, mean deviation, standard deviation (simple problems only).

Suggested Books

Semester – III**15PHU311A****ALLIED CHEMISRY PRACTICALS - I****L T P C****- - 3 2****Course Objective**

- To make the student able to identify the elements and the functional groups present in an organic compound.
- The student on successful completion of the course should learn the principles of volumetric analysis.
- To estimate the compounds by acidimetry, alkalimetry and permanganometry.
- To acquire practical skills in volumetric analysis.
- To understand the basic principles of volumetric analysis.
- To estimate the Acidimetry & Alkalimetry by volumetric analysis

Course Outcome

After successful completion of the course, the student is expected to

1. Learnt about the qualitative analysis of organic compounds.
2. Learnt the detection of elements and functional groups present in an organic compound by systematic analysis.
3. Verify the presence compositions by experimentally.
4. Analyse the properties of different chemical compounds by experimentally.
5. Differentiate the chemicals such as aldehydes, Ketones, amines, diamides etc.,
6. Identify the chemical properties of different chemicals.

Contents

Systematic analysis of an organic compound, preliminary tests, detection of elements present, aromatic or aliphatic, saturated or unsaturated, nature of the functional group, confirmatory tests– aldehydes, ketones, amines, diamide, carbohydrates, phenols, acids, esters & nitro compounds.

Note: Each student should analyse minimum 6 compounds.

REFERENCE BOOKS:

1. R. Ramasamy, Allied Chemistry Practical Book, Priya Publications, Karur (2008).
2. A.O. Thomas, Practical Chemistry for B.Sc. Main Students, Scientific Book Centre, Cannanore-1, Kerala (2010).
3. V.Venkateswaran, R.Veerarwamy and A. R. Kulandaivelu, Basic Principles of Practical Chemistry, 2nd Edition, S.Chand Publications, New Delhi (2004).

Course Objective

- Demonstrate knowledge of probability and the standard statistical distributions.
- Demonstrate knowledge of fixed-sample and large-sample statistical properties of point and interval estimators.
- Demonstrate knowledge of the properties of parametric, semi-parametric and nonparametric testing procedures.
- Demonstrate the ability to perform complex data management and analysis.
- Demonstrate the ability to apply linear, nonlinear and generalized linear models.
- Demonstrate understanding of how to design experiments and surveys for efficiency.

Course Outcome

After successful completion of the course, the student is expected to

1. Continue their higher studies and scientific research to analyze and solve complex problems in the field of computer science.
2. Design, develop and test the solutions using contemporary technologies with full participation in profession and society.
3. Communicate effectively in their work environment with multidisciplinary team for their lifelong learning, ethical and professional development.
4. Participate in national mission through technical expertise, leadership and entrepreneurship.
5. Demonstrate knowledge of classical and repeated measures multivariate methods and computational techniques.

List of Experiments

1. Using SPSS Package, draw bar diagram and pie diagram for discrete series.
2. Using Excel Package, draw bar diagram and pie diagram for discrete series.
3. Using SPSS Package, calculate the Mean for individual, discrete and continuous series.
4. Using Excel Package, calculate the Mean for individual, discrete and continuous series.
5. Using SPSS Package, calculate the Median for individual and discrete series.
6. Using SPSS Package, calculate the Mode for individual and discrete series.
7. Using SPSS Package, calculate the Standard deviation.
8. Using SPSS Package, calculate the Karl Pearson's Correlation.
9. Using SPSS Package, calculate the Rank Correlation Coefficient for Untied Rank.
10. Using SPSS Package, calculate the Rank Correlation Coefficient for Tied Rank.

Semester – III**15PHU311C****ALLIED BIOINFORMATICS PRACTICALS - I****L T P C****- - 3 2****Course Objective**

- The course aims to provide students with a foundation in the basic concepts of Biophysics.
- Topics will include canonical and non-canonical structures of nucleic acids, structure of proteins, enzymes etc.
- Fundamental concepts that underlie biomolecular interactions will be discussed
- Biophysical methods that are employed for the structural analysis of these systems will be introduced at an elementary level.

Course Outcome

After successful completion of the course, the student is expected to

1. Students will function successfully in the laboratory and use safe laboratory practices.
2. Students will critically evaluate data and design experiments to test hypotheses relevant to the practice of Biochemistry and Biophysics.
3. Students will demonstrate awareness of ethical issues in the practice of science.
4. Appreciate the physical significance of biomolecules.
5. Apply chemical reaction to formulate and solve problems arising in physics.
6. Understand the concept of Regression.

List of Practicals

1. Introduction to MS Office.
2. Analysis of databases
 - NCBI
 - EMBL
 - DDBJ
 - PIR
 - SWISS PROT
3. Retrieval of protein structures –PDB
4. Bibliographic Databases
 - Pubmed
 - Medline
5. Secondary structure prediction
 - SOPMA
6. Molecular Visualization and analysis
 - RASMOL
7. Sequence similarity search for a pair of sequences using
 - BLAST

- FASTA

8. Multiple sequence alignment

Semester-III

		L	T	P	C
15FCC301A	INTRODUCTION TO COMPUTERS	4	0	0	2

Course Objectives

This course enables the students

- To develop skills for quantitative estimation using computer language.
- To code various differentiation and integration methods in a modern computer language.
- To plot the graphs of function
- To develop an understanding of computer networking basics.
- To develop an understanding of different components of computer networks, various protocols, modern technologies and their applications.

Course Outcomes (COs)

After successful completion of the course, the student is expected to

1. Solve complicated matrix related problems like matrix inverse and matrix multiplication.
2. Acquire problem-solving skills through computer programming.
3. Plot various functions and parametric curves.
4. Understand the basic coding of MS Office Word.
5. Gain knowledge on Internet Terminology.
6. Apply their knowledge to solve the problems.

Unit-I

Introduction- Characteristics of computers- development of computers- generations of computers- classification of computers-the computer system- types of Input/ Output and memory devices-computer software-categories of software.

Unit-II

Starting with MS Office Word – Working with Text – working with tables-Checking spelling and grammar- adding graphics to document- Mail merge- printing a document – Advanced features of MS Office Word- Keyboard shortcuts.

Unit III

Starting with MS Office Excel- Working with Excel workbook-working with worksheet-formulas and functions-inserting charts-sorting-importing data-printing in excel- Advanced features of MS Office Excel.

Unit IV

Starting with MS Office PowerPoint – Working with PowerPoint- Working with different views- Designing Presentations- Slide Show.- Printing in PowerPoint.

Unit-V

The Internet-Evolution of Internet-Owner of Internet- Anatomy of Internet – Internet Terminology- Getting Connected to Internet- Web Brower- Electronic Mail- Search engines- Uses of internet to society.

Suggested Book

1. Fundamentals of Computers: For Undergraduate Courses in Commerce and Management, ITL Education Solutions. 2011. Pearson, New Delhi.
2. PradeepK.Sinha, PritiSinha. Computer Fundamentals, 2007, 6th Edition BPB Publications, New Delhi.
3. V. Rajaraman. Fundamentals of Computers, Prentice-Hall Of India Pvt. Limited, 2003.
4. Wallace Wang.Microsoft Office 2007 For Dummies,1st Edition Wiley Publishing Inc.

Semester III

		L T P C
15FCC301B	INTRODUCTION TO MULTIMEDIA	4 0 0 2

Course Objectives

This course enables the students

- To develop skills for quantitative estimation using computer language.
- Acquire basic knowledge on Multimedia devices.
- Understand current trends in multimedia by experiencing a variety of applications and development packages.
- To train and give idea about computer graphics.
- To gain the skills and project-based experience needed for entry into web design and development careers.
- To understand how the web pages are designed interactively.

Course Outcomes

After successful completion of the course, the student is expected to

1. This course in curriculum is an introduction to the multimedia and its applications.
2. This course enables students to understand how the web pages are designed interactively.
3. How to critically evaluate website quality, learn how to create and maintain quality web pages learn to create and manipulate images.
4. Gain the skills and project-based experience needed for entry into web design and development careers.
5. Gain knowledge on Computer based animation.
6. Apply knowledge to Creating animation.

UNIT - I

Multimedia – An overview: Introduction – Multimedia presentation and production – Characteristics of Multimedia presentation – Hardware and Software Requirements – Uses of Multimedia. Text: Types of text - Font - Text File formats. Image: Image data representation – Image file formats – Image processing software. Graphics: Advantages of graphics – Uses – Components of a graphics system.

UNIT - II

Audio: Sound waves – Types and properties of sound – Components of audio system – Digital audio - Musical Instrument Digital Interface (MIDI) – Audio file formats – Audio processing software. Video: Motion video – Television systems – Video file formats – Video processing software. Animation: Uses of animation – Computer based animation – Animation file formats – Animation software.

UNIT - III

Introducing Photoshop elements: About elements – Welcome screen – Create mode – Menu bar – Toolbox – Options bar – Panels. Organizing images: Obtaining images – Tagging images – Searching for images – Opening and saving images. Selecting Areas – Layers – Text and Drawing Tools.

UNIT - IV

Understanding Flash: Understanding Flash basic elements – Creating a simple animation. Learning Flash Toolbox: Learning the toolbox – Using tools. Learning Flash Panels: Understanding the panels. Using timeline and layers: Understanding how timeline works – Understanding layers. Drawing objects: Drawing lines and fills – Using colors – Rotating, skewing and scaling – Grouping objects.

UNIT - V

Creating animation – How animation works – Creating motion tweens – Creating shape tweens. Understanding masks – Creating masks. Creating symbols and using the library: Learning about symbols – Creating symbols – Using libraries. Learning Basic Action Script concepts: Action Script basics – Data type basics.

Suggested Books

1. Ranjan Parekh, 2013, Principles of Multimedia, 2nd Edition, Tata McGraw hill.
2. Nick Vandome, 2011, Photoshop Elements 9, Tata McGraw hill.
3. Brian Underdahl, 2002, Macromedia Flash MX – A Beginners Guide, Dreamtech Press.
Tay Vaughan, 2002, Fundamentals of Multimedia, 5th Edition, Tata McGraw-Hill.
4. Bill Sanders. 2001. Flash5 Action Script, 1st Edition, Dream Tech Press, New Delhi

Semester – IV**15ENU401****ENGLISH – IV****L T P C****4 - - 4****Course Objectives:**

- To train the students in understanding the concepts of communication.
- To be familiar with the four basic skills of English.
- To train students in developing their written communication.
- To train students in developing their presentation skills.
- To acquire the skill of making grammatically correct sentences.
- To reflect originality on the application of soft skill views and express in writing their views.

Course Outcome:

1. Students have acquired proficiency in communication.
2. Students have become adept in written communication and presentation skills.
3. Developed the skill of writing in English and that of public speaking.
4. Establish and maintain social relationships.
5. Develop communication skills in business environment.
6. Enhanced communication competency through LSRW skills

UNIT I – Concept of Communication – Barrier to Communication –Body language – Personality Development – Etiquette and Manners- Soft Skills – Emotional Intelligence

UNIT II – Listening Comprehension – Reading Comprehension – Paragraph writing – Precis Writing – Writing Resume and Covering Letter -Speaking – Welcome Address, Vote of Thanks, Compering, Debates, Role Play, Dialogues – Vocal Communication Techniques. Voice, Quality, Volume, Pitch

UNIT III – Dicto Composition – Letter Writing (Informal, Letters to the Editor etc) – Term paper – Book reviews

UNIT IV – Business Correspondence – Layout of Business Letter – Formal Styles of Business Letters – Letters of Acceptance, Appointment, Resignation, Complaint, Sending E-mails.

UNIT V – Effective Presentation – Planning – Audience Analysis –Logical Sequencing – Timing of the Presentation – Conclusion – Answering Queries – Group Discussion – Interview.

Suggested Books:

1. Juneja. P. Om and AaratiMujumdar, “Business Communication -Techniques and Methods”, Orient Blackswan Pvt. Ltd., Hyderabad: 2010.
2. Badi, R.V and K. Aruna. Business Communication, 2008, Vrinda Publications: New Delhi.

4. Mohan, Krishna and Meenakshi Raman.2008, Effective English Communication, Tata McGraw Hill: New Delhi.
5. Selley, John. Oxford Guide to Effective Writing and Speaking. 2005. OUP: New Delhi.

Course Objective

- This is a basic course in Physics which deals with the phenomena taking place in the nuclear domain. Students will be given an insight into the dimensions of a nucleus.
- The aim is to tell them about the stability of nucleus and various other properties.
- The students will learn about various types of radiations and their interaction with matter.
- Students will learn the methods to find the mass and charge of any nucleus by using some instruments.
- To gain knowledge in the content areas of nuclear and particle physics.
- Students will learn the concept of nuclear reactions.

Course Outcomes

After successful completion of the course, the student is expected to

1. Determine the charge, mass of any nucleus by using various spectrographs.
2. They are able to understand the size of nucleus and all its properties.
3. Develop and communicate analytical skills in subatomic physics.
4. This course has led the students to understand interaction of various types of radiation with matter which they observe in their daily life. It's easy for them now to relate the theory to practical.
5. Acquire knowledge in the content areas of nuclear and particle physics, focusing on concepts that are commonly used in this area.
6. Students now know various methods of accelerating various types of particles to perform scattering experiments.

UNIT - I

Basic nuclear structure: Classification of nuclei - Nuclear spin angular momentum - Nuclear magnetic dipole moment - Electric quadrupole moment - Nuclear size - Nuclear stability - Nuclear forces - Meson theory of nuclear forces - Theories of nuclear composition - Proton-electron hypothesis - Models of nuclear structure - Liquid drop model - Shell model.

Synchrocyclotron - Betatron - Electron Synchrotron and proton synchrotron.

UNIT - II

Radioactivity: Determination of e/m of alpha particles - Determination of the charge of alpha particles - Experimental measurement of range of alpha particles - Geiger and Nuttall experiment - Geiger Nuttall law - Alpha particle disintegration energy - Determination of e/m of beta particles - Origin of the line and continuous spectrum - Neutrino theory of beta decay - K-electron capture - Origin of gamma rays - Absorption of gamma rays - Natural radioactive series - Law of successive disintegration - Radioactive equilibrium and radioactive dating.

UNIT - III

Nuclear Models: Discovery of artificial transmutation - Rutherford's experiment - Bohr's theory of nuclear disintegration - Nuclear reactions - Energy balance in nuclear reactions and the Q-value. Transmutation by (i) Alpha particles (ii) Protons (iii) Deuterons and (iv) Neutrons. The scattering cross-section and its determination. Production of radioisotopes and their uses.

UNIT - IV

Nuclear Reactions: Nuclear fission - Energy released in fission - Bohr and Wheeler's theory of nuclear fission - Chain reaction - Multiplication factor - Natural uranium and chain reaction - Design of nuclear reactor - Breeder reactor - Nuclear fusion - Source of stellar energy - Thermonuclear reactions - Transuranic elements.

Ionization chamber – Geiger-Muller counter – Proportional counter – Wilson's cloud chamber – Bubble chamber – Their principles and working.

UNIT - V

Particle Physics: Baryons - Leptons - Mesons - Particles and antiparticles - concept of antimatter - strong interaction - Electromagnetic interaction - Weak interaction - Gravitational interaction - Elementary particle quantum numbers - Conservation laws and symmetry - Charge conjugation, parity and time reversal - CPT Quark model – Nuclear isotopes - Introduction to medical physics.

Suggested Books

1. Murugesan. R, 2000 edition, Nuclear Physics, S. Chand & Company, New Delhi.
2. Brijlal and Subramaniam, 1st edition 2001, Atomic and Nuclear Physics, S. Chand & Company, New Delhi.
3. Murugesan. R, 17th edition 2014, Modern Physics, S. Chand & Company, New Delhi.
4. Theraja. B.L., 2002, Modern Physics, S. Chand & Company, New Delhi.
5. Tayal. D.C. ,5th edition 2014, Nuclear Physics, Himalaya Publishing house, Mumbai.
6. Goshal. S. N, Atomic and Nuclear Physics Vol.1&2 2014, S.Chand& Company

Course Objective

- This course builds the ideas of harmonic motion to cover in depth concept of waves in physics with particular emphasis on light waves as an example.
- The foundation of the course is Fourier theory, which will then be used to understand dispersion of waves, image formation in optics and diffraction and other aspects of Fourier optics.
- Understand how the principle of superposition is applied when two pulses meet
- Define three terms to describe periodic waves: speed, wavelength, and frequency
- Explain the characteristics of transverse and longitudinal waves.
- Identify the relationship between the speed, wavelength, and frequency of a wave.

Course Outcome

After successful completion of the course, the student is expected to

1. To develop an understanding of the principles of optics.
2. Understand linear, time-invariant systems.
3. Understand the role of the wave equation and appreciate the universal nature of wave motion in a range of physical systems
4. To build connections between mathematical development and conceptual understanding.
5. Understand dispersion in waves and model dispersion using Fourier theory.
6. Understand optical phenomena such as polarization, birefringence, interference and diffraction in terms of the wave model.

UNIT 1 - Geometrical Optics

Aberrations - Spherical aberrations in lens - coma - Astigmatism - chromatic aberration - dispersion by a prism - Cauchy's dispersion formula - dispersive power, achromatism in prism - deviation without dispersion - chromatic aberrations in a lens - circle of least confusion - achromatic lens - condition for achromatism of two thin lenses separated by a finite distances.

UNIT 2 - Physical Optics**Interference**

Fresnel's Biprism – Interference in thin films due to reflected light – Fringes due to wedged shaped thin film – Newton's rings – Refractive index of the Liquid – Michelson interferometer – Determination of a wave length of monochromatic light – difference in Wave length between two neighboring spectral lines – Fabry Perot Interferometer.

UNIT - 3 Diffraction

Fresnel's assumptions – rectilinear propagation of light – half period zone – Zone Plates – Action and Construction – comparison with a convex lens – Fresnel and Fraunhofer diffraction – Fraunhofer diffraction at a Single light – Diffraction grating – Resolving power & Dispersive power of Grating.

UNIT 4 - WAVES AND OSCILLATIONS

Simple harmonic motion - free, damped, forced vibrations and resonance - Fourier's Theorem - Application to saw tooth wave and square wave - Intensity and loudness of sound - Decibels - Intensity levels - musical notes - musical scale. Acoustics of buildings: Reverberation and time of reverberation - Absorption coefficient - Sabine's formula - measurement of reverberation time - Acoustic aspects of halls and auditoria.

UNIT-V- ULTRASONICS

Ultrasonic waves - Different modes - Characteristic properties - Behaviour - Focusing - Stationary waves and resonance - Attenuation - Diffraction - Sources of ultrasound. Piezoelectric crystal - Low frequency / high Intensity applications - high frequency - low intensity applications - clinical applications of different scans.

Suggested Books

1. A Text book of Optics Brijlal&Subramaniam; 25th edition 2014 S.Chand& co New delhi
2. Text book of sound by BrijLal&Subramaniam, N Vikas Publishing House, New Delhi, 2nd edition 2014
3. Text book of sound by M N Srinivasan – Himalaya Publications (1991).
4. Science and technology of Ultrasonics by Baldevraj, and V. Rajendran 1st edition 2009 Narosa (2004).
5. Optics and Spectroscopy R Murugesan 9th edition 2014 S.Chand& co.
6. Optics Ajoy Ghatak 5th edition 2014; Tata Mcgraw hill.
7. Optics 2nd edition 2011; Miller V Keiln; Thomas E. Furtak; CBS publishers.

Course Objectives:

- To familiarize the students with working, design and analysis of basic amplifier circuits.
- To design and analyze wave shaping circuits, rectifiers and power supply circuits
- Introduce the basic concept of qualitative and quantitative analysis of an instruments.
- Study the concept of separation science and its applications.
- To understand the concept of spectrometer
- To know about the resistance usages

Course Outcomes:

After successful completion of the course, the student is expected to

1. Handle any kind of process by framing it in block diagram, mathematical model and different process variables.
2. Use modern engineering tools and techniques in the practice of electronic devices.
3. Know all the industrial processes and demonstrate their knowledge in designing the control loops for these processes.
4. Measure the thickness of thin material using optical means
5. Determine the wavelength of Mercury spectrum
6. Estimate the specific resistance of any conductor
7. Analyze frequency response of RLC circuit.

ANY TEN EXPERIMENTS

1. Spectrometer – hollow prism
2. Spectrometer- Cauchy's constant
3. M-Field along the axis of a circular coil carrying current
4. Elongation of spring
5. Calibration of high range ammeter-reduction factor-potentiometer
6. Energy band gap – Ge/ Si diode
7. PN junction diode characteristics
8. Characteristics of Zener diode
9. CRO
10. High resistance by charging – B.G

11. High resistance by discharging – B.G
12. B-H curve
13. Spectrometer – narrow angle prism

Suggested Books

1. Ouseph C.C., U.J. Rao and V. Vijayendran 2007, Practical Physics and Electronics, S.Viswanathan (Printers & Publishers) Pvt. Ltd., Chennai
2. Singh S.P., 2003, Advanced Practical Physics – 1, 13th Edition, PragathiPrakashan, Meerut
3. Singh S.P., 2000, Advanced Practical Physics – 2, 12th Edition, PragathiPrakashan, Meerut

Semester – IV

15PHU403A

ALLIED CHEMISRY - II

L T P C

4 - - 4

Course Objectives

- To make the student to be conversant with the extraction of metals, coordination chemistry, preparation, properties uses and structure of naphthalene and heterocyclic compounds.
- To make the student acquire sound knowledge of electrochemistry, biological functions of amino acids and proteins, thermodynamic laws, entropy, enthalpy change and the principles of electroplating.
- To understand the concept of aromaticity and preparation of aromatic compounds including heterocyclic compounds.
- To identify the new materials by different synthesis methods.
- To classify the proteins, amino acids, carbohydrates, etc

Course Outcome

After successful completion of the course, the student is expected to

1. The student understand the metallurgy of metals and the theories of coordination compounds and the industrial importance of EDTA, haemoglobin and chlorophyll.
2. Understand the concept of aromaticity and preparation of aromatic compounds including heterocyclic compounds.
3. Understand the preparation, classifications and properties of amino acids, proteins and carbohydrates.
4. Know the concept of Heterocyclic Compounds and their properties, synthesis methods.
5. Apply their knowledge to identify the new materials by different synthesis methods.
6. Classify the proteins, amino acids, carbohydrates, etc.

Unit-I**Metals and Coordination Chemistry:**

Metals: General methods of extraction of metals-methods of ore dressing-types of furnaces-reduction methods-electrical methods-types of refining-Van Arkel process-Zone refining.

Coordination Chemistry: Nomenclature-theories of Werner, Sidgewick and Pauling-chelation and its industrial importance-EDTA-haemoglobin-chlorophyll-applications in qualitative and quantitative analysis.

Unit-II**Aromatic Compounds and Heterocyclic Compounds:**

Aromatic Compounds: Aromaticity-Huckel's ($4n+2$) rule- aromatic electrophilic substitution in benzene- mechanism of nitration, halogenation, alkylation, acylation and sulphonation.

Naphthalene: Isolation, preparation, properties and structure.

Heterocyclic Compounds: Preparation and properties of pyrrole, furan, thiophene and pyridine.

Unit-III

Amino acids, Proteins and Carbohydrates:

Amino acids: Classification, preparation and properties. Peptides-preparation of peptides (Bergmann method only).

Proteins: Classification, properties, biological functions and structure.

Carbohydrates: Classification, preparation and properties of glucose and fructose- discussion of open chain and ring structures of glucose and fructose-glucose-fructose inter conversion.

Unit-IV

Energetics: Type of systems-processes and their types - isothermal, adiabatic, reversible, irreversible and spontaneous processes-statement of first law of thermodynamics-need for the second law of thermodynamics-heat engine-Carnot cycle-efficiency-Carnot theorem-thermodynamics scale of temperature-Joule-Thomson effect- Enthalpy- Entropy and its significance-Free energy change.

Unit-V

Electrochemistry: Kohlrausch law-conductometric titrations-hydrolysis of salts-galvanic cells-E.M.F.-standard electrode potentials-reference electrodes- electrochemical series and its applications-buffer solution-buffer solution in the biological systems-pH and its determination-principles of electroplating.

Suggested Books

1. V.Veeraiyan& A.N.S. Vasudevan, Text Book of Allied Chemistry (II Edition), Highmount Publishing House, Chennai (2005).
2. B.R.Puri and L.R.Sharma, Principles of Inorganic Chemistry, Shobanlal& Company Ltd., Jalandar (2002).
3. B.S.Bahl&ArunBahl, Advanced Organic Chemistry, S.Chand& Company Ltd., New Delhi (2005).
4. Puri, Sharma &Pathania, Physical Chemistry, Vishal Publishing Company Ltd., Jalandhar (2003).
5. R.Gopalan&S.Sundaram, Allied Chemistry (III Edition), Sultan Chand & Sons., New Delhi (2003).

Course Objectives

- To provide students with a repertoire of mathematical methods that are essential to the solution of advanced problems encountered in the fields of applied physics
- In addition, intended to prepare the student with mathematical tools and techniques that are required in advanced courses offered in the applied physics.
- Demonstrate the ability to perform complex data management and analysis.
- Demonstrate the ability to apply linear, nonlinear and generalized linear models.
- Demonstrate understanding of how to design experiments and surveys for efficiency.
- Statistics is a scientific discipline by which statisticians assist other scientists and researchers in making informed decisions in the face of uncertainty.

Course Outcomes (COs)

After successful completion of the course, the student is expected to

1. Communicate mathematical and statistical knowledge and ideas to the students.
2. Apply his/her knowledge and skills to carry out advanced tasks and projects.
3. Contribute innovations and application of basic research.
4. Know the concept of different test methods.
5. Obtain the knowledge on problem solving and explain their steps.
6. Understand the concept of time series, probability, distribution, etc.,

UNIT I

Probability – definitions – addition and multiplication rules (only statements), permutation and combination, diagrammatic representation of probability (Venn diagram) – simple problems.

UNIT II

Probability distribution - Binomial distribution – Poisson Distribution – properties, mean and variance, Normal distribution—characteristics of normal curve (No derivations) simple problems only.

UNIT III

Test of Significance: Basic concepts – Z-test for two means – Small sample tests- t- test for single mean, two means – Chi Square Test.

UNIT IV

Index numbers – meaning and definition – uses – methods of construction – Unweighted and weighted index number – Laspeyre's, Paasche's and Fischer's method – Tests for an ideal index number – Wholesale and Cost of living index .

UNIT V

Time Series: Meaning – Components – Models – Business forecasting – methods of estimating trend – graphic, semi average, moving average and least square method – Seasonal variation – Methods of Simple Average.

1. Pillai R.S.N., and Bagavathi V., 2002., Statistics, S. Chand & Company Ltd, New Delhi.
2. Gupta S.C., and Kapoor V.K., 1999. Fundamentals of Mathematical statistics, Sultan Chand & Sons, Educational Publishers, New Delhi.
3. Dr.P.N.Arora, 1997, A foundation course statistics, S. Chand & Company Ltd, New Delhi.
4. Navnitham P.A , 2004, Business Mathematics And Statistics, Jai Publications, Trichy,
5. Gupta S.P., 2001, Statistical methods, Sultan Chand & Sons, New Delhi.
6. Richard. I. Levin., & David. S. Rubin., 1998. Statistics for management, Seventh edition, Prentice hall of India, New Delhi.

Semester – IV**15PHU403C****ALLIED BIOINFORMATICS - II****L T P C****4 - - 4****Course Objective**

- This paper is aimed at giving idea to the students regarding the nature of human body and usage of different radiations for the treatment of body.
- To get introduced to the basic concepts of Bioinformatics and its significance in Biological data analysis.
- To explain about the methods to characterise and manage the different types of Biological data.
- Give an overview about pathway and enzyme databases, Sequence submission tools.
- To describe about Multiple Sequence Alignment, its significance, algorithms and tools used for MSA
- To classify and explain about tools used for genome sequence assembly

Course Outcomes

After successful completion of the course, the student is expected to

1. Gain knowledge on Different areas of research in bio Physics
2. Understand and apply key concepts specific to energy deposition for both ionizing
3. Know about the Gene therapy and Genetic variability.
4. Understand the concept of NCBI, DDBJ, and EMBL.
5. Analyse the Biological Database and its Types.
6. Gain knowledge on Gel electrophoresis, NMR Spectroscopy, X-Ray Diffraction, et.,

Unit I

Data generation: Generation of large scale molecular biology data. (Through Genome sequencing, Protein sequencing, Gel electrophoresis, NMR Spectroscopy, X-Ray Diffraction, and microarray). Applications of Bioinformatics.

Unit II

Biological Database and its Types Introduction to data types and Source. Population and sample, Classification and Presentation of Data Quality of data, private and public data sources.

General Introduction of Biological Databases; Nucleic acid databases (NCBI, DDBJ, and EMBL).

Unit III

Data storage and retrieval and Interoperability Flat files, relational, object oriented databases and controlled vocabularies. File Format (Genbank, DDBJ, FASTA, PDB, SwissProt).

Introduction to Metadata and search; Indices, Boolean, Fuzzy, Neighboring search

Unit IV

Sequence Alignments and Visualization Introduction to Sequences, alignments and Dynamic Programming; Local alignment and Global alignment algorithm and example) Pairwise alignment (BLAST and FASTA Algorithm) and multiple sequence alignment (Clustal W algorithm)

Unit V

Gene Expression and Representation of patterns and relationship General introduction to Gene expression in prokaryotes and eukaryotes, transcription factors binding sites. SNP, EST, STS. Introduction to Regular Expression, Hierarchies, and Graphical models (including Markov chain and Bayes notes). Genetic variability and connections to clinical data.

Course Objective

- This paper presents the basic Principles of quantitative analysis in Chemistry.
- Enable the students to learn about the fundamentals of Practicals in Chemistry.
- The student on successful completion of the course should learn the principles of volumetric analysis.
- To estimate the compounds by acidimetry, alkalimetry and permanganometry.
- To acquire practical skills in volumetric analysis.
- To understand the basic principles of volumetric analysis.
- To estimate the Acidimetry & Alkalimetry by volumetric analysis

Course Outcomes

After successful completion of the course, the student is expected to

1. Learnt about the quantitative analysis.
2. Learnt the estimation of sample present in a solution by volumetric analysis.
3. Analysis the volumetric of given samples.
4. Know the procedure of Permanganometry analysis.
5. Understand the basic knowledge on experimental procedurers.
6. Apply their theoretical knowledge and find the new materials by different reaction schemes.

List of Experiments**I. VOLUMETRIC ANALYSIS****A. Acidimetry&Alkalimetry**

1. Estimation of sodium carbonateusing standard sodium hydroxide.
2. Estimation of sodium hydroxide using standard sodium carbonate.
3. Estimation of sulphuric acid using standard oxalic acid.
4. Estimation of potassium permanganate using standard sodium hydroxide.

B. Permanganometry

1. Estimation of ferrous sulphate using standard Mohr's salt.
2. Estimation of oxalic acid using standard ferrous sulphate.
3. Estimation of calcium-direct method.

Suggested books

1. R. Ramasamy, Allied Chemistry Practical Book, Priya Publications, Karur (2008).
2. A.O. Thomas, Practical Chemistry for B.Sc. Main Students, Scientific Book Centre, Cannanore-1, Kerala (2010).
3. V. Venkateswaran, R. Veeraswamy and A. R. Kulandaivelu, Basic Principles of Practical Chemistry, 2nd Edition, S. Chand Publications, New Delhi (2004).

Course Objective

- The course is designed to provide students with transferable skills, to understand the uses of SPSS, as a tool to summarize and aid in the interpretation of research findings.
- Demonstrate knowledge of probability and the standard statistical distributions.
- Demonstrate knowledge of fixed-sample and large-sample statistical properties of point and interval estimators.
- Demonstrate knowledge of the properties of parametric, semi-parametric and nonparametric testing procedures.
- Demonstrate the ability to perform complex data management and analysis.
- Demonstrate the ability to apply linear, nonlinear and generalized linear models.

Course Outcome

After successful completion of the course, the student is expected to

1. Continue their higher studies and scientific research to analyze and solve complex problems in the field of computer science.
2. Design, develop and test the solutions using contemporary technologies with full participation in profession and society.
3. Communicate effectively in their work environment with multidisciplinary team for their lifelong learning, ethical and professional development.
4. Participate in national mission through technical expertise, leadership and entrepreneurship.
5. Demonstrate knowledge of classical and repeated measures multivariate methods and computational techniques.

List of Experiments

1. Using SPSS Package, hypothesis test using Z- test for two different populations.
2. Using SPSS Package, hypothesis test using Z- test for two different samples.
3. Using SPSS Package, hypothesis test using t- test for two different populations.
4. Using SPSS Package, hypothesis test using t- test for two different samples.
5. Using SPSS Package, hypothesis test using Chi Square Test.
6. Using Excel Package, Calculate Laspeyre's, method.
7. Using Excel Package, Calculate Paasche's method.
8. Using Excel Package, Calculate Fischer's method.
9. Using Excel Package, Calculate moving average and show the results in graph.
10. Using Excel Package, Calculate seasonal indices by the methods of simple average.

Semester – IV**15PHU411C****ALLIED BIOINFORMATICS PRACTICALS - II****L T P C****-- 3 2****Course Objective**

- The course is designed to provide students with transferable skills, to understand the uses of SPSS, as a tool to summarize and aid in the interpretation of research findings.
- To be comfortable using SPSS as a data analysis tool
- To understand how to work with SPSS
- To learn to use new features of SPSS on their own
- To acquire information (samples)
- To understand how to enter and reorganize information within SPSS
- To understand how to effectively summarize research finds using SPSS through the use of appropriate indexes and tables.

Course Outcome

1. be able to choose charts to successfully highlight their research results
2. be able to understand and interpret charts
3. understand the basic principles behind inferential statistics
4. be able to carry out inferential statistical analysis using SPSS
5. be able to integrate information and build models
6. be able to edit SPSS output
7. be able to use SPSS output to produce scientifically sound research reports

List of Experiments

1. Using SPSS Package, hypothesis test using Z- test for two different populations.
2. Using SPSS Package, hypothesis test using Z- test for two different samples.
3. Using SPSS Package, hypothesis test using t- test for two different populations.
4. Using SPSS Package, hypothesis test using t- test for two different samples.
5. Using SPSS Package, hypothesis test using Chi Square Test.
6. Using Excel Package, Calculate Laspeyre's, method.
7. Using Excel Package, Calculate Paasche's method.
8. Using Excel Package, Calculate Fischer's method.
9. Using Excel Package, Calculate moving average and show the results in graph.
10. Using Excel Package, Calculate seasonal indices by the methods of simple average.

Semester V**15PHU501****ATOMIC AND MOLECULAR PHYSICS****L T P C****5 - - 5****Course Objective**

- This paper explains the evolution of matter from electron to molecules, different properties of atoms and molecules, structure of molecules, radioactivity etc.
- The student knowledge of the basics of science atom and molecules
- Learn the basic atomic concepts and principles, and the basics of emission spectroscopy with a highlight on its practical and scientific significance.
- Describe the atomic spectra of one and two valance electron atoms.
- Explain the change in behaviour of atoms in external applied electric and magnetic field.
- Explain rotational, vibrational, electronic and Raman spectra of molecules.
- Describe electron spin and nuclear magnetic resonance spectroscopy and their applications.

Course Outcomes

After successful completion of the course, the student is expected to

1. To make the students understand the basics of atoms and molecules, molecular structure, different types energy transfer in molecules etc.
2. Understand the emergence of quantum concept.
3. Distinguish between different photo devices and working.
4. Understand different atom models.
5. Analyse the prerequisite in a molecule towards its Rotational and vibrational activity.
6. Gain knowledge on theory of diamagnetism and paramagnetism.

UNIT I

Discharge of electricity through gases – Cathode rays, positive rays, x-rays – Discovery of electron – Determination of e/m by Thomson's method – Determination of charge of electron – Thomson's experiment - Electron theory and applications – electrical conductivity in metals – Thermal conductivity – Thermo-electric effect – Langevin's theory of diamagnetism and paramagnetism – Thermionic emission – photoelectric emission – applications

UNIT II

The Thomson atom model – Rutherford atom model – Bohr atom model – Applications of Bohr's theory – excitation and ionization of atoms – X-ray spectra – Continuous and

Characteristic x-ray spectra – The Sommerfeld relativistic atom model – Vector atom model –
Electronic structure in atoms – Fine structure of spectral lines

UNIT III

Radioactivity – origin of radiation from natural radioelements – alpha disintegration – wave
mechanical theory – Beta disintegration – internal conversion of gamma rays – gamma ray
emission – origin of gamma rays

UNIT IV

Molecular Structure – General classification of molecules – Electronic structure in molecules –
linkage between atoms – electrovalent and covalent atomic molecules – wave mechanical theory
of covalent linkage – Van der Waals type of binding – metallic binding – electric moments of
molecules – size and shape of molecules – heat of disassociation – photo-chemical disassociation
– Frank Condon principle

UNIT V

Molecular spectra – experimental study – theoretical explanation – pure rotation spectra –
rotation-vibration spectra – Fortrat diagram – Peculiarities of certain band spectra – Isotopic
effect in molecular spectra.

Suggested Book:

1. Murugesan. R, 17th edition 2014, Modern Physics, S. Chand & Company, New Delhi.
2. Arutherbeiser ; 1st edition 1969 McGraw hill ; Prespective of morden physics.
3. J.B.Rajam, 'Atomic Physics', S.Chand& Co., New Delhi, 7th edition 2009.
4. White H.E., 'Introduction to Atomic Spectra', McGraw Hill Book Co., New York, 1934.
5. Banwell, 'Fundamentals of Molecular Spectroscopy', Tata McGraw Hill Education, 1994.

Course Objectives

- This paper explains the shortcomings of quantum mechanics in explaining different subatomic physics and the evolution of quantum mechanics.
- This course is part one of a two semester course focused on a rigorous exposition to the principles of Quantum mechanics.
- The Dirac bra-ket formalism will be introduced and used throughout to present the principles of Quantum Mechanics in a general context.
- We will discuss analytic solutions to the Schrodinger equation for a variety of potentials in one, two and three dimensions.
- The role of symmetries as the underlying principle of Quantum Mechanics will be emphasized throughout the course.
- The use of symmetry principles and operators methods will be discussed.

Course Outcome

After successful completion of the course, the student is expected to

1. Understand the interpretation of wave function of quantum particle.
2. Know the quantum phenomena are exposed to the student.
3. Understanding the behavior of quantum particle encountering a i) barrier, ii) Potential.
4. Gets exposed to solving non-relativistic hydrogen atom, for its spectrum and eigenfunctions.
5. Study of influence of electric and magnetic fields on atoms will help in understanding Stark effect and Zeeman Effect respectively.
6. Understand the difference between classical and quantum concept.
7. Use the superposition principle to predict experimental outcomes for measurement of observables on simple quantum systems.
8. Apply the uncertainty principle and heuristic arguments to obtain rough descriptions of quantum systems.
9. Describe generally the physical implications, such as possible bound states and un-bound states for any given hamiltonian.

UNIT - I

Introduction - Inadequacy of classical mechanics - Dual nature of light - Dual nature of matter; De-Broglie wavelength - Experimental detection of wave properties of material particles based on diffraction of electrons; Davisson and Germer experiment -Normal incidence and oblique incidence - G.P. Thomson's experiment - Wave velocity and Group velocity for De-Broglie waves - Wave packet-Relationship between particle velocity and Group velocity for De-

Broglie waves - relation between phase velocity and group velocity for a non-relativistic free particle.

UNIT - II

Introduction-statement of the uncertainty principle - Physical significance of Heisenberg's uncertainty relation - Illustration of uncertainty principle - Examples of position, momentum, uncertainty - Heisenberg's Gamma ray microscope. Diffraction of a beam of electrons by a slit - Application of the uncertainty principle - The non existence of the electron in the nucleus - The radius of the Bohr's first orbit of H₂ atom and energy in the ground state.

UNIT - III

Physical interpretation of the wave function - Equation of motion of matter wave (i) Time-independent Schroedinger equation (ii) Schroedinger equation for a free particle and (iii) Time dependent Schroedinger equation-Solution of the Schroedinger equation -Orthogonal, normalized and orthonormal of wave function - Expectation values of dynamical qualities, probability current density, particle flux-Ehrenfest's theorem. Eigen function, Eigen value and Eigen value equation - orthogonality of Eigen function - Reality of energy Eigen value.

UNIT - IV

Constraints and degrees of freedom-generalized coordinates-generalized displacement-velocity-acceleration-momentum-force-potential-D'Alembert's principle-Lagrangian differential equation from D'Alembert's principle-Application of Lagrangian equation of motion to linear harmonic oscillator, simple pendulum and compound pendulum.

UNIT - V

Phase Space - Hamiltonian function - Hamilton's variational principle - Hamilton's canonical equations of motion - Physical significance of H - Application of Hamiltonian equation of motion to simple pendulum, compound pendulum and linear harmonic oscillator.

Suggested Books

4. Singh. S.P., 2nd edition 2013, Elements of Quantum Mechanics, M.K. Badge & Kamal Singh, S.Chand& Co, New Delhi.
5. SathyaPrakash, 2002, Mathematical Physics, 4th Edition, S. Chand & Company, New Delhi.
6. Leonard.I.Schiff, 1968, Quantum Mechanics, 3rd Edition, McGraw Hill International, Auckland.

15PHU503

LASER AND SPECTROSCOPY**L T P C****5 - - 5****Course Objectives**

- Laser is a versatile tool with applications in almost all fields from medical to astronomy, communications, welding, cutting etc.
- This paper explains the characteristics of lasers, different types of lasers and their construction. Applications of lasers in different fields are also explained.
- To give exposure to students about the characteristics of different lasers, their fabrication techniques, applications etc. To provide a basis of LASER.
- To develop the student should have had a knowledge on the different types of lasers ... radiation-Power radiated by a point charge Velocity and acceleration ...
- Spectroscopy; Basic principle of NMR and its Applications.
- Basic Laser principles, Laser behaviour, Properties of laser radiations, Different types of Lasers and Laser applications

Course Outcomes (COs)

After successful completion of the course, the student is expected to

1. Absorption and spontaneous and stimulated emission in two level system, the effects of homogeneous and inhomogeneous line broadening, and the conditions for laser amplification.
2. Know the operations and basic properties of the most common laser types, He-Ne, Argon-ion, and carbon-dioxide, ruby, titanium sapphire, neodymium YAG and glass, knowledge of other main laser types.
3. Classify fibers as single-mode, multimode step index and multi-mode graded index.
4. Understanding of the physics of lasers, their unique properties and potential for applications.
5. Understand the laser action phenomena, properties of laser.
6. Understand the fundamental processes that occur during the interaction of light and matter

UNIT-I**Laser physics**

Basic Principle of Laser - Einstein Coefficients - condition for light amplification - Population Inversion - Threshold Condition - Line shape function - Optical Resonators - Three level and four level systems.

UNIT-II**Types of lasers and output modulation methods**

Solid State lasers - Ruby and Nd-YAG Laser - Gas lasers - He-Ne and Co₂ lasers - semiconductor lasers - Heterojunction lasers - Liquid Dye lasers - Q switching and mode locking.

UNIT-III

Applications of LASER

Application of laser in industry - cutting and welding - Drilling - surface Hardening - Medical applications - laser as diagnostic and therapeutic tool - Holography - Theory of recording and reconstruction - application of Holography.

UNIT IV

Basic Elements of Spectroscopy:

Quantum of Energy-Regions of Spectrum-Representation of Spectrum-Basic Elements of Practical Spectroscopy-Signal to Noise Ratio-Resolving Power-Width & Intensity of Spectral Transitions

Microwave Spectroscopy

Classification of Molecules-Interaction of Radiation with Rotating Molecules Rotational Spectrum of Rigid Diatomic Molecule-Example of CO-Information derived from Rotational Spectrum

UNIT V

I.R spectroscopy: Practical aspects – Theory of I.R rotation vibration spectra of gaseous diatomic molecules – applications of I.R spectroscopy – Basic principles of F.T.I.R spectroscopy
Raman spectroscopy: Classical and Quantum theory of Raman effect - Rotation vibration Raman spectra of diatomic and polyatomic molecules – Applications - Laser Raman spectroscopy - Surface Enhanced Raman Scattering.

Suggested Books

1. Aruldas. G., 2008, Molecular Structure and Spectroscopy, 2nd Edition, Prentice Hall of India, New Delhi
2. Laser theory and applications by K. Thyagarajan and Ajoy Ghatak, 1st edition Cambridge University Press, 1999.
3. Introduction to laser Spectroscopy, D L Andrews and A Ademidov 2nd edition 2005, Springer
4. An Introduction to laser: Theory and Applications by M. N. Avadhanulu, S. Chand and Co., New Delhi 2nd edition 2015.

Course Objectives

- This course provides in-depth knowledge of switching theory and the design techniques of digital circuits, which is the basis for design of any digital circuit.
- The aim of this course is to enable the students to design and trouble shoots the electrical circuits, networks and appliances through hands-on mode.
- To use Circuit Theory as a carrier of the fundamentals of Linear System and Continuous Signal Analysis so that the students are well-prepared to take up a detailed study of higher level subjects
- To apply their knowledge to analog and digital electronics, pulse electronics, analog and digital communication systems, digital signal processing, control systems, and power electronics at a later stage.
- To make the students understand coherence between theoretical and practical measurement.
- To use the techniques, skills and modern technical tools necessary for technical or engineering practice.
- The primary objective of this course is to provide a thorough understanding and working knowledge of design, implementation and analysis of instruments.

Course Outcomes (COs)

After successful completion of the course, the student is expected to

1. Apply concepts for the design of Regulators and Amplifiers.
2. Verify the theoretical concepts through laboratory and simulation experiments.
3. Implement mini projects based on concept of electronics circuit concepts.
4. Have basic knowledge of semiconductor diode, rectifier and filter circuits.
5. Understand transistor biasing and working principle of Amplifiers.
6. Explain feedback and oscillatory circuits.
7. An idea about Multivibrators and operational amplifiers.
8. Comprehend the operation and characteristics of FET, MOSFET, SCR and UJT.

UNIT I**Basic concepts of semiconductors**

P-N junction Diode-Diode Characteristics-Expression for Diode current (Expression without derivation)-Static and Dynamic resistances-Junction capacitance-Equivalent circuit-Avalanche and Zener breakdown-PIV -Voltage regulation-Line regulation and load regulation- Rectifiers-Half wave-Centre tapped full wave and Bridge rectifiers-Derivation of efficiency and ripple factor of half wave and full wave rectifiers,LED,SCR.

UNIT II**Transistors**

Transistors-Bipolar junction transistors-Mechanism of amplification in a transistor- Common base, common emitter and common collector configurations and their characteristics-Active, saturation and Cut-off regions-Current gain α , β , γ and their relationships-Experiment to draw the characteristics of transistor in the CB and CE modes-Leakage currents-Expressions for output currents in the three modes-Transistor as a switch,FET,MOSFET,UJT.

UNIT III**Amplifiers**

Different transistor amplifier configurations:- C-B, C-E, C-C, their characteristics, amplification factors, their relationships, Load line Analysis, Expressions for voltage gain, current gain and power gain of C.E amplifier, cut-off and saturation points, Transistor biasing, Different types of biasing - Base resistor, voltage divider bias method, single stage transistor amplifier circuit, load line analysis, DC and AC equivalent circuits.

UNIT IV**Operational amplifier**

Operational amplifier- Block diagram-characteristics-parameters- Applications of Op-amp: Inverting-Non-inverting-differentiator-integrator-comparator-adder-subtractor- Active filters using 741: high pass and low pass filters- band pass filter-Schmitt trigger.

UNIT V**Oscillators**

Oscillatory Circuits-LC, RC oscillators, tuned collector oscillator, Hartley, Colpitt's, phase shift Oscillators, Weinbridge oscillators. Multivibrators-Astable, monostable and Bistablemultivibrators(using 555 Timer)

Suggested Books

1. V.K. METHA Principles of Electronics S Chand & co Newdelhi 11th edition 2014
2. Solid State Electronics-B.L.Theraja: S.Chand C 5th edition 2014.
3. A Text Book of Applied Electronics-R.S.Sedha: S.Chand Co. Multi Colour Edn.
4. Malvino A.P. 7th edition 2013, Electronics Principles, Tata McGraw Hill, New Delhi
5. Milmann and Halkias, 48th reprint 2008, Integrated Electronics, Tata McGraw Hill, New Delhi.

Course Objectives

- Numerical methods is very important where large number of calculations are involved, and the original calculations from first principles is very difficult and complicated. In this paper, different methods are introduced for carrying out complicated calculations.
- This paper explains the different numerical methods of calculations which is of very much importance in the analysis of many problems in Physics.

Course Outcomes (COs)

After successful completion of the course, the student is expected to

1. Demonstrate basic knowledge of numerical methods.
2. Demonstrate an understanding of the applicability of numerical methods for modeling physical systems and its advantages and disadvantages.
3. Communicate mathematical and physical knowledge and ideas to the students.
4. Understand the relationship between observation and theory and their use in building the basic concepts of computing.
5. Gain the knowledge on curve fitting and plotting the data.
6. Know the processes of data analysis and interpretation of physical problems.

UNIT I

Principle of least squares - fitting a straight line - linear regression - fitting a parabola - fitting an exponential curve.

UNIT II

Bisection method - method of successive approximations - RegulaFalsi method - Newton-Raphson method - Horner's method - Euler's method - modified Euler's method - RungeKutta method (II & IV).

UNIT III

Gauss elimination method - Gauss-Jordan method - Gauss-Seidel method - computation of inverse of a matrix using Gauss elimination method - method of triangularisation.

UNIT IV

First differences - difference tables - properties of the operator A.E.D.
Linear interpolation: Newton forward interpolation formula and backward interpolation formula - Bessel's Formula.
Interpolation with unequal intervals: Lagrange's interpolation formula.

UNIT V

Trapezoidal rule - Simpson's 1/3 rule and 3/8 rule - practical applications - Weddle's rule
- Gaussian Quadrature formulae.

Suggested Books

1. E Balagurusamy 1st edition 2014 numerical methods Tata Mcgraw hills
2. Venkatraman, M.K., 1977, Numerical Methods in Science and Engineering, National publishing Company, Chennai.
3. Shastry, S.S, 2007, Introductory Methods of Numerical Analysis, Prentice Hall of India, Pvt. Ltd., New Delhi.
4. M K Jain, R K Jain, SRK Iyenger 6th edition 2014 Numerical methods for Scientific and Engineering Computation, New Age Publishers.

Course Objective

- To understand the various forms of conventional energy resources.
- To learn the present energy scenario and the need for energy conservation
- To explain the concept of various forms of renewable energy
- Give outline division aspects and utilization of renewable energy sources for both domestics and industrial application.
- To provide the awareness and need of renewable energy.
- To describe the uses, needs and applications of various renewable energy sources.

Course Outcomes (COs)

After successful completion of the course, the student is expected to

1. Describe the environmental aspects of non-conventional energy resources. In Comparison with various conventional energy systems, their prospects and limitations.
2. Understand the concept of hydro energy resources and their classification.
3. Describe the use of solar energy and the various components used in the energy production with respect to applications like - heating, cooling, desalination, power generation, drying, cooking etc.
4. Appreciate the need of Wind Energy and the various components used in energy generation and know the classifications.
5. Understand the concept of Biomass energy resources and their classification, types of biogas Plants- applications.
6. Compare Solar, Wind and bio energy systems, their prospects, Advantages and limitations.

UNIT I**Solar Energy**

Review of energy resources, solar energy estimation of intensity of terrestrial radiation, solar radiation on inclined plane surface, estimation of monthly average, daily total radiation and diffused radiation on horizontal surface, solar collectors. Flat plate collector- Solar water heater- solar cooker & furnaces, solar greenhouse. Solar thermomechanical systems- thermal water pump- solar cell characteristics, solar cell module, panel and array construction, applications.

UNIT II**Wind and Ocean Energy**

Origin of winds, Factors affecting wind energy, Nature of winds, Variation of wind speed with height, Major applications of wind power, Wind turbine, Energy available in windpower extraction- Axial thrust or turbine, Torque developed by turbine, Dynamic matching for

maximum power extraction. Wind turbine operation and power versus wind speed characteristics, Wind energy Conversion Systems- Fixed speed drive scheme- Variable speed drive scheme. Tidal Energy-range power-tidal energy conversion schemes. Wave energy-Power in waves. Ocean Thermal Energy-OTEC

UNIT III

Biomass

Biofuels .Biomass resources-Biomass conversion Technologies. Urban waste to energy conversion. Biomass gasification. Biomass to Ethanol production. Biogas from waste Biomass. Biogas plants and operational parameters-Constant pressure and constant volume type Biogas plants-Comparison. Landfill reactors.

UNIT IV

Geo-thermal energy

Origin and distribution of Geothermal energy.Types of Geothermal resources.Hydro-thermal resources-dry steam system-wet steam system.Geopressured resources- hot dry rock resources-magma resourcesexploration and development of Geothermal resources. Environmental aspects.

UNIT V

Emerging trends in Renewable Energy Sources.

Fuel cell- Classification of fuel cells –Phosphoric acid Fuel cell(PAFC), Alkaline Fuel Cell(AFC) –Solid polymer Fuel cell(SPFC) Molten carbonate Fuel cell(MCFC) Solid oxide Fuel cell (SOFC) FUEL for FUEL cells-efficiency of a fuel cell- V I characteristics of Fuel cell. Chemical polarization- resistance polarization- concentration polarizationFuel cell power plant hydrogen energy- production- storage conversion to energy sources and safety issues, Hydropower resources, Magneto Hydrodynamic (MHD) power conversion, MHD generator-MHD system- Thermal electric power conversion, Thermo electric power generator.

Suggested Books

1. Rai G. D.: Non-conventional energy sources, Khanna Pub., 4th Edn, 2000.
2. B. H. Khan: 2nd edition Non-conventional energy resources, Tata McGraw-Hill, 2006.
3. Rao S. and B. B. Parulekar: Energy Technology, Non-Conventional, Renewable and Conventional, Khanna Publications, 3rd edn., 1999.
4. Gupta B. R., 6th edition 2013 Generation of electrical energy, S Chand & Co

Course Objectives

- Study of non-linear optical properties of materials is very important as many of such materials are used in different instruments etc.
- This paper gives basic knowledge about different nonlinear optical properties and their theoretical aspects.
- To be able to apply the fundamental concepts of optics in lasers, optical fiber communications and optoelectronics.
- Apply the concept of optical fiber, its construction and importance in communication physics.
- To analyze different laser systems and its applications in various fields.
- To identify few different applications of optics i.e. Laser, Fiber Optics, Optoelectronics and Non Linear Optics.
- To understand the basic lasing mechanism, types of Lasers, characteristics of Laser Light, types of Lasers,

Course Outcomes (COs)

After successful completion of the course, the student is expected to

1. Know the absorption and spontaneous and stimulated emission in two level system, the effects of homogeneous and inhomogeneous line broadening, and the conditions for laser amplification.
2. Know the operations and basic properties of the most common laser types, He-Ne, Argon-ion, and carbon-dioxide, ruby, titanium sapphire, neodymium YAG and glass, knowledge of other main laser types.
3. Classify fibers as single-mode, multimode step index and multi-mode graded index.
4. Describe modes in multimode fibers and mode field parameter in single-mode fibers.
5. Basic ideas about Non-linear equations and chaos.
6. Understand the difference between linear and nonlinear properties.

UNIT I

Review of the concepts of polarizability and dielectric tensor of a medium. Frequency dependence of the dielectric tensor – wave vector dependence of the dielectric tensor – electromagnetic waves in an isotropic dielectrics.

UNIT II

Introduction to non linear optics- Nonlinear dielectric response of matter – frequency variation of the nonlinear susceptibilities – properties of non linear susceptibilities- time domain description of optical non- linear susceptibilities- wave vector dependence of the nonlinear susceptibilities.

UNIT III

Second harmonic generation – perturbation theory – phase matching evolution of SHW under phase matching conditions. Four wave mixing spectroscopy – optical phase conjugation – nonlinear materials.

UNIT IV

Scattering of light – Raman scattering – Quantum theory of Raman scattering – Brillouin scattering. Interaction of atoms with nearly resonant fields – wave function under near resonant conditions. Bloch equations – self induced transparency.

UNIT V

Fibre optics – normal modes of optical fibres – nonlinear Schrodinger equations – linear theory. Basic concepts of solutions and non-linear periodic structures. Effect of fibre loss – effect of waveguide property of a fibre – conditions of generation of a solutions in optical fibres.

Suggested Books

1. D.L. Mills, 1st edition 1998 Basic Concepts of Nonlinear Optics ,Springer
2. F.Zernike and J.E. Midwinter, Applied Nonlinear Optics , revised edition 2006, Dover books
3. G.C. Baldwin, 1st edition 1969 An Introduction to Nonlinear Optics Tata McGraw Hills
4. Ajoy Ghatak & Tyagarajan 1st edition 2011, Introduction to Fibre Optics Tata McGraw Hills

Course Objective

- To gain knowledge on the applications of operational amplifier such as adder, subtractor, inverting and non-inverting amplifier, voltage follower.
- To gain knowledge on characteristics of transistors
- To gain knowledge on construct amplifiers
- To gain knowledge on oscillators using transistors and study their performance.
- To understand the various parameters of the Hysteresis loop
- Acquire the knowledge of semiconducting and dielectric materials.

Course Outcomes (COs)

After successful completion of the course, the student is expected to

1. Study the working of different electronic components/ circuits practically.
2. Learn to minimize contributing variables and recognize the limitations of equipment.
3. Design and construction of circuits using analog component and trouble shooting of the circuits.
4. Understand the Biasing network for BJT and FET, transient analysis and frequency response of BJT and FET in single stage and multistage amplifier.
5. Understand the frequency response feedback amplifier using BJT and FET and Tuned amplifier.
6. Understand the operation of Oscillators and waveform generators.

ANY TEN EXPERIMENTS

1. Transistor characteristics – CE & CB
2. JFET characteristics
3. UJT characteristics
4. Full wave & Half wave rectifier
5. Op-amp inverting & non- inverting circuits
6. High pass – op-amp
7. Low pass – Op-amp
8. Clipper circuits
9. Clamping circuits
10. CE amplifier
11. Hartley oscillator

12. Colpit's oscillator

13. Adder & subtrator Op-Amp

Suggested Books

1. Ouseph C.C., U.J. Rao and V. Vijayendran 2007, Practical Physics and Electronics, S.Viswanathan (Printers & Publishers) Pvt. Ltd., Chennai
2. Singh S.P., 2003, Advanced Practical Physics – 1, 13th Edition, PragathiPrakashan, Meerut
3. Singh S.P., 2000, Advanced Practical Physics – 2, 12th Edition, PragathiPrakashan, Meerut

Semester–VI

		L T P C
15PHU601	DIGITAL ELECTRONICS AND MICROPROCESSOR	5 - - 5

Course Objectives

- Digital electronics is very important in present day life due to its applications in almost all fields of life.
- Any signals stored in memory are first digitized. So it is important to have knowledge about digital electronics.
- This paper is intended to give an insight into the theory and applications of digital electronics, design of circuits with digital devices, details of microprocessor and its applications.
- To apply their knowledge to analog and digital electronics, pulse electronics, analog and digital communication systems, digital signal processing, control systems, and power electronics at a later stage.
- To make the students understand coherence between theoretical and practical measurement.
- To use the techniques, skills and modern technical tools necessary for technical or engineering practice.
- The primary objective of this course is to provide a thorough understanding and working knowledge of design, implementation and analysis of instruments.

Course Outcomes (Cos)

After successful completion of the course, the student is expected to

1. Acquire the basic knowledge of digital logic levels and application of digital electronics circuits.
2. Perform the analysis and design of various digital electronic circuits.
3. Acquired knowledge about Microprocessors and its need.
4. Identify basic architecture of different Microprocessors.
5. Conversion between various number systems
6. Employ Logic gates for carrying out logic operations
7. Apply the concept of Boolean laws and employ a Karnaugh Map to reduce Boolean expressions.
8. Design various combinational and sequential circuits using flipflops.
9. Explain different types of memory used in computers.

UNIT - I

Decimal, binary, octal, hexadecimal - Conversion of number system - Conversion of decimal to binary, binary to decimal- decimal to octal - Octal to decimal - Octal to binary - Binary to octal -

Decimal to hexadecimal - Hexadecimal to decimal, hexadecimal to binary - Binary to hexadecimal.

Binary coded decimal - 8421 code - Alphanumeric codes ASCII code - EBCDIC code - Error detecting code – Parity - Even parity and odd parity method.

UNIT - II

Logic gates - AND, OR, NOT, NAND, NOR gates - Construction of circuit only I/C - Action truth table - Logic symbol.

Boolean operators - Logic expressions – Demorgan's theorems - Laws and rules of Boolean algebra - Truth table - Reducing Boolean expressions, K maps; logic diagrams of Boolean algebra expressions - Converting logic circuits to expressions.

UNIT - III

Flip-flop definitions; clocked flip-flop; S-R flip-flop: JK flip flop: T-flip flop; D flip flop; master slave J-K flip flop: construction circuits.

Ring counter; Ripple counter and mod counters

UNIT - IV

XOR gates half adder - Full adder - Full subtracter - Parallel binary adder - Parallel binary subtracter - Construction, action and truth table.

Magnetic tape - Magnetic disc - Floppy disc - Magnetic cores - Magnetic core logic, coincident memory - Memory addressing. MOS - random access memory - MOD read only memory PROM-EPROM.

UNIT - V

Brief history, organization of 8085 - Data and address bus, addressing the I/O devices, registers in the 8085, instruction set - Instruction types, and classification of instruction, simple programs.

Suggested Book

1. Floyd, 2003, Digital Fundamentals, 8th Edition, Pearson education, New Delhi.
2. Ramesh Gaonkar 6th edition 2013 Microprocessor Architecture, Programming and Applications with 8085 ,PENRAM International P Ltd.
3. Malvino and Leach, 1983, Digital Principles and Applications, 3rd Edition, Tata McGrawHill, New Delhi.
4. Aditya P. Mathur, 1995, Introduction to Microprocessor, 3rd Edition, Tata McGrawHill, New Delhi.
5. Morris Mano. M, 1st2002, Digital Logic and Computer Design, Prentice Hall, New Delhi.
6. Paul M.Julich and John Hilburn, 1st 1987, Microcomputers / Microprocessors, Prentice Hall of India, New Delhi.

Semester–VI**15PHU602****STATISTICAL MECHANICS****L T P C****5 - - 5****Course Objectives**

- To create a bridge between theory of the micro-world and macroscopic phenomena.
- To give explanation for the properties of macroscopic systems using the knowledge of the properties of individual molecules.
- To provide rigorous definitions of thermodynamic quantities and derivations of the laws of thermodynamics from the laws of quantum mechanics.
- The aim of statistical mechanics is to give knowledge on the laws of classical thermodynamics for macroscopic systems using the properties of its atomic particles.
- To apply the concepts and principles of black-body radiation to analyze radiation phenomena in thermodynamic systems.
- To apply the concepts and laws of thermodynamics to solve problems in thermodynamic systems such as gases, heat engines and refrigerators etc.
- To give knowledge on the statistical mechanics and explain the applications of thermodynamics.
- To provide the correlation of thermodynamical problems with statistical concepts.

Course Outcomes

After successful completion of the course, the student is expected to

1. Understand the concepts of statistical mechanics
2. Know about different types of distributions, Maxwell-Boltzmann distribution, Fermi-Dirac distribution and Bose-Einstein distribution.
3. Different types of particles follow different distributions and hence it is necessary to have idea about these distributions.
4. Compare Maxwell-Boltzmann, Bose-Einstein and Fermi-Dirac Statistics and derive its outcomes.
5. Understand the classical and quantum theory of radiation.
6. Know the concept apply on the Thermodynamical problems.

UNIT I**Classical Statistics**

Entropy and Thermodynamic Probability. Maxwell-Boltzmann Distribution Law. Ensemble Concept. Partition Function. Thermodynamic Functions of Finite Number of Energy Levels. Negative Temperature. Thermodynamic Functions of an Ideal Gas. Classical Entropy Expression, Gibbs Paradox. Law of Equipartition of Energy – Applications to Specific Heat and its Limitations.

UNIT II

Statistical definition of temperature, pressure, entropy and chemical potential. Partition function of a system in thermal equilibrium with a heat bath.

Classical Theory of Radiation

Properties of Thermal Radiation. Blackbody Radiation. Pure Temperature Dependence. Kirchhoff's Law. Stefan-Boltzmann Law and Wien's Displacement law. Saha's Ionization Formula. Saha equation for thermal ionization and its application to astrophysics.

UNIT III**Quantum Theory of Radiation**

Stefan-Boltzmann Law: Thermodynamic Proof. Radiation Pressure. Spectral Distribution of Black Body Radiation. Wien's Distribution Law and Displacement Law. Rayleigh-Jean's Law. Ultraviolet Catastrophe. Planck's Quantum Postulates. Planck's Law of Blackbody Radiation : Experimental Verification. Deduction of (1) Wien's Distribution Law, (2) Rayleigh-Jeans Law, (3) Stefan-Boltzmann Law and (4) Wien's Displacement Law from Planck's Law.

UNIT IV**Bose-Einstein Statistics**

B-E distribution law. Thermodynamic functions of a Completely Degenerate Bose Gas. Bose-Einstein condensation, properties of liquid He (qualitative description). Radiation as photon gas. Bose's derivation of Planck's law.

UNIT V

Fermi-Dirac Statistics Fermi-Dirac Distribution Law. Thermodynamic functions of an ideal Completely Degenerate Fermi Gas. Fermi Energy. Electron gas in a Metal. Specific Heat of Metals. White Dwarf Stars. Chandrasekhar Mass Limit.

Suggested Book

1. Lokanathan S. and R.S.Ganbhir, 'Statistical and Thermal Physics: an introduction', Printice Hall of India, New Delhi, 1991.
2. Reif F., 'Statistical Physics: Berkeley Physics Course', Volume 5, Tata McGraw-Hill Company Ltd, 2008
3. Patharia R.K., 'Statistical Mechanics', Oxford: Butterworth, 1996.
4. Haung K., 'Statistical Mechanics', K. Huang, Wiley, 1987.

Semester–VI**15PHU603A****MATHEMATICAL PHYSICS****L T P C****5 - - 5****Course Objectives**

- To provide students with a repertoire of mathematical methods that are essential to the solution of advanced problems encountered in the fields of applied physics and engineering.
- In addition, intended to prepare the student with mathematical tools and techniques that are required in advanced courses offered in the applied physics
- To communicate mathematical and physical knowledge and ideas to the students.
- To learn the fundamentals and applications of Complex Variable, Analyticity, Cauchy-Riemann and Cauchy's Integral.
- To contribute innovations and application of basic research.
- To get knowledge to find the relationship between observation and theory and their use in building the basic concepts of computing.

Course Outcomes (COs)

After successful completion of the course, the student is expected to

1. Communicate mathematical and physical knowledge and ideas to the students.
2. Get introduced to Special functions like Gamma function, Beta function, Delta function, Bessel functions and their recurrence relations
3. Learn the fundamentals and applications of Complex Variable, Analyticity, Cauchy-Riemann and Cauchy's Integral.
4. Build connections between mathematical development and conceptual understanding.
5. Understand the relationship between observation and theory and their use in building the basic concepts of computing.
6. Contribute innovations and application of basic research.

UNIT - I

Operations with Del operator - Gradient of scalar field, physical interpretation - Divergence of a vector function - curl of a vector - curl of the curl - The Laplacian operator - Line, surface and volume integrals - Important vector identities - Gauss divergence theorem - Problems in Gauss divergence theorem - Stoke's theorem and its proof with simple problems - Classification of vector fields - Orthogonal, curvilinear coordinates, differential operators in terms of orthogonal curvilinear coordinates - gradient, curl and Laplacian in spherical polar coordinates and cylindrical coordinates.

Tensors – Contravariant and covariant tensor

UNIT - II

Matrices-Special types of matrices -Transpose of a matrix - Conjugate of a matrix - Conjugate transpose of a matrix-symmetric and antisymmetric matrices - Hermitian and skew - Hermitian matrices - Determinant of a matrix - Adjoint of a matrix - Inverse of a matrix -Unitary matrices - Rank of a matrix and simple problems - Characteristic matrix and characteristic equation - Characteristic vector - Methods of finding the Eigen values and Eigen vectors of a matrix.

UNIT - III

Differential Equations: Introduction – Solution in simple cases of ordinary differential equations of second order – Simple problems from Physics – Partial Differential equations – Special types of differential equations arising in Physics.

Group Theory: Introduction in sets, mappings and binary operations – groups – elementary properties of groups – The centre of a group – Cosets or consents of a subgroup – cyclic group.

UNIT - IV

Functions of a complex variable – single and multivalued functions – Cauchy – Riemann differential equation – analytical – line integrals of complex function – Cauchy's integral theorem and integral formula – derivatives of an analytic function – Taylor's variable – Residue and Cauchy's residue theorem – application to the equation of definite integrals – conformal transformation – Invariance of the Laplacian.

UNIT – V

Arithmetic mean - Median - Quartiles - Deciles - Percentiles - Mode - Empirical relation between mean, median and mode - Geometric mean, harmonic mean - Relation between arithmetic mean, geometric mean and harmonic mean - Range - Range meanor average deviation - Standard deviation - Variance and mean square deviation.

Suggested Book

1. SathyaPrakash, 2002, Mathematical Physics, 4th Edition, S. Chand & Company, New Delhi.
2. Gupta. B.D., 2002, Mathematical Physics, 2nd Edition, Vikas Publishing house Pvt Ltd, New Delhi.
3. Gerald C.F., 1998, Applied Numerical Analysis, 5th Edition, Addison Wesley, California.
4. Rajput. B.S., 2003, Mathematical Physics, 16th Edition, PragatiPrakasan, Meerut.
5. Pipes L.A. and L.R. Harwill, 'Applied Mathematics for Engineers and Physicists', McGrawhill, 1970.

Semester–VI**15PHU603B****NANOTECHNOLOGY AND ITS APPLICATION****L T P C****5 - - 5****Course Objective:**

- This course covers the different classes of nanomaterials that have been developed in recent years in light of various technological applications.
- In order to understand the behavior of these nanomaterials, quantum phenomena and the limitations of basic physical laws that are important at the nanometer length scale are introduced and developed.
- In particular, properties that exhibit size effects (including electronic, magnetic, photonic, and mechanical) at the nanometer length scale will be presented so that nanomaterials becoming increasingly relevant to modern technologies can be better understood.
- The course will cover recent breakthroughs and assess the impact of this burgeoning field.
- Specific nanofabrication topics include epitaxy, beam lithographies, self-assembly, biocatalytic synthesis, atom optics, and scanning probe lithography.
- The course consists of topics in fundamental nanoscale science, plus an overview of areas in nanotechnology.

Course Outcome

After successful completion of the course, the student is expected to

1. Explain the fundamental principles of nanotechnology and their application to biomedical engineering.
2. Apply engineering and physics concepts to the nano-scale and non-continuum domain.
3. Identify and compare state-of-the-art nanofabrication methods
4. perform a critical analysis of the research literature.
5. Design processing conditions to engineer functional nanomaterials.
6. Evaluate current constraints, such as regulatory, ethical, political, social and economical, encountered when solving problems in living systems.

UNIT I

Structure: Size dependence of properties – Crystal Structures – Face centred nano particles – Particle size determination – Surface structure

UNIT II

Metal nano particles: Magic numbers – Theoretical model of nano particles – Geometric structure – Reactivity – Fluctuations – Magnetic clusters – Bulk to nano transitions
Semi conducting nano particles – optical properties – photo fragmentation – Coulombic explosion.

UNIT III

Semiconductors: sensors, electronic devices – brief explanation and examples – classification of nanomaterials as nanoparticles, nanorods, nanotubes, and nanowires – structure and applications of the above

UNIT IV

Instrumentation: Working principle, and applications of scanning electron microscope - transmission electron microscope - scanning tunneling microscope - atomic force microscope, and surface plasmon resonance – theories and principles of soft lithography, self assembled monolayers and multilayers

UNIT V

Polymers: Forming and Characterizing polymers – Polymerisation – Sizes of polymers – Nano crystals – Condensed ring types – Poly diacetylene types – Polymers – Conductive polymers – Supra molecular structures – Transition-metal mediated types – Dendritic molecules – Supra molecular dendrimers – Micellers

Suggested Book

1. Charles P. Poole Jr., Frank J.Owens, 1st edition 2003, Introduction to Nano-technology, Wiley India, New Delhi
2. Mick Wilson, Kamil Kannangara, 1st edition 2005 Geoff Smith, Michele Simmons, Burkhard Raguse, Nano technology, Overseas Press India(P) Ltd., New Delhi
3. Mark Ratner, Daniel Ratner, 1st edition 2009 Nano-Technology, A gentle introduction to the new big idea, Pearson Education (Singapore) (P) Ltd., New Delhi.
4. Jean-Marie Lehn, 1994, Supramolecular Chemistry, Journal of Chemical Sciences, Vol. 106, No.5, pages 915-922.
5. Jonathan Steed and Jerry Atwood, 2009, Supramolecular Chemistry, 2nd Edition, John Wiley & Sons, New York.
6. Jacob Israelachvili, 1992, Intermolecular and Surface Forces, 2nd Edition, Academic Press.
7. Jackie Ying, 1st edition 2001, Nanostructured Materials, Academic Press.
8. G. Timp, 1st edition 1999, Nanotechnology, Springer Verlag, New York.

Course Objectives

- Astronomy and Astrophysics is a very fundamental subject in Physics.
- Includes study of the solar system, evolution of stars, different physical processes going on stellar bodies, life cycle of stars etc.
- Be able to read technical articles efficiently for key concepts
- Have experience working and discussing in a group setting
- Be able to use analytical and mathematical skills to solve problems
- Acquire critical thinking skills by learning to evaluate the evidence behind a scientific theory

Course Outcomes (COs)

After successful completion of the course, the student is expected to

1. Plan and engage in an independent and sustained critical investigation of a chosen research topic to generate new knowledge in an area of astronomy and astrophysics.
2. Systematically evaluate relevant theory and concepts in astronomy and astrophysics,
3. Relate these to appropriate methodologies and evidence and draw appropriate conclusions.
4. Demonstrate capacity for astronomy and astrophysics reasoning through analyzing, proving and explaining concepts from the chosen research area.
5. Have Peripheral ideas about astronomy and astrophysics.
6. Gain the knowledge on Astronomical instruments, Stellar Evolution, Theories of the universe, etc.,

UNIT- I

Astronomical instruments Optical telescope - reflecting telescope - types of reflecting telescope - advantages of reflecting telescope - Radio telescopes - astronomical spectrographs - photographic photometry - photo electric photometry - detectors and image processing.

UNIT-II

Solar system The sun-physical and orbital data - Photosphere - Chromosphere - corona - solar prominences - sunspot - sunspot cycle - theory of sunspots - solar flare - mass of the sun - solar constant - temperature of the sun - source of solar energy - solar wind. Other members of the solar system - Mercury - Venus - Earth - Mars - Jupiter - Saturn - Uranus - Neptune - Pluto - Moon - Bode's law - Asteroids - comets - Meteors.

UNIT-III

Stellar Evolution, Binary and variable stars Birth of a star - Death of a star - Chandrasekhar limit - white dwarfs - Neutron stars - black holes - Quasars - Nebulae - Supernovae Binary stars - Origin of Binary stars. Variable stars - Cepheid variables - RV Tauri variables - long period variables - irregular variables - flare stars.

UNIT-IV

Magnitudes, distance and spectral classification of stars Magnitude and brightness - apparent magnitude of stars - absolute magnitude of stars - relation between apparent magnitude and absolute magnitude of stars - Luminosities of stars - measurement of stellar distance - Geometrical parallax method - distance from red shift measurement - Harvard system of spectral classification .

UNIT-V

Theories of the universe, galaxies and star clusters Origin of the universe - the big bang theory - the steady state theory - the oscillating universe theory - Hubble's law. Galaxies - types of galaxies - Milky Way - star clusters - open clusters - globular clusters.

Semester–VI**15PHU604A****ELECTROMAGNETIC THEORY****L T P C****5 - - 5****Course Objective**

The aim and objective of the course

- The aim of this course is to provide the students with the fundamental principles of electrical energy (electro- magnetism).
- It is very important to understand the propagation of waves in different media, its transmission and reception.
- To understand the relation between electric and magnetic fields.
- To gain the knowledge on electromagnetic wave propagations.
- To describe simple models for electromagnetic interaction with media
- To experience the wave propagation in different media.

Course Outcome

After successful completion of the course, the student is expected to

1. Calculate electric and magnetic fields from stationary and dynamic charge and current distributions.
2. Use electromagnetic wave theory and principles in a wide range of applications.
3. Solve such problems in simple geometries using separation of variables and the method of images.
4. Define and derive expressions for the energy both for the electrostatic and magnetostatic fields.
5. Gain confidence in their ability to apply mathematical methods to understand electromagnetic problems to real-life situations.
6. Solve simple electrostatic boundary problems.
7. Describe simple models for electromagnetic interaction with media
8. Choose adequate models and solution methods for specific problems.

UNIT- I

Electrostatics: Electric intensity – Electric potential – Gauss Law - Dielectric and its polarization - Electric displacement D – Dielectric constant ϵ_r – Polarizability α - Clausius-Mossotti relation (Non-polar molecules) – The Langevin equation (Polar molecules) – Electrostatic energy

UNIT II

Magnetostatics: Current density J – Ampere’s law of force – Biot-Savart law – Ampere’s circuital law – Magnetic scalar potential ϕ_m (no applications) – Magnetic vector potential A –

Magnetisation and magnetization current – Magnetic intensity – Magnetic susceptibility and Permeability.

UNIT III

Maxwell's Equations

Maxwell Equations-Displacement Current-Vector and Scalar Potentials. Gauge Transformations: Lorentz and Coulomb Gauge. Boundary Conditions at Interface between Different Media. Wave Equations. Plane Waves in Dielectric Media. Poynting Theorem and Poynting Vector. Electromagnetic Energy Density. Physical Concept of Electromagnetic Field Energy Density, Momentum Density and Angular Momentum Density.

UNIT IV

Interaction of E.M.Waves with matter (Macroscopic): Boundary conditions at interfaces - Reflection and refraction – Frenel's laws-Brewster's law and degree of polarization - Total internal reflection and critical angle.

UNIT V

Interaction of E.M.Waves with matter (Microscopic): Scattering and Scattering parameters - Scattering by a free electron (Thomson Scattering) - Scattering by a Bound electron (Rayleigh scattering) – Dispersion Normal and Anomalous – Dispersion in gases (Lorentz theory)

Suggested Book

1. Chopra & Agarwal 2004, Electromagnetic theory, 6th Edition, Nath & Co, Meerut.
2. Jackson. J.D., 1998, Classical Electro dynamics, 3rd Edition, Wiley Eastern, New Delhi.
3. Schwartz. M. 1972, Revised edition, Principles of Electro dynamics, McGraw Hill, Auckland.
4. Jordon and Balmain 2nd edition 2002, EMW radiating systems, Prentice Hall of India Pvt Ltd, New Delhi.
5. Gupta, Kumar and Singh, 2007, Electro dynamics, 19th Edition, PragatiPrakasan, Meerut, New Delhi.
6. SatyaPrakash 10th edition 2003, Electromagnetic theory and Electro dynamics, Kedar Nath Ram Nath & Co, Meerut.
7. Griffiths D., 1998, Introduction to Electrodynamics, 3rd Edition, Printice Hall of India, New Delhi.

Course Objectives

- In the present day life, methods of communication have improved quite a lot.
- Optical communication where light is used as the carrier wave has become important due to its high frequency.
- This paper contains different techniques used in optical communication, like optical fiber, laser etc.
- This course provides basic of optical communication system.
- Students will learn about optical fiber transmission link with the functional description of each block, Point –to-point link –system considerations, Link power budget and rise.

Course Outcomes:

After successful completion of the course, the student is expected to

1. Explain the concept of amplitude and frequency modulation
2. Know fundamental of Optical sources and their uses.
3. Compare working principle of single mode and multimode optical fibres.
4. Distinguish Digital modulation (pulse code and Pulse amplitude modulation) types
5. Explain the fundamentals of nonlinear properties of optical fibers.
6. Know the optical waves in communication and the methods of implementation are explained in this paper.

UNIT I

Evolution of Optical Communication, Evolution of fiber types, guiding properties of fibers, crosstalk between fibers, dispersion properties of fibers, nonlinear properties of optical fibers, SRS, SBS, Intensity dependent refractive index. Characterization of materials for fibers, fiber preparation, cable structures, connectors, splicing.

UNIT II

Transmission characteristics of optical fibre, attenuation, absorption and scattering losses, nonlinear losses, wavelengths for communication, bend losses, dispersion effects in optical fibres- material and waveguide dispersions, modal birefringence and polarization maintaining fibres.

UNIT III

Optical sources- LED, structures, materials, quantum efficiency, power, modulation-Laser Diode, Modes and threshold conditions, laser diode rate equations, external quantum efficiency, resonant frequencies, laser diode structures and radiation patterns, single mode lasers, modulation of laser diodes, temperature effects.

UNIT IV

Photodetectors, photodetector noise, signal to noise ratio, optical receiver operation, error sources, receiver configuration, digital receiver performance calculations, pre amplifier types, High impedance and Trans impedance amplifiers, analog receivers.

UNIT V

Digital transmission systems, Point to point links, link power budget, rise time budget, line coding, coherent systems, heterodyne and homodyne detection, WDM concepts and components, operational principle of WDM, Optical Amplifiers, semiconductor optical amplifiers, Erbium Doped Fiber Amplifiers, Gain and Power Conversion Efficiency.

Suggested Book

1. Gerd Keiser, 'Optical Fiber Communications', 5th edition, Tata McGraw Hill, New Delhi, 2013.
2. Senior M., 'Optical Fiber Communications Principles and Practices', Prentice Hall India (1994)

Semester–VI**15PHU604C****BIOPHYSICS****L T P C****5 - - 5**

Course Objectives:

- The course aims to provide students with a foundation in the basic concepts of Biophysics.
- Biophysics is an interdisciplinary science that employs and develops theories and methods of the physical sciences for the investigation of biological systems.
- Topics will include canonical and non-canonical structures of nucleic acids, structure of proteins, enzymes etc.
- Fundamental concepts that underlie biomolecular interactions will be discussed and biophysical methods that are employed for the structural analysis of these systems will be introduced at an elementary level.
- To Understand the concept of life of molecules.
- The physical quantities such as temperature, energy, enthalpy, entropy, and free energy will be employed to understand why a biological system chooses particular state at conditions under study.

Course Outcome

After successful completion of the course, the student is expected to

1. Demonstrate knowledge of the fundamental concepts in physics and chemistry that underlie biological processes.
2. Define the structural characteristics of nucleic acids and proteins
3. Examine parameters that variously determine their stability and function(s).
4. Describe the principles that govern biomolecular interactions
5. Appreciate how established methods of research and enquiry are employed to analyze the different aspects of these interactions.
6. Understand the concept of life of molecules.

Unit I

Atoms and Molecules: Introduction – Physical and chemical properties of atoms and molecules – Internal structure of atom and molecule – Proton, neutron and electron – Chemical bonds – Orientation of bonds in space – Energy of atoms – Hydrogen bond – Molecular weight and mole – Bond energy.

Unit II

Matter and mechanics of cell: Materials of the cell – Celluloid – Kinetic molecular theory – Diffusion – Osmosis – Osmotic pressure and turgor pressure – Water potential – Methods for measuring osmotic pressure of cell – Permeability – Theories of cell permeability – Imbibition – Volume changes, energy relations and effect of temperature on imbibition.

Unit III:

Physics in biological systems: Breathing – Inspiration – Expiration – Other mechanical actions – Types of breathing – Artificial breathing – Lung air volume – Modified form of breathing – Periodic breathing – Coughing – Swallowing – Sneezing.

Unit IV

Molecular physics in plant physiology: Distribution of light – light on lens – Wavelength and energy – light in water – orientation – Central importance of light to the physiology of plants – Photochemistry – Electronic transition in atoms, molecules and crystals – Other transitions.

Unit V

Ultra sound: Generation of Ultrasound scanning – A mode scan – TM mode – Echoencephalograph (EEG) – Echo opthalmoscope – B mode scan – Gray scale imaging – Measurement of motion – Doppler technique – Ultrasonic technique – Methods & Instrumentation.

Suggested Books

1. Arora M.P., 'Bio Physics', 1st edition 2005, Himalaya Publishing House
2. Rodney Cotterill, 'Bio Physics – An Introduction', 1st edition 2014 Wiley Student Edition.

Semester - VI**15PHU691****PROJECT****L T P C****- - - 3**

Course Objectives

- The aim of the B.Sc. project work is to expose the students to preliminaries and methodology of research in Theoretical Physics and Experimental Physics.
- Students get the opportunity to participate in some ongoing research activity and development of a laboratory experiment.
- To explain the physics problem and its solution in both words and appropriately specific equations to both experts and non-experts.
- To understand the objective of a physics laboratory experiment, properly carry out the experiments, and appropriately record and analyze the results.
- To use computers in data acquisition and processing and how to use available software as a tool in data analysis.
- To think creatively about scientific problems and their solutions.

Course Outcomes (COs)

After successful completion of the course, the student is expected to

1. Complete an independent research project, resulting in research outputs in terms of publications in journals and conference proceedings.
2. To apply his/her knowledge and skills to carry out advanced tasks and projects.
3. Apply their knowledge to develop the instruments.
4. Verify the basic principles and laws experimentally as a project.
5. Demonstrate knowledge of contemporary issues in their chosen field of research.
6. Demonstrate an ability to present and defend their research work.

Semester - IV**150EU401****ATMOSPHERE AND WEATHER****L T P C****- - - 3****Course Objective:**

- The aim of this course is not just to impart theoretical knowledge to the students but to enable them to develop an awareness
- To understand the causes and effects of different weather phenomenon and basic forecasting techniques.
- To know the role of air, water, and wind in weather systems.
- Assess variability and change within this expanded, extended and quality assured network.
- To explain what causes different types of weather.
- To understand the concept of Ecosystems and climate interactions

Course Outcomes

After successful completion of the course, the student is expected to

1. Demonstrate knowledge of cloud properties.
2. Demonstrate knowledge of the thermodynamic drivers of cloud development and evolution.
3. Demonstrate knowledge of basic atmospheric chemistry and its role in atmospheric phenomena.
4. Determine if the atmosphere is stable or unstable from a vertical temperature profile
5. Understand atmospheric general circulation and the basic principles of physical and applied climatology and climate change.
6. Explain the composition and structure of the atmosphere.

UNIT - I

Atmospheric composition - Laws of thermodynamics of the atmosphere - Adiabatic process - Potential temperature - The Clausius – Clapeyron equation - law of black body radiation - solar and terrestrial radiation - Albedo - Green house effect - Heat balance of earth atmosphere system.

UNIT - II

Fundamental force - Non-Inertial reference frames and apparent forces - Structure of static atmosphere - Momentum - Continuity and energy equations - Thermodynamics of the dry atmosphere - Elementary applications of the basic equations.

The circulation theorem - Vorticity, Potential Vorticity, Vorticity and potential Vorticity equations.

UNIT - III

Wind - Temperature and pressure distribution over India in the lower - Middle and upper atmosphere during pre, post and mid-monsoon season - Monsoon circulation in the meridional (Y-Z) and (X-Y) planes - Energy cycle monsoon - Dynamics of monsoon depressions and easterly waves - Intra-Seasonal and inter-annual variability of monsoon - Quasi-be weekly and 30-60 day oscillations - ENSO and dynamical mechanism for their existence.

UNIT - IV

Role of meteorology on atmospheric pollution - Atmospheric boundary layer, air stability, local wind structure, Ekman spiral, turbulence boundary layer scaling - Residence time and reaction rates of pollutants, sulphur compounds nitrogen compounds - carbon compounds, organic compounds, aerosols, toxic gases and radioactive particles trace gases.

UNIT - V

Basic meteorology - radar principles and technology - Radar signal processing and display - Weather radar-observation of precipitating systems - Estimation of precipitation radar observation of tropical cyclones - Use of weather radar in aviation, clear air radars - Observation of clear air phenomena - Other radar systems and applications.

Suggested Books

2. Keshvamuthy. R.N. and M.ShankarRao, 1992, The Physics of Monsoons, Allied Publishers, New Delhi
3. Haltiner. G.J. and R.T. Villians, 1980, Numerical Weather Prediction, John Wiley and sons, New Delhi.
4. Tom Lyons and Prillscott, Principles of Air Pollution Meteorology, CBS publishers and Distributors (P) Ltd.

SPECIAL PAPER I FOR B.Sc. (Hon.)**Semester V****L T P C****15PHU506****ADVANCED QUANTUM MECHANICS****- - - 5****Course Objectives**

- This paper explains the shortcomings of quantum mechanics in explaining different subatomic physics and the evolution of quantum mechanics.
- This course is part one of a two semester course focused on a rigorous exposition to the principles of Quantum mechanics.
- The Dirac bra-ket formalism will be introduced and used throughout to present the principles of Quantum Mechanics in a general context.
- We will discuss analytic solutions to the Schrodinger equation for a variety of potentials in one, two and three dimensions.
- The role of symmetries as the underlying principle of Quantum Mechanics will be emphasized throughout the course.
- The use of symmetry principles and operators methods will be discussed.

Course Outcomes :

After successful completion of the course, the student is expected to

1. Study the problems like scattering problem, relativistic quantum mechanics, quantum electrodynamics etc.
2. Calculate the de Broglie Wavelength of a wave associated with the particle.
3. Explain the importance of Field theory.
4. Explain the Angular momentum commutation relations and describe the applications.
5. Describe wave function and derive the Schrödinger equation and interpret the wave function and eigen value equation.
6. Describe the different types of potentials and derive the solutions of Schrödinger equation for the same.
7. Apply the variational principle and find the value of energy at ground state of helium.

UNIT - I

Wave Mechanics Matter waves – Uncertainty principle –Wave packet – Time-dependent and Time-independent Schrodinger equations for a free particle and particle in a potential – Linear vector space – Hilbert's space – Orthogonal and orthonormal functions – Linear operator – Eigen functions and Eigen values – Hermitian operator – Dirac's notation – Equations of motion – Schrodinger, Heisenberg and Interaction representation – Momentum representation.

UNIT - II

One dimensional potential well: Square-well potential with rigid walls – Square-well potential with finite walls – Square-well potential barrier – Alpha emission – Bloch waves in a periodic potential – Linear harmonic oscillator (Schrodinger method and operator method) – Free particle.

Three dimensional potential Well: Particle moving in a spherically symmetric potential – System of two interacting particles – Rigid rotator – Hydrogen atom – Hydrogenic orbitals – The free particle – Three-dimensional square-well potential - Deuteron

UNIT - III

Time-independent Perturbation theory: Basic concepts – Non-degenerate energy levels – First and Second order corrections for energy and wave functions – Ground state of Helium atom – Effect of electric field on the ground state of hydrogen atom (Stark effect) Degenerate energy levels – Effect of electric field on the $n=2$ state of hydrogen atom – Variational principle – Variation method for excited states – Application of variation method to ground state of helium – The WKB method

Time dependent perturbation theory: Introduction – First-order perturbation – Harmonic perturbation – Transition to continuum states (Fermi's Golden rule) – Absorption and emission of radiation – Transition probability – Selection rules

UNIT IV

Angular momentum: Angular momentum operators – Angular momentum commutation relations – Eigen values and Eigen functions of L^2 and L_z – General angular momentum – Eigen values of J^2 and J_z – Ladder operators (J_+ and J_-) – Angular momentum matrices – Matrices for J^2 , J_z , J_+ , J_- , J_x and J_y – Spin angular momentum – Spin $\frac{1}{2}$ systems – Spin vectors for spin $\frac{1}{2}$ systems – Addition of angular momentum – Clebsch-Gordan coefficients.

Scattering: Scattering cross-section – Significant number of partial waves – Scattering by an attractive square-well potential – Briet-Wigner formula – Scattering length – Expression for phase shift – Integral equation – The Born approximation – Scattering by screened coulomb potential – Validity of Born approximation - Laboratory and center of mass co-ordinate systems

UNIT V

Field theory: Introduction – Classical approach to field theory – Relativistic Lagrangian and Hamiltonian of a charged particle in an electromagnetic field – Field: Lagrangian and Hamiltonian formulations – Quantum equation for the field – Second quantisation – Quantisation of non-relativistic Schrodinger equation – Creation, annihilation and number operators.

Suggested Books

1. Aruldas. G, 2008, Quantum Mechanics, 2nd Edition, Prentice-Hall of India, NewDelhi.

2. Gupta, Kumar and Sharma, 2002, Quantum Mechanics, 22nd Edition, Jai Prakash Nath & Co, Meerut.
3. Satya Prakash, 2003, Quantum Mechanics, New Edition Kedar Nath & Ram Nath & Co, Meerut.
4. Leonard Schiff, 1968, Quantum Mechanics, 3rd Edition, McGraw Hill International, Auckland.
5. Engen Merzbacher, 1997, Quantum Mechanics, 3rd Edition, Wiley, Weinheim.
6. Mathews. P.M. and K. Venkatesan, 2002, Textbook of Quantum Mechanics, McGraw
7. Hill International, Weinheim.
8. Chatwal R.G. and Sk. Anand, 2004, Quantum Mechanics, Himalaya Publishing House, New Delhi

SPECIAL PAPER I FOR B.Sc. (Hon.)**Semester VI****15PHU605****EMERGING TRENDS IN MATERIALS SCIENCE****L T P C****- - - 5****Course Objectives:**

- To give an exposure to students about different characteristics of materials, their importance, study of these characteristics, preparation of different materials.
- To review physics in the context of materials science & engineering.
- To describe the different types of bonding in solids, and the physical ramifications of these differences.
- To describe and demonstrate diffraction, including interpretation of basic x-ray data. Give an introduction to metals, ceramics, polymers, and electronic materials in the context of a molecular level understanding of bonding.
- Give an introduction to the relation between processing, structure, and physical properties.
- Give the beginning student an appreciation of recent developments in materials science & engineering within the framework of this class.
- Give the beginning student an opportunity for teamwork in research Give the beginning student practice in basic expository technical writing

Course Outcomes

After successful completion of the course, the student is expected to

1. Different types of materials for new applications like solar cells, sensors etc. etc.
2. Know about various types of bonding.
3. Distinguish between various types of crystal imperfection.
4. Explain the basics of crystal growth.
5. An idea about basics of thin film technology and few deposition methods.
6. Describe nondestructive testing methods and its applications.

Unit I

Crystalline solids – space lattice – the basis and crystal structure; crystal translational vectors, symmetry operation primitive lattice cell and unit cell symmetry elements, Fundamental type of lattice, atomic packing, atomic radius, lattice constants and density, crystal structure other cubic structure – type of bonding – Ionic bonding – Energy of formation of NaCl molecules, Madelung constants – potential energy of diagram of ionic molecules – calculation of repulsive exponent – Born Haber cycle characteristics of ionic bond.

Unit II

Ionic conductivity – Normal and super ionic conductors – Mass transport in crystals – Diffusion – Atomic diffusion theory – Experimental determination of the diffusion constant – Ionic conduction – Experimental results – for ionic conduction – The Einstein relation – Dielectric loss in ionic crystals – Electronic conduction in ionic crystals – Excess conductors – Deficit conductors – Amphoteric semiconductor.

Unit III

Phenomenological Models – Huberman's Theory – Riechle Strassler Toom's Theory – Wele and Diene Theory – Lattice Gas theory – Free ion model – Domain Model – Riechle and Roth Theory – The Path Probability Method – The static variables – the Path variables – The path Probability – Stationary state condition – Classification of Superionic solids – Crystalline and Amorphous – Glasses – Dispersed solid Electrolytes – polymers – Ion exchange resins – biological basis resins – Classification over conducting ion species – mode and mechanism of conduction in each case and their corresponding criteria to be superionic conductors.

Unit IV

Structural characterization – XRD surface Analysis, EXAFS, IPS and Quasi neutron scattering – Thermo dynamical characterization – Differential scanning calorimetry, Differential Thermal Analysis, Thermo Gravimetric Analysis and Thermo electric power – Ion transport properties – Electrical conductivity – Two probe method – four probe method – Impedance spectroscopy – Dynamical conductivity – state conductivity – polarisation characteristic – determination of small electronic transport numbers – The permeation Technique (Static) – The polarization cell (Static) – the polarized cell technique (Dynamic) – The permeation technique (Dynamic).

Unit V

Application of superionic solid – Battery and Non-Battery application – conventional cells – fuel cells – Supercapacitors-sensors and partial pressure – gauges – Oxygen and non-Oxygen sensors – coulometers – timers – Diffusion coefficient measurement in solids and liquids – Electrochemic displays.

M.Sc. PHYSICS
CHOICE BASED CREDIT SYSTEM (CBCS)

Syllabus
2015 – 2016

KARPAGAM ACADEMY OF HIGHER EDUCATION

(Deemed to be University)

(Established Under Section 3 of UGC Act 1956)

Eachanari Post, Coimbatore – 641 021

Course Objectives

- Studying the properties of materials is very important at all times, to choose the correct material for the correct use.
- To aware the students about the field of Condensed matter physics.
- This paper is intended to give the students an idea about importance of crystals and their properties.
- This paper enable the students to understand about the crystal structure, interaction with X-ray, lattice vibrations, defects, electronic properties and the magnetic properties etc.
- To explain the concept of energy bands and effect of the same on electrical properties.
- To learn the importance of different materials in a variety of applications

Course Outcomes (COs)

After successful completion of the course, the student is expected to

1. Differentiate between different Lattice types and explain the concepts of reciprocal lattice and crystal diffraction.
2. Predict electrical and thermal properties of solids and explain their origin.
3. Explain the concept of energy bands and effect of the same on electrical properties.
4. Describe the dielectric properties of insulators.
5. Explain various types of magnetic phenomenon, physics behind them, their properties and applications.
6. Explain superconductivity, its properties, important parameters related to possible applications.
7. learn the importance of different materials in a variety of applications

UNIT – I

Inter planar spacing: Inter planar spacing for SC, FCC, BCC lattices - diamond cubic structure - NaCl structure - The reciprocal lattice and their properties - Bragg condition in terms of reciprocal lattice - Rotatory crystal method of X ray diffraction -Neutron diffraction – experiment.

Lattice: Vibrations of one dimensional diatomic linear lattice-acoustic and optical branches - Semi conductors and their properties - Hall effect - Dielectrics - Lorentz field in dielectrics - The Clausius –Mosotti equation - Ferro electric crystals - Ferro electric domains.

UNIT - II

Crystal defects: Classification of defects - Points defect - The Schottky defect - The Frenkel defect -colour centers - F center - other colour centers - Production of colour centers by X rays or practice irradiation – Defect and energy state.

Dislocations - Slip and plastic deformation - Shear strength of single crystals - Edge dislocation - Screw dislocation - Stress field around an edge dislocation.

Ultrasonics: Non destructive testing and applications.

UNIT - III

Heat capacity of the electron gas: Experimental electrical resistivity of metals – Free electron theory of metals – Debye's equation - superconductivity - Electron phonon interaction - Cooper pairs – BCS theory - Energy gap and its temperature dependence - London equation – Josephson effect and its applications.

Langevin theory of Para magnetism: Quantum theory of Para Magnetism - Curie law- Ferro Magnetism - Weiss molecular field theory - Domain theory - Anti Ferro magnetism - Neel theory - Ferri Magnetism – Ferrites – spin – waves - Experimental techniques to study the magnetic properties.

UNIT - IV

NANOSCIENCE

Structure: Size dependence of properties – Crystal Structures – Face centred nano particles – Particle size determination – Surface structure - Metal nano particles - Magic numbers – Theoretical model of nano particles – Geometric structure – Reactivity – Fluctuations – Magnetic clusters – Bulk to nano transitions Semi conducting nano particles – optical properties – photo fragmentation – Coulombic explosion.

Polymers: Forming and Characterizing polymers – Polymerisation – Sizes of polymers – Nano crystals – Condensed ring types – Poly diacetylene types – Polymers – Conductive polymers – Supra molecular structures – Transition-metal mediated types – Dendritic molecules – Supra molecular dendrimers – Micellers

UNIT - V

Instrumentation: Working principle, and applications of scanning electron microscope - transmission electron microscope - scanning tunneling microscope - atomic force microscope, and surface plasmon resonance – theories and principles of soft lithography, self assembled monolayers and multilayers.

11. http://www-personal.umich.edu/~sunkai/teaching/Winter_2018/phys520.html

Course Objectives

- This paper contains details of basic electronic components, their characteristics and applications in the construction of different electronic instruments.
- Other than ordinary transistors and diodes special devices are also explained.
- To give an idea about the basics of electronics and electronic devices, which is very important for knowing the basics of any modern instrument.
- To analyze PN junctions in semiconductor devices under various conditions.
- To design and analyze simple rectifiers and voltage regulators using diodes.
- To understand the high frequency application of diodes.

Course Outcomes (COs)

After successful completion of the course, the student is expected to

1. Build, design and analyze analog to digital converter.
2. Design digital and analog systems.
3. Understand the basic operation and working of different diodes like FET, MOSFET, CMOS, etc.
4. Analyze PN junctions in semiconductor devices under various conditions.
5. Design and analyze simple rectifiers and voltage regulators using diodes.
6. Understand the high frequency application of diodes.

UNIT I

Electronic Devices and Applications - Transistor Biasing and Stabilization with design problems, h-parameters and their applications in transistor circuit analysis for CE, CB and CC configurations; FET and MOSFETs: Characteristics and Biasing, Design of biasing circuits, Design and analysis of amplifiers, Numerical problems.

UNIT II

Frequency response of amplifiers General concepts; bode plot; low frequency response: BJT and FET amplifiers; miller effect capacitance; high frequency response of BIT amplifiers; hybrid pie model: short circuit current gain, cut off frequency, and current gain with resistive load; high frequency response of FET amplifiers; frequency response of multistage amplifiers; square wave testing, Numerical problems.

UNIT III

Analysis of compound configurations Cascade connection; Cascade connection; Darlington connection; Bootstrapping principle; Bootstrapped Emitter Follower; Bootstrapped Darlington Emitter Follower; Feedback pair; . CMOS circuits; Current source circuits; Current mirror circuits; Differential amplifier circuits; Numerical problems.

UNIT IV

Power amplifiers Introduction, Series-fed Class A amplifier, Transformer coupled class A amplifier, Class B amplifier operation, Class B amplifier distortion, Power transistor heat sinking, Class C and Class D amplifiers, Numerical problems.

UNIT V

Network theory, mesh and node analysis Kirchhoff's voltage and current law, Network Theorems- Thevenin's theorem, Norton's theorem, Superposition Theorem, Maximum power transfer theorem, Problems based on network theorems

Course Objectives

- Thermodynamics is an important branch of physics, which helps us to understand the different phenomena in the evolution of the universe.
- This paper gives a basic idea about the laws of thermodynamics and statistical processes.
- To apply the knowledge of mathematics, science and engineering fundamentals to model the energy conversion phenomenon.
- To identify and formulate power production based on the fundamentals laws of thermal engineering.
- To instill upon to envisage appropriate experiments related to heat engines.
- To investigate the effectiveness of energy conversion process in mechanical power generation for the benefit of mankind

Course Outcomes (COs)

After successful completion of the course, the student is expected to

1. Identify and describe the statistical nature of concepts and laws in thermodynamics, in particular: entropy, temperature, chemical potential, Free energies, partition functions.
2. Apply the knowledge of mathematics, science and engineering fundamentals to model the energy conversion phenomenon.
3. Identify and formulate power production based on the fundamentals laws of thermal engineering.
4. Investigate the effectiveness of energy conversion process in mechanical power generation for the benefit of mankind
5. Use the statistical physics methods, such as Boltzmann distribution, Fermi-Dirac and Bose-Einstein distributions to solve problems in physical systems.
6. Apply the concepts and laws of thermodynamics to solve problems in thermodynamic systems such as gases, heat engines and refrigerators etc.
7. Study important examples of ideal Bose systems and Fermi systems

UNIT I

Laws of Thermodynamics: Some consequences of the laws of thermodynamics – Entropy – Calculation of entropy changes in reversible processes. The principle of increase of entropy – Thermodynamic potentials – Enthalpy, Helmholtz and the Gibbs functions – Phase transitions – The Clausius-Clayperon equation – Van der Waals equation of state.

UNIT II

Kinetic Theory: Distribution function and its evolution – Boltzmann transport equation and its validity – Boltzmann's H-theorem – Maxwell-Boltzmann distribution – Transport phenomena – Mean free path- Conservation laws – Hydrodynamics (No derivation).

UNIT III

Classical Statistical Mechanics: Maxwell Boltzmann distribution law: Evaluation of constants - Maxwell's law of distribution of velocities - Most probable speed, Average speed, Root mean square speed - Principle of equipartition of energy - Partition function - Condition for applicability of M.B statistics - Non degenerate and degenerate systems - Maxwell velocity distribution in a given direction - Total internal energy of an ideal gas - Molar heat capacity of a gas at constant volume – Entropy - Helmholtz free energy - Pressure and equation of state of an ideal gas - Limitation of M.B method.

UNIT IV

Quantum Statistical Mechanics: B.E energy distribution for energies in the range E to $E + dE$ – Condition for B.E distribution to approach classical M.B distribution - Bose temperature - Bose Einstein condensation - Planck's law from B.E law - Fermi Dirac distribution law (no derivation) - FD law for the energies in the range E to $E+dE$ – Fermi energy - Effect of temperature - Energy distribution curve - Free electron in a metal - Fermi temperature and Thermionic emission - Richardson Dushman Equation - Comparison of MB, BE and FD statistics.

UNIT V

Applications of Quantum Statistical Mechanics: Ideal Bose gas : Photons – Black body and Planck radiation – Photons – Specific heat of solids – Liquid Helium.
Ideal Fermi gas : Properties – Degeneracy – Electron gas – Pauli paramagnetism
Ferromagnetism : Ising and Heisenberg models.

Course Objectives

- It is necessary for a physics student to be familiar with different methods in mathematics.
- Give a basic idea about different methods of mathematics, used in Physics.
- To provide students with a repertoire of mathematical methods that are essential to the solution of advanced problems encountered in the fields of applied physics and engineering.
- In addition, intended to prepare the student with mathematical tools and techniques that are required in advanced courses offered in the applied physics
- To communicate mathematical and physical knowledge and ideas to the students.
- To learn the fundamentals and applications of Complex Variable, Analyticity, Cauchy-Riemann and Cauchy's Integral.
- To contribute innovations and application of basic research.
- To get knowledge to find the relationship between observation and theory and their use in building the basic concepts of computing.

Course Outcomes (COs)

1. Students will be able to apply integral transform (Fourier and Laplace) to solve mathematical problems of interest in physics, use Fourier transforms as an aid for analyzing experimental data.
2. Manipulating vectors as “atomic” entities without recourse to underlying coordinates
3. Sound grasp of the concept of a vector field
4. Ability to link this idea to descriptions various physical phenomena
5. Intuition of the physical meaning of the various vector calculus operators (div, grad, curl) Students can formulate and express a physical law in terms of tensors, and simplify it by use of coordinate transforms (example: principal axes of inertia).
6. Students will be able to solve some simple classical variation problems.

UNIT - I

Definition of vector space – Linear dependence – Linear independence – Basis – Dimension of a vector space – Representation of Vectors and linear operators with respect to basis – Schmidt orthogonalization process – Inner product.

Tensors : Transformation of coordinates – Summation convention – Contravariant Tensor – Covariant Tensor – Mixed Tensor – Rank of a Tensor – Kronecker delta symbol – symmetric and antisymmetric tensors – Invariant tensors.

UNIT - II

Functions of a complex variable – single and multivalued functions – Cauchy-Riemann differential equation – analytical – line integrals of complex function – Cauchy's integral theorem and integral formula – derivatives of an analytic function – Liouville's theorem - Taylor's series – Laurent's series - Residues and their evaluation - Cauchy's residue theorem – application to the evaluation of definite integrals.

UNIT - III

Fourier Transform – Properties of Fourier transform – Fourier transform of derivatives – Fourier sine and cosine transforms of derivatives – Fourier transform of functions of two or three variables – Finite Fourier transforms – Simple Applications of FT

Laplace transform – Properties of Laplace transforms – Laplace Transform of derivative of a function – Laplace transform of integral – Laplace transform of periodic functions - Inverse Laplace Transform – Fourier Mellin Theorem - Properties of inverse Laplace Transform – Convolution theorem – Evaluation of Laplace Transform using Convolution theorem.

UNIT - IV

Fourier series – Dirichlet's theorem – change of interval – complex form – Fourier series in the interval $(0, T)$ – Uses of Fourier series - Legendre's polynomials and functions – Differential equations and solutions – Rodrigues formula – Orthogonality – relation between Legendre polynomial and their derivatives – recurrence relations – Laguerre Polynomials – recurrence relations

UNIT - V

Bessel's functions – differential equation and solution – generating functions – recurrence relations – Bessel function of second order – Spherical Bessel function - Hermite differential equation and Hermite polynomials – Generating function of Hermite polynomials – Recurrence formulae for Hermite polynomials – Rodrigue's formula for Hermite Polynomials – Orthogonality of Hermite Polynomials – Dirac's Delta Function.

Course objective

- Studying Classical Mechanics will give an idea about how classical physics deal with matter and energy.
- Have a deep understanding of Newton's laws
- Be able to solve the Newton equations for simple configurations using various methods,
- To give an insight into the classical methods of physics.
- The emphasis of the course is on applications in solving problems of interest to physicists.
- Students are to be examined on the basis of problems, seen and unseen.
- To demonstrate knowledge and understanding of the following fundamental concepts in the dynamics of system of particles, motion of rigid body, Lagrangian and Hamiltonian formulation of mechanics.
- To represent the equations of motion for complicated mechanical systems using the Lagrangian and Hamiltonian formulation of classical mechanics.
- To develop math skills as applied to physics.
- They will use critical thinking skills to formulate and solve quantitative problems in applied physics.

Course Outcomes (Cos)

- Students can understand the classical laws of motion.
- Competency in using the essential mathematical skills needed for describing mechanics and special relativity
- Understanding of significance of conservation of various physical quantities to discuss the motion of dynamical system.
- Understanding of constraints and their significance to solve the equations of motion of the dynamical system.
- Understanding of necessity of Lagrangian and Hamiltonian formulations for simplified treatments of many complex problems in classical mechanics.
- They can develop problem solving skills.

UNIT - I

Conservation laws: Mechanics of a system of particles – Conservation laws: linear momentum, angular momentum, energy – Constraints, Degrees of freedom – Generalised co-ordinates – Generalized notations – Brachistocrone problems – Atwood's machine. Hamilton's variational principle – Lagrange's equation of motion from Hamilton's principle, D'Alembert's principle – Applications of Lagrange's equation of motion – Linear harmonic oscillator – Simple pendulum – particle moving under a central force – particle moving on the surface of earth, cylinder rolling on inclined plane, electric circuit – Superiority of Lagrange's approach over Newtonian's approach.

UNIT – II

Phase space: Hamiltonian – Hamilton's canonical equations of motion – Physical significance of H – Advantage of Hamiltonian approach – Hamilton's canonical equation of motion in different coordinate systems – Hamilton-Jacobi method – Kepler's problem solution by Hamilton-Jacobi method – Action and angle variables – Solution of Harmonic oscillator by action angle variable method – canonical or contact transformation – Condition for a transformation to be canonical.

Poisson brackets – Invariance of Poisson brackets with respect to canonical transformation – Equations of motion in Poisson bracket form – Lagrange's bracket – Relation between Lagrange and Poisson brackets

UNIT – III

General features of central force motion – General features of orbits – Centre of mass and laboratory coordinates – Virial theorem – Stable and unstable equilibrium – Properties of T, V and ω for small oscillations – Normal coordinates and normal frequencies of vibrations – Parallel pendula – Double, Triple pendula – Linear triatomic molecule.

Generalized coordinates for rigid body motion – Euler's angles – Angular velocity, momentum of rigid body – moment and products of inertia – Principal axis transformation – rotational kinetic energy of a rigid body – Moment of inertia of a rigid body – motion of a symmetric top under action of gravity.

UNIT - IV

Special Theory of Relativity: Introduction – Galilean transformation and invariance of Newton's laws of motion – Non variance of Maxwell's equations – Michelson Morley experiment and explanation of the null result.

Concept of inertial frame – Postulates of special theory – simultaneity – Lorentz transformation along one of the axes – length contraction – time dilatation and velocity addition theorem – Fizeau's experiment – Four vectors – Relativistic dynamics – Variation of mass with velocity – Energy momentum relationship.

UNIT - V

General theory of Relativity: Introduction – Limitation of special theory of relativity and need for a relativity theory in non-inertial frames of reference. Concept of gravitational and inertial mass and the basic postulate of GTR, gravitation & acceleration and their relation to non-inertial frames of reference – principle of equivalence of principle of general co-variance – Minkowski space and Lorentz transformation.

10. <https://iopscience.iop.org/book/978-0-7503-1398-8>

Course Objective

- To gain practical knowledge by applying the experimental methods to correlate with the Physics theory.
- To learn the usage of optical systems for various measurements.
- Apply the analytical techniques and graphical analysis to the experimental data.
- To develop intellectual communication skills and discuss the basic principles of scientific concepts in a group.
- To experience the practical difficulties to find the physical constant values.
- To apply the theoretical knowledge into the experiments and find the solutions.
- Students will be observe the readings practically.
- Students will experience the phenomena of reflection, refraction, etc.,

Course Outcomes (COs)

1. The course is designed to train the students so that they can efficiently handle various instruments.
2. Students will verify laws studied in the different theory course.
3. Students will measure different properties of materials.
4. Capable to classify the materials with the properties
5. Will overcome the fear of experimental skill
6. Capable to built his own equipments for measuring the properties of materials

ANY TWELVE EXPERIMENTS

1. Viscosity of liquid – Mayer’s oscillating disc method.
2. Michelson Interferometer – Determination of λ and $d\lambda$.
3. ‘e/m’ by Thomson’s method and Magnetron method.
4. Fresnel’s biprism - Determination of Wavelength of monochromatic source.
5. Determination of Plank’s constant using Photo cell.
6. Forbe’s method – Thermal conductivity.
7. ‘e’ by Millikan’s method.
8. Ferguson’s method - Specific heat of a liquid.
9. Faraday effect – Determination of Verdet constant using He-Ne laser.
10. Young’s Double slit – Determination of Wavelength of monochromatic source.
11. Regulated dual power supply construction.
12. Astable, monostable and bistable multi-vibrators, using discrete components.

13. Analog computer setup – Solving simultaneous equations.
14. UJT characteristics and relaxation oscillator.
15. FET characteristics and Source follower

Suggested Book

1. Ouseph C.C., U.J. Rao and V. Vijayendran 2007, Practical Physics and Electronics, S.Viswanathan (Printers & Publishers) Pvt. Ltd., Chennai
2. Singh S.P., 2003, Advanced Practical Physics – 1, 13th Edition, Pragathi Prakashan, Meerut
3. Singh S.P., 2000, Advanced Practical Physics – 2, 12th Edition, Pragathi Prakashan, Meerut
4. Gupta S.L. and V.Kumar, 2002, Practical Physics, 25th Edition, Pragathi Prakashan, Meerut

Course Objectives

- Quantum mechanics is the most important branch of physics, as it has got application in any other branch of physics.
- It has revolutionized the whole science, important for any physics student to know the basics of quantum mechanics.
- This paper gives an idea about the development of quantum mechanics.
- This paper explains the shortcomings of quantum mechanics in explaining different subatomic physics and the evolution of quantum mechanics.
- This course is part one of a two semester course focused on a rigorous exposition to the principles of Quantum mechanics.
- The Dirac bra-ket formalism will be introduced and used throughout to present the principles of Quantum Mechanics in a general context.
- We will discuss analytic solutions to the Schrodinger equation for a variety of potentials in one, two and three dimensions.
- The role of symmetries as the underlying principle of Quantum Mechanics will be emphasized throughout the course.
- The use of symmetry principles and operators methods will be discussed.

Course Outcomes (COs)

After the completion of course, students should be able to understand and grasp

1. The basic concepts of quantum mechanics including the solution of wave equation, interpretation of dynamical variables and applying wave mechanics to various situations in terms of boundary value problems so as to understand the quantum well, barriers and particle motion in different types of force field (potentials).
2. Applying special functions as the solutions of differential equation as the wave function/state functions and understanding the physical situations where these can be applied.
3. Calculating states of electrons in hydrogen atom and harmonic oscillators and the interpretation of quantum states.
4. Applying the stationary perturbation problems to various problems including particle states splitting in electric and magnetic field.
5. interpret the wave function and apply operators to it, to obtain information about a particle's physical properties such as position, momentum and energy
6. Be able to solve the Schrodinger equation to obtain wave functions for some basic, physically important types of potential in one dimension, and estimate the shape of the wavefunction based on the shape of the potential

7. Be able to understand the role of uncertainty in quantum physics, and use the commutation relations of operators to determine whether or not two physical properties can be simultaneously measured

UNIT - I

Quantum Theory: Introduction – Limitation of classical physics – Origin of quantum theory – Planck's quantum hypothesis – Einstein's theory of Photoelectric effect – Bohr model of hydrogen atom – Inadequacy of quantum theory.

Wave Mechanics Matter waves – Uncertainty principle – Wave packet – Group and phase velocity – Time-dependent and Time-independent Schrodinger equations for a free particle and particle in a potential – Linear vector space – Hilbert's space – Orthogonal and orthonormal functions – Linear operator – Eigen functions and Eigen values – Hermitian operator – Dirac's notation – Equations of motion – Schrodinger, Heisenberg and Interaction representation.

UNIT - II

One dimensional potential well: Square-well potential with rigid walls – Square-well potential with finite walls – Square-well potential barrier – Alpha emission – Bloch waves in a periodic potential – Linear harmonic oscillator (Schrodinger method and operator method) – Free particle.

UNIT - III

Three dimensional potential Well: Particle moving in a spherically symmetric potential – System of two interacting particles – Rigid rotator – Hydrogen atom – Hydrogenic orbitals – The free particle – Three-dimensional square-well potential - Deuteron

Matrix mechanics: Matrix representation of wave function – Matrix representation of operator – Properties of matrix elements – Schroedinger equation in matrix form – Eigen value problem – Unitary Transformations – Linear harmonic oscillator, Matrix method

UNIT - IV

Time-independent Perturbation theory: Basic concepts – Non-degenerate energy levels – First and Second order corrections for energy and wave functions – Ground state of Helium atom – Effect of electric field on the ground state of hydrogen atom (Stark effect) – Degenerate energy levels – Effect of electric field on the $n=2$ state of hydrogen atom

UNIT - V

Variational method & WKB Approximation: Variational principle – Variation method for excited states – Application of variation method to ground state of helium – The WKB method

Time dependent perturbation theory: Introduction – First-order perturbation – Harmonic perturbation – Transition to continuum states (Fermi's Golden rule) – Absorption and emission of radiation – Transition probability – Selection rules

Course Objectives

- Nuclear physics is one of the fundamental subjects of physics. It is important to know about the physics of nuclei and the different energies involved in the nuclear processes.
- The aim is to tell them about the stability of nucleus and various other properties.
- The students will learn about various types of radiations and their interaction with matter.
- Nuclear energy is one of the major sources of energy, which, with proper careful usage, can solve the energy crisis to a large extent.
- This paper is intended to give an insight into the different nuclear processes and the fundamental particles, which are the real building blocks of the universe.
- To understand the operation of G.M. counter.
- To study the general properties of nucleus, nuclear forces and nuclear reactions.
- To analyse the B-H curve and their concepts practically.
- To introduce the concept of elementary particles practically.

Course Outcomes (COs)

Students who have completed this course should

1. Understand the relation between the standard model and QCD
2. Understand the importance of models in describing the properties of nuclei and nuclear collisions
3. Be able to make quantitative estimates of phenomena involving nuclei.
4. Students understand the basic principle, type of accelerators, working and operation of Accelerators.
5. Students learn the basic of ion sources, beam transport and application of accelerator in different branches of science.
6. Training given to students and researchers of the Universities to handle such complicated machine.
7. Acquire knowledge in the content areas of nuclear and particle physics, focusing on concepts that are commonly used in this area.

UNIT - I

Nuclear mass and charge: Distribution of nuclear charge - Nuclear mass and binding energy of a nucleus – semi-empirical mass formula – Nature of nuclear force – form of

nucleon-nucleon potential – charge independence and charge symmetry of nuclear forces - Bound states of two nucleons-Ground state of Deuterium - Wave mechanics of ground state of Deuterium-Spin states –Pauli’s exclusion principle -Tensor force - Exchange force - Low energy Nucleon - Nucleon scattering

UNIT - II

Radioactivity:

Alpha decay: Properties of α particles - Velocity and energy of α particles - Gamow’s theory of α particles- Geiger - Nuttall law- α ray energies and fine structure of α rays - α disintegration energy-Low range α particles

Beta decay: Properties of β particles - General features of β ray spectrum – Pauli’s hypothesis - Fermi’s theory of β particles - Forms of interaction and selection rules - Fermi’s and Gamow teller transition

Gamma decay: The absorption of γ rays by matter - Interaction of γ rays with matter - Measurement of γ ray energies - Dumont bent crystal spectrometer method-internal conversion –Applications.

UNIT -III

Nuclear models: Liquid drop model - Bhor Wheeler theory of fission - Condition for spontaneous fission - Activation energy-Seaborg’s expression

Shell model: Explanation for magic numbers - Prediction of shell model -Prediction of spin and parity - Nuclear statistics - Magnetic moment of nuclei - Schmidt lines-Nuclear isomerism

Collective model: Explanation of Quadrupole moments - Prediction of sign of electric quadrupole moments. Optical model: Nilsson model - Elementary ideas

UNIT - IV

Nuclear reactions: Nuclear fission and fusion - Kinds of reaction and conservation laws - energetics of nuclear reaction – Applications of Nuclear Energy – Nuclear Reactors - Isospin - Reaction cross section-Continuum theory of nuclear reaction - Resonance - Briet Wigner Dispersion formula - Stages of nuclear reaction - Statistical theory of nuclear reaction - Evaporation probability and cross section – Kinematics of stopping and pickup reaction - Surface reaction

UNIT -V

High energy physics : Types of interaction in nature-typical strengths and time-scales, conservation laws, charge-conjugation, Parity and Time reversal, CPT theorem, GellMann-Nishijima formula, intrinsic parity of pions, resonances, symmetry classification of elementary particles, quark hypothesis, charm, beauty and truth, gluons, quarkconfinement, asymptotic freedom.

Suggested Books

Course Objectives

- One of the main objectives of the course is to familiarize the students with the fundamental concepts of Materials Science and Engineering which will be used as background knowledge for the understanding of specialized courses in the field of Materials Science.
- Study of materials is always important, for any application, including fabrication of satellites.
- To introduce various methods available for characterizing the materials.
- The relationship between the properties, structure and processes of engineering materials is discussed
- The characterization of materials specifically addresses that portfolio with which researchers and educators must have working familiarity.
- This course provides the introduction to the field of materials science

Course Outcomes (COs)

1. The students are exposed with X-ray, thermal, microscopic, and electrical methods of characterization.
2. Understand and describe the fundamental principles behind the methods of characterization which are included in the curriculum
3. Analyze, interpret and present observations from the different methods.
4. Evaluate the uncertainty of observations and results from the different methods.
5. A thorough understanding of the history of materials science with basic understanding of metals, binary alloys, magnetic materials, dielectric materials and polymers
6. Concept of phase, phase diagram, phase boundaries, Invariant points and reactions leading to the understanding of the material synthesis and dependence of properties on thermodynamic parameters
7. Understanding nucleation, growth and phase transformation kinetics

UNIT - I

Nature of thin films: Deposition technology – Distribution of deposits – Resistance heating – Thermal evaporation – Flash evaporation.

Electron beam method – Cathodic sputtering – Glow discharge sputtering – Low pressure sputtering – Reactive sputtering – R. F. sputtering – Chemical and Physics vapour deposition – Chemical deposition.

Thickness Measurement Methods: Mass methods – Optical method – Photometric – Ellipsometry – Interferometry – Other methods – Substrate cleaning.

UNIT- II

Electron Diffraction Technique: Electron diffraction technique – High energy electron diffraction – Low energy electron diffraction – Electron microscopy – Scanning electron microscopy – X-ray photoelectron spectroscopy – Mass spectroscopy – Thermodynamics of nucleation – Nucleation theories – Film growth – Incorporation of defects, impurities etc. in film – Deposition parameters and grain size.

UNIT – III

Single Crystals: Significance of single crystals – Crystal growth techniques – The chemical physics of crystal growth – crystal growth phenomena – Nucleation – Gibbs Thomson equation – for vapour – for solution – Spherical nucleus – Heterogeneous nucleation – Cap shaped nucleus – Disc shaped nucleus – Characterisation techniques – XRD spectra and Analysis.

UNIT IV

Singular and rough faces: Models on surface roughness – The Kossel, Stranski, Volmer (KSV) theory – The Burton, Cabrera and Frank (BCF) theory – BCF theory of solution growth – Periodic Bond chain theory – the Muller – Krumbhaar Model.

The Bridgman and related techniques – Crystal pulling techniques – Convection in melts – Modeling and simulation of bulk crystal growth considering melt dynamics – Melt growth of oxide crystals for saw, piezo electric and non linear optical applications – Liquid encapsulated and Czochralski technique – Zone melting technique – Skull melting process – Heat exchanger method.

UNIT V

Nanotechnology: An introduction – Nanodevices – Carbon nanotubes – Types of Carbon Nanotubes: Single walled, Multiwalled, Torus – Properties: Hardness – Strength – Electrical – Thermal – Optical – Synthesis – Arc discharge – Laser Ablation.

Suggested Book

Course Objectives

- Astronomy and Astrophysics is a very fundamental subject in Physics.
- Includes study of the solar system, evolution of stars, different physical processes going on stellar bodies, life cycle of stars etc.
- Students will learn the composition and nature of the universe, from our own solar system, to stars and stellar evolution, interstellar matter, galaxies, and clusters of galaxies.
- Students will explore historic astronomy, some fundamental physics such as Newton's laws and the nature of light, and discuss how astronomers discover the nature of the universe.
- To understand the fundamental methodology of science, including scientific inquiry, data gathering, analysis, generating hypotheses, and testing predictions.
- To connect observations of the Universe with the fundamental laws and principles that govern the behavior of the physical world.

Course Outcomes (COs)

Students will have understanding of

1. Plan and engage in an independent and sustained critical investigation of a chosen research topic to generate new knowledge in an area of astronomy and astrophysics.
2. Systematically evaluate the relevant theory and concepts in astronomy and astrophysics,
3. The theory to appropriate methodologies and evidence and draw appropriate conclusions.
4. Demonstrate capacity for astronomy and astrophysics reasoning through analyzing, proving and explaining concepts from the chosen research area.
5. Identify important constellations – orient in space.
6. Describe the planets of the solar system and their properties.
7. Explore the objects that comprise the solar system, with focus on chemical and atmospheric composition and how these interact to determine the changing nature of planetary environments.

UNIT - I**Astrophysics:**

Introduction - Astrophysics and Astronomy - Celestial coordinate systems (Sun-Earth system, Galactic Coordinate system)

UNIT - II

Stellar Structure and Evolution:

Star formation - Stellar Magnitudes - Classification of stars - H-D classification - Saha Equation of ionization - Hertzsprung-Russel (H-R) diagram - Gravitational energy - Virial theorem - Equations of stellar structure and evolution - Pre-main sequence evolution - Jeans criteria for star formation - fragmentation and adiabatic contraction - Evolution on the main sequence - Post main sequence evolution

UNIT - III

Nuclear Astrophysics:

Thermonuclear reactions in stars - pp chains and CNO cycle - Solar Neutrino problem - subsequent thermonuclear reactions - Helium burning and onwards - nucleosynthesis beyond iron - r- and s- processes

Stellar Objects & Stellar Explosions:

Qualitative discussions on: Galaxies – Nebulae – Quasars - Brown dwarfs - Red Giant Stars – Nova - Supernova.

UNIT - IV

Gravitational Collapse and relativistic Astrophysics:

Newtonian theory of stellar equilibrium - White Dwarfs - Electron degeneracy and equation of States - Chandrasekhar Limit - Mass-Radius relation of WD - Neutron Stars - Spherically symmetric distribution of perfect fluid in equilibrium - Tolman-Oppenheimer-Volkoff (TOV) equation – Mass - Radius relations of NS – Pulsars - Magnetars - Gamma ray bursts - Black holes - Collapse to a black hole (Oppenheimer and Snyder) - event horizon - singularity.

UNIT - V

Accretion disks:

Formation of Accretion Disks - Differentially rotation systems in Astrophysics - Disk dynamics - Steady Disks - Disk formation in close binary systems through mass transfer - Accretion onto compact objects.

15PHP203C

CRYSTAL GROWTH TECHNIQUES

5 - - 5

Course Objectives

- Will give knowledge on Crystals and its applications in electronics, energetics etc.
- Gives the general characteristics of crystals, methods of preparation etc.
- To give an idea about historical importance of crystals, methods of preparation and characterization of crystals etc.
- This interdisciplinary course unifies various aspects of the recent progress in the physical, chemical and mineralogical materials science.
- This course will provide the basic knowledge of the oxide thin film deposition and the oxide single crystal growth.
- In the latter parts, the basic theory of the single crystal growth and various single crystal growth methods will be explained.

Course Outcomes (COs)

1. The student will learn about the crystal growth mechanisms and techniques.
2. Various thin films deposition techniques and thin film characterization techniques are also covered in the course.
3. Gain the knowledge about phonons and its importance in thermal physics
4. Acquire the theoretical concept behind electrical and thermal properties of metals
5. Understand the fundamental theories to describe the energy bands in metals
6. Gain the knowledge about Semiconductor Crystals and their properties
7. Have the basic understanding of the thin film deposition process through vapor phase.
8. Have the understandings of the thin film deposition by PVD process and CVD process.
9. Have a brief knowledge of the characterization method for the thin film.

UNIT- I

Crystal Growth phenomena

The historical development of crystal growth – significance of single crystals - crystal growth techniques - the chemical physics of crystal growth - Theories of nucleation - Gibb's Thompson equation for vapour, melt and solution- energy of formation of spherical nucleus- heterogeneous nucleation - kinetics of crystal growth, singular and rough faces, KSV theory, BCF theory - periodic bond chain theory- The Muller- Krumbhaar model.

UNIT- II

Crystal Growth from Melt and Solution Growth

Growth from the melt - the Bridgmann technique – crystal pulling - Czochralski method- experimental set up - controlling parameters advantages and disadvantages.- convection in melts – liquid solid interface shape - crystal growth by zone melting - Verneuil flame fusion technique.

UNIT - III

Low temperature crystal growth

Low temperature solution growth - methods of crystallization - slow cooling - solvent evaporation, temperature gradient methods - crystal growth system - growth of KDP, ADP and KTP crystals - high temperature solution growth - gel growth.

UNIT - IV

Vapour Growth and Epitaxial Growth

Physical vapour deposition - chemical vapour transport – definition - fundamentals, criteria for transport, Specifications, STP, LTVTP & OTP - advantages and limitations of the technique, hydrothermal growth – design aspect of autoclave – growth of quartz, sapphire and garnet.

Advantages of epitaxial growth - epitaxial techniques - liquid phase epitaxy - vapour phase epitaxy - molecular beam epitaxy - chemical beam epitaxy and atomic layer epitaxy

UNIT - V

Materials for Semiconductor Devices

Semiconductor optoelectronic properties - band structure - absorption and recombination, semiconductor alloys - group III-V materials selection - binary compounds, ternary alloys - lattice mismatch - lattice mismatched ternary alloy structures - compositional grading, heteroepitaxial ternary alloy structure - Quaternary alloys - Semiconductor Devices - Laser diodes, light emitting diodes (LED) – photocathodes - microwave Field-Effect Transistors (FET).

Course Objectives

- Digital processing of signals has an extensive range of applications, from the military to the medical, from entertainment to mass production.
- In many areas of application the advent of these specially designed DSP devices has started a revolution in engineering which will pervade most areas of modern life.
- To give idea about different classifications of signals, different methods of recording and processing.
- This paper is to give knowledge to students about the theory of signal processing and the different methods involved in it.
- Apply the principles of discrete-time signal analysis to perform various signal operations
- Apply the principles of z-transforms to finite difference equations.
- Apply the principles of Fourier transform analysis to describe the frequency characteristics of discrete-time signals and systems
- To understand the digital filters and their classifications based on the response, design and algorithm.

Course Outcomes (COs)

The students can able to

1. Determine the spectral coefficients and the Fourier series components of discrete-time signals.
2. Determine the frequency response and the z-transform of discrete-time systems.
3. Determine the discrete Fourier transform of discrete-time signals.
4. Calculate the outputs of discrete-time systems in response to inputs.
5. Understand the characteristics field effect transistors
6. Analyze the characteristics of oscillators and wave shaping circuits

UNIT - I**Introduction:**

Signals and systems - Classification of signals - Concept of frequency in continuous time and discrete– time signals. Theory of A/D and D/A conversion - Sampling of analog signals - sampling theorem - Quantization of continuous amplitude signals - Quantization of sinusoidal signal - Coding of quantized – samples - Digital to analog conversion

UNIT - II

Discrete- time signals and systems:

Discrete - time linear time-invariant systems-Techniques of analysis of linear systems - Resolution of a discrete time signal into impulses - Response of LTI systems to arbitrary inputs : Convolution sum - Properties of convolution and the interconnection of LTI systems - Casual LTI systems Stability of LTI systems - Systems with finite duration and infinite duration impulse – response

UNIT - III

The Z-transform:

The Direct Z-Transform - The Inverse Z-Transform - Properties of Z-transform - Rational Z-transforms - Poles and zeros - Inversion of Z-transforms. The inverse Z-Transform by contour integration - Power series expansion - Partial fraction expansion – Decomposition of rational Z-transform – Analysis of linear time invariant systems in the Z-domain – one sided Z-Transform.

UNIT - IV

Frequency Analysis of Signals and Systems:

Frequency analysis of continuous - time signals. The Fourier Series for continuous Time Periodic Signals - Power Density Spectrum of Periodic Signals - The Fourier Transform of Continuous -Time Aperiodic Signals - Energy Density Spectrum of Aperiodic Signals - Frequency analysis of discrete time signals – The Fourier Series for discrete time Periodic Signals - Power Density Spectrum of Periodic Signals – Fourier transform for discrete time Aperiodic signal - Convergence of the Fourier Transform - Energy Density Spectrum of Aperiodic signals - Relationship of the Fourier Transform to the Z Transform.

UNIT - V

Discrete Fourier Transform:

Frequency domain sampling and reconstruction of discrete time signals – The Discrete Fourier transform – DFT as a linear transformation - Relationship of the DFT to the other transforms. Properties of DFT - Multiplication of two DFTs and Circular convolution - Linear filtering methods based on DFT - Frequency analysis of signals using the DFT – Discrete cosine transform - Computation of the Discrete Fourier Transform

Course Objectives

- Computational physics may be broadly defined as 'the science of using computers to assist in the solution of physical problems, and to further physics research.
- Computers now play a role in almost every branch of physics like large scale
- Quantum mechanical calculations in nuclear, atomic, molecular and condensed matter physics, large scale calculations in such fields as hydrodynamics, astrophysics, plasma physics, meteorology and geophysics etc.
- The huge increase in the power of computers in recent years has made an impact on the role of computational physics.
- To use the tools, methodologies, language and conventions of physics to test and communicate ideas and explanations.
- This paper gives idea about different types of computations involved in Physics, like curve fitting, interpolation, extrapolation, numerical calculations etc.

Course Outcomes (COs)

At the end of the course students should be able to:

1. The students programming tactics, numerical methods and their implementation like applying to problem in physics, including modeling of classical physics to quantum system as well as data analysis (Linear and non linear) will be improved.
2. Use analysis techniques for propagating error, representing data graphically. Create, solve and interpret basic mathematical tool.
3. independently program computers using leading-edge tools,
4. formulate and computationally solve a selection of problems in physics,
5. Use the tools, methodologies, language and conventions of physics to test and communicate ideas and explanations.
6. Identify and describe the characteristics of various numerical methods.

UNIT - I**Curve Fitting**

The least squares method for fitting a straight line, parabola, power and exponential curves with the help of principle of least square fit.

UNIT - II**Interpolation**

Introduction to finite difference operators - Newton's forward and backward difference interpolation formulae - Lagrange's interpolation formula - Newton's divided difference formula with error term - interpolation in two dimensions - Cubic spline interpolation end conditions. Statistical tests - χ^2 - test and T-test.

UNIT - III

Numerical Differentiation and Integration

Numerical differentiation - errors in numerical differentiation - cubic spline method - finding maxima and minima of a tabulated function - Integration of a function with Trapezoidal Rule - Simpson's 1/3 and 3/8 Rule and error associated with each - Romberg's integration - Gaussian integration method - Monte Carlo evaluation of integrals - numerical double integration

Unit IV

Numerical Solution of Ordinary Differential Equations

Euler method - modified Euler method and Runge - Kutta 4th order methods - adaptive step size R-K method - predictor - corrector methods - Milne's method - Adam-Mouton method.

Numerical Solution of System of Equations

Gauss-Jordan elimination Method - Gauss-Seidel iteration method – Gauss elimination method and Gauss-Jordan method to find inverse of a matrix - Power method and Jacobi's method to solve eigenvalue problems.

Unit V

Numerical solutions of partial differential equations

Elementary ideas and basic concepts in finite difference method – Schmidt Method - Crank - Nicholson method - Weighted average implicit method - Concept of stability.

Suggested Books:

10. <https://iopscience.iop.org/book/978-1-6817-4896-2>

Course Objectives

The objectives of this course are:

- Introduce physical concepts and mathematical tools used to describe surfaces, interfaces and thin films
- To develop an intuition for surface and thin film physical principles through plotting of functions using Maple
- Relate the mathematical results to practical applications and experiments Develop an appreciation of the mathematical basis for experimental techniques for deposition and analysis of thin films
- Understand physical phenomena that can be exploited for the deposition of thin films Demonstrate knowledge of different thin film deposition strategies.
- To analyse the behavior of the thin films by different characterization methods.
- To know the importance of use of thin films in application and research.

Course Outcomes (COs)

At the end of the course, the students will be able to understand

1. Discuss the differences and similarities between different vacuum based deposition techniques, evaluate and use models for nucleating and growth of thin films, asses the relation between deposition technique, film structure, and film properties, discuss typical thin film applications.
2. Motivate selection of deposition techniques for various applications.
3. The basic concepts about the thin film technology
4. The importance of use of thin films in application and research.
5. Acquire the knowledge of thin film preparation by various techniques.
6. Apply the knowledge to develop a device.

UNIT - I: Preparation of Thin Films

Spray pyrolytic process – characteristic feature of the spray pyrolytic process – ion plating – Vacuum evaporation – Evaporation theory – The construction and use of vapour sources – sputtering Methods of sputtering – Reactive sputtering – RF sputtering - DC planar magnetron sputtering.

UNIT - II: Thickness measurement and Nucleation and Growth in Thin Film

Thickness measurement: electrical methods – optical interference methods – multiple beam interferometry – Fizeau – FECO methods – Quartz crystal thickness monitor.
Theories of thin film nucleation – Four stages of film growth incorporation of defects during growth.

UNIT - III: Electrical properties of metallic thin films

Sources of resistivity in metallic conductors – sheet resistance - Temperature coefficient of resistance (TCR) – influence of thickness on resistivity – Hall effect and magneto resistance – Annealing – Agglomeration and oxidation.

UNIT - IV: Transport properties of semiconducting and insulating Films

Semiconducting films; Theoretical considerations - Experimental results – Photoconduction – Field effect thin films – transistors, Insulation films Dielectric properties – dielectric losses – Ohmic contacts – Metal – Insulator and Metal – metal contacts – DC and AC conduction mechanism .

UNIT - V: Optical properties of thin films and thin films solar cells

Thin films optics –Theory – Optical constants of thin films – Experimental techniques – Multilayer optical system – interference filters – Antireflection coating, thin films solar cells: Role, Progress, and production of thin solar cells – Photovoltaic parameter, thin film silicon (Poly crystalline) solar cells : current status of bulk silicon solar cells – Fabrication technology – Photo voltaic performance: Emerging solar cells: GaAs and CuInSe₂.

		Semester – II
		L T P C
15PHP204B	NANOSTRUCTURE AND CHARACTERIZATION	5 - - 4

Course Objectives

- This course introduces the fundamentals of nano-scale engineering and manufacturing.
- Current and future applications of nanostructured materials will be reviewed with respect to their impact in commercial products and technologies.
- The main physical forces controlling the nucleation and deposition of nanostructures will be presented allowing a better understanding of key design factors at the nano-scale.
- Well-established and novel synthesis/fabrication methods nanostructures will be critically discussed giving a broad overview of the state-of-the-art nano manufacturing processes.
- The course will cover recent breakthroughs and assess the impact of this burgeoning field.
- Specific nanofabrication topics include epitaxy, beam lithographies, self- assembly, biocatalytic synthesis, atom optics, and scanning probe lithography.
- The course consists of topics in fundamental nanoscale science, plus an overview of areas in nanotechnology.

Course Outcomes (COs)

At the end of the course, Students will understand and:

1. Explain the fundamental principles of nanotechnology and their application to biomedical engineering.
2. Apply engineering and physics concepts to the nano-scale and non-continuum domain.
3. Identify and compare state-of-the-art nanofabrication methods and perform a critical analysis of the research literature.
4. Design processing conditions to engineer functional nanomaterials.
5. Evaluate current constraints, such as regulatory, ethical, political, social and economical, encountered when solving problems in living systems.
6. Evaluate current constraints, such as regulatory, ethical, political, social and economical, encountered when solving problems in living systems.
7. Motivate selection of deposition techniques for various applications

UNIT - I

Low Dimensional Structures

Preparation of quantum nanostructures - size and dimensionality effects - size effects - potential wells - partial confinement - conduction electrons and dimensionality - Fermi gas and density of states - properties dependent on density of states - excitons - single-electron tunneling - Applications - infrared detectors - quantum dot lasers - superconductivity. Microelectromechanical Systems (MEMS) - Nanoelectromechanical Systems (NEMS) – Fabrication of nanodevices and nanomachines - Molecular and Supramolecular Switches.

UNIT - II

Carbon Nanostructures

Carbon Molecules - Nature of the Carbon Bond - New Carbon Structures - Carbon Clusters - Small Carbon Clusters - Carbon Nano tubes - Fabrication - Structure – Electrical Properties - Vibrational Properties – Mechanical Properties - Applications of Carbon Nano Tubes - Computers - Fuel Cells - Chemical Sensors - Catalysis – Mechanical Reinforcement - Field Emission and Shielding. Solid Disordered Nanostructures - Methods of Synthesis - Failure Mechanisms of Conventional Grain sized Materials – Mechanical Properties – Nano structured Multi layers -Electrical Properties – Porous Silicon - Metal Nano cluster - Composite Glasses.

UNIT - III

Thermal, Microscopic and Infrared Analysis

Thermal analysis – DTA, DSC and TGA – methodology of DTA, DSC and TGA and Instrumentation. Microscopy – Electron microscopy – Principles and instrumentation – resolution limit – scanning tunnelling microscopy – principles – scanning tunnelling microscope - SEM & TEM. Atomic force microscope

UNIT - IV

Instrumentation

IR spectrophotometers – Theory and Instrumentation- Applications. Fourier transform techniques – FTIR principles and instrumentation. Raman spectroscopy – Principles, Instrumentation and Applications. Microwave Spectroscopy -Instrumentation and Applications

UNIT - V

Mass Spectrometry, Resonance Spectroscopy

Mass Spectrometry - Principle – Instrumentation – Types of ions produced in a Mass spectrometer - Interpretation of Mass spectra – Applications. NMR – Principles and Instrumentation – Chemical shift - Spin-spin coupling - Applications of NMR - Electron spin resonance spectrometry – Theory of ESR –Instrumentation - Interpretation of ESR spectra - Applications.

9. <https://nptel.ac.in/courses/118/104/118104008/>

Course objective:

- It is an applied mathematics course designed to provide an introduction to the theory and basic concepts of Nonlinear Dynamics and Chaos.
- The course concentrates on simple models of dynamical systems, their relevance to natural phenomena.
- The main goal of the course is to introduce and describe nonlinear phenomena in physical systems by only using a minimum background in physics and mathematics.
- The computer exercises is mainly based on the use of MATLAB, but students will be free to use different software tools as desired.
- To make complex arguments that don't follow a pattern, and state the key components.
- Students will learn real-life examples illustrating the main ideas of the course (such as equilibria, stability, bifurcations)

Course Outcomes (COs)

At the end of the course, Students will understand and:

1. Students will be able to read a mathematical text and reproduce its main ideas.
2. Students will be able to make complex arguments that don't follow a pattern, and state the key components.
3. Will be able to give real-life examples illustrating the main ideas of the course (such as equilibria, stability, bifurcations)
4. Will be able to describe qualitatively the behaviour of the solution of a dynamical system without necessarily finding the exact solution.
5. Be able to prove existence of limit cycles using Poincaré Bendixon.
6. Identify gradient fields and use their special properties to obtain phase portrait.

UNIT - I**Basic Concepts**

What is Nonlinearity? Dynamical Systems: Linear and Nonlinear Systems - Linear Superposition Principle - Working Definition of Nonlinearity. Linear and Nonlinear Oscillators - Linear Oscillators and Predictability - Damped and Driven Nonlinear Oscillators - Forced Oscillations – Primary Resonance and Jump Phenomenon (Hysteresis) Secondary Resonances (subharmonic and superharmonic) Nonlinear Oscillations and Bifurcations

UNIT - II

Qualitative Features of non-linear systems

Autonomous and Nonautonomous Systems - Dynamical Systems as Coupled First-Order Differential Equations; Equilibrium Points ; Phase Space/Phase Plane and Phase Trajectories: Stability, Attractors and Repellers ; Classification of Equilibrium Points: Two-Dimensional Case - General Criteria for Stability; Limit Cycle Motion – Periodic Attractor- Poincaré–Bendixson Theorem. Higher Dimensional Systems - Lorenz Equations ; More Complicated Attractors - Torus - Quasiperiodic Attractor - Poincaré Map – Chaotic Attractor ; Dissipative and Conservative Systems -Hamiltonian Systems

UNIT - III

Chaos in Dissipative Systems

Bifurcations and Onset of Chaos in Dissipative Systems: Some Simple Bifurcations- Saddle-Node Bifurcation -The Pitchfork Bifurcation - Transcritical Bifurcation - Hopf Bifurcation ; Discrete Dynamical Systems ; The Logistic Map - Equilibrium Points and Their Stability – Periodic Solutions or Cycles -Period Doubling Phenomenon - Onset of Chaos – Lyapunov Exponent - Bifurcation Diagram - exact Solution at $a = 4$

UNIT - IV

Logistic Map: A Geometric Construction of the Dynamics – Cobweb Chaos in Dissipative Nonlinear Oscillators and Criteria for Chaos: Bifurcation Scenario in Duffing Oscillator - Period Doubling Route to Chaos - Intermittency Transition - Quasiperiodic Route to Chaos - Strange

Nonchaotic Attractors (SNAs) ; Lorenz Equations - Period Doubling Bifurcations and Chaos ; Necessary Conditions for Occurrence of Chaos - Continuous Time Dynamical Systems - Discrete Time Systems

UNIT - V

Chaos in Conservative Systems

Poincaré Cross Section ; Possible Orbits in Conservative Systems – Regular Trajectories - Irregular Trajectories - Canonical Perturbation Theory: Overlapping Resonances and Chaos; Hénon–Heiles System – Equilibrium Points - Poincaré Surface of Section of the System - Numerical Results; Periodically Driven Undamped Duffing Oscillator ; The Standard Map - 98

Linear Stability and Invariant Curves - Numerical Analysis: Regular and Chaotic Motions; Kolmogorov–Arnold–Moser Theorem (qualitative ideas only).

Semester – II

L T P C

5 - - 4

15PHP204D

QUANTUM FIELD THEORY

Course objective:

- The course gives an understanding of the Standard Model of particle physics, which describes the elementary particles and their interactions.
- To understand the basic concepts in quantum field theory and its importance in electromagnetic fields.
- Student will use effective field theory techniques to develop models at large scales
- Student will get knowledge on Path Integral Quantization of Gauge Fields and their applications.
- They can describe the origin of particles and forces.
- To apply Feynman rules to calculate probabilities for basic processes with particles.

Course Outcomes (COs)

Upon successful completion, students will have the knowledge and skills to:

1. Describe the reasons for the failure of relativistic quantum mechanics, such as the causality problem, and the need for quantum field theory
2. Describe the origin of particles and forces
3. Analyse the statistical distributions of identical particles and the repulsive/attractive nature of the forces as a function of spins
4. Apply Feynman rules to calculate probabilities for basic processes with particles (decay and scattering)
5. Obtain classical and/or non-relativistic limits of fully quantum and relativistic models, and identify the relativistic origin of effects such as the spin-orbit interaction
6. Use effective field theory techniques to develop models at large scales

UNIT - I

Path Integrals and Quantum Mechanics

Review of single particle relativistic wave equations – Klein- Gordon equation, Dirac equation, Maxwell and Proca equations; Path integral formulation of quantum mechanics; perturbation theory and the S matrix; Coulomb scattering; Functional calculus: differentiation, generating functional for scalar fields. Functional integration

UNIT - II

Path Integral Quantization of Scalar and Spinor Fields

Free particle Green's functions, Generating functional for interacting field; ϕ^4 theory – generating functional, 2-point function, 4-point function; generating functional for connected diagrams; fermions and functional methods, The S – matrix and reduction formula, pion-nucleon scattering amplitude, scattering cross-section

UNIT - III

Path Integral Quantization of Gauge Field Fields

Propagators and gauge conditions in QED; Non-abelian gauge fields and Faddeev - Popov method; Self-energy operator and vertex functions; Ward – Takahashi identities in QED, Becchi – Rouet – Stora transformations; Slavnov – Taylor identities.

UNIT - IV

The Weinberg – Salam Model

Field theory vacuum; the Goldstone theorem; Spontaneous symmetry breaking of gauge symmetries; superconductivity; Higgs boson; The Weinberg – Salam model; Experimental confirmation of the models

UNIT – V

The EPR Experiment And Bell's Theorem:

The EPR argument, The BKS theorem, The hidden variable theories, The Bell's theorem and its proof, Tests of Bell's inequalities, Alain Aspect's experiments.

Suggested Books

1. Lewis H. Ryder, Quantum Field Theory, 2nd Edn, Cambridge University Press, (1996)

6. Quantum Field Theory, 2nd Edition, Ryder Lewis H.

Course Objectives

- The aim of this course focuses to enable the students to understand optics and non-linear optics concepts in physics
- Optoelectronics is the science that deals with designing devices that can detect or emit light in any part of the spectrum.
- This paper gives an introduction to semiconductors and light.
- The application of optics in electronics, usage of optical waves in communications, optical fibers are explained in this paper.
- The term optoelectronics is a specific discipline of electronics that focuses on light-emitting or light-detecting devices.
- Optoelectronics is the communication between optics and electronics which includes the study, design and manufacture of a hardware device that converts electrical energy into light and light into energy through semiconductors.

Course Outcomes (COs)

1. The students are conversant with the application of optical properties and processes in semiconductor optical sources.
2. The students understand the operation of LEDs and lasers.
3. The students are familiar with the structures and performance of LEDs and lasers.
4. Apply the knowledge of laser in holography
5. Gain the knowledge in Fourier optics and Fourier transforming properties of lenses
6. Understand the concepts of nonlinear optics and harmonic generations.

UNIT - I**Semiconductor Science and Light Emitting Diodes**

Semiconductor energy bands - semiconductor statistics – extrinsic semiconductors – compensation doping – degenerate and non degenerate semiconductors – energy band diagrams in applied field - direct and indirect bandgap semiconductors, - p-n junction principles - open circuit- forward and reverse bias – depletion layer capacitance – recombination life time – p-n junction band diagram - open circuit - forward and reverse bias – light emitting diodes – principles - device structures - LED materials, heterojunction high intensity LEDs – double heterostructure – LED characteristics and LEDs for optical fiber communications - surface and edge emitting LEDs.

UNIT - II

Fiber Optics

Symmetric planar dielectric slab waveguide – waveguide condition – single and multimode waveguides – TE and TM modes – modal and waveguide dispersion in the planar waveguide – dispersion diagram – intermodal dispersion – intramodal dispersion – dispersion in single mode fibers – material dispersion – waveguide dispersion – chromatic dispersion – profile and polarization dispersion – dispersion flattened fibers - bit rate and dispersion – optical and electrical bandwidth – graded index optical fiber - light absorption and scattering – attenuation in optical fibers.

UNIT - III

Laser Principles

Laser oscillation conditions - diode laser principles - heterostructure laser diode – double heterostructure – stripe geometry – buried heterostructure – gain and index guiding - laser diode characteristics – laser diode equation - single frequency solid state lasers – distributed feedback –quantum well lasers - vertical cavity surface emitting laser - optical laser amplifiers.

UNIT - IV

Photodetectors and Photovoltaics

Principle of p-n junction photodiode - Ramo's theorem and external photocurrent - absorption coefficient and photodiode materials – quantum efficiency and responsivity - PIN-photodiode – avalanche photodiode – phototransistor - photoconductive detectors and photoconductive gain – noise in photo-detectors – noise in avalanche photodiode - solar energy spectrum - photovoltaic device principles – I-V characteristics - series resistance and equivalent circuit - temperature effects - solar cell materials, device and efficiencies

UNIT - V

Optoelectronic Modulators

Optical polarization, birefringence, retardation plates, electro-optic modulators – Pockels effect - longitudinal and transverse electro-optic modulators, Kerr effect, Magneto-optic effect, acousto-optic effect – Raman Nath and Bragg-types.

Non-linear optics

Wave propagation in an anisotropic crystal - polarization response of materials to light - second order non-linear optical processes – second harmonic generation - sum and frequency generation, optical parametric oscillation - third order non-linear optical processes - third harmonic generation - intensity dependent refractive index - self-focusing - non-linear optical materials, phase matching - angle tuning - saturable absorption - optical bistability - two photon absorption.

Suggested Books

1. Ajoy Ghatak & Thyagarajan 2nd edition, 2013, Laser Fundamentals and applications Laxmi Publications (P) Ltd
2. William T. Silfvast, Laser fundamentals, CUP 2nd Edn. 2009.
3. Pallab Bhattacharya, 2nd edition Semiconductor optoelectronic devices: Pearson(2008)

4. Jasprit Singh, 1st edition 2014 Optoelectronics: An introduction to materials and devices, Mc Graw Hill International Edn.
5. A. Yariv and P. Yeh, 1st edition 2003 Optical waves in crystals: Propagation and Control of Laser Radiation, John Wiley and Sons Pub.
6. <https://www.elprocus.com/optoelectronics-devices-with-their-applications/>
7. <https://www.allaboutcircuits.com/technical-articles/an-introduction-to-optoelectronics/>
8. <https://www.rp-photonics.com/optoelectronics.html>

Course Objective

- To gain practical knowledge by applying the experimental methods to correlate with the Physics theory.
- To learn the usage of optical systems for various measurements.
- Apply the analytical techniques and graphical analysis to the experimental data.
- To develop intellectual communication skills and discuss the basic principles of scientific concepts in a group.
- To make the students understand coherence between theoretical and practical measurement.
- The course as a whole outlines some ways of thinking about analog circuits that hopefully will help to develop intuition.
- To design, fabricate and test small electronic circuit.

Course Outcomes (COs)

1. The course is designed to train the students so that they can efficiently handle various instruments.
2. Students will verify laws studied in the different theory course.
3. Students will measure different properties of materials.
4. Gain the knowledge in quantization of electromagnetic fields.
5. Analyze the characteristics of oscillators and wave shaping circuits
6. Understand the basic concepts of amplifiers and operational amplifiers

ANY TWELVE EXPERIMENTS

1. Fabry – Perot interferometer – Determination of wavelength.
2. Arc spectra – Copper and Iron
3. Determination of V-I characteristics of a solar cell.
4. Susceptibility – Quinke's and Guoy's method
5. Hall Effect
6. Measurement of resistivity and conductivity of dielectric using Four-probe apparatus.
7. Compressibility of a liquid – Ultrasonic Interferometer, and verify with Ultrasonic Diffractometer
8. Determination of Stefan's constant.

9. Kelvin's double bridge – To measure low resistance.
10. Characteristics and an application of SCR
16. Schmidt trigger
17. Op – amp – V to I, I to V converter
18. Op-amp Log and Antilog amplifier.
19. Op – amp – Analog computation second order differential equation
20. Op – amp comparator – Zero crossing detector, Window detector, time marker

Suggested Books

1. Ouseph C.C., U.J. Rao and V. Vijayendran 2007, Practical Physics and Electronics, S.Viswanathan (Printers & Publishers) Pvt. Ltd., Chennai
2. Singh S.P., 2003, Advanced Practical Physics – 1, 13th Edition, Pragathi Prakashan, Meerut
3. Singh S.P., 2000, Advanced Practical Physics – 2, 12th Edition, Pragathi Prakashan, Meerut
4. Gupta S.L. and V.Kumar, 2002, Practical Physics, 25th Edition, Pragathi Prakashan, Meerut

Course Objectives

- The aim of this course is to make the students to understand the concepts of quantum physics and their applications in microscopic systems
- This is a continuation of Quantum Mechanics – I.
- More detailed study of problems like scattering problem, relativistic quantum mechanics, quantum electrodynamics etc, are added in this paper.
- To make the students capable of analyzing theoretical problems like interaction of particles, scattering of particles etc.
- to understand and evaluate modern research utilizing quantum theory in condensed matter, nuclear and particle physics.
- To know the basic knowledge on Eigen values and Eigen functions.

Course Outcomes (COs)

1. Students will get the knowledge of non-relativistic and relativistic quantum mechanics including time-dependent perturbation theory, scattering theory, relativistic wave equations, and second quantization.
2. Students will be able to understand concepts and to perform calculations of scattering of particles.
3. Students will be able to understand and evaluate modern research utilizing quantum theory in condensed matter, nuclear and particle physics.
4. Acquire the basic knowledge on eigen values and eigen functions
5. Apply the Schrodinger wave equation to get eigen values of bound systems Understand the matrix formulation in quantum mechanics
6. Acquire the basic knowledge on angular momentum of quantum mechanical systems

UNIT - I

Angular momentum: Angular momentum operators – Angular momentum commutation relations – Eigen values and Eigen functions of L^2 and L_z – General angular momentum – Eigen values of J^2 and J_z – Ladder operators (J_+ and J_-) – Angular momentum matrices – Matrices for J^2 , J_z , J_+ , J_- , J_x and J_y – Spin angular momentum – Spin $1/2$ systems – Spin vectors for spin $1/2$ systems – Addition of angular momentum – Clebsh-Gordan coefficients.

UNIT -II

Scattering: Scattering cross-section – Scattering amplitude – Partial waves – Scattering by a central potential: partial wave analysis – Significant number of partial waves – Scattering by an attractive square-well potential – Briet-Wigner formula – Scattering length – Expression for phase shift – Integral equation – The Born approximation – Scattering by screened coulomb potential – Validity of Born approximation - Laboratory and center of mass co-ordinate systems.

UNIT - III

Many Electron Problem: Indistinguishable particles, Pauli principle – Inclusion of spin – Spin functions for two electrons – Spin functions for three electrons – The Helium atom – Central field approximation – Thomas-Fermi model of the atom – Hartree equation – Hartree-Fock equation – Molecular orbital theory: Hydrogen molecule ion H_2^+ - Valence bond theory – Heitler-London theory of hydrogen molecule.

UNIT - IV

Relativistic quantum mechanics: Klein-Gordon equation – Interpretation of the Klein-Gordon equation – Particle in a coulomb field – Dirac's equation for a free particle – Dirac matrices – Covariant form of Dirac equation – Probability density – Negative energy states – Spin of the Dirac particle – Magnetic moment of the electron – Spin-orbit interaction – Radial equation for an electron in a central potential – Hydrogen atom – Lamb shift.

UNIT - V

Field theory: Introduction – Classical approach to field theory – Relativistic Lagrangian and Hamiltonian of a charged particle in an electromagnetic field – Field: Lagrangian and Hamiltonian formulations – Quantum equation for the field – Second quantisation – Quantisation of non-relativistic Schroedinger equation – Creation, annihilation and number operators.

12. Quantum Field Theory, 2nd Edition, Ryder Lewis H.

Course Objectives

- Laser is a versatile tool with applications in almost all fields from medical to astronomy, communications, welding, cutting etc.
- This paper explains the characteristics of lasers, different types of lasers and their construction.
- Applications of lasers in different fields are also explained.
- To give exposure to students about the characteristics of different lasers, their fabrication techniques, applications etc.
- To classify fibers as single-mode, multimode step index and multi-mode graded index.
- To understand the concept of different type of lasers and their applications.

Course Outcomes (COs)

Students can understand

1. Acquire fundamentals and principles of Laser action CO2: Understand the basic concepts of different types of lasers
2. Absorption and spontaneous and stimulated emission in two level system, the effects of homogeneous and inhomogeneous line broadening, and the conditions for laser amplification.
3. operations and basic properties of the most common laser types, He-Ne, Argon-ion, and carbon-dioxide, ruby, titanium sapphire, neodymium YAG and glass, knowledge of other main laser types.
4. Classify fibers as single-mode, multimode step index and multi-mode graded index.
5. Describe modes in multimode fibers and mode field parameter in single-mode fibers.
6. They are able to explain the characteristics of lasers, different types of lasers and their construction.

Unit- I

Laser Characteristics: Spontaneous and stimulated emission, Einstein's quantum theory of radiation, theory of some optical processes, coherence and monochromaticity, kinetics of optical absorption, line broadening mechanism, Basic principle of lasers, population inversion, laser pumping, two & three level laser systems, resonator, Q-factor, losses in cavity, threshold condition, quantum yield.

Unit – II

Laser Systems: Solid state lasers- the ruby laser, Nd:YAG laser, ND: Glass laser, semiconductor lasers – features of semiconductor lasers, intrinsic semiconductor lasers, Gas

laser - neutral atom gas laser, He-Ne laser, molecular gas lasers, CO₂ laser, Liquid lasers, dye lasers and chemical laser.

Unit-III

Advances in laser Physics : Production of giant pulse -Q-switching, giant pulse dynamics, laser amplifiers, mode locking and pulling, Non-linear optics, Harmonic generation, second harmonic generation, Phase matching, third harmonic generation, optical mixing, parametric generation and self-focusing of light.

Unit – IV

Multi-photon processes; multi-quantum photoelectric effect, Theory of two-photon process, three- photon process, second harmonic generation, parametric generation of light, Laser spectroscopy : Rayleigh and Raman scattering, Stimulated Raman effect, Hyper-Raman effect, Coherent anti-stokes Raman Scattering, Photo-acoustic Raman spectroscopy.

Unit – V

Laser Applications – ether drift and absolute rotation of the Earth, isotope separation, lasma, thermonuclear fusion, laser applications in chemistry, biology, astronomy, engineering and medicine. Communication by lasers: ranging, fiber Optics Communication, Optical fiber, numerical aperture, propagation of light in a medium with variable index, pulse dispersion.

Course Objectives

- This paper gives an insight into the theoretical and practical aspects of spectroscopy. it is used as a tool for non-destructive testing of samples. It is important to know the physical aspects of spectroscopy.
- The major objectives of this course are to integrate theory and practice and to bring together different branches of both Academic studies and Industrial Research through the presentation of critical aspects of modern Spectroscopy.
- The course will provide a valuable theoretical introduction and an overview of modern topics in spectroscopy, which are of current interest and importance in Semiconductor Industry and Biomedicine.
- To give an understanding of wide range of techniques including optical Nearfield spectroscopy, X-ray, Raman, and FTIR spectroscopy.
- To introduce optical spectroscopy methods that are widely used in physics, chemistry and biological sciences
- To teach the basic aspects of nuclear magnetic resonance (NMR) spectroscopy.

Course Outcomes

After successfully completed course, student will be able to

1. Student shows interest in the phenomenon of the interaction of light with matter in terms of the relationship with the molecular structure
2. Understand quantum chemical principles
3. Student will know the basic physical chemistry law that govern molecular spectroscopy
4. Student will know basic information on molecular methods (IR, Raman, UV-VIS, NMR, EPR)
5. Student will be able to select molecular spectroscopy methods suitable for solving given scientific problem
6. Student will be able to analyze results of measurements using molecular spectroscopy

UNIT- I

Atomic spectra: Hydrogen spectra – Angular momentum – Larmor precession – Spin-orbit interactions - Spectra of alkali metals – Energy level and spectral transitions of Helium - Normal Zeeman effect – Anomalous Zeeman effect – Paschen back effect – Inference of nuclear spin - Hyperfine structure of spectral lines – Stark effect – Characteristic X-ray spectra

Microwave spectra: Classification of molecules – Interaction of radiation with rotating molecule – Rotational spectra of rigid diatomic molecule – Isotopic effect – Non-rigid rotator – Linear, symmetric and asymmetric top molecules – Quadrupole hyperfine interaction – Microwave spectrometer

UNIT- II

I.R spectroscopy: Practical aspects – Theory of I.R rotation vibration spectra of gaseous diatomic molecules – applications of I.R spectroscopy – Basic principles of F.T.I.R spectroscopy

Raman spectroscopy: Classical and Quantum theory of Raman effect - Rotation vibration Raman spectra of diatomic and polyatomic molecules – Applications - Laser Raman spectroscopy - Surface Enhanced Raman Scattering.

UNIT -III

Electronic spectra: Electronic excitation of diatomic species - Vibrational analysis of diatomic molecules - Deslandre's table - Intensity distribution Frank Condon principle - Rotational structure of electronic bands - Resonance and Normal Fluorescence – Intensities of transitions - Phosphorescence population of triplet state and intensity- Experimental methods - Applications of Fluorescence and phosphorescence.

UNIT- IV

NMR Spectroscopy: Quantum mechanical and Classical description - The Bloch equation - Relaxation process - the experimental technique - Principle and working of high resolution NMR Spectrometer - Chemical shift – Applications of NMR

NQR Spectroscopy: Fundamental requirements - General principle - Experimental detection of NQR frequencies – Interpretation and chemical explanation of NQR spectroscopy – Applications of NQR

UNIT - V

ESR Spectroscopy: Basic principles of ESR - Experiments – ESR spectrometer reflection cavity and microwave bridge – ESR spectrum hyperfine structure - Study of free radicals – Applications of ESR

MOSSBAUER Spectroscopy: The Mossbauer effect- the recoilless emission and absorption of - Mossbauer spectrum – Experimental methods- Hyperfine interaction - Chemical Isomer Shift – Magnetic hyperfine and electric quadrupole interaction.

Semester III

L T P C

15PHP304A DIGITAL ELECTRONICS AND MICROPROCESSOR

4 - - 4

Course Objectives

- This paper is intended to give an insight into the theory and applications of digital electronics, design of circuits with digital devices, details of microprocessor and its applications.
- The objective of this paper is to give information about different analog electronic circuits and their applications.
- To understand operation of semiconductor devices Digital electronics is very important in present day life due to its applications in almost all fields of life.
- Any signals stored in memory are first digitized.
- It is important to have knowledge about digital electronics.
- To implement mini projects based on concept of electronics circuit concepts.

Course Outcomes (Cos)

At the end of the course, Students can

1. Acquire the basic knowledge of digital logic levels and application of digital electronics circuits.
2. Perform the analysis and design of various digital electronic circuits.
3. Acquired knowledge about Microprocessors and its need.
4. Ability to identify basic architecture of different Microprocessors.
5. Foster ability to write the programming using 8085 microprocessor.
6. Foster ability to understand the internal architecture and interfacing of different peripheral devices with 8085 Microprocessor.

UNIT I

Flip Flops : SR, JK, JK Master Slave, T Flip flop & D Flip Flop (Symbol and Truth table) Registers (Types, shift operations) - Counters (Types, Designing of MOD 5 synchronous Counter, Construction and truth table - verification of MOD 16 Asynchronous UP, Down counter) - Multiplexer And demultiplexer (16:1 and 1:16 description and truth table verification) - Decoders and encoders (Definitions, Seven segment decoder, decimal to BCD encoder)

UNIT II

Special Function ICs: Timer IC 555 (Block diagram, pin description) , Application as Astable, monostable, bistable multivibrator - VCO IC 566 (Block diagram and pin

description) - PLL IC 565 (Block diagram and pin description) - Fixed voltage Regulator ICs 7800 and 7900 series - Voltage Regulator IC 723 (description, designing for low and high voltage)

UNIT III

Microprocessor: Microprocessor Architecture, Pin out configuration of 8085-bus organization and timings –address bus, data bus, multiplexing address/data bus and control and status signal, Interrupts: maskable and non-maskable interrupt(concept),8085 interrupt.

UNIT IV

Programming Model of 8085 : Instruction set-Data transfer ,arithmetic, logical and branch instruction-Addressing modes -16 bit data transfer and memory related instructions-stack and subroutine instructions.

Simple Program: 8 bit addition-subtraction-multiplication- finding largest and smallest number, ascending and descending order, 16 bit addition,

UNIT V

Interfacing Peripherals and Applications: Interfacing concepts-peripheral I/O instructions-Interfacing programs- Data Converters, LED interfacing, stepper motor interfacing, Hex Keyboard Interfacing.

		Semester III
		L T P C
15PHP304B	PHYSICS OF MATERIALS	4 - - 4

Course Objectives

- This course discusses the properties of materials that engineers need to be aware of.
- This includes mechanical, thermal, electrical, chemical and optical properties.
- All these properties are controlled by the microscopic structure of these materials, and this course will cover the quantum mechanics, atomic physics and thermodynamics that control what materials can do.
- The course will focus on the structure and properties of crystalline materials and on how these properties can be manipulated to create more capable materials.
- To describe a polymer's elastic behavior above and below the glass transition.
- To value and select suitable materials for different practical applications;

Course Outcomes (Cos)

Upon successful completion, students will have the knowledge and skills to:

1. Describe the mechanical, electrical, thermal and optical properties of materials;
2. Analyse the importance of material properties for a wide variety of engineering situations;
3. Evaluate and select suitable materials for different practical applications;
4. Recall typical values of the properties of common practical materials;
5. Understand the micro-physics and chemistry responsible for material properties, and analyse how they can be modified.
6. Be able to describe a polymer's elastic behavior above and below the glass transition.

Unit I

Vacuum Technology: Basic ideas about vacuum, Throughput, Conductance, Vacuum pumps : rotary pump, diffusion pump, ion pump, molecular pump, cryopump, Vacuum gauges : pirani gauge, penning gauge, ionization gauge (hot cathode ionization gauge, cold cathode ionization gauge).

Unit II

Thin Film and growth process, Influence of nature of substrate and growth parameters (substrate temperature, thickness, deposition rate). Thin film deposition, techniques: thermal evaporation, chemical vapor deposition, spray pyrolysis, sputtering. Epitaxial growth, Thin film thickness measurement techniques: film resistance method, optical method, microbalance method.

Unit III

Polymers, Ceramics, Liquid Crystals and Nanophase Materials: Characteristics, Application and Processing of polymers : Polymerization, Polymer types, Stress- Strain behaviour, melting and glass transition, thermosets and thermoplasts. Characteristics, Application and Processing of Ceramics, glasses and refractories, Liquid Crystals : classification and applications, Nanophase materials: synthesis and applications.

Unit IV

Synthesis of Nanomaterials: Introduction, particle size, particle shape, surface interaction of nanoparticles, DLVO theory, Classical nucleation theory for cluster formation. Physical methods: inert gas condensation, Chemical vapour deposition, sputtering , Arc discharge, PLD, mechanical milling, MBE, Electrodeposition, laser pyrolysis. Chemical methods: Introduction, Sol-gel process, Hydrothermal process, Solvothermal synthesis, Metal reduction method, Photochemical synthesis.

Unit V

Characterization of Materials

Powder and single crystal X-ray diffraction, Transmission electron microscopy, Scanning electron microscopy, Low Energy Electron Diffraction (LEED), Auger electron microscopy, Atomic force microscopy.

Suggested Books:

4. W.D. Callister 6th edition 2002, WIE Material Science and Engg – Introduction Wiley,
5. J.C. Ying- 1st edition 2001 Nanostructured Materials: -Wiley-. Academic Press,
6. J.M. Walls 1st edition 1989, Methods of Surface Analysis- CUP Archive.
7. <https://nptel.ac.in/courses/113/106/113106039/>

		Semester III
		L T P C
15PHP304C	REACTOR PHYSICS	4 - - 4

Course Objectives

- The aim of the basic course on "Reactor Physics for reactor operators" is to provide the reactor operators with a basic understanding of the main concepts relevant to nuclear reactors.
- Seen the education level of the participants, mathematical derivations are simplified and reduced to a minimum, but not completely eliminated.
- The goal is for the students to develop a basic knowledge of the methods employed in veterinary hospitals and clinics to protect employees and the veterinarians themselves against radiation exposure.
- Discuss the difference between a rotating anode and a fixed anode.
- Discuss which types of machines today have fixed and which have rotating anodes.

Course Outcomes (Cos)

Upon successful completion, students will have the knowledge and skills to:

1. express the basic concepts of nuclear physics.
2. an express the radioactive decays
3. able to express Successive Decays
4. explain nuclear reactions
5. explain nuclear fission
6. Understand the guiding principles of reactor safety and the lessons learned from past accidents.

Unit I

Interaction of Neutrons with Matter in Bulk Transport and diffusion equations, transport mean free path, solution of diffusion equation for a point source in an infinite medium and for an infinite plane source in a finite medium, extrapolation length and diffusion length - the albedo concept.

Unit II

Moderation of Neutron Mechanics of elastic scattering, average logarithmic energy decrement, slowing down power and moderating ratio of a medium. Fermi's age theory, solution of age equation for a point source of fast neutrons in an infinite medium, slowing down length, Fermi age.

Unit III

Theory of Homogeneous Bare Thermal Reactor Critical equation, material and geometric bucklings, Neutron balance in a thermal reactor, four factor formula, typical calculations of critical size and composition in simple cases.

Unit IV

Homogeneous Natural Uranium Reactors: Advantages and disadvantages of heterogeneous assemblies, various types of reactors and a brief discussion of their design features.

Unit V

Problems of Reactor Control and Maintenance Role of delayed neutrons, Inhour formula, temperature effects, fission product poisoning, use of coolants and control rods Power Reactors : Fast breeder reactors, dual purpose reactors, concept of fusion reactors.

Text Books

1. The elements of Nuclear reactor Theory: Glasstone & Edlund-Vam Nostrand, 1st edition 1952.
2. Raymond L Murray 5th edition 2001 Nuclear energy – An introduction to concept systems and applications of nuclear process.

		Semester III
		L T P C
15PHP304D	PLASMA PHYSICS	4 - - 4

Course Objectives

- Basic theory of plasma, its occurrence in nature, producing plasma experimentally, and their detection are explained in this paper.
- The course covers basic principles on plasmas, waves in plasma, stability analysis of the equilibrium solutions of the equations. Examples are taken from the phenomena in the Earth's ionosphere and magnetosphere.
- To make a simplified model for the Earth's magnetosphere, and obtain analytical expressions for some characteristic quantities
- To have a very good knowledge on formulating and modifying the basic dynamic fluid equations to account for the dynamics of plasma media at different levels: from MHD to kinetic scales.
- To describe the propagation of waves in plasmas, and derive the dispersion relation for these waves.

Course Outcomes (Cos)

Upon successful completion, students will:

1. understand and use the basic mathematical formalism needed for describing the dynamics of continuous media.
2. have a very good knowledge on mathematical models for plasma and will be able to distinguish the dynamics of plasmas and neutral fluid media.
3. have a very good knowledge on formulating and modifying the basic dynamic fluid equations to account for the dynamics of plasma media at different levels: from MHD to kinetic scales.
4. be able to describe the propagation of waves in plasmas, and derive the dispersion relation for these waves.
5. have good insight into plasma instabilities and turbulence.
6. be able to make a simplified model for the Earth's magnetosphere, and obtain analytical expressions for some characteristic quantities

Unit I

Basics of Plasmas: Plasma - Definition, concepts of plasma parameter, Debye shielding, Motion of charged particles in an electromagnetic field - Uniform electric and magnetic fields, Boltzmann and Vlasov equations, their moments - Fluid equations, Plasma oscillations, Enough exercises.

Unit II

Occurrence of plasma in nature, definition of plasma, concept of temperature, Debye shielding and plasma parameter. Single particle motion in uniform E and B, nonuniform magnetic field, grid B and curvature drifts, invariance of magnetic moment and magnetic mirror. Simple application of plasmas.

Unit III

Plasma Waves: Plasma oscillations electron plasma waves, ion waves, electrostatic electron and ion oscillations perpendicular to magnetic field upper hybrid waves, lower hybrid waves, ion cyclotron waves. Light waves in plasma.

Unit IV

Boltzmann and Vlasov Equations: The fokker plank equation, integral expression for collision term zeroth and first order moments, the single equation relaxation model for collision term. Application kinetic theory to electron plasma waves, the physics of Landau damping, elementary magnetic and inertial fusion concepts.

Unit V

Non-linear Plasma Theories: Non-linear Electrostatic Waves, K dV Equations, Non-linear Schrodinger Equation, Solitons, Shocks, Non-linear Landau Damping.

Suggested Books

1. Introduction to Plasma Physics and Controlled Fusion: F. F. Chen-Springer, 2nd edition 2007
2. An introductory course of Plasma Physics: R. O. Dendy-Cambridge University Press, 1st edition 1995.
3. Ideal Magnetohydrodynamics: J. P. Friedberg-Springer edition, 1st edition 1987
4. Fundamental of Plasma Physics: S. R. Seshadri-American Elsevier Pub. Co., 1st edition 1973.

		Semester III
		L T P C
15PHP304E	GEOPHYSICS	4 - - 4

Course Objectives

- Geophysics is to expose students to a broad spectrum of geophysics, including resource exploration, environmental geophysics, seismology, and tectonics.
- Students in the major obtain a solid foundation in the essentials of mathematics, physics, and geology.
- To build upon that foundation with advanced course work in geophysics to develop the in-depth knowledge they need to pursue advanced graduate study and professional careers in government or the private sector.
- To demonstrate the ability to make observations using a variety of geophysical instruments and laboratory experiments and to reduce, model, and interpret their data and uncertainties
- To know the principles of geophysical measurements with physics-based mathematical models.
- Students will prepare for the research, analyze, and synthesize solutions to an original and contemporary geophysics problem

Course Outcomes (Cos)

Upon successful completion, the students can able

1. demonstrate a fundamental understanding of the physical processes governing the structure and evolution of Earth and planetary systems, including geophysical fluids, environmental hazards, and energy and freshwater resources.
2. demonstrate the ability to quantitatively describe the behavior of natural systems
3. ability to know the principles of geophysical measurements with physics-based mathematical models.
4. demonstrate the ability to make observations using a variety of geophysical instruments and laboratory experiments and to reduce, model, and interpret their data and uncertainties
5. demonstrate the ability to effectively communicate original scientific results as was as evaluate the published and presented results of others.
6. research, analyze, and synthesize solutions to an original and contemporary geophysics problem

Unit I:

The earth as a planet; different motions of the earth; gravity field of the earth, Clairaut's theorem, size and shape of earth; geochronology; seismology and interior of the earth; variation of density, velocity, pressure, temperature, electrical and magnetic properties of the earth; earthquakes-causes and measurements, magnitude and intensity, focal mechanisms, earthquake quantification, source characteristics, seismotectonics and seismic hazards; digital seismographs, geomagnetic field, paleomagnetism; oceanic and continental lithosphere; plate tectonics.

Unit II

Scalar and vector potential fields; Laplace, Maxwell and Helmholtz equations for solution of different types of boundary value problems in Cartesian, cylindrical and spherical polar coordinates; Green's theorem; Image theory; integral equations in potential theory; Eikonal equation and Ray theory. Basic concepts of forward and inverse problems of geophysics, Illposedness of inverse problems.

Unit III

'G' and 'g' units of measurement, absolute and relative gravity measurements; Land, airborne, shipborne and bore-hole gravity surveys; various corrections in gravity data reduction – free air, Bouguer and isostatic anomalies; density estimates of rocks; regional and residual gravity separation; principle of equivalent stratum; upward and downward continuation; wavelength filtering; preparation and analysis of gravity maps; gravity anomalies and their interpretation – anomalies due to geometrical and irregular shaped bodies, depth rules, calculation of mass.

Unit IV

Earth's magnetic field – elements, origin and units of measurement, magnetic susceptibility of rocks and measurements, magnetometers, Land, airborne and marine magnetic surveys, corrections, preparation of magnetic maps, upward and downward continuation, magnetic anomalies-geometrical shaped bodies, depth estimates, Image processing concepts in processing of magnetic anomaly maps; Interpretation of processed magnetic anomaly data.

Unit V

Conduction of electricity through rocks, electrical conductivities of metals, non-metals, rock forming minerals and different rocks, concepts of D.C. resistivity measurement, various electrode configurations for resistivity sounding and profiling, application of filter theory, Typecurves over multi-layered structures, Dar-Zarrouck parameters, reduction of layers, coefficient of anisotropy, interpretation of resistivity field data, equivalence and suppression, self potential and its origin, field measurement, Induced polarization, time and frequency domain IP measurements; interpretation and applications of IP, ground-water exploration, environmental and engineering applications.

Course Objectives

- Solar energy harvesting and utilizing for day to day purposes has become order of the day.
- The scarcity and increasing need of the fossil fuel has made man to think about alternate sources, the easiest and best being Solar energy.
- To introduce the students to the world of solar energy, its different uses, the different methods of harvesting solar energy.
- To understand the basic concepts of energies produced from various energy sources, advantages and disadvantages.
- To apply systems concepts and methodologies to analyze and understand interactions between social and environmental processes.
- To motivate public to participate in environment protection and improvement.

Course Outcomes (COs)

Students can be able to

1. Impart the knowledge of Storage technologies form the autonomous renewable energy sources.
2. Explain the principles that underlie the ability of various natural phenomena to deliver solar energy.
3. Discuss the positive and negative aspects of solar energy in relation to natural and human aspects of the environment.
4. Understand the basic principles in wind energy conversion and advantage and disadvantage of wind energy conversion systems.
5. Gain the knowledge about the energy produced from biomass and biogas.
6. Understand the concepts of solar cell and solar energy

Unit -1

Introduction to Energy Sources : World Energy Features, Indian Energy Scene, Conventional and non-conventional energy sources, Prospects of renewable energy sources.

Solar Energy Source: Introduction, Solar constant, radiation on Earth's surface, Radiation geometry, Radiation measurements, Radiation data, Average solar radiation, radiation on tilted surfaces

Unit – II

Solar Energy collectors : Principle of conversion of energy, Flat plate collector, Transmissivity of cover system, Collector energy balance equation, Thermal Analysis of FPC, Useful heat gain, Focusing collectors, advantages and disadvantages, Factors affecting collector performance.

Application of Solar Energy: Solar Water Heating, Heating and Cooling of Buildings, Thermo electric conversion, Power generation, PV cells, Solar distillation, Pumping, Cooking, Hydrogen production.

Unit – III

Wind Energy: Principle of energy conversion, Power generation, Forces on blades, energy estimation, Wind data, Components of WECS, Classification of WECS, Advantages and Disadvantages, Types of Wind machines, Performance of Wind machines, Applications of wind energy. Problems

Energy from Biomass: Conversion technology, Factors affecting gas generation, classification of biogas plants, Advantages and disadvantages of different types of plants.

Unit – IV

Fuel Cells: Design and Principle of operation, Classification, Types, Advantages and disadvantages, Conversion efficiency, Types of electrodes, Work output and EMF of Fuel Cells, Applications of Fuel Cells.

Thermo Nuclear Fusion Energy: Fusion Reactions, Requirements, Plasma, Magnetic and Inertial Confinement fusion, Muon Catalyzed Fusion, Characteristics of D-T Reaction, Advantages of Nuclear Fusion, Fusion Hybrid, Cold Fusion.

Unit – V

Principles of working: Geothermal, OTEC, Tidal, Waves, and Hydrogen (Generation and Application)

		Semester III
		L T P C
15PHP305B	NANOTECHNOLOGY	4 - - 4

Course Objectives

- This course introduces the fundamentals of nano-scale engineering and manufacturing.
- Current and future applications of nanostructured materials will be reviewed with respect to their impact in commercial products and technologies.
- The main physical forces controlling the nucleation and deposition of nanostructures will be presented allowing a better understanding of key design factors at the nano-scale.
- Well-established and novel synthesis/fabrication methods nanostructures will be critically discussed giving a broad overview of the state-of-the-art nanomanufacturing processes.
- The course will cover recent breakthroughs and assess the impact of this burgeoning field.
- Specific nanofabrication topics include epitaxy, beam lithographies, self- assembly, biocatalytic synthesis, atom optics, and scanning probe lithography.

Course Outcomes (COs)

At the end of the course, Students will understand and:

1. Explain the fundamental principles of nanotechnology and their application to biomedical engineering.
2. Apply engineering and physics concepts to the nano-scale and non-continuum domain.
3. Identify and compare state-of-the-art nanofabrication methods and perform a critical analysis of the research literature.
4. Design processing conditions to engineer functional nanomaterials.
5. Evaluate current constraints, such as regulatory, ethical, political, social and economical, encountered when solving problems in living systems.
6. learn the fundamentals about the different types of nanostructures

UNIT I

GENERIC METHODOLOGIES FOR NANOTECHNOLOGY

Introduction and classification - What is nanotechnology? - Classification of nanostructures - Nanoscale architecture; Summary of the electronic properties of atoms and solids - The isolated atom - Bonding between atoms - Giant molecular solids - The free electron model

and energy bands - Crystalline solids - Periodicity of crystal lattices - Electronic conduction; Effects of the nanometre length scale - Changes to the system total energy - Changes to the system structure - How nanoscale dimensions affect properties.

UNIT II

CARBON NANOSTRUCTURES

Introduction; carbon molecules – nature of the carbon bond – new carbon structures; carbon clusters – small carbon clusters discovery of C₆₀ – structure of C₆₀ and its crystal – alkali doped C₆₀ – superconductivity in C₆₀ – large and smaller fullerenes – other buckyballs; carbon nanotubes – fabrication – structure – electrical properties – vibrational properties – mechanical properties; applications of carbon nanotubes – field emission and shielding – computers – fuel cells – chemical sensors – catalysis – mechanical reinforcement.

UNIT III

INORGANIC NANOSTRUCTURES

Overview of relevant semiconductor physics - Quantum confinement in semiconductor nanostructures - The electronic density of states - Fabrication techniques - Physical processes in semiconductor nanostructures - The characterisation of semiconductor nanostructures - Applications of semiconductor nanostructures.

UNIT IV

NANOSTRUCTURED MOLECULAR MATERIALS

Introduction; Building blocks - Principles of self-assembly - Self-assembly methods to prepare and pattern nanoparticles - Templated nanostructures - Liquid crystal mesophases - Macromolecules at interfaces - The principles of interface science - The analysis of wet interfaces - Modifying interfaces - Making thin organic films - Surface effects on phase separation - Nanopatterning surfaces by self-assembly - Practical nanoscale devices exploiting macromolecules at interfaces .

UNIT V

EVOLVING INTERFACES OF NANO

Nanobiology - Introduction - Bio-inspired nanomaterials - Interaction Between Biomolecules and Nanoparticle Surfaces - Different Types of Inorganic Materials Used for the Synthesis of Hybrid Nano-bio Assemblies - Applications of Nano in Biology - Nanoprobes for Analytical Applications - Current Status of Nanobiotechnology - Future Perspectives of Nanobiology; Nanosensors - Introduction - What is a Sensor? - Nanosensors - Order from Chaos - Characterization - Perception - Nanosensors Based on Quantum Size Effects - Electrochemical Sensors - Sensors Based on Physical Properties - Nanobiosensors - Smart Dust; Nanomedicines - Introduction - Approach to Developing Nanomedicines - Various Kinds of Nanosystems in Use Nanodrug Administration - Nanotechnology in Diagnostic Applications - Materials for Use in Diagnostic and Therapeutic Applications - Future Directions.

Suggested Books

9. <https://nptel.ac.in/courses/118/104/118104008/>

Course Objectives

- Particle physics is one of the fundamental subjects of physics.
- It is important to know about the physics of nuclei and the different energies involved in the nuclear processes.
- Particle energy is one of the major sources of energy, which, with proper careful usage, can solve the energy crisis to a large extent.
- This paper is intended to give an insight into the different nuclear processes and the fundamental particles, which are the real building blocks of the universe.
- To understand the importance of models in describing the properties of nuclei and nuclear collisions
- To know the concept of balanced strong interactions, understanding the role of gluons

Course Outcomes (COs)

Students who have completed this course should

1. Understand the relation between the standard model and QCD
2. Understand the importance of models in describing the properties of nuclei and nuclear collisions
3. Be able to make quantitative estimates of phenomena involving nuclei.
4. Understand the different elementary particles and their behaviour.
5. write balanced strong interactions, understanding the role of gluons
6. write balanced weak interactions, understanding the role of W and Z bosons

Unit – I

Nucleon - Nucleon interaction and Hadron Structure : Phenomenological Nucleon - Nucleon potentials - Meson theory - Derivation of Yukawa interaction - Electromagnetic properties of deuteron - Polarisation in nucleon - nucleon scattering - Scattering matrix - Probing charge distribution with electron - Form factors - Proton form factors - Deep inelastic electron - proton scattering - Bjorken scaling and partons - Quarks within the proton - Gluons as mediators of strong interaction.

Unit II

Particle Phenomenology : Pion – Nucleon scattering - Isospin analysis - Phase shifts - Resonance and their quantum numbers - Production and formation experiments Relativistic kinematics and invariants - Mandelstam variables - Phase space - Decay of one particle into three particles - Dalitz plot.

Unit III

Ionizing radiations : Ionization and transport phenomena in gases - Avalanche multiplication Detector Properties : Detection - Energy measurement - Position measurement Time measurement. Gas Counters : Ionization chambers, - Proportional counters - Multiwire proportional counters - Geiger - Muller counters - Neutron detectors. Solid State Detectors : Semiconductor detectors - Integrating solid state devices - Surface barrier detectors.

Unit IV

Scintillation counters : Organic and inorganic scintillators - Theory, characteristics and detection efficiency. High Energy Particle Detectors : General principles - Nuclear emulsions - Cloud chambers - Bubble chambers - Cerenkov counter.

Unit – V

Nuclear Electronics : Analog and digital pulses - Signal pulses - Transient effects in an R-C circuit - pulse shaping- linear amplifiers - Pulse height discriminators - Single channel analyser - Multichannel analyser.

Suggested Books

4. H.A. Enge, Introduction to Nuclear Physics, Addison - Wesley, 1975.
5. S.S. Kapoor and V.S. Ramamurthy, Nuclear Radiation Detectors, Wiley - Eafstern, New Delhi, 1986.
6. Peacock, John A. Cosmological Physics. New York, NY: Cambridge University Press, 1998. ISBN: 9780521422703.
7. <https://ocw.mit.edu/courses/physics/8-952-particle-physics-of-the-early-universe-fall-2004/>

Course Objectives

- This course will be useful to understand the zero-th and first law of thermodynamics and link thermodynamics to the micro description used in classical Statistical Mechanics.
- Statistical Mechanics is a probabilistic approach to equilibrium properties of large numbers of degrees of freedom.
- Students will learn thermodynamics, probability theory, kinetic theory, classical statistical mechanics, interacting systems, quantum statistical mechanics, and identical particles.
- Basic principles are examined in this class, such as the laws of thermodynamics and the concepts of temperature, work, heat, and entropy.
- Topics from modern statistical mechanics are also explored, including the hydrodynamic limit and classical field theories.
- To learn the behavior of Bose and Fermi gases.

Course Outcomes (COs)

1. The student should understand the connection between microphysics and thermodynamics.
2. Understand the basic concepts of classical statistical Physics
3. Understand the basic knowledge of quantum statistical Physics
4. Learn the behavior of Bose and Fermi gases.
5. Apply knowledge of statistical Physics to solve real world physical problems
6. To link thermodynamics to the micro description used in classical Statistical Mechanics.

Unit - I

Statistical basis of thermodynamics: macro states and micro states – connection between statistics and thermodynamics – Classical ideal gas – entropy of mixing and Gibbs paradox – phase space of a classical system – Liouville's theorem and its consequences – microcanonical ensemble – Quantum states and phase space – Equipartition theorem. The canonical ensemble Equilibrium between a system and a heat reservoir – A system in the canonical ensemble – thermodynamic relations – classical systems – Statistics of paramagnetism. The grand canonical ensemble – A system in the grand canonical ensemble Physical significance of statistical quantities – examples.

Unit – II

Fluctuations–fluctuations in microcanonical, canonical and grand canonical ensembles. Quantum Statistics – Quantum mechanical basis – ideal gas in various quantum mechanical

ensembles. Gaseous systems composed of molecules with internal motion – monatomic molecules – diatomic molecules – ortho and para hydrogen.

Unit – III

Thermodynamic behaviour of ideal Bose gas – thermodynamics of black body radiation Specific heats of solids – Einstein and Debye model – Bose-Einstein condensation. Thermodynamic behaviour of an ideal Fermi gas – Magnetic behaviours of an ideal Fermi gas – Pauli paramagnetism – electron gas in metals.

Unit – IV

Brownian motion – Langevin equation for random motion – random walk problem, diffusion – Einstein relation for mobility.

Unit – V

General remarks on the problem of condensation – The Yang-Lee theory. Bragg-Williams approximation. Ising model – solution for a linear chain – Equivalence of Ising model to other models: Lattice gas, Binary alloy.

9. <https://ocw.mit.edu/courses/physics/8-08-statistical-physics-ii-spring-2005/>

Course Objectives

- Biophysics deals with the application of physics to biological systems.
- The concepts and techniques of biophysics find applications in bioelectronics, medicine/health, and population dynamics and are closely related to statistical mechanics and transport processes.
- Interdisciplinary skills and knowledge have heralded novel scientific outcomes with benefits to society.
- As such, this course develops foundational thinking and methods that are fundamental to an effective interdisciplinary STEMM workforce.
- Fundamental concepts that underlie biomolecular interactions will be discussed and biophysical methods that are employed for the structural analysis of these systems will be introduced at an elementary level.
- The physical quantities such as temperature, energy, enthalpy, entropy, and free energy will be employed to understand why a biological system chooses particular state at conditions under study.

Course Outcomes (COs)

On successful completion of the course students will be able to:

1. Explain models of biological systems and models dealing with statistical mechanics and transport phenomena.
2. Solve qualitative and quantitative problems, using appropriate mathematical and computing techniques.
3. Perform experiments which involve making correct and appropriate use of a range of scientific equipment, keeping an accurate record of experimental work and analysing results and reaching non-trivial conclusions from them.
4. Communicate the results of both theoretical and experimental work in various forms including written reports, oral presentations and poster presentations.
5. Contribute to team and group work for scientific investigations and for the process of learning.
6. Understand transport phenomena of neutral and electrically charged particles and biological systems.

UNIT I

Bio molecules: Organisation of molecules – macromolecules and intermolecular forces – stability of macromolecules – Types of bonds in biological molecules – Biological membranes – lipid composition – protein.

UNIT II

Principles of kinetics of molecules: diffusion – factors affecting diffusion – simple diffusion – Fick's law of diffusion – diffusion of electrolytes – biological significance of diffusion – osmosis – osmotic pressure – laws of osmosis

UNIT III

Dialysis: Principles of dialysis in artificial kidneys – kinds of dialysis – Kinetic theory of surface tension – Factors affecting surface tension – Determination of surface tension of liquids by capillary method

UNIT IV

Principles of Optics in biological studies: Characteristics of light – microscopy – types of microscopes – compound microscope – phase contrast microscope – Optical principle – interference microscope

UNIT V

Photometry of absorptiometry: Important components in instruments of photometry – light source – monochromator – Sample holders – light sensitive detectors.

2. Physics in Molecular Biology; Kim Sneppen & Giovanni Zocchi (CUP 2005)
3. Biological Physics: Energy, Information, Life; Philip Nelson (W H Freeman & Co, NY, 2004)
4. Physical Biology of the Cell (2nd Edition), Rob Phillips et al (Garland Science, Taylor & Francis Group, London & NY, 2013)
5. An Introduction to Systems Biology; Uri Alon (Chapman and Hall/CRC, Special Indian Edition, 2013)
6. Evolution; M. Ridley (Blackwell Publishers, 2009, 3rd edition)
7. http://www.physics.drexel.edu/~brigita/COURSES/BIOPHYS_2011-2012/
8. <https://www.easybiologyclass.com/biophysics-free-online-classes-lecture-notes-references-study-materials/>

Course Objective

- To understand the Biasing network for BJT and FET, transient analysis and frequency response of BJT and FET in single stage and multistage amplifier
- To understand the frequency response feedback amplifier using BJT and FET and Tuned amplifier
- This course introduces the assembly language programming of 8085 Microprocessor. It gives a practical training of interfacing the peripheral devices with the 8086 microprocessor.
- To apply their knowledge to analog and digital electronics, pulse electronics, analog and digital communication systems, digital signal processing, control systems, and power electronics at a later stage.
- To demonstrate their knowledge in designing the control loops for these processes.
- To apply the theoretical knowledge into the experiments and find the solutions.

Course Outcomes (COs)

On completion of this lab course the students will be able to:

1. Understand and apply the fundamentals of assembly level programming of microprocessors and microcontroller.
2. Work with standard microprocessor real time interfaces including GPIO, serial ports, digital-to-analog converters and analog-to-digital converters;
3. Troubleshoot interactions between software and hardware;
4. Analyze abstract problems and apply a combination of hardware and software to address the problem
5. Students will practically study the working of different electronic components/ circuits.
6. Learn to minimize contributing variables and recognize the limitations of the equipment.
7. Design and construction of circuits using analog component and trouble shooting of the circuits.

ANY TWELVE EXPERIMENTS

1. Arc spectra – Aluminium and Brass
2. (i) Determination of wavelength of He-Ne laser – Ruler method.
(ii) Determination of thickness of a wire using He-Ne laser.

3. G.M.Counter – Characteristics.
4. Experiment on rotatory dispersion of quartz.
5. Microprocessor – Stepper motor interfacing, ADC interface wave form generation
6. Microprocessor –Traffic control simulation
7. Microprocessor –Hex Key board interfacing
8. Multiplexer and de-multiplexer
9. Ring counter using IC's
10. 4-bit binary adder
11. 4-bit binary subtractor
12. Half adder and Half subtractor
13. Full adder and full subtractor
14. BCD counter, using IC 7490 and 7473.
15. A/D Converters any one method, D/A converter – Binary weighted, Ladder methods

Suggested Books

2. Singh S.P., 2003, Advanced Practical Physics – 1, 13th Edition, Pragathi Prakashan, Meerut
3. Singh S.P., 2000, Advanced Practical Physics – 2, 12th Edition, Pragathi Prakashan, Meerut
4. Ouseph C.C., U.J. Rao and V.Vijayendran, 2007, Practical Physics and Electronics, S. Viswanathan (Printers & Publishers), Pvt. Ltd., Chennai.

		Semester IV
		L T P C
15PHP401	ELECTROMAGNETIC THEORY AND ELECTRODYNAMICS	4 - - 4

Course Objectives

- The aim of this course is to provide the students with the fundamental principles of electrical energy (electro- magnetism).
- To understand the propagation of waves in different media, its transmission and reception.
- To understand, develop, and design various engineering applications involving electromagnetic fields.
- To expose the students to the ideas of electromagnetic waves and structure of transmission line
- To obtain an understanding of Maxwell's equations and be able to apply them to solving practical electromagnetic fields
- To provide the understanding to the propagation of EM wave in free space, conductors & dielectrics.

Course Outcomes (COs)

Students will:

1. Formulate potential problems within electrostatics, magnetostatics and stationary current distributions in linear, isotropic media, and also solve such problems in simple geometries using separation of variables and the method of images. .
2. Define and derive expressions for the energy both for the electrostatic and magnetostatic fields, and derive Poyntings theorem from Maxwells equations and interpret the terms in the theorem physically.
3. Understand the theories and properties of electrostatics
4. Analyze the interaction of electrostatic properties with matter.
5. Acquire the fundamental knowledge in Magnetostatics
6. Understand the basic concepts of electrodynamics

UNIT- I

Electrostatics: Electric intensity – Electric potential – Gauss Law - Dielectric and its polarization - Electric displacement D – Dielectric constant ϵ_r – Polarisability α - Clausius-Mossotti relation (Non-polar molecules) – The Langevin equation (Polar molecules) – Electrostatic energy

Magnetostatics: Current density J – Ampere's law of force – Biot-Savart law – Ampere's circuital law – Magnetic scalar potential ϕ_m (no applications) – Magnetic vector potential A –

Magnetisation and magnetization current – Magnetic intensity – Magnetic susceptibility and Permeability.

UNIT- II

Field Equations and Conservation Laws: Equation of continuity - Displacement currents - The Maxwell's equations derivations - physical significance - Poynting vector - Electro magnetic potentials A and ϕ - Maxwell's equations in terms of Electro magnetic potentials - Concept of gauge - Lorentz gauge - Coulomb gauge

UNIT- III

Propagation of Electromagnetic Waves: Electromagnetic waves in Free space - Isotropic dielectric - Anisotropic dielectric – Conducting media - Ionized gases.

Radiating systems: Oscillating electric dipole – Radiation from an oscillating dipole – Radiation from small current element.

UNIT- IV

Interaction of E.M.Waves with matter (Macroscopic): Boundary conditions at interfaces - Reflection and refraction – Frenel's laws-Brewster's law and degree of polarization - Total internal reflection and critical angle.

Interaction of E.M.Waves with matter (Microscopic): Scattering and Scattering parameters - Scattering by a free electron (Thomson Scattering) - Scattering by a Bound electron (Rayleigh scattering) – Dispersion Normal and Anomalous – Dispersion in gases (Lorentz theory) – Dispersion in liquids and solids.

UNIT – V

Relativistic Electrodynamics: Purview of special theory of relativity – 4-vectors and Tensors - Transformation equations for charge and current densities J and ρ – For electromagnetic potentials A and ϕ - Electromagnetic field tensor $F_{\mu\nu}$ - Transformation equations for the field vectors E and B - Covariance of field equations in terms of 4-vectors - Covariance of Maxwell equations in 4-tensor forms – Covariance and transformation law of Lorentz force.

		Semester IV
		L T P C
15PHP491	PROJECT	4 - - 4

Course Objectives

- The aim of the M.Sc. Research project work is to expose the students to preliminaries and methodology of research in Theoretical Physics and Experimental Physics.
- To provides the students to get opportunity and participate in some ongoing research activity and development of a laboratory experiment.
- To provide the student with a broad spectrum of physics projects courses
- To emphasize the role of physics in life and other discipline (chemistry, mathematics and biology)
- To develop the ability of the students to conduct, observe, analyzes and report an experiment and deal with physical models and formulas mathematically.
- To provide the student with different practical, intellectual and transferable skills.
- To understand the objective of a physics laboratory experiment, properly carry out the experiments, and appropriately record and analyze the results.
- To think creatively about scientific problems and their solutions.
- To design experiments, and to constructively question results they are presented with, whether these results are in a newspaper, in a classroom, or elsewhere.

Course Outcomes (COs)

After successful completion of the course, the student is expected to

1. Complete an independent research project, resulting in research outputs in terms of publications in journals and conference proceedings.
2. Demonstrate a depth of knowledge of Physics.
3. Complete an independent research project, resulting in research outputs in terms of publications in journals and conference proceedings.
4. Demonstrate knowledge of contemporary issues in their chosen field of research.
5. Demonstrate an ability to present and defend their research work.

6. Demonstrate an ability to succeed in problem solving in electronics
7. Solve physics problems using qualitative and quantitative reasoning including sophisticated mathematical techniques
8. Conduct independent research or work successfully in a technical position.
9. Successfully pursue career objectives in graduate school or professional schools, in a scientific career in government or industry, in a teaching career, or in a related career.
10. Apply their knowledge to develop the instruments.
11. Verify the basic principles and laws experimentally as a project.

15PHP306	MICROWAVE COMMUNICATION	Semester IV			
		L T P C			
		- - - 4			

Course Objectives:

- This course provide a wide understanding of microwave waveguides, passive & active devices, tubes and network analysis.
- An ability to design microwave matching networks.
- An ability to perform microwave measurements.
- An understanding of RADARs and its applications.
- To describe and explain working of microwave tubes and solid state devices.
- To perform measurements on microwave devices and networks using power meter and VNA.

Course Outcomes:

The student after undergoing this course will be able to:

1. Explain different types of waveguides and their respective modes of propagation.
2. Analyze typical microwave networks using impedance, admittance, transmission and scattering matrix representations.
3. Design microwave matching networks using L section, single and double stub and quarter wave transformer.
4. Explain working of microwave passive circuits such as isolator, circulator, Directional couplers, attenuators etc.
5. Describe and explain working of microwave tubes and solid state devices.
6. Perform measurements on microwave devices and networks using power meter and VNA.

UNIT-I

Microwave Fundamentals: Microwave frequency spectrum, Types and characteristics of transmission line, Transmission line equation solution, Reflection coefficient and transmission coefficient, Standing wave and standing wave ratio, Line impedance and admittance, Smith chart.

Unit II

Microwave Passive Devices

Rectangular wave guide, Circular wave guide, Microwave cavities, Microwave hybrid circuit, Directional coupler, Circulators and ferrit devices, Attenuators, Scattering matrix, Isolators.

Unit –III

Microwave Active Devices

Klystron, Reflex Klystron, Velocity modulation, Basic principle of magnetron, Principles and operations of magnetrons and traveling wave tube, Transfer electron devices, Gunn diode, Pin diode.

Unit –IV

Microwave Measurements

Attenuation measurement, Frequency measurement, Power measurement, Reflection coefficient and VSWR measurement, Scattering measurement. Microwave detection, Point contact diode, Schottky barrier diode.

Unit -V

Microwave Applications

Antenna fundamental, Microwave antennas, Antenna basic, Power received from an antenna, Radiation pattern, Radiation resistance, Efficiency, Directivity and gain, Antenna types, Rectangular horn antennas, H and E plane Horn antennas, Pyramidal Horn antenna, Parabolic reflector antenna. Radar system, Basic radar system, Radar range, Moving target indicator,

Suggested Books

1. Microwave Fundamental-Sanjeeva, Gupta and Others, Khanna Publications.
2. Microwave Devices and Circuits -Samull Y. Lio, Prentice Hall of India Pravate Limited, New Delhi. 3rd edition 1997
3. Microwave Communications Components and Circuits-Hunds, Mc Graw Hill, International Edition. 1st edition 1989
4. Microwave Techniques -D.C. Agarwal, S. Chand and Company.
5. Microwave Engineering-David M. Pozar, John Wiley and ons, New York. 4th edition 2012
6. Microwave Principles-Herbert S. Reich, C.B.S. Publications. 1st edition 2004

Course Objectives:

- This paper gives information about the nature of cosmic rays, detection of cosmic rays, and their analysis.
- To distinguish between mechanical and electromagnetic waves.
- To recognize that electromagnetic waves are transverse waves and travel at the speed of light through a vacuum.
- To give a basic description of cosmic rays.
- To demonstrate an understanding of a cloud chamber.
- To gain a better understanding of subatomic particles.

Course Outcomes:

Students able to

1. The students can use the acquired knowledge about experimental methods in their work in several fields of engineering (measurement techniques, electronics, computers) and knowledge about the basic properties of cosmic rays at their work in the field of medicine and radiology
2. Identify three aspects of contemporary cosmic ray physics which they wish to study in detail.
3. play a role in many different phenomena - e.g, climate
4. the student will have knowledge of the experimental and phenomenological aspects of the origin, nature and propagation of charged cosmic rays and neutrinos and a basic knowledge of the nature of Dark Matter, Gravitational Waves and Cosmic Microwave
5. Background and the related experimental detection techniques.
6. In particular, the student will be able to understand the connection between astrophysics and particle physics.

Unit I

Introduction to Cosmic Rays – The nature of the radiation – the latitude effect and effect of earth's magnetic fields – The primary cosmic ray energy spectrum – components in the primary radiation – Observation of knee and ankle in the energy spectrum – origin of cosmic rays – Possibility of electromagnetic acceleration – Fermi's acceleration mechanism – Supernovae as sources – Other sources – Motion and storage of cosmic rays.

Unit II

Extensive Air Shower (EAS) – Phenomenology – The cascade process – Bhabha's cascade theory – Electromagnetic cascade – Interaction of photons with matter – Interaction of electrons with matter – Lateral spread of EAS particles – EAS cascade – Monte Carlo simulation – Numerical methods – EAS initiated by primary nuclei.

Unit III

General features of EAS – Electromagnetic component – Lateral studies – Hadron component – Temporal structure of Hadrons – Charged to neutral (C/N) ratio – Muon component – Cherenkov light from EAS – Fluorescence light – Radio emission from EAS

Unit IV

Detection of EAS – Electron detectors – Scintillation detectors – Yes/No type detectors – Proportional counters – Fast timing – Muon detectors – Importance of muon detectors in EAS detector arrays – Hadron detectors – Underground detectors – Recording systems – Calibration of the detectors and electrons.

Unit V

Analysis of EAS data – Determination of shower parameters – NKG function – Search for sources – Significance of size spectrum – Relation to the energy spectrum – Knee and Ankle of the energy spectrum – Possible explanations – Models of origin of cosmic rays.

Suggested Books

1. Rao M.V.S and B.V. Sreekantan, Extensive Air Shower, world scientific publishing 1st edition 1998.
2. Hillas A.M., Cosmic Rays, Pergamon Press, New York 1st edition 1972.
3. <http://neutronm.bartol.udel.edu/catch/cr2.html>
4. <https://www.classe.cornell.edu/Outreach/>
5. <https://www.imagesco.com/geiger/radioactive-sources.html>

Course Objectives:

- This is a non-major elective paper for students of other departments.
- This paper gives an overview of the solar system, the stars, their evolution etc., for those who are interested in knowing about our Universe.
- Astronomy and Astrophysics is a very fundamental subject in Physics.
- Includes study of the solar system, evolution of stars, different physical processes going on stellar bodies, life cycle of stars etc.
- Is to apply basic physical principles from a broad range of topics in physics to astronomical situations
- Be able to formulate scientific problems in mathematical terms and apply analytical and numerical methods towards its solution
- Develop skills to design observing projects with research telescopes and projects drawing upon data in the literature and in archives
- Establish competence in focused areas of astrophysical theory and experiment

Course Outcomes:

Upon successful completion of this course, Students will be able to

1. Understand the basic concepts of coordinate systems, coordinate system used in astronomy, and evolution and properties of stellar objects.
2. Understand different mechanisms of energy transfer in stellar objects.
3. Understand the nuclear reactions in stellar objects and their behaviour.
4. Learn the basic concepts of cosmology and astrophysics.
5. Understand the different types astronomy according to the wavelengths of emission
6. Demonstrate a thorough understanding of current accepted theories for the origin of the universe

UNIT I

SUN: Sun, the nearest star to earth – Size, Mass and different layers of Sun – energy production in Sun – Temperature of the core, photosphere and Corona – Corona Heating problem – Solar activities – Sun spot – future of sun.

UNIT II

Planets: Planets of solar system – Orbits of the planets – Moons of the planets – Rings – Size, atmosphere temperature of the planets – Asteroids, Meteorite, Comets – Earth's Moon – Craters in Moon – Water in Moon.

UNIT III

Eclipse: Solar eclipse – Partial, Total, Annular and Hybrid eclipse – Conditions for these eclipses – Lunar eclipse.

Extra Solar Planets: Discovery of extra solar planets – Number of extra solar planets discovered – Telescopes – Invention – Different types of telescopes – Space telescopes

UNIT IV

Evolution of stars – Different stages of evolution – main sequence – white dwarf – supernova – pulsars – quasars – neutron stars – black holes – Chandrasekhar limit – Stellar cluster – Galaxy.

UNIT V

Evolution of the Universe – Big-bang theory – Steady state theory – Introduction to Radio astronomy, Infrared Astronomy, X-ray astronomy and Gamma ray astronomy.

Suggested Book

1. Bhatia V.B., 2001, Text Book of Astronomy and Astrophysics with elements of Cosmology, Narosa Publishing Co., New Delhi.
2. Martin Harwit, 1998, Astronomical Concepts, 3rd Edition, Springer Verlag, New York
3. Franklin Shu, 1st edition 1982, Physical Universe, University Science Books, U.S.A.
4. E.W.Kolb and M.S.Turner, 1st edition, 2007, The Early Universe Sarth book house and distributors
5. J.V.Narlikar, 3rd edition 2012 Introduction to Cosmology, Cambridge University Press.
6. A.K.Raychaudhuri, S.Banerji and A.Banerjee, General Relativity, Astrophysics and Cosmology – 1st edition (Springer-Verla, 2001)
7. S. Banerji and A. Banerjee, General Relativity and Cosmology – 1st edition (Elsevier, 2007)

15BEAE751	Value Added Course –II	1	1	0	1	100	0	100

Total Credits : 185

Note:

- The credits of value added courses will not be accounted.
- Interested students can opt one self study course in VIII semester from open electives, which will be reflected in the marksheets if he/she passes the course

L: Lecture Hour T: Tutorial Hour CIA: Continuous Internal Assessment

P: Practical Hour C: No. of Credits ESE: End Semester Examinations

Note: For the following courses, Evaluation will be purely internal. The marks should be handed over to the Office of The Controller of Examinations, along with the Semester Internal marks.

1. Communication Skills Development
2. Soft Skills Development
3. Technical Presentation and Seminar
4. All Value Added Courses

B.E. AUTOMOBILE ENGINEERING

LIST OF ELECTIVES

Electives (For V Semester)								
Sub. Code	Title Of The Course	L	T	P	C	CIA	ESE	Total

Course Objectives :

- To enable students to attain fluency and accuracy to inculcate proficiency in professional communication to meet the growing demand in the field of Global communication.
- To help students acquire their ability to speak effectively in real life situations.
- To inculcate the habit of reading and to develop their effective reading skills.
- To ensure that students use dictionary to improve their active and passive vocabulary.
- To enable students to improve their lexical, grammatical and communicative competence.
- To study formal context

Course Outcomes

Students undergoing this course will be able to

- 1 Use English language for communication: verbal & non –verbal.
- 2 Enrich comprehension and acquisition of speaking & writing ability.
- 3 Gain confidence in using English language in real life situations.
- 4 Improve word power: lexical, grammatical and communication competence.
- 5 To guide the students to write business letters and other forms of technical writing.
- 6 To remember students to prepare for oral communication in formal contexts.

Unit I**(9)**

Listening– Types of listening - Listening to class reading - Video tapes/ Audio tapes. **Speaking** – Introduction on self - Introduction on one's friend. **Reading** - Reading for comprehension – Reading different kind of passages like descriptive, narrative, objective, conversational and argumentative. **Writing** – Free writing on any topic –My favorite place, hobbies, dreams, goals, etc- Writing short messages - To fill in different application forms. **Grammar** – Articles- WH questions –Yes/No Question - Subject Verb agreement. **Vocabulary** - Word Formation – Word expansion (Root word) - Prefix and Suffix.

Unit II**(10)**

Listening – Understanding the passage in English –Pronunciation practice. **Speaking** – Asking and answering questions - Telephone etiquette. **Reading** – Critical reading – Finding key information in a given text (Skimming - Scanning). **Writing** – Coherence and cohesion in writing – Short paragraph writing – Letters to the Editor. **Grammar**– Parts of speech – Noun – Verb – Adjectives - Adverbs. **Vocabulary**– Compound Nouns/Adjectives – Irregular verbs.

Unit III**(10)**

Listening – Listening for specific task – Fill in the gaps. **Speaking** – Phonemes – Syllables – Role play – Conversation Practice. **Reading** – Reading and Comprehension. **Writing** - Autobiographical writing –

Biographical writing - Instruction writing. **Grammar** – Preposition – Infinitive – Gerund – Tenses.
Vocabulary – Foreign words used in English – British and American usage.

Unit IV

(8)

Listening – Responding to questions – Reading in class for complete understanding and for better pronunciation. **Speaking** – Debate- Presentations in seminars. **Reading** – Making inference from the reading passage – Predicting the content of reading passages. **Writing** - Interpreting visual materials (tables, graphs, charts, etc) – Formal and Informal letters. **Grammar** – Sentence pattern – Voice (active and passive voice).
Vocabulary – One word substitution.

Unit V

(8)

Listening - Listening to different accents, speeches/presentations. **Speaking**- Extempore talk –Just-a-minute talk. **Reading**-Reading strategies–Intensive reading – Text analysis. **Writing** - Creative writing – Writing circulars and notices – Writing proposal. **Grammar** – Direct and Indirect speech – Conditional sentences - Auxiliary verbs. **Vocabulary** – Abbreviations & Acronyms.

Note: Students shall have hands on training in improving listening skill in the language laboratory @ 2 periods per each unit.

Course Objectives:

- To understand geometrical aspects of curvature and elegant application of differential calculus and improper integrals, Gamma, Beta and Error functions which are needed in engineering applications.
- The goal of this course is for students to gain proficiency in calculus computations. In calculus, we use three main tools for analyzing and describing the behavior of functions: limits, derivatives and vector calculus.
- To acquaint the student with mathematical tools needed in evaluating multiple integrals and their usage.
- To make the student acquire sound knowledge of techniques in solving ordinary differential equations and partial differential equations.
- To introduce sequence and series which is central to many applications in engineering.
- To study the algebraic manipulation

Course Outcomes:

The student will be able to

- The student will be able to Apply advanced matrix knowledge to Engineering problems.
- Improve their ability in solving geometrical applications of differential calculus Problems.
- Solve engineering problems involving hyperbolic functions, Beta and Gamma functions.
- Expose the concept of sequences and series.
- To analyze and evaluate the accuracy of solution for ordinary differential equations
- To understand the difference of beta and gamma functions in control engineering

UNIT I MATRICES**(12)**

Review of Matrix Algebra - Characteristic equation – Eigenvalues and Eigenvectors of a real matrix – Properties – Cayley-Hamilton theorem (excluding proof) – Orthogonal transformation of a symmetric matrix to diagonal form – Quadratic forms – Reduction to canonical form through orthogonal reduction.

UNIT II DIFFERENTIAL CALCULUS**(12)**

Overview of Derivatives - Curvature in Cartesian co-ordinates – Centre and radius of curvature – Circle of curvature – Evolutes – Envelopes- Evolutes as Envelope of normals – Maxima and Minima of functions of two or more Variables – Method of Lagrangian Multipliers

UNIT III SEQUENCES AND SERIES**(13)**

Sequences: Definition and examples – **Series:** Types and Convergence – Series of positive terms – Tests of convergence: Comparison test, Integral test and D'Alembert's ratio test – Alternating series – Leibnitz's test – Series of positive and negative terms – Absolute and conditional convergence.

UNIT IV HYPERBOLIC FUNCTIONS, BETA AND GAMMA FUNCTIONS (12)

Hyperbolic functions: Hyperbolic functions and Inverse Hyperbolic functions – Identities – Real and imaginary parts – solving problems using hyperbolic functions.

Beta And Gamma Functions : Definitions – Properties – Relation between beta and gamma integrals – Evaluation of definite integrals in terms of beta and gamma functions.

UNIT V DIFFERENTIAL EQUATIONS

(11)

Linear Differential equations of second and higher order with constant coefficients - Euler's form of Differential equations – Method of variation parameters.

3. www.intmath.com/matrices-determinants
4. [www. Intmath.com/calculus/calculus-intro.php](http://www.Intmath.com/calculus/calculus-intro.php)

Course Objectives:

- To inculcate the basics of properties of matter and its applications.
- To study the basics of sound and ultrasonics with appropriate applications.
- To study the fundamentals of thermal and quantum physics and their applications.
- To introduce the concepts of light, laser and fibre optics for diverse applications.
- To impart the basic knowledge of crystal and its various crystal structures.
- To study the quantum mechanics.

Course Outcomes:

Upon successful completion of the course, the students should be able to:

- Describe the basics of properties of matter and its applications.
- Express the concepts of sound, ultrasonic and their applications.
- Illustrate the thermal properties of materials and advanced physics concepts of quantum theory.
- Identify the basics of light, laser and their applications.
- Identify the basics of fibre optics and their applications.
- Explain the basics of crystals and their structures.

UNIT I PROPERTIES OF MATTER AND THERMODYNAMICS (9)

Three types of modulus of elasticity – basic definitions, relation connecting the moduli (Derivation), poisson ratio- Torsional pendulum- bending of beams- bending moment – basic assumption of moment – uniform and non uniform bending.

Concept of entropy- change of entropy in reversible and irreversible processes – refrigeration.

UNIT II LASER AND FIBER OPTICS (9)

Introduction – emission and absorption process- Einstein's coefficients derivation. Types of LASER -CO₂, Semiconductor LASER- Applications of LASER in industry and medicine.

Total internal reflection – modes of propagation of light in optical fibers – numerical aperture and acceptance angle –derivations, types of optical fibers (Material, refractive index and mode) – fiber optical communication system (block diagram)

UNIT III QUANTUM PHYSICS (9)

Introduction to quantum theory – Compton effect- dual nature of matter and radiation – de Broglie wavelength, uncertainty principle – physical significance of wave function, Schrödinger's wave equation – time dependent and time independent equations – particle in one dimensional box- scanning electron microscope.

UNIT IV CRYSTAL PHYSICS (9)

Lattice – unit cell – Bravais lattice – lattice planes – Miller indices – calculation of number of atoms per unit cell, atomic radius, coordination number, packing factor for SC, BCC, FCC and HCP structures- crystal defects – point, line and surface defects

UNIT V ULTRASONICS AND NUCLEAR PHYSICS (9)

Production of ultrasonics by piezoelectric method –Non Destructive Testing – pulse echo system through transmission and reflection modes - A,B and C –scan displays, Medical applications - Sonogram
 Introduction – basics about nuclear fission and fusion, nuclear composition –Radiation detectors – semi conductor detector. Reactors – essentials of nuclear reactor- power reactor.

WEBSITES:

1. www.nptel.ac.in
2. www.physicsclassroom.com
3. www.oyc.yale.edu
4. www.physics.org

Course Objectives:

- To understand the terminologies of atomic and molecular structure.
- To study the basics of periodic properties and intermolecular forces.
- To study about spectroscopic technique.
- To understand the thermodynamic functions.
- To comprehend the basic Surface Chemistry.
- To get the knowledge of fuels and combustion

Course Outcomes:

Upon successful completion of the course, the students should be able to:

- Analyse microscopic chemistry in terms of atomic and molecular orbital and intermolecular forces.
- Rationalise periodic properties such as ionization potential, oxidation states and electronegativity.
- Distinguish the ranges of the electromagnetic spectrum used for exciting different molecular energy levels in various spectroscopic techniques.
- Rationalise bulk properties and processes using thermodynamic considerations.
- List major chemical reactions that are used in the synthesis of molecules.
- Integrate the chemical principles in the projects undertaken in the field of engineering and technology.

UNIT I WATER TECHNOLOGY (9)

Characteristics – Alkalinity – Types of alkalinity and determination – Hardness – Types and estimation by EDTA method (problems) - Domestic water treatment – Disinfection methods (Chlorination, Ozonation, UV treatment) – Boiler feed water – Requirements – Disadvantages of using hard water in boilers – Internal conditioning (Phosphate, Calgon and Carbonate conditioning methods) – External conditioning – Demineralization process – Desalination and Reverse osmosis.

UNIT II ELECTROCHEMISTRY AND STORAGE DEVICES (9)

Electrochemical cells – Reversible and irreversible cells – EMF – Measurement of emf – Single electrode potential – Nernst equation – Reference electrodes – Standard Hydrogen electrode - Calomel electrode – Ion selective electrode – Glass electrode and measurement of pH – Electrochemical series – Significance – Potentiometric titrations (Redox - Fe^{2+} vs dichromate) – Batteries- Primary batteries-Leclanche cell- Secondary batteries- Lead acid battery.

UNIT III FUELS AND ROCKET PROPELLANTS (9)

Coal - Proximate and Ultimate analysis - Metallurgical coke - Manufacture by Otto-Hoffman method - Petroleum processing and fractions - Synthetic petrol - Bergius and Fischer-Tropsch method - Knocking - Octane number and Cetane number - Gaseous fuels - Water gas, Producer gas, An introduction to Fuel Cell, $\text{H}_2\text{-O}_2$ Fuel Cell - Rocket engines-Types of rocket engines, Basic principles, Mass fraction.

UNIT IV CORROSION SCIENCE (9)

Chemical and Electrochemical corrosion - Galvanic corrosion - Differential aeration corrosion - Corrosion control - Sacrificial anode and Impressed current cathodic methods - Corrosion inhibitors - Protective

coatings - Paints - Constituents and functions -- Metallic coatings - Electroplating (Au) and Electro less plating (Ni) - Surface conversion coating and Hot dipping.

UNIT V SURFACE CHEMISTRY

(9)

Introduction-Adsorption-Types, adsorption of gases on solids, adsorption of solutes from solutions, Adsorption isotherms-Freundlich adsorption isotherm-Langmuir adsorption isotherm-Industrial adsorbent materials- Role of adsorbents in catalysis and water softening-Emulsion-Types-water/oil, oil/water-Applications of adsorption.

Course Objectives

1. To impart the basic knowledge about the Electric circuits.
2. To understand the working of various Electrical Machines.
3. To understand the concepts of AC and DC currents.
4. To know about various measuring instruments.
5. To understand the basic concepts in semiconductor devices.
6. To understand the basic concepts of digital electronics

Course Outcomes

Upon completion of this course, the students will be able to

- Understand the basic knowledge about the Electric circuits.
- Infer the characteristics of various Electrical Machines.
- Extend the knowledge on concepts of AC and DC currents.
- Understand the various measuring instruments.
- Develop the idea of semiconductor devices.
- Understand the basic knowledge about digital electronics

UNIT I ELECTRIC CIRCUITS**9**

Ohm's Law – Kirchoff's Laws – Steady State Solution of DC Circuits – Introduction to AC Circuits – Waveforms and RMS Value – Power and Power factor – Single Phase and Three Phase balanced Circuits.

UNIT II ELECTRICAL MACHINES**9**

Construction, Principle of Operation, Basic Equations and Applications of DC Generators, DC Motors, Single Phase Transformer, Single Phase Induction Motor.

UNIT III MEASURING INSTRUMENTS**9**

Operating Principles of Moving Coil and Moving Iron Instruments (Ammeters and Voltmeters), Dynamometer type Watt meters and Energy meters.

UNIT IV SEMICONDUCTOR DEVICES AND APPLICATIONS**9**

Characteristics of PN Junction Diode – Zener Effect – Zener Diode and its Characteristics – Half wave and Full wave Rectifiers – Voltage Regulation, Bipolar Junction Transistor – CB, CE, CC Configurations and Characteristics.

UNIT V DIGITAL ELECTRONICS**9**

Binary Number System – Logic Gates – Boolean Algebra – Half and Full Adders – Flip-Flops – Registers and Counters – A/D and D/A Conversion (single concepts)

ENGINEERING PHYSICS

Course Objectives

- To learn the basic concepts in physics relevant to different branches of Engineering and Technology.
- To study the concept of semiconductor and conductivity.
- To learn the properties of materials.
- To learn the device for determine the wavelength and velocity of sound
- To study the viscosity of liquids
- To learn the bandgap of semiconductor

Course Outcome

- Familiarize the properties of material and basic concepts in physics.
- Get experience in laser wavelength experimenattion
- Get practical exposure to analyse the velocity of sound
- Get knowledge in bandgap and wavelength determination
- Acquire knowledge about different bendings
- Practical knowledge in therml conductivity of wire and its thickness

LIST OF EXPERIMENTS – PHYSICS

1. Determination of velocity of sound and compressibility of liquid – Ultrasonic interferometer.
2. Determination of wavelength of mercury spectrum – spectrometer grating.
3. Determination of Young's modulus of the material – Non uniform bending or Uniform bending.
4. Determination of Viscosity of liquid – Poiseuille's method.
5. Spectrometer Dispersive power of a prism.
6. Torsional pendulum – Determination of Rigidity modulus.
7. Particle size determination using Diode Laser
8. Determination of Laser parameters – Wavelength, and angle of divergence.
9. Determination of acceptance angle in an optical fiber.
10. Determination of thickness of a thin wire – Air wedge method
11. Determination of Band Gap of a semiconductor material.
12. Determination of Specific resistance of a given coil of wire – Carey Foster Bridge

ENGINEERING CHEMISTRY

Course Objectives

- To learn the basic concepts in chemical terms relevant to different branches of Engineering and Technology.
- To study the concept of alkalinity of water sample.
- To study the hardness and chloride in water by experimental methods
- To learn the ferric ion by spectrophotometry
- To study the PH Titration
- To study the molecular weight and degree of polymerization using viscometry

Course Outcome

- 1.Familiarize the properties of material and basic concepts in chemistry
- 2.Get experience in argentometric method experimentation
- 3.Get practical exposure to analyse the water sample
- 4.Get knowledge in spectrophotometry
- 5.Acquire knowledge about different crystal formation in water
- 6.Practical knowledge in determine the chemical oxygen demand

LIST OF EXPERIMENTS - CHEMISTRY

1. Estimation of alkalinity of Water sample
2. Estimation of hardness of Water by EDTA
3. Estimation of chloride in Water sample (Argentometric method)
4. Determination of corrosion rate by weight loss method.
5. Conductometric Titration (Simple acid base).
6. Conductometric Titration (Mixture of weak and strong acids).
7. Conduct metric Titration using BaCl_2 vs Na_2SO_4 .
8. pH Titration (acid & base).
9. Potentiometric Titration (Fe^{2+} / KMnO_4 or $\text{K}_2\text{Cr}_2\text{O}_7$).
10. Estimation of Ferric iron by Spectrophotometry.
11. Determination of water of crystallization of a crystalline salt (Copper sulphate).
12. Determination of molecular weight and degree of polymerization using Viscometry.
13. Determination of chemical oxygen demand.

Course Objectives:

- To provide hands-on training for the fabrication of components using carpentry and welding equipment/tools.
- To gain the skills for making fitting joints and household pipeline connections using suitable tools.
- To develop the skills for preparing the green sand mould.
- To present the skills for making the simple household electrical connection.
- To develop the skills for making wood/metal models using suitable tools.

Course Outcomes:

- Fabricate simple components using carpentry and welding equipment/tools.
- Make fitting joints and household pipeline connections using suitable tools.
- Prepare green sand mould using suitable tools.
- Make simple household electrical connections using suitable tools.
- Make simple models using wood and metal.
- Make simple plumbing work

PART – A (CIVIL & MECHANICAL)**1. WELDING**

- i. Preparation of arc welding of butt joints, lap joints and tee joints.

2. BASIC MACHINING

- i. Simple Turning and Taper turning
- ii. Drilling and Tapping

3. SHEET METAL WORK

- i. Model making – Trays, funnels, etc.

4. DEMONSTRATION ON

- i. Smithy operations
- ii. Foundry operations
- iii. Plumbing Works
- iv. Carpentry Works

PART –B (ELECTRICAL & ELECTRONICS)**5. ELECTRICAL ENGINEERING**

- i. Study of electrical symbols and electrical equipments.
- ii. Construct the wiring diagram for Stair case wiring and Fluorescent lamp wiring.
- iii. Construct the wiring diagram for Residential house wiring using switches, fuse, indicator, lamp and energy meter.
- iv. Measurement of electrical quantities – voltage, current, power & power factor in R load.
- v. Measurement of energy using single phase energy meter.

6. ELECTRONICS ENGINEERING

- i. Study of Electronic components– Resistor (color coding), capacitors and inductors.
- ii. Soldering practice – Components Devices and Circuits – Using general purpose PCB.
- iii. Study of logic gates AND, OR, NOT, NOR and NAND.
- iv. Study of HWR and FWR.

Course Objectives:

- To learn conventions and use of drawing tools in making engineering drawings.
- To impart knowledge on orthographic projection.
- To draw orthographic projections of points, line and plane surfaces.
- To draw orthographic projections of solids.
- To impart the basic concepts of isometric projections through simple examples.
- To impart knowledge of the CAD software

Course Outcomes:

Upon successful completion of the course, the students should be able to:

- Recognise the conventions and apply dimensioning concepts while drafting simple objects.
- Draw freehand sketching of multiple views from pictorial views of objects.
- Draw the orthographic projection of points, line and plane surfaces.
- Draw the orthographic projection of solids.
- Draw the isometric projection of the given objects.
- Demonstrate knowledge of the CAD software

UNIT I INTRODUCTION

Introduction to Engineering Drawing, Bureau of Indian Standards (BIS), Layout of drawing sheets, sizes of drawing sheets, different types of lines used in drawing practice geometric constructions, principles of dimensioning– linear, angular, aligned system, unidirectional system, parallel dimensioning, chain dimensioning, location dimension and size dimension.

UNIT II SCALES AND PLANE CURVES

SCALES:Reducing Scale, Enlarging Scale, Plain Scale, Diagonal Scale and Vernier Scale. Conics – Construction of Ellipse, Parabola and Hyperbola by eccentricity method

UNIT III FREE HAND SKETCHING

Representation of Three Dimensional objects – General principles of orthographic projection – Need for importance of multiple views and their placement – First angle projection – layout views – Developing visualization skills through free hand sketching of multiple views from pictorial views of objects.

UNIT IV PROJECTION OF POINTS, LINES AND PLANE SURFACES

Projection of points and straight lines located in the first quadrant – Determination of true lengths and true inclinations – Traces–Projection of polygonal surface and circular lamina inclined to both reference planes.

UNIT V PROJECTION OF SOLIDS

Projection of simple solids like prisms, pyramids, cylinder and cone when the axis is inclined to one reference plane by change of position method.

Introduction to Drafting Software/Package (Not for Exam):

Basic operation of drafting packages, use of various commands for drawing, dimensioning, editing, modifying, saving and printing/plotting the drawings. Introduction to 3D primitives.

INTENDED OUTCOME:

- Educate the values and meaning of life in the young minds and to transform them as responsible citizens

UNIT – I :(4)

Human life on Earth - Concept of Human Values - Value Education - Aim of education and value education
- Types of values - Components of values – Attitudes – types of attitudes

UNIT – II :**(4)**

Self Development : Self analysis – Goal Setting - Thought Analysis – Guarding against Anger - Respect to age, experience, maturity, family members, neighbors, co-workers

UNIT – III :**(5)**

Individual Qualities – Truthfulness – Constructivity – Sacrifice – Sincerity - Self Control – Altruism – Tolerance - Scientific Vision – Regulating Desire

UNIT – IV:(4)

Mind Culture - Modern Challenges of Adolescent - Emotions and behavior - Sex and spirituality - Adolescent Emotions - Meditation

UNIT - V :(3)

Body and Mind Fitness : (a) Physical Exercises (b) Activities: (i) Moralization of Desires (ii) Neutralization of Anger (iii) Eradication of Worries (iv) Benefits of Blessings .

Total: 20**REFERENCE BOOKS:**

S.No	Author(s) Name	Title of the book	Publisher	Year of Publications
1	Subramanian. R	Professional Ethics	Oxford, New Delhi	2013
2	Govindarajan. M, Natarajan. S, Senthil Kumar. V.S	Engineering Ethics	Prentice Hall of India, New Delhi	2004
3	Tripathi. A.N	Human Values	New Age International	2009
4	Pope. G. U.	Thirukkural with English Translation	Uma Publication, Thanjavur.	2002

Course Objectives

- To motivate learners to acquire listening & speaking skills in both formal and informal context.
- To focus on question forms & to make them understand the importance of using question tags and also the functional use of transformation of sentences.
- To improve their reading habit and to train them in critical and analytical reading.
- To equip them to write for academic as well as work place context.
- To enable students to face interviews.
- To study the receptive and productive skills

Course Outcomes

Students undergoing this course will be able to

- Acquire second language: speaking convincingly, expressing their opinions clearly, negotiating and arguing using appropriate communicative strategies.
- Enhance their reading texts critically and analytically.
- Develop writing effectively, persuasively and producing different types of writing such as narration, description, exposition and argument as well as creative, critical, analytical and evaluative writing.
- Producing different types of writing such as narration, description, exposition and argument as well as creative, critical, analytical and evaluative writing.
- Enrich the ability to face interviews with confidence.
- Ensure the good communication with the society.

UNIT-1

(10)

Listening - Difference between Hearing & Listening – Listening to informal conversation. **Speaking** - Spoken structures on different situations - Introduction, Greeting, Comments on topics like Films, Games etc, Excuse, Request, Agreement, Disagreement, etc., **Reading** – Extensive and Intensive reading. **Writing** – Report writing - Writing a covering letter. **Grammar** – Regular & Irregular verbs - Kinds of sentences - Question tags. **Vocabulary** – Homonyms and Homophones.

UNIT-II

(8)

Listening – Note Taking- Improving grasping ability. **Speaking** – Welcome address - Vote of thanks - Master of ceremony. **Reading** – Active and Passive reading - Reading for vocabulary- Reading for a purpose. **Writing** - Writing a review (Film review) - Summary of a story. **Grammar** - Modal verbs – Conjunction - Expression of cause and effect. **Vocabulary** - Phrasal verbs - Idioms.

UNIT – III

(9)

Listening - Barriers to listening (Physical, Psychological, Linguistic & Cultural). **Speaking** – Stress, Pause and Intonation. **Reading** – Rapid reading – Skimming, Scanning and Surveying. (SQ3R) **Writing** - Essay writing - Minutes of meeting - Agenda – **Grammar** - Active and Passive voice - Purpose expression. **Vocabulary** - Same words used as noun and verb - Often misspelt and confused words.

UNIT-IV**(8)**

Listening – Listening to telephone conversation - Viewing model interviews. **Speaking** – Group Discussion - Correlation between verbal & non - verbal communication. **Reading** – Reading comprehension (short & long text) - Reading job advertisements and profile of a company. **Writing** – Job application - Resume writing - Checklist preparation. **Grammar** - Numerical expressions – Collocations - **Vocabulary** - Singular and Plural (Nouns)

UNIT- V**(10)**

Listening – Types of listening- Improving listening comprehension. **Speaking** - Oral presentation - Vocal communication techniques - Voice, quality, volume, pitch etc., **Reading** -Note making - Making notes from books/ any forms of writing materials. **Writing** - Describing process & products - Recommendation writing – Short essays writing- **Grammar**- Transformation of sentences (Simple, Compound & Complex). **Vocabulary** - Collection of Technical Vocabularies with their meanings.

Note: Students shall have hands on training in improving listening skill in the language laboratory @ 2 periods per each unit.

Course Objectives:

1. To have knowledge in integral calculus and Vectorcalculus
2. To expose the concept of Analytical function and Complexintegration.
3. The syllabus is designed to develop the use of integrals techniques which is needed by Engineers for practical applications.
4. It aims to equip the students in integration to solve engineering problems
5. To learn Basic concepts of multiple and vector integrals.
6. To study complex integration

Course Outcomes:

The student will be able to

1. Solve problems in Fluid Dynamics, Theory of Elasticity, Heat and MassTransfer etc.
2. Find the areas and volumes using MultipleIntegrals
3. Improve their ability in Vectorcalculus
4. Expose to the concept of Analyticalfunction.
5. Apply Complex integration in their Engineeringproblems
6. Analysis the real time application of it.

UNIT-I PARTIAL DIFFERENTIAL EQUATIONS (11)

Formation of partial differential equations by elimination of arbitrary constants and arbitrary functions – Solution of standard types of first order partial differential equations – Lagrange’s linear equation – Linear partial differential equations of second and higher order with constantcoefficients.

UNIT-II MULTIPLE INTEGRALS (11)

Double integral – Cartesian coordinates – Polar coordinates – Change of order of integration – Triple integration in Cartesian co-ordinates – Area as double integrals.

UNIT-III VECTOR CALCULUS (13)

Gradient, Divergence and Curl – Directional derivative – Irrotational and Solenoidal vector fields – Vector integration – Green’s theorem, Gauss divergence theorem and Stoke’s theorems (Statement Only)- Surfaces : hemisphere and rectangular parallelopeds.

UNIT-IV ANALYTIC FUNCTIONS (12)

Analytic functions - Cauchy-Riemann equations in Cartesian and polar forms – Sufficient condition for an analytic function (Statement Only) - Properties of analytic functions – Constructions of an analytic function - Conformal mapping: $w = z+a$, az , $1/z$, z^2 and bilinear transformation.

UNIT-V COMPLEX INTEGRATION (13)

Complex Integration - Cauchy’s integral theorem and integral formula (Statement Only) – Taylor series and Laurent series - Residues – Cauchy’s residue theorem (Statement Only) - Applications of Residue theorem to evaluate real integrals around unit circle and semi circle (excluding poles on the real axis).

2. www.mathcentre.ac.uk
3. www.sosmath.com/diffeq/laplace/basic/basic.html
4. www.mathworld.wolfram.com

COURSE OBJECTIVES:

1. To impart knowledge on aspects of materials.
2. To understand various types of Conducting Material.
3. To familiarize on Semiconducting Materials.
4. To impart knowledge on Magnetic and Superconducting Material
5. To learn about the Dielectric Materials.
6. To comprehend the significance of Advanced Materials.

COURSE OUTCOMES:

Learners should be able to

1. Identify the aspects of materials.
2. Identify suitable types of Conducting Material.
3. Select appropriate Semiconducting Materials for various applications.
4. Identify and select Magnetic and Superconducting Material.
5. Identify suitable Dielectric Materials.
6. Significance of Advanced Materials.

UNIT I CONDUCTING MATERIALS (9)

Conductors – classical free electron theory of metals – Electrical and thermal conductivity – Wiedemann – Franz law – Lorentz number – Draw backs of classical theory – Quantum theory – Fermi distribution function – Effect of temperature on Fermi Function – Density of energy states – carrier concentration in metals.

UNIT II SEMICONDUCTING MATERIALS (9)

Intrinsic semiconductor – carrier concentration derivation – Fermi level – Variation of Fermi level with temperature – electrical conductivity – band gap determination – extrinsic semiconductors – carrier concentration derivation in n-type semiconductor – variation of Fermi level with temperature and impurity concentration – compound semiconductors – Hall effect – Determination of Hall coefficient – Applications.

UNIT III MAGNETIC AND SUPERCONDUCTING MATERIAL (9)

Origin of magnetic moment – Dia and para magnetism – Ferro magnetism – Domain theory – Hysteresis – soft and hard magnetic materials – anti – ferromagnetic materials – Ferrites – applications.

Superconductivity : properties - Types of super conductors – BCS theory of superconductivity (Qualitative) - High Temperature superconductors – Applications of superconductors – magnetic levitation.

UNIT IV DIELECTRIC MATERIALS (9)

Electrical susceptibility – dielectric constant – electronic, ionic, orientational and space charge polarization – frequency and temperature dependence of polarisation – internal field – Claussius – Mosotti relation (derivation) – dielectric loss – dielectric breakdown – Applications of dielectric materials – ferroelectricity and applications.

UNIT V ADVANCED MATERIALS (9)

Metallic glasses: preparation, properties and applications.

Shape memory alloys (SMA): Characteristics, properties of NiTi alloy, applications.

Composite materials, Aircraft materials and non-metallic materials.

Nano materials: synthesis – Physical and chemical vapour deposition – ball milling - properties of nanoparticles and applications. Carbon nanotubes: structure – properties and applications.

3. www.oyc.yale.edu
4. www.physics.org

Course Objectives:

- To give a comprehensive insight into natural resources, ecosystem and biodiversity.
- To educate the ways and means of the environment
- To protect the environment from various types of pollution.
- To impart some fundamental knowledge on human welfare measures.
- To create the awareness about environmental problems among people.
- To motivate public to participate in environment protection and improvement.

Course Outcomes (COs)

Upon completion of the course the students will be able to

1. Master core concepts and methods from ecological and physical sciences and their application in environmental problem solving.
2. Master core concepts and methods from economic, political, and social analysis as they pertain to the design and evaluation of environmental policies and institutions.
3. Appreciate the ethical, cross-cultural, and historical context of environmental issues and the links between human and natural systems.
4. Understand the transnational character of environmental problems and ways of addressing them, including interactions across local to global scales.
5. Apply systems concepts and methodologies to analyze and understand interactions between social and environmental processes.
6. Reflect critically about their roles and identities as citizens, consumers and environmental actors in a complex, interconnected world.
7. Demonstrate proficiency in quantitative methods, qualitative analysis, critical thinking, and written and oral communication needed to conduct high-level work as interdisciplinary scholars and/or practitioners.

UNIT I INTRODUCTION TO ENVIRONMENTAL STUDIES AND NATURAL RESOURCES**(9)**

Definition, Scope and Importance – Need for public awareness - Forest resources: Use and over-exploitation, deforestation- Water resources- Use and over-utilization of surface and ground water, floods, drought, conflicts over water- Land resources- Land as a resource, land degradation, man induced landslides, soil erosion and desertification – Mineral resources: Use and exploitation, environmental effects of extracting and using mineral resources- Food resources- World food problems, changes caused by agriculture and overgrazing, effects of modern agriculture- Energy resources- Growing energy needs, renewable and non renewable energy sources, use of alternate energy sources- role of an individual in conservation of natural resources.

UNIT II ECOSYSTEM**(9)**

Chemistry and Environment- Environmental segments, Composition and Structure of atmosphere- Concept of an ecosystem- Structure, components and function of an ecosystem Energy flow in the ecosystem – Food chain, Food web and Ecological pyramids, Structure and function of Terrestrial ecosystem (Forest, Desert and Grassland ecosystem) and Aquatic ecosystem (Fresh water and Marine ecosystem)

UNIT III BIODIVERSITY

(9)

Introduction to biodiversity, Definition- Genetic diversity, Species diversity and Ecosystem diversity, Biogeographical classification of India, Importance of biodiversity-Value of biodiversity - Hot Spots of biodiversity-Threats to biodiversity - Endangered and Endemic Species of India – Conservation of biodiversity- In-Situ and Ex-Situ conservation of biodiversity.

UNIT IV ENVIRONMENTAL POLLUTION

(9)

Definition – causes, effects and control measures of Air pollution, Water pollution, Soil pollution, Marine pollution, Noise pollution and Thermal pollution. Solid waste management-causes, effects and control measures of urban and industrial wastes– Role of an individual in prevention of pollution– Disaster management-earthquake, tsunami, cyclone and landslides.

UNIT V SOCIAL ISSUES AND ENVIRONMENT

(9)

From Unsustainable to Sustainable development, Urban problems related to energy sources, Water conservation, Rain water harvesting and Watershed management, Resettlement and rehabilitation of people, its problems and concerns, Environmental ethics- Issues and possible solutions- Climate change- Green house effect and Global warming, Acid rain, Ozone layer depletion, Wasteland reclamation- Environment Protection Act- Human Rights- Value education, Role of Information Technology in Environment and Human health-Population growth, Variation of population among nations-Population explosion.

4. www.unesco.org/ext/field/beijing/scienceb.htm, www.infinitepower.org/education.htm

Course Objectives:

- To familiarise the basic concepts and force systems in a real-world environment.
- To impart knowledge on the equilibrium of rigid bodies.
- To learn the concept of centroid, centre of gravity and moments of inertia.
- To understand the rectilinear motion and curvilinear motion.
- To enrich the understanding of dynamic forces exerted in rigid body
- To provide knowledge on the friction.

Course Outcomes:

Upon successful completion of the course, the students should be able to:

- Determine the resultant force and moment for a given system of forces.
- Analyse the plane trusses having different types of supports and determine the forces in each member.
- Identify the location of centroid, centre of gravity and calculate the moment of inertia for different sections.
- Apply the equations of motion of particles to calculate displacement, velocity and acceleration.
- Calculate dynamic forces exerted in rigid body
- Determine the friction and its effects by using the laws of friction.

UNIT I STATICS OF PARTICLES (12)

Forces – system of forces - concurrent forces in plane and space- resultant - problems involving the equilibrium of a particle-free body diagram-equilibrium of particle in space.

UNIT II STATICS OF RIGID BODIES IN TWO DIMENSIONS (12)

Rigid bodies-two dimensional structure-moment of force about an axis-moment of a couple-equivalent system of coplanar forces-Rigid body in equilibrium-problems involving equilibrium of rigid body-types of supports-reactions of beams and frames.

APPLICATION OF STATICS: Roof trusses-Method of joints, method of sections and Tension coefficient method.

UNIT III CENTROID, CENTRE OF GRAVITY AND MOMENT OF INERTIA (12)

Centroids of areas, composite areas, determination of moment of inertia of plane figures, polar moment of inertia-radius of gyration – mass moment of inertia of simple solids.

UNIT IV KINEMATICS OF PARTICLES (12)

Introduction-plane, rectilinear motion - time dependent motion-rectangular coordinates-projectile motion.

IMPULSE AND MOMENTUM: Concept of conservation of momentum- Impulse-Momentum principle-Impact-Direct central impact-oblique central impact.

UNIT V FRICTION (12)

Laws of friction-coefficient of friction-problems involving dry friction- wedge and ladder friction.

KINETICS OF PARTICLES: Equation of motion-rectilinear motion-Newton's II law – D'Alembert's principle- Energy - potential energy-kinetic energy-conservation of energy-work done by a force - work energy method.

4.	Jivan Khachane and Ruchi Shrivastava	Engineering Mechanics	ANE Books, New Delhi.	2008

Course Objectives:

- To identify and understand the working of key components of a computer program.
- To identify and understand the various kinds of keywords and different data types of C programming.
- To understand, analyse and implement software development tools like algorithm, pseudo codes and programming structure.
- To study, analyse and understand the logical structure of a computer program, and different constructs to develop a program in C language.
- Understand, analyze and implement software development tools like algorithm, pseudo codes and programming structure.
- Study, analyze and understand logical structure of a computer program, and different constructs to develop a program in 'C' language

Course Outcomes:

Upon successful completion of the course, the students should be able to:

- Formulate simple algorithms for arithmetic and logical problems.
- Translate the algorithms to programs (in C language).
- Test and execute the programs and correct syntax and logical errors.
- Implement conditional branching, iteration and recursion.
- Apply programming to solve matrix addition and multiplication problems and searching and sorting problems.
- Apply programming to solve simple numerical method problems, namely root finding of function, differentiation of function and simple integration.

UNIT I	Overview of Computer	8
---------------	-----------------------------	----------

What is computer- Computer Components-Generation of Computers- Memory Organization-Memory Types- Input and Output Devices- Concepts of Hardware and Software- What is OS-Windows and Unix OS- Programming Languages- Basics of Computer Networks- LAN, WAN-Concept of Internet- ISP- Basics of word processing- Basics of spreadsheet – Basics of presentation Software

UNIT II	Overview of ‘C’	8
----------------	------------------------	----------

Algorithms-Representation of Algorithms-Flowchart- Introduction to programming Languages-What is C- C Character set- Constants, Variables and Keywords-General form of C Program-The First C Program-Data types-Arithmetic Instructions- Type conversions- Relational and Logical Operators-Hierarchy and associativity

UNIT III Selection and Iteration 9

Selection Structures- If and nested if - Loops-Definition and types-While loop-for loop- do-while loop- break and continue- Nested loops- Advantages of iteration-Menu driven programs-Switch Case

UNIT IV Functions

10

Functions- Definition-types-Functions without arguments- Functions with Input arguments- Functions with output parameters-local and global variables- advantages of functions- Call by value and Call by reference- Recursion- Function as an argument

UNIT V Arrays and Strings

10

Arrays-definition- Declaring and referencing arrays- Array initialization- Using for loops for accessing arrays-Passing array elements as function arguments-2D Array - Matrix Addition and multiplication- Introduction to Strings- declaration and Initialization--String constant -Strings as Array of Characters

Total Hours: 45

Text Books:

1. H. M. Deitel and D. J. Deitel, 'C: How to Program', Prentice Hall, 7th Edition, 2012
2. Yashavant Kanetkar, "Let us C", BPB Publications, 13th Edition, 2013

References:

1. E. Balagurusamy, "Computing Fundamentals and C Programming", TMH Education, 5th Edition, 2014
2. E. Balagurusamy, "Programming in ANSI C", TMH Education, 6th edition, 2012

Course Objectives

- Identify and understand the working of key components of a computer program.
- Identify and understand the various kinds of keywords and different data types of C programming
- Understand, analyze and implement software development tools using algorithm
- Understand, analyze and implement software development tools using linux
- Acquire and analyse the roots of equations
- Study, analyze and understand logical structure of a computer program, and different construct to develop a program in “C” language

Course Outcomes:

The course will enable the students.

1. To formulate simple algorithms for arithmetic and logical problems.
2. To translate the algorithms to programs(in C language).
3. To test and execute the programs and correct syntax and logical errors.
4. To implement conditional branching, iteration and recursion.
5. To decompose a problem in to functions and synthesize a complete program using divide and conquer approach. and use arrays, pointers and structures to formulate algorithms and programs.
6. To apply programming to solve matrix addition and multiplication problems and searching and sorting problems.

List of Experiments

1. Working with word Processing, Spreadsheet and presentation software in Linux.
2. Programming in Scratch:
Practicing fundamental concepts of programming like sequence, selection decision statements, working of loops and event driven programming.
3. C Programming:
Practicing programs to get exposure to basic data types, algebraic expressions, Conditional statements, Input and Output Formatting, Decision Statements, Switch Case, Control structures, arrays, Strings and function.

Total Hours: 45

- To explain the surfaces for sheet metal working applications.
- To Understand the representation of details in machine drawing.
- To introduce tolerances and fits of machine elements.
- To equip them with skills to Construct an assembly drawing using part drawings of machine components.
- To equip them with skills to Construct an assembly drawing of machine components using 2D drafting.
- To Understand various Cam Profile

Course Objectives:

Course Outcomes:

- Draw the surfaces for sheet metal working applications.
- Understand the representation of details in machine drawing.
- Represent tolerances and fits of machine elements.
- Construct an assembly drawing using part drawings of machine components.
- Construct an assembly drawing of machine components using 2D drafting
- Understand the various Cam Profile

UNIT I CONVENTIONS

Importance of sectional views, Code of practice for engineering drawing, drilled and tapped holes, countersunk and counter bored holes, internal and external threads, undercuts, grooves, chamfers, fillet radii and keyways. Conventions to represent standard components-bolts, nuts, washers, screws, cotters, pins, circlips, bearings, gears, springs and flanges.

UNIT II ASSEMBLY CONCEPTS AND DRAWING PRACTICE

Methods and concepts of assemblies-assembly requirements, Bill of materials. Methods of assembly-bolts, nuts, studs, screws and pins. Methods of arresting motion of a member in an assembly. Drawing Practice of flange coupling, universal coupling, oldhams coupling, swivel bearing, stuffing box, knuckle joint, C clamp, plummer block, screw jack, simple drill jig.

UNIT III FITS AND TOLERANCES

Limits, fits and tolerances-need, types, representation of tolerances on drawing, calculation of minimum and maximum clearances and allowances. Geometric tolerance-uses, types of form and position tolerances, symbols, method of indicating geometric tolerances on part drawings. Surface finish symbols- methods of indicating the surface roughness.

UNIT IV SOLID MODELING

Modelling of flange coupling, universal coupling, oldhams coupling, swivel bearing, stuffing box, knuckle joint, C clamp, plummer block, screw jack, simple drill jig.

UNIT V CAM PROFILE

Classifications, displacement diagrams-parabolic, uniform velocity, simple harmonic paths. Layout of plate cam profiles for different types of followers - knife - edged, roller, mushroom, flat type, derivatives of follower motion, pressure angle and undercutting.

3.	ASME Y 14.5M-1994	Dimensioning and Tolerancing	ASME, New York	1995

INTENDED OUTCOMES:

- To understand the basics of biomolecules, human anatomy and physiology
- To have better understanding of advancements in biology

UNIT-I BASICS OF CELL BIOLOGY**(4)**

History, Cell theory, Cell Structure-Prokaryotic and Eukaryotic cells, Animal and Plant Cell. Cell cycle, Mitosis, Meiosis and Reproductive cycle.

UNIT-II BIOMOLECULES**(4)**

Carbohydrates-Classification, Qualitative tests for sugars, Lipids-Definition, Classification; Proteins-classification and functions; Nucleic acids-basic structure; Hormones-definition, importance; Vitamins.

UNIT-III HUMAN ANATOMY AND PHYSIOLOGY**(5)**

Levels of Structural organization, the eleven systems of human body, central nervous system-cardiovascular system and immune system.

UNIT-IV GENETICS AND GENETIC DISORDERS**(4)**

History of genetics-Scope and Importance of genetics, Mendel and his work, DNA stores genetic information-genemutation, disorders due to mutant genes.

UNIT-V TECHNOLOGICAL ADVANCES IN BIOLOGY**(3)**

Biopharmaceuticals, Gene therapy, genetically modified crops, probiotics.
